INTRODUCTION

TO THE ARTICLES RELATING TO ORGANIC CHEMISTRY

The names used we denote ring formulæ are given below for convenience of reference

Since the publication of the last volume I have been assisted in the work of reading and making abstracts of original memoirs by Drs T Cooksey, T A Lawson, Samuel Rideal, Messrs J Wilkie, G N Huntly, J T Norman, and D A Louis I have also been assisted by Mr Arthur G Green and Mr Cecil W Cunnington in the work of revising the proof sheets I have great pleasure in thanking these gentlemen for the energetic and efficient manner in which they have carried out their share of the work

H I ORSTER MORLEY

Nomenclature of Ring Formulæ

Hydrocarbons

$_{ m CH}<_{ m CH_2}^{ m CH_2}$ Trimethylene	C _v H ₄ <ch>CH Indonaphthene</ch>
CH < CH > CH2 Tetramethylene	CH≤CH CH Tetramethenyl
CH CH ₂ Pentamethylene	CH CH CH Pentamethenyl hydride

Nitrogen compounds					
NH <ch ch="" pyrrole<="" th=""><th>⁄ ен сн Сн сн}сн</th><th>Pyruline</th></ch>	⁄ ен сн Сн сн}сн	Pyruline			
NH<\\ H \ Pyrazole	л ≷ <mark>СН СН</mark> >СН	P pida-ine			
NH CH CH Gli oxalini	/≪CH CH >/	Pyra≠ine			
N CH N Metapyrazole	z ∉ CH CH SCH	Purimia ie			
NH CHN or CHN True ole	$\gamma \leqslant_{\mathrm{CH}}^{\mathrm{CH}} \gamma \geqslant_{\mathrm{CH}}$	Tria~oline			
NH N CH Osotriazele	/ <pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre>/<pre< th=""><th>Osotetra_ole</th></pre<></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre>	Osotetra_ole

 SHp
                                                   pressure
              Quantity of heat, in gram units, produced during the complete com-
bustion of the mass of a solid or liquid body represented by its
 HC
                   formula, ...ken in grams
              Heat of combustion in gram units of a gram molecule of an element or
 HCv
                   compound, when gaseous, under constant volume
 HCp
HF
              The same, under constant pressure
              Quantity of heat, in gram units, produced during the formation of the mass of a solid or liquid body represented by its formula, taken in
                   grams, from the masses of its constituent elements expressed by
                   their formulæ, taken in grams
 HF v
              Heat of formation of a gram molecule of a gaseous compound from the
                   gram molecules of its elements under constant volume
 HFp
HV
              The same, under constant pressure
              Heat of vaporisation of a liquid, i.e. gram units of heat required to change
                    a gram molecule of the liquid compound at B P into gas at same
                    temperature and pressure
               Thermal conductivity (unit to be stated)
 S V
               Specific volume, or the molecular weight of a gaseous compound divided
                   by the SG of the liquid compound at its boiling point compared with
                    water at 4°
 8.V S
               Specific volume of a solid, or the mass of the solid expressed by its
                    formula, taken in grams, divided by its S G
 EC
               Electrical conductivity (the unit s stated in each case)
               Coefficient of expansion (between 10° and 20°)
  CE (10°
  • to 20°)
                          of a gas = volume dissolved by 1 volume of water of a liquid or solid = number of grms dissolved by 100 grms of water. In both cases the temperature
  8
               Solubility in water
  B (alco
    hòl)
                                       18 stated
               Index of refraction for hydrogen line \beta
  μ,
  μ<sub>υ</sub>, &ο

* Denotes that the formula to which it is affixed has not been determined by analysis. But it by no means follows that formulæ without this mark are those of analysed compounds

All temperatures are given in degrees Centigrade unless when specially stated otherwise

Wave lengths are given in 10 7 mm

Formulæ, when used instead of names of substances, have a qualitative meaning only

Thomsen's notation is used in thermochemical data

DICTIONARY OF CHEMISTRY.

INDIGO CARBOXYLIC ACID v Indigo INDIGO-CARMINE . INDIGO IKDIGO-SULPHONIC ACID v Indigo INDIGOTINE v Indigo INDIGO-WHITE v Indigo INDILEUCINE v Indigo

INDIN C16H10N2O2 Formed by the action of potash upon isatyde, thio isatyde, or di thio isatyde, formed also by heating isatan (Laurent, A Ch [3] 3, 471) Obtained also by boiling a solution of dioxindole in glycerin for a long time (Knop, Z 1865, 273) Deep rose coloured pow der or minute needles Insol water, v sl sol alcohol and ether Dissolves in H2SO, forming a red solution, whence it is ppd unchanged by water A solution in concentrated alcoholic KOH deposits black crystals, apparently either C₁₆H₉KN₂O₂ or, more probably, potassium indate C16H16KN2O3

Di bromo-indin C16HBr2NO Formed by the action of bromine on indin or on di thio isatyde (Laurent) Formed also by heating di bromo isatvde at 220° (Erdmann J pr 22, 265)

Violet black powder, sl sol alcohol

Di chloro-indin C₁₆H₂Cl N₂O₂ Obtained by heating di chloro isatvde either alone or with alcoholic potash (E) Dirty violet powder, insolwater, alcohol, and HClAq Forms a vellowish solution in KOHAq from which HCl ppts vellow flakes

Tetra caloro indin C16H2Cl4N2O Formed by heating di chloro isatyde either with alcoholic potash or alone below 200° (E) Dirty violet

powder

Di nitro-indin C₁₆H₄(NO₂)₂N O₂ Formed by boiling indin or hydrindin with HNO₃ (L) Formed by Bright violet powder, insol water, v sl sol al cohol and ether Forms a dark brown solution

in KOHAq

Indin di-sulphonic acid C16H, (SO,H)2N2O2? Formed by oxidising hydrindin di-sulphonic said with IINO2, with K2FeCy4, with NaOCl, or even by exposing it in alkaline solution to the air (G a A Schlieper, A 120, 24) Red deliquescent crystals, v sol water, sl sol alcohol, insol ether Its solution dyes silk and wool scarlet nium sulphide reduces it to hydrindin di sul phonic acid. It forms a purple solution in KOHAq, and on warming the solution it becomes pale red, probably through assimilation of water On adding HCl to the pale red sol tion a yellow pp is formed (C₁₈H₁₆(SO₃H)₂N₂O₅?), which, when heated, quickly changes to indin disulphonic, acid Salts—K,A'5aq lustrous red needles—Ag,A'' bulky brown needles—BaA''2aq slender dark reddish-brown needles or crimsch berg (c. 1 p. c.), also from Durham (Flight, B. 10, Vor. III

powder M sol water, insol BaCl, Aq, alcohol

and cold HClAq

Hydrindin C₁₂H₂₂N₄O₅? Formed by the ac tion of alcoholic potash upon indin, isatyde, thio isatyde, or di thio isatyde (Laurent A Ch [3] 3, 475) White, or pale yellow powder or needles (from alcohol), insol water, sl sol boiling Boiling HNO, converts it into a violet alcohol powder Hydrindin dissolves in warm aqueous KOH, and on cooling there separate pale vellow needles of a salt C, H, KN,O, 3aq, which is decomposed by washing with water, leaving hydrindin

Hydrindin disulphonic acid, so called, C_{1a}H₁ (SO₃H)₂N₂O₂? Formed by the action of ammonium sulphide on indin sulphonic acid or on isatin sulphonic acid (G a A Schlieper, A 120, 20) Colourless radio crystalline mass, which becomes reddish when exposed to Lar V water, m sol alcohol, insol ether In alkaline solution it is oxidised by air to indin sulphonic acid -BaA'4aq white scales, v sol water, v sl sol BaCl, Aq

Leucindin disulphonic acid

C₁₆H₁₆(SO₃H) N₂O₄ Formed by boiling the preceding with baryta water (G a A Schlieper, A 1'0, 33) White crystalline mass, v sol water, sl sol alcohol Not reddened by the action of air on its alkaline solutions. On evaporating with HCl Aq there is formed indin disulphonic acid—BaA" 5aq colourless crystals Its solution is not ppd by AgNO, till NH,Aq is added

INDIPURPURIN is identical with Indirubin v Indigo

INDIRETIN v INDIGO INDIRUBIN v Indigo

INDIUM In At w 1134 Mol w unknown, as V D of element has not yet been de-[176°] (Winkler, J pr 102, 273) termined S G $^{20.4^{\circ}}$ 7 11 to 7 147 (Reich a Richter, J pr 93, 480), 150 7 362, 16 90 7 421 (Winkler, J pr 95 414, 102, 273) SH (0° to 100°) 05695 (Bun sen, P 141, 1) CE (0° to 100°) 0000459 (Fizeau, C R 68, 1125) Characteristic lines in emission spectrum 4510 2,4101 3, 4071 6, 4032 7, 3452 8, 3834 7, 3257 8, 3255 5, 3038 7, 3008, 2982 3, 2940 8, 2889 8, 2559 5, 2527 1, 2351 3, 2306 9 (Hartley, T 1884 102)

The observation of two indigo blue lines in the spark spectrum of a specimen o. the sincblende of Freiberg in 1863, led Reich a Richter

INDIUM

2054), and from Bohemia (Kachler, J pr 96, 447), in some Italian galenas (Denegri, B 11, 1249), in various zinc ores (Tanner, J 1874 1227), in the fumes from zinc-ovens (Böttger, J pr 98, 26), ir some tungsten ores (Hoppe-Seyler, A 140, 247)

Preraration -Indium is more readily prepared from zinc which has been made from indium containing blendes than from zincblende itself The zinc is treated, for some days at the ordinary temperature, or for a shorter time at boiling temperature, with so much dilute H.SO.Aq or HClAq that a small quantity remains undissolved, the residue contains In, with some Zn, and Pb, Cu, Cd, As, and Fe There are many methods for obtaining In from this residue, that of Bayer (A 158, 372) is simple, and yields very pure in The residue is washed, treated with a few drops of dilute H2SO, Aq (to remove any basic Zn salts), again washed enoroughly with hot water, dissolved in HNO,Aq (any SnO, which may be present is allowed to remain), evaporated with excess of H2SO, until all HNO, is removed, and treated with water, the solution now contains sulphates of In and the other metals which may be present, but the greater part of the PbSO4 remains insoluble Large excess of NH,Aq is added, whereby hy droxides of In and Fe are ppd with small quan tities of hydroxides of Zn, Cd, Pb, and Cu, the pp is well washed and dissolved in the smallest possible quantity of HClAq, the solution is boiled after addition of NaHSO, until the smell of SO₂ is a most cone, a basic sulphite of In, 2In,O, 3SO, is thus ppd as a fine crystalline The pp is free from salts of Cu, Zn, and Cd If much Fe should have been present in the original Zn, small quantities of Fe salts may be ppd by the action of the air during filtration, in this case ppn should be conducted in CO2, or the pp should be dissolved in NaHSO Aq, and re ppd by boiling may contain Pb salts and traces of alkali, it is dissolved in SO₂Aq in which Pb sulphite is in soluble, after filtration In sulphite is ppd , free from Na salts, by boiling (cf Winkler, J pr 102, 278, Böttger, J pr 98, 26, R E Meyer, A 150, For methods of preparing In from zincblendes v Reich a Richter, J pr 89, 441, 90, 175, 93, 480, Weselsky, J pr 94, 443, Richter, J pr 94, 414, Stolba, D P J 198, 223) The ppd basic In sulphite may be dissolved in H.SO.Aq, after boiling off SO, addition of NH,Aq ppts InO,H,, which when strongly heated yields In₂O, In is obtained from the oxide (1) by heating in a stream of pure H, (2) by mixing with pure C, and heating to a very high temperature, (8) by heating with an equal weight of Na cut in small slices, under a layer of fused NaCl in a porcelain crucible placed in a larger Hessian crucible, decomposing the alloy of Na and In so formed by water, and melting with Na₂CO₂ (Winkler, J pr 102, 275) Böttger (J. pr 107, 39) recommends to ppt In from solutions in H SO, by placing a stick of pure Zn in the liquid, he washes the ppd metal with water, presses it with the finger, then between paper, and when quite dry fuses it under dry

Properties -A silver white, lustrous, ductile metal; softer than lead, leaves a mark when

rubbed on paper Non-crystalline Electronegative ... Zn and Cd , much less volatile than these me cals . Unchanged in air at ordinary temperateres, but burns to In,O,, with blueviolet flame and brownish fumes, when strongly heated in air Combines directly with Cl, Br, I, and S when heated Boiling water is not de composed by In Soluble in dili e acids with evolution of H and formation if salts In.X. where $X = SO_4$, $2NO_3$, &c

The at w of In has been deermined (1) by synthesis of In₂O, from an (Acich a Richter, J pr 92, 484, Winkler, J pr 94, 8, 102, 282, Bunsen, P 141, 28), (2) by analyses of In₂S, (R a R, lc) (8) by decomposing NaAuCl, by In, and determining the Au (Winkler, J pr 102, 212), (4) by determs ng the VD of InCl_{st}, InCl_{st}, and InCl (Nilson a Pettersson, C I 53, 814), (5) by determining the S H of In (Bunsen,

P 141, 1)

The atom of In appears to be monovalent (in InCl), divalent (in InCl2), and trivalent (in InCl,), in gaseous molecules, as the lower chlorides are decomposed by water with forma tion of In and InCl, it is probable that in solu tions of its haloid compounds the atom of in is directly combined with at least three monova lent atoms

In is distinctly metallic, with acids it evolves H and forms salts A few basic, and some double, salts are known In forms an ammonia alum InO, H, rCacts towards acids as a salt form ing hydroxide In is closely related to Al and Ga, less closely to Tl, it is also related to the other earth metals Sc, Yt, La, and Yb (v EARTHS, METALS OF THE, vol 11 p 424) The investigation of In compounds is as yet far from complete

Detection and Estimation -In salts colour the flame blue violet Hoppe Seyler (A 140, 247) boils c 1 gram of an In ore with aqua regia, neutralises by soda, filters, adds Na acetate, and ppts by H2S, he dissolves the pp in acid, and reppts, the In2S, is then tested in the flame after moistening with HClAq The spectral lines 4510 2 and 4101 3 are very characteristic Boiling with NaHSO, causes ppn of t, fine crys talline pp 2In,O, 3SO, 8H,O, this salt is used for the estimation of In

Indium bromide InBr. White crystalline tablets, v sol water, formed by heating In in a White crystalline stream of CO, charged with Br, and subliming (R Meyer, A 150, 429) VD not determined Indium chlorides In combines with Cl in

three proportions, forming InCl, InCl,, and

Indium monochloride InCl Mol w 148 77 V D at c 1100°-1400° = 78 16 (Nilson a Pet tersson, C J 53, 821) Obtained as a reddish black, vitreous, radiated, crystalline mass, by distilling InCl. (q v) on to In (rather more than the calculated quantity), heating for a little in a sealed tube, and distilling in a stream of CO. (N a P, l.c.) When melted InCkforms a darkred liquid, in thick layers appearing almost Deliquescent, gradually decomposes in black

moist air, and quickly in water, to In and InCl.
INDIUM DICHLORIDE InCl. Mol w 184 14
VD at 1000°-1400°-99 62 (Nilson a Petters Non, C J 58, 820) White radiated crystals, obtained by heating In to its melting point in a current of dry HOl free from air until an amberINDIUM.

coloured liquid is obtained, and removing any adhering HCl by heating in dry as free CO_x. Unchanged in dry air, but deliquese p in ordinary air Decomposed by water to in a id InCl. Aq

(N a P, lc)

INDIUM'TRICHLORIDE InCl. Mol wi 219 51 V D at c 850°=106 9 (Nilson a Pettersson, C J 53, 818), at bright red heat V D = 113 88 (V a objection at 140°, at c 600° volatilisation is slow and V DA is rather higher than that calculated for Incl., the normal V D is attained between 600° and 850°, at temperatures towards 1000' dissociation begins, probably into Cl and InCl. or InCl (N a Polc) InCl. is prepared by heating In or a mixture of In2O, with C, in a stream of dry Cl Vilson a Pettersson heated molten In in day air free HCl, and then gently heated the InCl, thus formed in air free, dry, Cl, and finally 'istilled in a current of dry, air free, CO, White, lustrous tablets, deliquescent, sol in water with production of heat, the solution may be evapo rated on a steam bath almost unchanged, but at higher temperatures decomposition probably w'th production of oxychlorides

InCl, combines with KCl NaCl, LiCl, and PtCl, to form crystalline double salts (R Meyer, A 150, 144, Nilson, B 9, 1059) The compound 2InCl, 6KCl 3H.O separates in quadratic crystals from a solution of the mixed salts in proper

proportions on evaporation

Indium cyanide v vol 11 p 332

Indium hydrosulphide The white pp pro duced by adding NH, sulphide, or kHS, to solu tion of an In salt, after addition of tartaric acid and NH, Aq, is probably a hydrosulphide, when dried, H2S is evolved and In2S, remains (R Meyer, A 150, 429)

Indium hydroxide v Indium oxides and

hydroxide

Indium iodide InI, VD not determined Yellow, crystalline, very hygroscopic, may be distilled in dry CO₂, easily melted to a dark reddish brown liquid. Prepared by heating In

two oxides, InO and In O,, the VD of neither has been determined, the existence of inter mediate oxides is probable In₂O₃ forms at least one hydrate In2O, 3H2O The oxides are basic, only salts corresponding to In,O, have dissolve in dilute acids without decomposition

into In and In,O,

INDIUM MONOXIDE INO Mol w unknown, as the oxide has not been volatilised Obtained by heating In,O, in H at c 300° until the oxide becomes almost black and water is no longer evolved Forms a light, loose, powder, which quickly oxidises to yellow In₂O₃, if brought into air before it is quite cold Very pyrophoric InO is changed by conc HNO₂Aq to In3NO₂ with evolution of NO, dilute acids dissolve it slowly without apparent formation of In₂O₂ or In (Winkler, J pr 94, 1, 95, 414, 98, 344, 102,

INDIUM SESQUIORIDE IngO, Mol. w unknown as the oxide has not been volatilised SG 7179, SH (0°-100°) 0807 (Nilson &. Pettersson, B 18, 1459) Obtained by ppg solution of an In salt by NH Aq, washing and host-

ing the pp, or by heating In talfull redness in air, also by strongly heating In carbonate or nitrate A yellow powder, becomes brown on heating but yellow again when cold (It is doubtful whether pure In₂O₃ is yellowish or white) Very infusible, reduced to metal by heating with C, or in H, or with Na, reduction in H begins at c 190°-200°, and at c 300° Ino is formed (v supra) Soluble, in soids, quickly on heating, forming salts In. 3X (X-SO, 2NO,

Oxides intermediate between InO and In.O. possibly exist By heating In₂O₂ in H to c 200°, a greyish blue body is obtained probably In.O. at c 230° a green substance, probably In O.

remains (Winkler, lc)

INDIUM HYDROXIDE InO,H, or In,O, 3H,O Formed by ppg a solution of an in salt by NH, Aq, washing the pp and drying at 100° The pp by NH,Aq is gelatinous and resembles AlO,H, in air it dries to horny semitransparent lumps Insol in NH,Aq, easily sol in KOHAq or NaOHAq, dissolves in acids to form salts $In_2 dX$ (X = SO_4 , $2NO_3$, &c) A series of very unstable hydrates of In.O. probably exists (cf Carnelley a. Walker, C J 53, 88) Indium exybromide The white amorphous

solid formed by heating In,O, in Br vapour is probably an exybromide, this substance is said not to be decomposed by heating with acids or

alkalıs (R. Meyer, A. 150, 137)

Indium oxychloride When InCl.Aq 18 boiled down to dryness, the white residue is pro-

bably an oxychloride

Indium salts Not many salts of In have been isolated and examined. They are obtained by dissolving In or InO.H. in acids, and evaporating, and in some cases by ppn from other In salts The chief salts are the carbonate, in solution nitrate, sulphate, and a basic sulphite (v Car BONATES NITRATES, &c) The sulphate forms an ammonia alum, In, (SO,), (NH,), SO, 24H,O, but with K₂SO, and Na, SO, it forms double sul phates In₂(SO₄), K₂(Na) SO₄ 8H₂O

in I vapour (R. Meyer, A. 150, 144, 429)

Indium sulphide In, S. Mol w unknown
Indium oxides and hydroxide In forms as compound has not been gasined. Obtained by ppg a neutral or feebly acid solution of an In salt by H.S. and drying the pp , also by heating together In and S. or In.O. and S. A yellowishgrey solid If In,O, is heated with S and Na,CO, and the fused mass is treated with water, In.S. been isolated, although the lower oxide is said to remains as lustrous tablets resembling mosaic gold (Winkler, lc) In2S, is infusible, with acids it gives In salts and H.S (Reich & Richter, lc) Heated in air it is burnt to In₂O, According to Winssinger (Bl (2) 49, 452) In₂S, is obtained in aqueous solution in a colloidal form, by passing H.S into InO,H, suspended in water, the dark yellow liquid thus obtained can be freed from H.S by boiling, it is coagulated by acetic acid and also by salts For reactions of alkali sulphides with In salts v R Meyer, lc

Potassium, and sodium, indium sulphides, K.S In.S., Na.S In.S. Formed by fusing together 1 pt In,0,, 6 pts S, and 6 pts K,CO, or Na,CO, The K salt remains as hyacinth red quadratic tablets on harvisting the fused mass with water, the Na salt goes into solution and separates on standing as Na,In,S, H,O which on drying gives Na,In,S, (R. Schneider, J pr [2] 9, 209)

M M P M

INDOGEN & INDOXYL INDOGENIC ACID v Indoxylic acid INDOGENIDE OF BENZOIC ALDEHYDE

C1.H11NO 16 C6H4 CONH CH.C6H, B nsyl-

[176°] Obtained by heating ıdene ψ-ındoxyl indoxylic acid with benzaldehyde (Baeyer, B 16, Long flat orange needles Sol alcohol and chloroform to yellowish red solutions, which have a yellowish green fluorescence In H,SO and strong HCl it dissolves with a deep red colour, in alcoholic KOH with a greenish blue, which gives the indigo spectrum
(a)-INDOGENIDE OF \(\psi \) ISATIN is INDIRUBIN

β)-Indogenide of ψ isatin is Indigo

Indogenide of ethyl ψ isatın 18 Ethyl ındı rubin v Indigo

INDOGENIDE OF p-NITRO-BENZALDE HYDE C₁₅H₁₀N₂O₃ 18

CH CH (NO) p Nitro-benzylidene-v-indoxyl [273°] Formed by adding an acetic acid solution of p nitro benzaldehyde to an aqueous solution of indoxyl acidined with Red needles (Baever, B 16, 2199)

INDOGENIDE OF PYRUVIC ACID C,H,NO, $C_{\bullet}H_{\bullet} < CO > C CM_{\bullet} CO_{\bullet}H$ [197°] pared by adding HCl to an aqueous solution of indoxyl and pyruvic acid (Baeyer, B 16, 2199) Easily soluble in alcohol and Red needles acetone Dissolves with a red colour in alkalis, with a blue colour in conc H2SO,

INDOINE v Indigo

small quantity in human excrement (Brieger,

J pr [2] 17, 133)

Formation -1 By passing the vapour of oxindole over heated zinc dust (Baeyer, A 140, 295, Suppl 7, 56, Engler a Janecke, B 9, 1411) -2 By distilling with zinc dust the yellow product of the action of tin and HCl on indigo (B) -3 By fusing o nitro cinnamic acid with KOH and iron filings (Baeyer a Limmer ling, B 2, 679, Z [2] 6, 213, Beilstein a Kuhl berg, A 163, 141) -4 Formed to the extent of 5 pc in the passage through a red hot tube of di ethyl o-toluidine, in less quantity from di methyl-o-toluidine, in small quantity frommethyl ethyl aniline, ethyl acetanilide, and di ethyl aniline, and in trace only from ethylaniline when subjected to like treatment (Baever a Caro, B 10, 692, 1262) — 5 By digesting albumen with pancreas and water at 40° to 45° for several days (Nencki, B 8, 336, Kuhne, B 8, 206) According to Harris and Tooth (JPhysiol 9, 220) its formation is due to a special micro-organism - 6 By distilling albumen (1 pt) with KOH (8 pts), the yield being about 25 pc (Engler a Janecke, B 9, 1411, Nencki, J pr [2] 17, 98) -7 By distilling (3,4,1) nitro propenylbenzoic acid with lime (Widmann, B 15, 2552) 8 By boiling aniline with di chloro acetic aldehyde or with di chloro di ethyl oxide (Berlinerblau, M 8, 180) - 2. By heating ω chloro o-amide styrene with NaOEt at 165° (Lipp, B 17, 8067) - 10 Together with ethane, ethylene, and propylene, by the distillation of o cumidine

C₀H₄(NH₂)(C₂H₂) over red hot PbO (Filett, G. 13, 381) — 1 By the dry distillation of o tolyloxamic as d (Mauthner a Linda, M 7, 238) — 12 From phenyl-ethylene diamines by successions of the control of the c sive oxidation vith CrO, and distillation over zinc du.t (Prud.iomme, Bl [2] 28, 550) -18 By fusing carbostyril with potash (Mo gan, C. N. 36, 239)—14 In small quantity, b. heating the phenyl hydrazide of pyruvic acid with ZnČl, at 200° (E. Fischer, B 19, 156°) —1? By distilling calcium phenyl amido acetate with calcium formate (Mauthner a Suida, M 1., 253)

Preparation —1 By heating aniline (50g)

with an equal volume of water with inverted condenser and gradually dding di chloro ether (25 g) After boiling for an hour the excess of aniline is distilled off, ad the res due heated for 5 hours at 220° (Berlinerblau, M 8, 189) --2 By distilling a mixture of calcium phenyl amido acetate with calcium formate, extractir the distillate with ether, shaking the ether with dilute acid to remove aniline, evaporating and distilling with steam The indole is purified by conversion into the picrate The yield is 5 p c of the theoretical quantity (M a S)

Properties - Colourless lamine, m sol not water, v sol alcohol, ether, and heroin Readily volatile with steam An alcoholic solution, acidified by HCl, dyes pine wood vellow a peculiar, but not very powerful, odour a very weak base, with cone HCl Aq it forms a sparingly solubio salt, decomposed by boiling

Reactions - 1 Suspended in water and sub jected to the action of ozonised oxygen indole is converted into indigo and resinous products (Nencki, B 8, 727, 1517) Indigo appears in the urine after subcutancous injection of indole 2 Aqueous CrO, yields a bulky violet brown pp, insol other, chloroform, and benzene, sl sol alcohol, forming a red solution sol conc HClAq (L a J) - 3 Heated with MeI it gives di methyl quinoline dihydride (Ciamician a Latti, B 22, 1980) —4 When to an aqueous solution of indole there is added a few co of HClAq, and then a large quantity of fuming HNO, (previously partially freed from nitrous fumes by evaporation), a red pp is formed which may be purified by solution in alcohol and precipitation by adding ether. This substance, so cilled nitroso indole nitrate C16H13(NO)N2HNO3, forms minute red needles. v sl sol water and ether, v sol alcohol nearly insol dilute nitric acid. It detonates sharply when heated Alcoholic ammonium suiphide reduces nitroso indole mitrate to so called hy drazo indole C10H13N2 (?), which forms vellow needles, sol alcohol and ether, melting at 140° to a deep-blue mass Acids and alkalis convert it into a dark brown colouring matter termed

Picrate C_nH₂NC₆H₂(NO₂)₂OH Long red glittering needles

Acetyl derivative C.H.NAc From indole and Ac,O at 190° (Bacyer, B 12, Long needles (from water) or four sided 1314) pyramids (by sublimation)

(A)-Acetyl-indole C.H. CCO CH. Methul in 'yl ketone [190° cor] Obtained by heating indole (a)-carboxylic ac 1, prepared fr .n methylketole, with ten times its bulk of Ac2C or 7 hours at 220° (Carlo Zatti, Rend Accod 1 inc [4] 4, 184, B 22, 662) White need'ss Sublimes in colourless plates, al sol cold, v sol warm water and benzene, may be extracted from its aqueous solution by ether Gives indole when heated with cone HClAq It readily yields an oxim and an only henyl hydrazide Potash fusion converts it nto indole (8) carboxylic soid [214°] identic , with that obtained by oxidising skatole

Piorate [1834] Needles, sl. sol cold benzene

Oxim C.H.C(NOH)Me [144'-147°] White

Di-acetyl indole C.H. CH CO CH, C CO CH2 [147°-150°]

Prepared by heating indole (a)-carboxylic acid with Ac,O and separated from the preceding by its greater solubility in water containing Na, CO, and in boiling benzene (Zatti) Needles (by sublimaticn), sl sol boiling water When bo ed with aqueous kOH or K₂CO₂ it yields (B) acetyl indolc

References - Di chlobo indolp, Brazil INDOLE, METHYL INDOLF, METHYL ETHYL INDOLE, ETHYL INDOLE

Isoindole is Di PHFNIL I TRAZINE (q v) Di indole v Indoline under Indiao

Retin indole C.H. O? Obtained by treating di chloro indole (chloro oxindole chloride) with HI dissolved in HOAc passing in SO and pps, with NaOH (Bacyer, B 12, 1313) Amorphous, insol NaOHAq, v sol alcohol and ether Its solution in HOAc volatile with steam mixed with HCl colours pine wood red On dry distillation it yields indole

INDOLE (a) CARBOXYLIC ACID C,H NO, • C,H, < CH > C CO H [201°]

Formation -1 By heating the phenyl hy drazide of pyruvic ether with ZnCl, at 195° (E. Fischer, B 19, 1567, A 236, 140) -2 By fusing (a) methyl indole (methyl ketole) (1 pt) with KOH (15 pts), the acid being ppd by H2SO, from the dissolved product, the yield 18 over 50 pc (Ciamician a. Zatti, hend Accad Lanc [4:4, 746) -3 From acetyl (a) methyl - indole C.H. CH SCMe by potash fusioi (Ciamician a Magnanini, B 21, 673)

Properties - Needles (from water) M sol hot water and benzene, v sol alcohol and ether May be sublimed in plates, but suffers partial decomposition thereby At 230° it splits up into indole and CO. Pine wood acidified with HCl is not coloured yellow by it. With isatin and H2SO4 it gives a reddish violet colouration It forms a picric acid compound crystallising in slender golden needles Its Ba salt is soluble Ac₂O at 220° forms (β) acetyl indole and di acetyl-indole

Anhydrede C₁₈H₁₈N₂O₂ se CH C CO N N_CO C CH C,H, [812°_815°] Mcl

Confirmed by Raoult's methou (Magnani 11, B. 22, 2508) Formed by boiling the acid with

Ac.O using an inverted condenser. Yellow needles

Methyl ether MeA' [152°] Needles Indole (β) -carboxylic acid

C₄H₄ C(CO₂H) CH [214°] Formed by fusing (3) methyl indole (skatole) with KOH (Cia mician, Magnanini a Zatti, 3 21, 673, 1929) Obtained also by fusing (8) acetyl indole with caustic potash (Zatti, B 22, 664) Plates (from water), decomposed on fusion Sl sol benzene and boiling water, m sol alcohol and ether, almost insol. ligroïn Its aqueous solution evolves CO, on boiling With isatin and H.SO. it gives a brownish violet colour Its ammonium salt gives pps with CuSO, and with FeCl. It does not yield a picric acid compound.

Indole di carboxylic acid

 $CO_2H C_0H_4 < \stackrel{CH}{\sim} CCO_2H$ [above 250°] C^{\bullet_4} tained by saponifying its acid ether, which is formed when CO Et C, H, N, H CMe CO, Et, the product of the condensation of hydrazido benz one ether with pyruvic ether, is heated with zinc dust (Roder, A 236, 169) Slender needles, sol. hot alcohol and acetic acid, al sol ether and water Does not colour pine wood Decomposed on fusion giving off CO2 and yielding a product that behaves like indole towards pine wood.

Mono ethyl ether LtHA" [250°] Yellow

needles (from HOAc) INDOLES Alkylated derivatives of indole may be formed synthetically in the following ways (a) By removal of NH, from the phenyl hydrazides of ketones, aldehydes, or ketonic acids Thus with the phenyl hydrazide of acetone C_4H_5 \₂H CMe = NH₃ + C_6H_4 < $\frac{CH}{NH}$ >CMe, in like manner from the phenyl methyl hydra zide of pyruyic acid C,H,N.Me CMe CO;H = NH₂+C₆H, CH_{Me} C CO₂H (E Fischer, A 236, 116) (b) By elimination of NH, from alkylated dı pyrroles -

(Dennstedt, B 21, 3429) (c) By heating (8) bromo & acetyl propionic acid with aromatic amines (Wolff, B 21, 3360) Thus o- or ptoluidine gives tri methyl indole, (8) naphthylamine gives di methyl (8) naphthindole, while ethyl aniline forms di methyl ethyl-indole.

C.H., NHEt + CH., CO CHBr CH...CO.H

= $HBr + H_2O + CO_2 + C_6H_4 < \frac{CMe}{NEt} > CMe$ Indoles may be converted by alkyl iodides into derivatives of quinoline dihydride

INDOLINE v Indigo INDONAPHTHENE The hypothetical hydrocarbon C,H, or C,H, CH >CH which stands in the same relation to indole that naphthalene stands to quinoline (Baeyer a. Perkin, jun, B 17, 122) The name undere has also been proposed for thesamehydrocarbon (Roser, A 247, 132), v also METHYL INDONAPHTHENE Besides the methods mentioned below, indonaphthene derivatives may be formed by condensation of naphthalene de

CO CO CHCl CCl₂ Thus C.H.

the chlorination of (B)-naphthoquinone is con-

C(OH) CO₂H NaOH into CCl₂ (Zincke, B 20, 2894) which

may be oxidised by chromic acid to

 $C_{\bullet}H_{\bullet} < \stackrel{CO}{cHCl} > CCl_{2}$ [59°]

INDONAPHTHENE DIHYDRIDE CAR BOXYLIC ACID C10H10O2 16

 $C_{\bullet}H_{\bullet} < CH_{\circ} > CH CO_{\circ}H$ Hydrindonaphthene

Formation —1 By heating the correspond ing di carboxylic acid until the evolution of CO2 has ceased, and distilling the product (Baeyer a Perkin, jun, B 17, 122)—2 By the action of (1 mol of) ω -di bromo xylene (o xylylene bromide) upon aceto acetic ether (1 mol) and NaOEt (2 mols) and saponification of the product with alco holic KOH (Scherks, B 18, 378)

Properties - Colourless needles (from water). may be distilled when quickly heated Sl sol cold water On oxidation with KMnO, it yields phenyl-glyoxylic acid It forms a bulky white

silver salt, si sol hot water

Indonaphthene dihydride dicarboxylic acid C₆H₄<CH₂>C(CO₂H)₂ [199°] Formed by the action of di w bromo o xylene on malonic ether (1 mol)and NaOEt (2 mols) in ether (Baeyer a Per kın, jun, B 17, 122, Perkın, jun, C J 53, 7), the resulting ether being saponified Trimetric plates, m sol hot water, alcohol, and ether, sl sol cold water When heated above 200° it gives off CO_2 and leaves the mono carboxylic acid $-Ag_2A''$ white amorphous pp becoming white amorphous pp becoming orystalline, sl sol water INDONAPHTHOQUINONE C,H,O,: 6

 $C_0H_4<_{CO}^{CO}>CH_2$ [131°] Di keto indonaphthene Di keto hydrindene Formed by warming its carboxylic ether C₆H₄<CO>CH CO₂Et with alkalıs (Wislicenus, A 246, 351) Best obtained by acidifying an aqueous solution of the sodium derivative C6H4 C2O2 CNa CO2Et, extracting with ether, and leaving the ethereal solution to stand, when CO₂ is given off

Properties - Small needles (from benzene ligroin), v sol hot alcohol and benzene, m sol ether and hot ligroin, v sl sol cold ligroin and Dissolves in alkalis with intense yellow water colour

Reactions -1 Gives a phenyl hydrazide C_eH₄CO CH₂ [163°] crystallising in yellow needles, insol water and ligroin, v e sol ether and benzene With phenyl hydrazine at 100° it gives rise to a di phenyl hydrazide C.H. C(N,HPh) CH2, which forms coloured plates [171°], and when dissolved in HaSO, is coloured deep bluish green by FeCl, (W

Wislicen 252, 73) -2 Forms a a Kötzle, nitroso erivative C.H. COC NOH [198°] crystalliung from HOAc in triangular plates -8 Be work aldehyde at 120° forms $C_6H_4 < CO > C$ CHPh [150°] -4 Gives with bromine a compound C,H, CC > CBr, [177°] crystallising in plates, m scl hot alcohol and HOAc, v sol ether and C32 (cf Zincke, B 20, 3216) This di bromo derivative, which is also formed by the bromine on C₆H₄ CC — CNH₂ CNH₁ - CNH₂ and on C_eH , CO — C NH_2 , is converted by the action C(NH) CHof alkali into bromoform, phthalic acid, and the compound C₆H₄<COH CBr [118°], whence Br forms again the original CaH CO CBr. while Cl forms C4H4CO>CClBr [147°] (Zincke, B 21, 2394) The corresponding C_sH_s CO CCl₂ [125°] is formed by the action of chlorine on C_oH, CO CO CO COl₂ CCl₂ CCl₂ CCl₃ CCl₄ CCl₅ dissolved in

Indonaphthoquinone carboxylic ether C₆H₄ CO CH CO Et [78] Formed by the action of NaOEt (2 mols) on phthalic ether (1 mol) and subsequent treatment with acetic ether, the product C,H, CO CNa CO F1 being treated with dilute H SO, (Wislicenus, A 246, 349) Slender yellow needles, insol water, v e sol alcohol, ether, benzene, and ligroin FeCl, colours its alcoholic solution deep red Dissolves in aqueous Na₂CO₃, expelling CO If its alkaline solution be boiled and then acid: fied CO2 is evolved and indonaphthoquinone libe rated It forms a phenyl hydrazide If its acid solution is boiled with water there is formed C18H10O3, which dyes wool violet red and forms orystalline C18H2BrO, [196°] and C18H2Br2O, $[242^{\circ}]$

aqueous Na₂CO,

Salts -C,2H,O,Na aq yellow needles (from Gives with Mel the compound CoH. CO>CMe CO2Et, orystallising in prisms [74°], v e sol alcohol and ether, insol water, sol NaOHAq with rose colour - (C12H,O), Cu green crystals (from alcohol)

INDONE The ketone CaH, CO>CH, a number of the haloid derivatives c* which have been described by Roser (A 247, 132) Indone may also be viewed as the anhydride of DI oxy INDOMAPHTHENE

INDOPHANE C₂₂H₁₀N₄O₄. A blue substance, resembling indigo, produced, together with naphayl purpure acid, by adding a hot concentrated solution of KCy (45 g) to limitro naphthol (f') g) dissoived in boiling water (2 litres) to which just enough NH, has been added to effect

INDOXYL 7

solution (Hlasiwetz, Sommaruga, C C 1871, 617) Violet mass with green lus' , insol. water, alcohol, ether, benzene, and C., m sol H₂SO₄ and hot HOAc, forming purple solu-tions Ma be sublimed Nitr c acid converts it into a brownish red body, soluble in alkalis Ferrous sulphate mixed with lime reduces it Aqueous KOH forms C₂₂H₂KN₄O₄aq, a body greatly resem ling indigo, NaOH acts in like manner

INDOPHEFAN (C,2H,NOS)x Formed by shaking isatin (1 pt) with H2SO, and benzene that contains thiophene C₈H,NO₂+C₄H,S=H₂O+C₁₁H,NOS (Baever, B 12, 1309, 16, 2188, 18, 2637, V Meyer, B 15, 2893, 16, 1465, P Meyer, B 16, 2269, Gumpert, J pr [2] 32, 278) Blue powder, which exhibits a coppery lustre when rabbed, or small needles (from alcohal phenol) Insol water, benzene, and ligroin, v si sol alcohol, ether, and CS₂, si sol HOAc in H₂SO₄ it forms a blue solution, whence it is ppd by water Cannot be sublimed May be re duced by zinc dust and HOAc to a colourless body which is re oxidised to indophenin on ex pos ire to air Bromo, di bromo, and methyl indophenins may be formed in like manner by using bromo, di bromo, or methyl isatin in place of isatin in the above preparation

INDOPHENOLS Quinonimides of the formula $C_eH_i <_{NR'}^{NH}>$, where R' is an aromatic radicle containing hydroxyl (of Indamines). Thus when a mixture of di methyl p phenylene diamine and (a) naphthol is oxidised with NaOCl or K2Cr2O there is formed the dark blue indophenol

NMe₂Cl (Pabst, Bl [2] 38, 161), C₁₀H₄ OH (Pabst, Bl [2] 38, 161), while p amido phenyl piperidine mixed with phenol and oxidised by K, FeCy, forms a similar

body C,H,CI (Lellmann a Geller, B

21, 2288)

INDOTANTHIC ETHER $C_{ii}H_{ii} \times O_4$ se. C,H,<CO>C(OH) CO,Et [107] Prepared

by the careful exidation of indexylic ether with $1 \, e_i \text{cl}_{\bullet}$ (Baeyer, B 15, 775) Yellow needles or monoclinic prisms Sol water needles or monoclinic prisms and ether On further oxidation it gives CO H C, H, NH CO CO, Et On reduction it is recorverted into indoxylic ether Decomposed by alkalis with formation of anthranilic acid

Nitrosamine C11H10(NO)NO4 [113°] Light yellow needles or tables Sol alcohol and

ether, sl sol water

Indoxyl $C_{\bullet}H$, no 1 e $C_{\bullet}H$, $< C_{NH}^{C(OH)} > CH$ (stable form) or C₆H₄ CO CH₂ (transition (orm)

Formation -1 By warming potassium in doxyl sulphate with HCl or H SO, -2 By heat ing indoxylic acid alone or with H.SO, (Bacyer, B 14, 1744) -3 By boiling o nitro phenyl ace tylene with acid ammonium sulphite, and tree t ing the product with zinc dust and ammonia (Baeyer, B 15, 56) -4 By reducing isatogensulphurous soid with zinc dust and ammonia

Properties —Oil Not volatile with steam. In the pseudo form C₈H₄ CO_{NH} CH₂ it is not knowr in the free state, but di substitution products of \(\psi \) indoxyl are stable. Nevertheless in doxyl forms condensation products, called in dogenides, with bodies containing a CJ group, in which reactions it must be supposed first to change into the pseudo form

Reactions -1 In alkaline solution it is rapidly oxidised in the air to indigo FeCl, forms a white amorphous body, which is imme diately converted by HCl into indigo (E Bau mann a Tiemann, B 13, 415) -2 Indoxyl is not affected by H_2SO_4 or cone HClAq, but dilute HClAq converts it into an amorphous red sub stance -3 A solution in H2SO, treated with o nitro-phenyl propiolic acid gives indoin -4 On warming with a solution of Na₂CO, and o nitrophenyl propiolic acid, indigo is produced -5 By the action of Na₂CO₂ upon an alcoholic solu tion of isatin and indoxyl there is formed indi rubin, while with bromo isatin the product is bromo indirubin (Baeyer) — 6 Bromine gives tri bromo aniline (E. Baumann a Tiemann, B12, 1192) -7 In alkaline solution K,S,O, forms indoxyl sulphuric acid -8 Diazo benzene chlor 1de forms C.H. COH, N.Ph CH? [236°] (Baeyer,

B 16,2190)

Nitrosamine C.H. COH, SCH Formed by the action of nitrous acid on indoxyl (Baeyer, B 16, 2188) Slender yellowish needles When boiled with HCl it gives indigo

Isonitroso derivative of \(\psi \) indoxyl

 $C_{\bullet}H_{\bullet} < CO > C \text{ NOH}$ See oxim of ψ isating

Ethyl derivative C.H. COEt) CH.

Tormed by heating the ethyl derivative of in doxylic acid Oil, volatile with steam Smells like indole, and colours pine wood, acidified with HCl, brownish red Its pierie acid com pound C10H11NOC, H2(NO2), OH forms brown needles Its nitroso derivative

C.H. $\langle \stackrel{C(OL,t)}{\sim} \rangle$ CH forms yellow prisms [85°], sol alcohol, insol water, and converted into indigo by heating with HCl (Baever, B 15, 781)

Indoxyl sulphuric acid C.H NSO. in the urine of herbivora and, in smaller quan tity, in that of man (Schunck, P M [4] 14, 288, Hoppe Seyler, C C 1864, 511, H 8, 79, E Baumann a Tiemann, B 13, 408) When in dole is introduced into a dog by injection or in food large quantities of indoxyl sulphuric acid appear in the urine (Jaffé, Fr 11, 358, E Baumann a Brieger, H 3, 254) Indoxyl sul phuric acid is also formed by adding K,S,O, to a solution of indoxyl in aqueous KOH (Baeyer, B 14, 1745)

Potassium salt -KA' Plates (from hot alcohol) V sol water, v sl. sol cold alcohol Not affected by KOH even at 170° Decomposed by hot dilute HCl or H₂SO,, or even by water at 120°, into indoxyl and I TSO, When warmed with FeCl, and a little HCl it is entirely converted into indigo Indigo is also formed when the salt is heated alone.

INDONYLIG ACID C,H,NO, re

C,H, C(OH) O CO,H (stable form) or

CO

C_cH_cCO_{NH} CH CO₂H (transition form) [123°]. Formed by saponifying its ether with fused NaOH at 180° White crystalline pp, sl sol water. In dilute alkaline solutions it is converted into indigo by the action of air or oxidising agents. On heating it splits off CO₂ forming indoxyl

Indoxylic ether C₈H₅N(OH) CO₂Et Colourless prisms, [121°], dissolves in alkalis and is reppd by CO₂ Prepared by reduction of isatogenic ether or o nitro phenyl propiolicether Heated with H₂SO₄ it gives indigo sulphonic soid On oxidation it gives successively indo xanthydic ether C₂,H₂₀N₂O₃, indoxanthic ether C₁₁H₁₁NO₄, and hydrogen ethyl oxaloxyl o amido benzoate CO₂Et CO NH C₈H₄CO₂H

Acetyl indoxylic ether
C.H.N(OAc) CO.Et white needles, [138°]
Ethyl indoxylic ether

C_aH_aN(OEt) CO_cEt large colourless crystals, [98°]

Ethyl-indoxylic acid C₂H₄N(OEt) CO₂H plates, [160°] Oxidised to indigo by Fe₂Cl₈, but not in alkaline solution

Nitroso-ethyl-indoxylic acid C₈H₄N(NO)(OEt) CO₂H flat golden needles Decomposes at about 200° Formed by the action of nitrous acid on ethyl indoxylic acid (Baeyer, B 14, 1742, 15, 775, 16, 2189, Forrer, B 17, 376)

INDUCTION When H and Cl are mixed in equal volumes and exposed to sunlight a measur able time elapses before chemical change begins Bunsen a Roscoe, who examined this phenome non (T 1857 355), regarded the mixture as resisting chemical change, and they used the term induction to express the gradual overcoming of this resistance. The term has also been used by Wright, who noticed a similar phenome non in the reduction of metallic oxides by CO and H (C J Trans 1879 475, 1880 757), Chemical Change, vol 1 p 749

MMPM INDULINES (O N Witt a Thomas, C 43, 112) Coloured compounds formed by the action of such bodies as azo, amido azo, nitro, or nitroso- compounds on the hydrochlorides of certain aromatic amines with elimination Anılıne hydrochloride gives a darkof NH, blue colouration with amido azo benzene mann a Geyger (B 5, 474) supposed that only one dye stuff was formed $C_{12}H_{11}N_3 + C_6H_1N$ = C₁₈H₁₅N₂ + NH₃ In reality a great number of dye-stuffs are got If the mixture of diazo benz ene anilide (1 pt), aniline (4 pts), and aniline hydrochloride (1 pt), which has been left until the diazo benzene anilide has changed into amido azo-benzene, be heated at 100° for 24 hours, crystals of azophenine C₁₀H₂₁N₄ separate This forms garnet coloured leaflets (from aniline) [237°] (v Azophenine) If the mixture of aniline, aniline hydrochloride, and amido azo-benz-ene, after heating at 100° till azophenine is formed, be further 1 sated at 125°-180° for 12 hours, the azophenine disappears, and the mass turns blue If it be slowly cooled crystals are These may be separated from the

mother-liquor (which contains 'induline B'), washed "th spirit and wi'h boiling water, and recrystal sed from aniline mixed with aniline hydrochloride So obtained, induline 3 B forms glistening brown leaflets, C₂₀H₂₂N₂ECl It is insol cold, sc' hot, spirit, and v sol aniline Alcoholic NaOH liberates the free base, which forms purple solutions with alcohol and with aniline Induline 3 B is sky blue Its sulphonic acid resembles that of induline B

Induline 6 B—C_{3e}H, N₅ Is formed by heat ing a mixture of amido azo benzene (100 pts), aniline hydrochloride (130 pts), and anil ne (300 pts), for 5 hours at 110°, then adding more aniline hydrochloride (65 pts), and heating to 165°–170° The hydrochloride, B'HCl, separates as green crystals The iree base separates from aniline as brilliant green needles. The solution of this base is of a dark bluish purple colour The hydrochloride is insoluble in the usual solvents, and is hardly soluble in aniline. It dissolves in phenol and in H₂SO₄, forming a greenish blue solution

Induline B hydrochloride is v sol spirit, sl sol water, v sol a cone aqueous olu tion of aniline hydrochloride. The base forms a brown red spirit solution. The sulphonic acid is insol water, but its neutral alkaline salts form reddish blue aqueous solutions.

Formation of indulines is due to the dehy drogenating action of amido azo benzene, which itself becomes aniline and p phenylene diamine, the latter then entering into the reaction A/o benzene, phenyl amido azo benzene, chrysoid ine, nitroso di methyl aniline, and even amido azo naphthalene, may be substituted for amido azo benzene, but if instead of amiline o toluidine or naphthylamine be used, red dyes are got (azo toline, &c) This would indicate that azophen ine was an oxidation product of aniline, and not derived from the amido azo benzene. In the preparation of azophenine by heating aniline (4 pts) with aniline hydrochloride (1 pt) and amido azo benzene (2 pts) at 85, am monium chloride and p phenylene diamine are constant by products, indicating that phenyla tion and reduction of the amido azo benzene has taken place (Witt, B 20, 1539) When azo phenine (400 g) is boiled with alcohol (40 litres) and strong H2SO4 (2 kilos) for 10 hours quinone dianilide (195 g) is formed The compound C_dH₄ NPh is converted by heating with ani line at 100° into azophenine (Baudrows' i, M These reactions confirm the formula 9, 414)

C₈H₂(NPhH)₂ | Proposed by Kimich and by

Fischer a. Hepp for azophenine, which is also consistent with its formation from nitroso di-N---HPh

phenylamine C.H. NHPh (O Fischera Hepp,

B 20, 2479, 21, 676, 2617) By the action of aniline on azophenine, induline (6 B) of the formula NPh C₄H(NHPh)₄ NPh C₄H, might be formed A mixture of 8 B and 6 B induline is

formed A mixture of 8 B and 6 B induline is formed by heating p-nitroso di-phenyl amine with aniline and aniline hydrochloride in alcohonic solution at 130° By heating p nitroso-di-

INOSITE 9

phenyl amine (1 pt) with aniline hydrichloride (1 to 2 pts) and ar 'ine (4 pts) at '5°-140°, a very rich yield of induline is obtained, which chiefly consists of 6B. If pure azophenine is heated at 140° with equal parti of aniline and aniline hydrochloride 6B induline is almost exclusively formed (Fischer a Hepp, B 20, 2484). By the action of azo, intro, or mitroso compounds on m-or p-dirmines, indulines which are soluble in water are formed, e.g. paraphenylene blue.

Rosinduline C28H19N, te

C_{1e}H₃(NPn) $\stackrel{N}{\sim}$ N_{Ph} $\stackrel{N}{\sim}$ C₆H₄ [225°] Formed by the action of nitroso phenyl (a)-naphthylamine hydrochloride on aniline and aniline hydrochloride at 120° (O Fischer, B 21, 2621) Formed also by oxi ising triphenyl tri amido-naphthelene C_{1e}H₃(NHPh), [1 2 4] Red plates, almost insol water, m sol alcohol, v sol benzere Reduced by HI and P at 150° to a yellowish red base and aniline Zinc and HCl give naphthalene and aniline

INOGEN v MUSCLE

INOSIC ACID $O_{10}H_{11}N_1O_{11}$? Occurs in the mother liquor in the preparation of creatine from flesh (Liebig, A, 62, 317, A, Ch, [3, 33, 129) Occurs to the extent of $\frac{1}{4}$, pc in the flesh of hens. Pigeon's flesh and human flesh contains none (Gregory, A, 64, 106, Schlossberger A, 66, 82). It is found in some fish (Limpricht, A, 133, 301)

Preparation - The filtrate from which creatin has separated is concentrated, then mixed with alcohol till it acquires a milky consistence, and left to itself for a few days. It then deposits a crystalline mixture containing the inosates of Na and Ba. The crystals are dissolved in hot water and BaCl, added. The Ba salt crystallises on cooling.

Properties —Uncrystallisable, v sol water, forming a solution with a flavour of broth, whence alcohol ppts it as an amorphous powder Insolution

Salts - K,A" 7 aq long, four sided prisms, ▼ sol water insol alcohol - BaA" 6 aq prisms 8 25 at 16°

INOSITE C.H. O. Phaseomannte [217°] (Maquenne), [225° cor] [Fick) (319° in vacuo) (M) SG (of C.H.,O.,2aq) L2 1524 SG (of C.H.,O.,2aq) L3 1524 SG (of C.H.,O.,2aq) L3 1525 SG (of C.H.,O.,2aq) 10 at 12 (T a V), 13 at 19° (Fick) H C 666500 H F 311500 (Berthelot a Recoura, C R 105, 14° Discovered by Scherer (A 73 322, 81, 375) in muscular substance (Is, ivos, muscie) It occurs especially in the heart, but also in the lungs, kidneys, liver, and spleen of oxen (Cloetta, 199, 289) in the train of oxen (W Millex, A 103, 140), in human kidneys, and in the urine in a case of Bright's disease to the amount of 1 p c.

and sometimes in healthy urine (Kulz, Fr 16, Found also in birds, in cephalopoda (Krukenberg, J Th 1881, 343), and in the flesh of a young porpoise (O Jacobsen, A 157, 227) Inosite occurs in green kidney beans (Phaseolus vulgaris) (Vohl, A 99, 125, 105, 330), in the green nods and unripe seeds of peas (Pisum sativum). in unripe lentils (Ervum Lens), in the unripe fruits of the common acacia (Robinia Pseud-Acacia), in the heads of the common cabbage (Brassica oleracea, var capitata), in foxglove leaves, in extract of digitalis, in the leaves of the dandelion (Taraxacum dens leonis), in potato shoots, in green asparagus and in its berries, in Lactaria piperatus, in Claiaria crocea (Marmé, 4 129, 222), in the leaves of the common ash (Frazinus excelsior) (Gintl, J pr 104, 491), in grape juice (Hilger, A 160, 333), in young vine leaves (Neubauer, Fr 12, 45), in walnut leaves (Tanret a Villiers, A Ch [5] 23, 389, C R 86 486, Maquenne, C R 104, 225)

Preparation -1 Walnut leaves are extracted with water The brown liquid is treated, at 100° with excess of milk of lime, filtered, ppd with lead acetate, again filtered and treated with am monia and lead acetate The crude lead com pound of mosite is treated with dilute sulphuric acid, and the mosite is ppd with alcohol and other It can be further purified by recrystallisa tion from hot dilute acetic acid (Hilger, Ma quenne) -2 The fresh-chopped tissue is covered with water, and allowed to stand for 24 hours in a cool place with frequent stirring, the liquid is then separated and the residue pressed, the solution is heated with a little acetic acid to separate albumin and hæmatin, then strained, evaporated on the water bath to one tenth, ppd with neutral accetate of lead and filtered, and the filtrate is mixed with basic acetate of lead, whereupon mosite is thrown down in combina tion with oxide of lead, accompanied by urio acid, evstine, and other substances The pp, after washing, is decomposed under water by H S, and the liquid filtered from the sulphide of lead, it then sometimes deposits crystals of urio acid, and when evaporated to a small bulk on the water bath, and mixed with alcohol till a tur bidity is produced, it yields crystals of inosite (Cloetta) -3 Crystals of mosite may often be obtained by evaporating an aqueous liquid containing it, and adding three volumes of alcohol to one of the boiling liquid (Cooper Lane, & 117

Propertu . - Monoclinic crystals (containing 2aq) $a \ b \ c = 1\ 090$ 1 1 5 35, $\beta = 111^{\circ} \ 39'$ Effloresces in dry air At 100° it gives off its water of crystallisation It has a sweet taste and is optically mactive Sl sol cold dilute alcohol, insol absolute alcohol and ether Does not combine with NaCl or kCl With lead sub acetate it forms a gelatinous pp which may be C, H, O, 2PbO Inosite does not react with phenyl hydrazine (E. Fischer, B. 17, 582) Ino. site is not turned brown by boiling alkalis, or by boiling dilute H.SO. It does not reduce Feh ling's solution but forms a green pp It will not undergo alcoholic fermentation In presence of decaying cheese or of putial meat and chalk it forms butyric and lactic acids Sodium amalgam does not affect mosite Inosite does not form an acid solution with borax

10 INOSITE.

Reactions -1 Evaporated with nitric acid it leaves a residue which gives with CaCl, in ammoniacal solution a rose red colouration (colour test) -2 When a solution of in osite is evaporated nearly to dryness and a drop of mer curic nitrate solution is added there is formed a yellow pp which turns red on warming (Galloir, Fr 4, 264) —3 Heated with oxalic acid it gives CO, and formic acid According to Lorin (Bl [2] 48, 235), this indicates that it is a polyhydric alcohol -4 HIAq at 170° gives a trace of benzene, phenol, and tri iodo phenol [153°] -5 It forms no addition products with chlorine and bromine -6 It does not reduce boiling ammoniacal AgNO, but on adding KOH a mirror is formed -7 Chromic acid oxidises it to CO, and formic acid in the cold —8 KMnO, gives CO, — 8 Conc HNO, at 100° forms oxalic acid, but in an open dish on the water bath it gives on eva poration a white substance which dissolves in water, and the solution, mixed with alcohol and evaporated, then deposits black crystals of tetra oxy quinone HNO, also forms rhodozonic acid (Maquenne, Bl [2] 47, 290) According to Maquenne this reaction, and reaction 4 indicate that mosite is hexa oxy benzene hexahydride

Hexa-acetyl derivative C. H. (OAc). [212°] (234° invacuo) From mosite and AcCl or Ac,O Sublimes at 200° Insol water, sol hot alcohol and Ac,O Saponified by alkalis and strong acids (Maquenne, C R 104, 1719, Bl [2] 48, 58) According to Fick (C C 1887, 452), the acetyl derivative is C. H. Ac,O. and

melts at 216 cor

Hexa-benzoyl derivative $C_sH_o(OBz)_s$ [258°] Minute needles Insol all usual sol vents

Hexa nitroxyl derivative C.H. (ONO), 'Nitro inosite' [120°] Formed by adding a solution of inosite in fuming HNO, to cone H.SO. May be crystallised from alcohol, a crystalline tri-nitroxyl derivative being left in the mother liquor Trimetric tables, insol water, v sol alcohol Detonates when struck Cold alcoholic KOH decomposes it forming KNO, the inosite being completely broken up When boiled with alcohol and a little H.SO. the pro

ducts are nitrous ether and inosite

INULIN (C₈H₁₀C₃), or C₇H₁₄C₉₂ Helenin Alantin Menyanthin Dahlin Synanthin Sinistrin Mol w 1980 (by Raoult's method Brown a Morris, C J 55 464) [160°] S G 1 35 (Kiliani), 1 36 (Payen), 1 46 (Dubrunfaut), 1 47 (Dragendorff) [a]_D = -35° (Dubrunfaut, C R 42, 803), -36 5° (Lescœur a Morelle, C R 57, 216), -40° (Lefranc, J Ph [5] 2, 216) H C 684900 (Berthelot a Vieille, Bl [2] 47, 868, A Ch [6] 10, 459) H F 230600 (B a V), 197000 (Von Rechenberg) A starch like substance occurring in the roots of elecampane (Inula Helenium) (Valentin Rose, A D 1804), dandelion (Taraxacum dens leonis), chicory (Cichorium Intybus), feverlew (Pyrethrum Parthenium), and meadow saffron (Colchicum au tumnale), in the tubers of the potato, the dahlia, affd the Jerusalem artichoke (Helianthus tuberosus), in Lerp manna (from Eucalyptus dumosa), and in ce. and lichens (Luchen frazzeueu and Luchen fastigatus) Sinistin, from the sea onnon (Urginea Scilla), is perhaps identical with inulin

Preparation—The finely divided roots are boiled v h water in pression of a small quantity of C.CO. The filtrate is cooled by a freezing mixture, and, after thawing the ice, filtered again. The up is redissolved in hot water, and the filtred solution again subjected to the action of a freezing mixture, the process being repeated until the inulin is perfectly white. The inulin is then freed from traces of levulose by treatment with 97 p c alcohol, and is finally dried over sulphuric acid. It will, however, contains about 6 pc proteid matter corresponding to 1 pc nitrogen, and also minute traces of in orga is substances (Kiliani, A. 205, 147)

Properties - White powder, resembling starch Tasteless Occurs also in a gum like or horny modification, probably as a hydrate SI sol cold water, v sol hot wa er, insol alco hol The powder is composed of minute sphere-(Sachsse) It melts at 160°, becoming changed to amorphous 'pyro inulin' (Prantl, N R 19, 513, 577, 641) Inulin is very hygroscopic, and even when dried at 100° its composition appears to be (C₄H₁₀O₅)₄H O (Kiliani) The aqueous solution of inulin does not form a jelly like that of starch It is not coloured blue by It dissolves in cold aqueous KOH and iodine the solution, when acidified, deposits after a while unaltered inulin It dissolves in am moniacal cupric oxide solution (Cramer, J pr 73, 16) the sol tion yielding after a few hours a copious blue pp (Schlossberger, J pr 73, 373) It dissolves in an ammoniacal solution of nickel oxide It does not ppt lead acetate or sub acetate, but with a solution of lead acetate con taining ammonia it gives a white pp Inulin is not ppd by salts of Fe, Cu, Hg Ag, or Au Inulin forms with alkalis unstable compounds which are soluble in water and ppd there from by alcohol When carbonised it emits an odour of burnt sugar It reduces ammoniacal gold and silver solutions, but not Fehling s solution It is not fermentable, nor is its optic activity affected by diastase It is not converted into levulose by invertin A solution of inulin dissolves PbO Baryta water gives a pp soluble in excess of a solution of inulin, and not decom posed by CO,

Reactions -1 When heated with water at 100° it is slowly but completely converted into levulose -2 Boiling dilute acids quickly con vert it into levulose - 3 Dilute nitric acid oxi dises it to racemic, oxalic, glycollic, and formic acids, but forms neither saccharic nor muc c acids (Tollens, A 249, 220) -4 By long contact with bromine it yields bromoform, oxalic acid, and CO2 -5 With bromine and silver oxide it yields glycollic acid (from the intermediate formation of levulose) -6 When heated with baryta water small quantities of lactic acid are formed -7 Sodium-amalgam has no action on inulin-8 With chloro sulphuric acid (CISO,H) at 0° it forms $C_0H_7(SO_4\tilde{H})_4(O)Cl([a]_D = +11\frac{10}{2})$ whence warm water produces levulose (Claesson, J pr

128, 27)

Acetyl delivatives Inese are best formulated as derivatives of $C_{12}H_{29}O_{10}$

Trs-acetyl derivative C₁₂H₁,Ac₂O₁₀ Formed by boiling mulin (1 pt) with Ac₂O₁O₁ pt and HOAo (2 pts) for 15 minutes (Ferroullat a Savigny, Z. [2] 5, 509, Lescour a Morelle, OR 87, 216) Amorphour yellowish me 1, v sol water and alcohol, ir ol ether Lawo _atory

Tetra acetyl derivative C, L, L, Ao, O, From inulin by heating with A, O (F a S, Schützenberger, A Ch [4] 21, 234 Amorphous Leworotatory

Hexa acetyl derivative C₁₂H₁₄Ac₆O₁₆ Amorphous Lævorotatory

Hepta acetyl derivative C12H13Ac,O10.

Dextrorotatory

When inulin is heated with gly Metinulin cerin alone, or when it is heated with dilute acids, the product contains bodies resembling dextrin. They are not very soluble in ater and on heating yield soluble metinulin and inuloid which are not so powerfully laworota tory as the unaltered inulin Optically inactive derivatives are also formed, but they are not id ntical with levulosan (Hönig a Schubert, M 8, 529) Metinulin was prepared by Dragendoiff by heating inulin (1 pt) with water (5 pts) in a Inuloid is closed vessel, and ppg with alcohol a similar or identical substance, said by Popp (A 156, 197) to occur in the Jerusalem arti It is twice as soluble in water as inulin choke

INVERTING FERMINATION, vol. in p. 541

IOD or IODO Use of this prefix applied to inorganic compounds and Iodo salts v the element the iodo compound of which is sought for or the salts to the name of which iodo is prefixed. Thus we childred of lead will be found under Li up and iodo chromate of potassium under Chromates.

(100°) 1396 (Stiecker, lc) 1 (of HIAq v hohlrausch, P 159, 233 SG of HIAq st trated at 0°-199 (De Luynes A Ch [4] 2, 3s-1), 20 (Vigier, Bl [2] 11, 125) Vapour pressure of liquid HI at -17 8° -2 9 atmos, at 0 = 4 atmos, at 15 5°=58 atmos (laraday, T 1845 170, values approx only) HF [H, I] = -60 36° gaseous H and solid I to form gaseous H1, [H, I] = -436 gaseous elements at 1s0, [H, I, Aq] =13,170 (Th 2, 35) HI does not occur in nature

Formation – 1 By direct union of H and I, by passing a stream of H over I at a full red heat (Courtois, A l'h 88, 305, Merz a Holzmann, B 22, 869) Corenwinder passes H and I tunnel, and a single drop of this is allowed to vapour over Pt black heated to 300°-400° (A Ch [3] 30, 242, 34, 77, v also Blundell, P 2, 216, Lemoine, C R 85, 34) —2 HI is formed by decomposing a metallic iodide by another acid, but a portion of the HI is generally decomposed with separation of I, and in some cases the HI reacts with the other acid, cg when H₂SO₄ is added to kI, SO₂ and H₂S are produced as well as HI and I. To prepare a solution of HI 17 water, Glover adds as exactly equivalent quantity of H₂SO₄ to BaI₂Aq, and separates from ppd BaSO₄ (P M [3] 19, 92)—

Hold into the tubulus of the retort, 5 g amolphous P and 10 g water are placed in the funnel, and a single drop of this is allowed to flow into the retort, after a little a drop or two more is allowed to follow, and a little later the flund is added in larger quantities. HI passes off and may be collected in water as described under 1. No heating is required If more than one drop of the P in water is added at first an explosion usually follows. The I carried over is nearly all deposited on the neck of the retort, 5 g amolphous P and 10 g water are placed in the funnel, and a single drop of this is allowed to flow into the retort, after a little a drop or two more is allowed to follow, and a little later the flunds is added in larger quantities. HI passes off and may be collected in water is added at first an explosion usually follows. The I carried over is nearly all deposited on the neck of the retort, 5 g.

1 to 1 the funnel, and 10 g water are placed in the funnel, and 10 g water are placed in the funnel, and 10 g it for interesting the funnel, and 10 g water are placed in the funnel, and 10 given the funnel

3 By the reaction between Na₂SO₂ (Mène, C R 28, 478), or Na₂S₂O₂ (Gladstone, P M [3] 35, 345), I, and H₂O (cf formation of HBr, vol 1 p 532) -4 By decomposing PI, by water (Kolbs, J pr 15, 172, Vigier, Bl [2] 11, 125, Petten kofer, A 138, 57) Rieckher (C C 1863 207) r commends to make PI, by adding P ω I in CS₂ and distilling off the CS₂ -5 Etard a Moissan (B 13, 1862) heat I with colophony Preparation -1 Washed H₂S is passed into

water in which a little finely powdered I is suspended (2H,SAq+2L,Aq=4HIAq+2S), more I is added little by little, and the passage of H.S is continued. When all the I has been added, and no brown colour is produced on shaking the liquid, the separated S is agglomerated by briskly agitating the vessel, the liquid is filtered, H2S is removed by gently warming, and the liquid is distilled, HIAq of SG c 17 distils at 120°-128° An inverted untubulated retort with wide neck is a suitable vessel, the H2S is passed down the neck of the retort by a tube dipping into the water in which the I is suspended. The HIAq thus prepared may be used for making gaseous HI or a more conc solution About 2 pts I are dissolved in the HIAq made as described, and the solution is dropped from a tap funnel on to amorphous P (in a flask) moistened with HIAq of the same concentration, the HI produced is passed through a wide U tube containing glass beads and some amor phous P moistened with HIAq (to convert any I vapour into HI) [PI, + 3H,O + Aq = H,PO,Aq + 3HI] If dry HI is wished for, the gas is passed through a CaCl, (or better Cal, tube and then over P,O, and collected by downward displacement If HIAq is to be pre pared, the gas coming from the first U tube is passed into the tubulus of a retort, the neck of which dips a very little way beneath the surface of water kept cold by ice this arrangement prevents the water from rushing back into the U tube The flask containing P in HIAq, into which the solution of I is dropped, should be only very gently warmed for some time, as H PO, is among the first products of the reaction, and when this is heated H,PO, and PH, are formed, the latter of which combines with HI to form PH,I to Bannow, B 6, 1498) -2 L Meyer recommends the following method of preparing HIAq by the formation and decom position by water of PI, (B 20, 3381) 100 gI in a retort, with the neck inclined upwards, are moistened with c 10 g water, a tap funnel (or a funnel into the neck of which its a glass rod) is titted into the tubulus of the retort, 5 g amorphous P and 10 g water are placed in the funnel, and a single drop of this is allowed to flow into the retort, after a little a drop or two more is allowed to follow, and a little later the liquid is added in larger quantities. HI passes off and may be collected in water as described under 1 No heating is required If more than one drop of the P in water is added at first an explosion usually follows The I carried over is nearly all deposited on the neck of the retort 8 14 pts KI are warmed with 20 pts I and 1 to 11 pts P with a little rater (Millon, J Ph 28, 99, Roscoe, C J 13, 140) — 4 Na₂SO₂ 28, 478, cf Gladstone, P M [3] 35, 345) — 5 60 g of copaiba oil are slightly warmed in a 500 c c retort connected with a reversed condenser, 20 g of I are added little by little, and the temperature is allowed to rise, after a few minutes a regular and steady stream of HI comes off, when this slackens the retort is allowed to cool somewhat, more I added, and heating is recommenced, about 145 g HI may be obtained from 150 g I (Bruylants, B 12, 2059)

obtained from 150 g I (Bruylants, B 12, 2059) S Kemp (P M [8] 7, 444) says that liquid HI may be prepared by placing H persulphide in one limb of a sealed tube and a little I in the other, and gently warming the persulphide, H₂S is evolved and liquefied, and the I dissolves in the liquid H₂S, on then adding a drop of water (this is done by a special arrangement of the tube) HI is produced and liquefied, no details are given as to how the HI is separated from the H₂S

Properties -HI is a colourless, strongly acrid gas, it is incombustible and extinguishes flame Dry HI is unchanged when kept in closed tubes in the dark (Lemoine, J 1877 138) HI is readily liquefied (v ante), liquid HI is colourless (Kemp, P M [3] 7,444, says it is yellowish), at -55° it solidifies to a colourless, ice like mass (Faraday, T 1845 170) Liquid HI is a very bad conductor of electricity (Bleekrode, W 3, 161, Hittorf, W 4, 374) HI is very soluble in water, the solution contains a strong acid, afti nity of HIAq is about the same as that of HClAq (v Affinity, vol 1 p 82) HIAq 18 a colourless, strongly acid, fuming liquid, the solution saturated at 0° has SG 199 to 20, this solution gives off much HI when warmed to 40°-50° When HIAq containing more than c 57 p c HI is distilled, HI is evolved until the SG becomes c 167-170 when the BP becomes approximately constant at 127° (at 774 mm), and the liquid contains 570 pc HI, if the original liquid contains less than 57 pc HI water distils over until the acid of 57 pc is produced, which then distils at 127° almost unchanged (Roscoe, C J 13, 160) By passing dry H through HIAq at 15°-19°, an acid of constant concentration, 603 to 607 p c HI, is obtained, at 100° the constant acid contains 58 2 to 58 5 p c HI (Roscoe, lc) Topsöe gives the following SG and composition of HIAq (B 3, 403, cf Wright, C N 23, 242)

HI is a worbed by charcoal, according to Favre 22,000 ram thermal units are produced for every 128 g ams HI absorbed (A Ch [5] 1, 209)

Reactions -1 HIAq is decomposed by electroly's to HJ), Aq and H (Riche, J 1858 101) 2 HI is slowly decomposed in sunlight, the decomposition proceeds without limit (Lemoine, J 1877 139) When mixed with oxygen and ex posed to sunlight, even v hen the gases are dry, decomposition occurs, and proceeds the more rapidly the greater the mass of O (dry HCl and HBr are not decomposed under the same conditions) (Richardson, C J 51, 801) HIAq is reaaily decomposed wit' separation of I by ex posure to air -3 HI is decomposed by heat to H and I, slowly at 180° quickly a 440° (Hautefeuille, Bl [2] 7, 198), the dissociation of HI has been exhaustively studied by Lemoine (v Dissociation, vol 11 p 400) —4 Heated 1 th oxygen H₂O and I are formed —5 Chlorine forms HCl and I, with excess of Cl, ICl, is produced, bromine leacts similarly -6 Sulphur and selenion form H S, or H Se, and iodide of S or Se (Hautefeuille, Bl [2] 7, 198), in presence of water I reacts with H.S to form HIAq and S (v Preparation No 1) -7 HI is without action on amorphous phosphorus at 100°, but with or dinary phosphorus, even at the ordinary tempe rature, it forms P₂I₄ HIAq slowly reacts with excess of P to produce H,PO, and PH,I [2P + HIAq + 3.1 O = PH, IAq + H, PO, Aq] (Da moiseau, J 1880 272) -8 Conc nitric acid de composes gaseous HI instantaneously -9 Conc. sulphuric acid forms I, and also SO and H S -10 Sulphur dioxide forms S, I, and H,O -11 Iodic acul reacts with IIIAq to form I and H₂O -12 Very many oxidisers separate I with simultaneous formation of H₂O, e g H₁O₄Aq, HClOAq, HClO₄, chromates 13 Many metals form iodides and evolve H, with HIAq -14 Me tallic oxides and carbonates generally form iod ides and H₂O, metallic peroxules form the same products and also separate I -15 HI produces pps of iodides when added to solutions of salts of metals which form insoluble iodides, e.g. salts of Hg, Ag, Cu, Pd -16 Potassium permangan ate produces KIO, -17 HI reacts with carbon compounds generally, especially with such as contain the group OH, as an energetic reducing agent (cf Berthelot, Bl [2] 9, 8, 91, 179, 265)

Combinations—1 HIAq dissolves several metallic volides, e.g. Bil., HgI., PtI., and PtI., some of the solutions thus formed react with alkalis and alkaline hydroxides to form salts, which are probably derived from acids containing I and the metal whose iodide was dissolved in HI., e.g. by dissolving AuI. in HIAq and adding KOH the salt KAuI. is obtained, by similar reactions the salts Na.PtI., MgPtI., &c., are formed Such reactions render it probable that HI combines with many metallic iodides, and that the products frequently r act as acids, one or two such acidic compounds have been isolated, e.g. H.PtI., 9H.O. (cf. Bromhydra Acid), Reaction 7, vol. i. p. 553, and Childhydra Acid, Reaction 13, vol. ii. p. 8)—2 HI combines with ammonia to form NH.I., [NH., HI] = 43,462 (Th., 75)—3 With phosphine HI combines to form PH.I., [PH., HI] = 24,100 (Ogi., C. R. 89, 705)

PH.I., $[PH^2,HI] = 24,100$ (Ogur, C R 89, 705) The solution of HI in water is attended with production of much heat [HI,Aq] = 19,207 (Th.2). IODIDES 13

84) Thomsen's measurements of the heat of solution of HIAq point to the "xistence of a ' ydrate HI HO, the results re similar to those obtained for HClAq, but cannot be represented by so simple a formula (cf CHLOBHY BIG ACID, vol 11 p 8)

The heat produced by diluting II in nH,O with quantities of water varying from 200 to 300 H₂O is given by Thomsen as follows (Th 3,

76) -[HI $nH^2O_1(300-n)H^2O$] 6670 3 4400 1830 5 10 630 20 220 50 70

100 30 The acids H., HBr, and HCl are very similar in their properties and reactions. All dissolve very freely in water, forming solutions of mono ba ic acids, the affinities of which are great and approximately equal All combine with certain metallic haloid compounds, especially with those of Hg, Au, Pt, and Pd, to form compounds which are best regarded as distinct acids. The thermal reactions attending the syntheses of the three acids show a gradation Thomsen (Th 2, 39) gives the following data

Y 'H,X] gaseous, at 180°, from gaseous elements.

Cl 22,153 Br 12,413

I -436

X [H X Aq]

Cl 39 315 Laseous Cl at 19°

Br 32,197 | calculated on assumption that Br 18,619 | and I are gase out at 19

Of the three acids HI is the most easily de composed by heat and by oxidisers (cf HALOGEN ELEMENTS, vol 11 p 605, where HF is compared and contrasted with the other haloid acids HX) MMPM

IODHYDRIN & GLYCERIN

Di-iodhydrin : Di iodo propte alcohol. IODIC ACID t Iodine Oxyacids of p 19

IODIDES Binary compounds of I with more positive elements, ie with any element except O, F, Cl, or Br lodides of almost all metals and binary compounds of I with all non metals except B, have been isolated Most metallic iodides may be obtained by direct combination of the clements, many are obtained by heating I with metallic oxides, or by dissolving netals or their oxides in HIAq, I reacts with alkalis and alkaline hydroxides to form iodides and iodates Some non metallic iodides are formed by direct union of the elements, eq iodides of H, Br, Cl, Se, S, and P, NI, is obtained by the reaction between I and NH, Aq, CI, by the reaction of Al, Iq on a mixture of CCI, and CS, O and I combine indirectly, oxides of I are obtained by the action of oxidisers on I The non metallic iodides as a class are more easily decomposed by heat than the chlorides or bromides, oxide of I is much more stable than oxide of Cl, and no oxide of either Br or F has yet been isolated If two chlorides or bromides of a specified metal are known, the more stable iodide of that metal ide or bromide, eg SbCl, and SbCl, exi t, but

FeI, exists it very easily goes to PeI, and I, similarly with Cul, which exists only in solution, and very readily parts with I becoming CuI, whereas CuCl, is more stable than CuCl. In their eactions with water metallic iodides are usually less easily decomposed than the corresponding bromides and chlorides Metallic iodides as a class dissolve in water without change some, however, form oxylodides, eg SbI, and Bil, and some form oxides and HIAq, eg Snl. Metallic iodides, generally speaking, are not so readily volatilised as chlorides or bromides. most of them are unchanged by heat, but some are decomposed to metal and I, eg nodides of Au, Pt, and Pd As a whole, then, the metallic iodides are not so numerous or so varied in composition as the chlorides or bromides, and they are more stable towards heat and the action of water than the chlorides and bromides, they are also less easily reduced, eg by H or CO, than the chlorides or bromides

The heat of formation of a metallic iodide is usually considerably less than that of the bromide or chloride of the same metal. The following data are taken from Thomsen .-

[Na, X, Aq]Cl 193,020 \mathbf{Br} 171,160 1 140,600 [Ca, X2, Aq] Cl 187,230 Br 165,360 134,940 [Al', X', Aq] Cl 475,650 410,040 I 318,780

The difference between the heat of formation in aqueous solution of a chloride and the ana logous bromide of the same metal is approximately n21,850, and the difference in the case of a chloride and analogous iodide is approximately no2 250 Some metallic iodides ex hibit differences in crystalline form and SG for instance SbI, forms hexagonal crystals, and also exists in trimetric and in monoclinic forms, CdI probably exists as a white salt 5 G 5 644 unchanged at 250, and also as a brownish com pound 5 G 4 626, which begins to change at 40° (t vol 1 p 656), there are also differences be tween Bil, according as it is prepared by sublima tion or by ppn

Iodides are usually decomposed when heated in Cl or Br with production of chlorides or bromides and I, heated in HCl they generally form chlorides and HI Heated with conc H SO, or cone HNO, I is separated, and SO, (also sometimes H S), or NO, is evolved. I is separated from iodides by the action of many oxidising agents, such as CrO, ferric salts, MnO , do

Many metallic iodides dissolve freely in solu tions of the alkali iodides, frequently with formation of double iodides. An aqueous solution of KI dissolves much I, with formation of KI, but the greater part of the I thus dissolved is ppd on largely diluting the liquid Some other periodides analogous to kI, are known, part of as a general rule corresponds to the lower chlor I the I in such compounds .. more loosely combined than the rest, and can generally be reonly SbI., FeOl, and FeCl, are stable, but it moved very easily, CuI, in solution, for instance, 14 IODIDES

is reduced to Cul by shaking with CS. Some iodides, e.g. PtI., HgI., combine with Hi to form compounds which are best regarded as metallic acids (H_PtI., H_HgI., &c) Some of the resemblances and differences between the three allied classes, chlorides, bromides, and iodides, are considered in the article Halogens, Binary compounds of the (vol 1) p 666)

Ramsay a Young, C J 49, 458 S V S 25 9 S 018 at 10°-12° (Wittstein, J 1857 123), 015 at 6 3° (Dossios a Weith, Z 1869 379) S in glycerin = 1 (Regarding solubility v further under Properties) The absorption spectrum of I vapour shows numerous fine lines extending from the red to the violet thickness of the layer increases absorption be comes very marked in the red, but even when the whole of the red part is obscured, the violet portion remains without bands (Plucker, J 1863 109, Thalen, P 139, 503, cf Conroy, J 1876 146, and Salet, A Ch [4] 28, 29) The emission spectrum shows many bright lines in the zellowgreen and yellow By using an induction cur rent of low tension lines are seen coincident with the dark absorption lines (Salet, lc, Wullner, P 120, 158), at red heat a continuous spectrum is observed I crystallises very easily from alcohol or HIAq, or by sublimation, the crystals are trimetric, $a\,b\,c=4866\,1\,7324$ (Mitscherlich, $B\,B\,1855\,416$)

Iodine was discovered by Courtois in 1811 in the mother liquor of kelp after preparation of Na₂CO₂ Davy (T 1814 74) and Gay Lussac (A Ch 88, 311, 319, 91, 5) showed I to be an element, and established its relationship to chlorine

Occurrence — Certain mineral waters contain small quantities of free I According to Wanklyn (C N 54, 300), the water of Woodhall Spa, near Lincoln, is coloured slightly brown by free I Iodides of Na and Mg, and iodate of Mg according to Sonstadt (C N 25, 196, 231, 241), occur in small quantities in sea-water, alkaline iodides are found in very many mineral waters, in the ashes obtained by burning sea-plants, and some sea animals, and in certain specimens of Chili saltpetre, dolomit, phosphates, and some other minerals Iodides of Hg, Ag, and Pb occur in small quantities in Mexico

Formation—1 By decomposing alkaline iodide. by MnO₂ and H_2SO_4 , or by Cl, or by K_2Cr_2C , and H_2SO_4 , or l. NO_2-2 By heating an acidified solution of an iodide with FeCl₂Aq. 3 By reducin; NaIO₂ by SO_2

 $(^{\circ}AaIO_{2}Aq + 5SO_{2} + 4H_{2}O$ = $2NaHSO_{4}Aq + 3H_{2}SO_{4}Aq + I_{2})$

Preparation — The greater part of the I of commerce is prepared from kelp, which is the product of burning sea plants, the kelp is lixivisted with hot water, and the liquid is eva porated in successive stages until most of the salts except NaI, Na, S, and Na, S, O I ave been ren oved Enough H, SO, is added to decompose the S compounds After exposure to the air for some time S separates and SH, and SO, escape The liquid is then run off and distilled with addition of more H, SO, and M. O, and the I is collected in a series of tubulated receivers buted one into the other For details of manufacture v Dictionary of Applied Chemistry The I obtained as described is dried and sublimed By slow resublimation fairly pure I is obtained, but ICy cannot thus be removed

The chief impurities in commercial I are chlorides, water, traces of various salts, and

sometimes ICy

Stas (Chem Proport 137) gives two methods for preparing pure I -1 KI is dissolved in its own weight of water, the solution is saturated with I (about 4 parts I are required to 1 part KI), water is added until formation of a perma nent pp begins After settling, the liquid is poured off and shaken with 3 of the quantity of water required to bring down all the I which can be ppd by this method (the amount of water is determined by a preliminary experiment on a small quantity of the liquid) The separated I is washed by decantation until the washings are free from K, distilled with water from a large retort, allowed to drain, placed over dry Ca2NO, which is frequently changed (all other drying materials bring impurities into the I), and finally twice distilled after mixing with 5 p c finely-powdered pure BaO The last traces of H₂O and traces of HI are thus removed -2 Niodide is prepared by adding powdered I to cold conc NH3Aq until the dark brown liquid is nearly colourless, the compound is washed by de cantation with cold cone NH3Aq until NH,I is removed, placed on a funnel, the neck of which is drawn to a fine point, and covered with cold water When the black colour of the com pound changes to brownish, and the wash water is coloured yellowish brown, the moist iodide is placed in ten times its weight of water contained in a large glass balloon, and slowly heated on a water bath to 60°-65°, when decom position occurs with formation of crystals of I. solution of I in NH, IAq, and a white salt. which is probably NH,IO, When the change seems completed the liquid is warmed to 100° for a few minutes, if the temperature is at once raised above 65° decomposition occurs very rapidly, at 100° it proceeds with explosive violence, at the ordinary temperature the change is very slow After cooling, the solid which separates is thrown on to a funnel with drawn out neck and washed with water, it is then distilled with water from a retort (NH,IO, is not IODINE 15

volatilised), and the I is dried over Ca2NO,, and finally by distilling with pi re BaO as in

Recovery of 10 .ine from laboratory residues Beilstein (Z 1870 528) recommends to evaporate with excess of Na₂CC₂, to heat the residue until it is white, to add excass of H SO, and to pass in Noxides, obtained by heating starch with HNO, until all I has separated, to wash the I in cold water, dry over P2SO4, and sublime slowly The stream of Noxides is best obtained by adding 15 grams starch to about 90 grams fairly conc HNO Aq in a large flask (the acid must not be added to the starch, else the latter may cake on the bottom of the flask and cause it to break), heating till red fumes appear, and then removing the flame and cooling from time to time, if necessary, by cold water If insoluble iodides, eg HgI₂, are present, Henry (B 2, 599) heats with water and granulated Zn or Fe filings, whereby soluble ZnI2 or FeI2 is produced final sublimation of the recovered I may con veriently be conducted as described by Mohr The rim of a flat porcelain basin is ground with sand, so that a glass plate placed on the basin touches the r'm in every part, the I is placed in the basin, a little finely powdered KI is strewed on the surface, the glass plate is placed in position and bound to the rim by a strip of paper, and the basin is placed on a sand tray and very slowly heated The process of sublimation should occupy several days If any ICl is pre sent it reacts with the KI to give I Cl and I

Properties —A greyish black, soft, solid with metal like lustre Perfectly pure I is described by Stas as quite black, whether solid or liquid Only the thinnest plates of I are transparent (cf Schultz Sellack, P 140, 334) I is very easily vaporised, the vapour corrodes the skin and mucous membranes, unsaturated vapour has a violet colour, saturated vapour appears deep blue in thin layers (Stas), a layer 10 centims thick is quite impervious to light (cf Andrews, C N 24, 75) I vapour shows orange yellow fluor escence (Lommel, W 19, 356), solid I does not fluoresce (Stokes) Crystals of I polarise light (Conroy, J 1876 147) I is a non conductor of electricity (Jolly, P 37, 420) I dissolves freely in solutions of alkaline oxides and in HIAq. it is more soluble in solutions of NH, salts than in water Dossios a Weith (Z 1869 379) give the following numbers for the S of I in KIAq

	P	c.		1	P.c.	
S.G at 7 90	KI	1	S.G at 7 9		1	
1 0234	1 802	1 173	1 1382	8 663	7 368	
1 0433	8 159	2 303	1 1637	10 036	8 877	
1 0668	4 628	8 643	1 1893	11 034	9 949	
1 0881	5 935	4 778	1 2110	11 893	11 182	
1 1112	7 201	6 037	1 2293	12613	12 060	

I is more soluble in solution of tannic acid than in water, addition of 015 parts of the acid in creases S to 42 at c 30°, and when 33 parts acid are present S is 24 at 12° (Koller, Z 1866 880) I is very sol in CS₁, CHCl₁, ether and alcohol, C₂H₂ and various hydrocarbons, also sol in SO₂ (Sestini, Z 1868 718), and in SO₃ (Weber, J pr 25, 224), solutions in ether or alcohol contain HI (cf Carles, Ph [3] 5, 89) Addition of CS₂ to an aqueous solution of I causes withdrawal of most of the I from the water, according to Berthelot a. Jungfleisch

c 400 parts of the I go into solution in the CS₂ for each part remaining in the water (C R 69, 338) Solutions of I in CS₂, CHCl₂, C_cH₆ and other liquid hydrocarbons are violet, solutions in ether, alcohol, and some other solvents are reddish brown. The reddish solutions absorb light in the violet end of the spectrum up to midway between D and E, cone violet solutions absorb the rays of mean refrangibility to the limits of the yellow and blue, very cone solutions absorb all rays except the ultra violet (cf. Vogel, B 11, 919)

The at w of I has been determined —1 By changing AgI into AgCl (Berzehus, P 14, 558, Dumas, J 1859 3)—2 By synthesis of ZnL (Gay Lussac, A Ch 91, 5)—3 By synthesis of AgI (Marignac, Bibl Univ Genève, 46, 367, Stas, Chem Proport)—4 By determining the quantity of KI required to ppt a known quantity of Ag dissolved in HNO. (Marignac, lc)—5 By analysis of AgIO. (Stas, lc)—6 By determining V D of many binaly compounds—7 By measuring S H of I

Attempts have been made to determine themol w of I in solution Paternoa Nasini (B 21, 2153) measured the lowering of the freezing point of benzene and acetic acid produced by dissolving I in these liquids, the results point to the existence of molecules of I, in very dilute benzene solutions, and more complex molecules in more cone solutions, the numbers got with acetic acid lead to a mol w between I and I. Loeb (C J 53, 805) determined the vapour pressure of I in solution in CS, and ether, ethereal solutions of I are reddish brown, solutions in CS, are violet, Loeb's results point to the mol w I, in red solutions, and a mol w between I, and I in violet solutions

Determinations of the S G of I vapour, by Gay Lus-ac, Dumas, Bineau, Deville a Troost, up to c 1000° gave values from 878 to 862 (calc for $I_a = 8.75$) V Meyer (B 13, 401, 1723, 14 1453) ob tained the following results -8 86 at 293°, 8 72 at c 586°, 6 76 at c 842°, 5 75 at c 1027°, 5 7 at c 1570° Crafts a Meier (B 13, 870, C R 92, 39) obtained similar results, the SG remained con stant (88) to c 700°, even when pressure was diminished, but decreased above that tempera ture, and decreased the more rapidly the more the pressure was lowered, the SG decreased with rising temperature rapidly to a certain point and then more slowly, at a pressure of 230 mm SG became constant at 1400° - 1500° and was = 46, at 152 mm SG became constant at c 1400°, at 76 mm a constant value for SG was obtained at c 1350° At c 1700° V D corresponds with molecular weight = I (Biltz a Meyer, \hat{B} 22, 725) There can be little doubt that these results prove a gradual dissociation of I2 into I (S G calc for I=4 375) (cf Dissociation, vol 11 p 394, v also Naumann, B 13, 1050) The molecule I_2 is more easily dissociated than either of the molecules Br, or Cl, The atom of I is monovalent in gaseous mole

The atom of I is monovalent in gaseous mole cules I acts as a non metallic element, it is negative to all elements except O, F, Cl and Br I combines directly with most of the metals, and with some of the non metals, eg H, Br, Cl, Se, S, and P, binary compounds of I with all non metals except B have been isolated I is closely related to F, Cl, and Br, the relationship is con

16 IODINE

sidered in the article Halogen elements, vol 11 p 664, of also Indines in this vol p 13

Reactions -1 I dissolves very slightly in water, the solution probably contains traces of HI According to Cross a Higgins (C J 35, 225) I dissolves slightly in water at 100° in a sealed glass tube with production of a little alkaline iodide and iodate Electrolysis of IAq yields HIO, Aq (Riche, J 1858 101)—2 I does not react directly with oxygen, even when I and O are heated to c 300 in presence of spongy Pt (Wehsarg, B 17, 2896) Ogier (C R 86, 722) sa s that if I vapour and O are subjected to the suent discharge, all the oxides of I are pro duced -3 Hydrogen peroxide produces HIAq and O, but conc HIAq is decomposed by HO2 with separation of I-4 Hydrogen sulphide is decomposed by I in presence of water forming HI and S, dry H2S does not react with I-5 With solutions of caustic alkalis, I forms alka line iodide and iodate, according to Van Deventer a Van't Hoff, KIO is also formed (the proof of this is indirect, C C 1888 362) -6 Ammonia gas forms NH, I and N (v Combinations, No 2), ammonia solution forms NH, IAq and N iodide 7 When I is shaken with lime suspended in water, a bleaching liquid is obtained which re acts as if it contained Ca hypoiodite Ca(IO) and CaI, (Lunge a Schock, B 15, 1883) -8 I va pour heated with oxides or carbonates of the alkaline earth metals, in presence of oxygen yields periodates without formation of oxy iodides, with lead oxides various oxyiodides are prod ced 'Cross a Sigiura, C J 33, 405) -9 I is oxidised to I2O3 by nitric acid, chromic anhydride, chlorates, and some other oxidisers -10 I in presence of water acts as an oxidiser towards some salts and other easily oxidised compounds, arsenious oxide and arsenites are oxidised to As₂O₅ and arsenates in alkaline solu Sulphurous acid is oxidised to H,SO sodium throsulphate is oxidised to Na S4O4 and a little NaHSO₄ (Pickering, C J 37, 128) —11 With some carbon compounds I reacts to substi tute I for H, but the HI formed tends to repro duce the original compound, so that the reactions of I with C compounds are much less marked than those of Cl and Br -12 I dissolved in CS, reacts with ppd arsenious sulphide (not with orpiment) to give AsI_3 and S, at a higher temp As_2S_3 and I are reformed, by distilling As_2S_3 and I in the ratio As, S, 6I and heating the dis tillate in a sealed tube to 72° (AsI₃)₂SI₄ was ob tained (Schneider, J pr [2] 36, 498)

Combinations —No combination of I with H_2O has been isolated —1 With most metals, and with many non metals, especially with H, Cl, Br, S, Se, P, As According to Holzmann (B 22, 869) Na is scarcely attacked by I when the pure elements are heated to 300° Fe and Icombine by shaking Fe filings with I in presence of water, FeI2 is produced, and also Fe2O3 and HI probably by the formation and decomposition of FeI₃ (Fleury, J Ph [5] 16,529) -2 Ammonia forms several compounds with I, the dry gas isabsorbedformingadark blueliquid, the volume of NH₃ absorbed varies with temperature, at 20° 1t corresponds to 3NH, 2I, at 80° to NH, I, at 0° to (NH_s), I, at -10° to (NH_s), I₂ (Raschig, A 241, 253, cf Bineau, A Ch [3] 15, 80, Millon, A 62, 54)

Detection and Estimation —Free I is detected in solution by the colour which it gives to CS, or CHCl, and by the formation of a deep blue colour when a drop of starch paste is added (cf Béchamp, Fr 14 66, Mylius, B 20,688, Personne, *C R 74,617, Duclaux, C R 74,533, Goppels-röder, P 119, 57, Hlasiwetz, W A B 1867 I in soluble iodides is detected by adding a very little Cl water, or a drop of a solution of NO2 in conc H2SO4, and then a little starchpaste Iodates are reduced to iodides by SO.Aq. alkaline iodates mixed with all aline iodides and a drop of a weak acid, eg tartaric, give free I Many insoluble iodides may be converted into soluble ZnI by treatr ent with Zn and dilute H,SO,Aq Most non metallic iodides are decomposed by water or critic alkali giving HI or alkaline iodide I is estimated gravim trically by ppn as AgI, iodates are reduced by SO Aq and then ppd by AgNO, Aq Volumetrici'ly I is estimated by titration with standard Na₂S₂O₃Aq, or standard As₂O₈ dissolved in NaHCO,Aq The water in samples of ordinary I may be determined by mixing with a weighed quantity of Hg, rubbing up with a little alcohol, and carefully drying at 100°, loss of weight = water (Bolley, D P J 126, 40) The quantity of I may be determined by dissolving in a cone solution of an alkalı sulphite, filtering, ppg by AgNO, Aq, washing pp with NH, Aq to remove AgCl and AgBr, boiling with H,O containing a little AgNO, to remove Ag SO, washing the residual AgI, and weighing it, after drying, in

the usual manner (Hesse, A 122, 225)

Iodine, bromides of Two bromides of I are known, IBr and IBr,, but neither has been gasified, attempts to prepare IBr3, analogous to ICl₃, have failed (Bornemann, A 189, 183) The combination of I with Br has been studied by Balard (A Ch 32, 337), Lagermark (B 7, 907),

and Bornemann (A 189, 201)

IODINE MONOBROMIDE IBr Formula not necessarily molecular, but probably so, from analogy to ICI which has been gasified Prepared by heating I with rather more than the calculated quantity of Br to 25°-50° in a retort, removing excess of Br by a stream of CO,, and allowing to cool Forms dark greyish, iodine like crystals, melting at 36°. probably sublimes with only partial decomposition, smells of Br, the vapour attacks the eyes and mucous membranes The vapour appears red in thick strata (Gernez, C R 74, 1190) Soluble in alcohol, CHCl3, CS2, and ether, slowly decomposed by water with separation of I Berthelot (A Ch [5] 21, 370) gives the H F of solid IBr from solid I and liquid Br as [I, Br] = 2470 A hydrate IBr 5H O described by Lowig is merely a mixture of IBr and ice

Iodine pentabromide IBr. A dark brown liquid obtained by heating excess of Br with I, soluble in water, with alkali solutions forms bromide and iodate, solution in sunlight decomposes to HBr and HIO,

Iodine, carbide of, better called Carbon iodide, v vol 1 p 689

Indices I combines rapidly with Cleven at -90° (Donny a Mareska, CRTwo chlorides of I have been isolated,

ICl and ICl,, ICl can be gasified without decom position, iCl, decomposes when heated Kam merer (J pr 83,83, cf B 8,489, note) asserted

the probable existence of a tetrachloride ICl., but the non existence of this compound has been proved (cf. Hannay, C. J. 35, 169), Brenken (B. 8, 187) failed to procure any higher chloride by passing Cl. over strongly cooled ICl. By adding I to liquid Cl. Hannay (~J. 35, 169) obtained a reddish liquid when the elements were present in the ratio I. 5Cl, but on removing pressure or raising temperature Cl was at once evolved.

IODINI MONOCHIORI & ICL Mol w 1619 [212], (1013), S.G. & 318223 (Thorpe, C.J. 37, 174, II.F. [I, Cl] = 2,100 (solid ICl from gaseous Cl and solid I), 6,700 (solid ICl from gaseous constituents) (Berthelot, A. Ch. [5] 21, 370) V.D. & 9.29 at 120° 83 2 at 512° (Hannay, C.J. [2] 11, 819) Absorption spectrum of vapour v. Gen. J., C.R. 74, 660

Preparation -1 By passing dry Cl over carefully dried I till liquidiction occurs and I infring by distillation with a gram or two of I 2 By heating an intimate mixture of I with 4 parts KclO₃ and distilling the preduct from powdered KClO₃ (I₂+3KclO₃ KclO₄+KlO₄+KCl+O₂+ICl) - 3 By boiling

KelO₄+ kIO₄+ kCl + O₂+ ICl) - 3 By boiling I with excess of aqua regue diluting with water, shaking with ether and evaporating the ethereal liquid (Bunsen, A Si, I)

Properties - ICI seems to exist in two forms, a reddish brown oily liquid (Gry Lussie, 1 Ch 91, 5), and a hy centh red solid (Schutzenberger, 2 5, 1) Thorpe (C J 37, 175) says that ICI remains liquid in a closed vessel for weeks even in a freezing mixture but solidities on addition of a minute frigment of ICl, If the liquid ICl is exposed to the ur it solidifies after a time and is partially changed to ICl, and I (cf. Hannay, C. J. [2] 11, 815, hornemann, 1, 189, 183). According to Stortenbeker (R. T. C. 7, 152), two forms of solid ICl exist one forming dark red needles melting c 27° obtained by cooling the liquid ICl to -25° , and another crystallising in dark red plates melting at a 14° obtained by crystallising the liquid between -10° and +5° ICl smells of I and Cl, it ittacks all mucous membranes rapidly and forms very bad sores if let fall on the skin, decolourises indigo, does not give blue colour with starch (cf Christomanos, B 9, 131) ICI dissolves in alcohol, also in HClAq C in be distilled with only very slight decomposition (Schutzenberger, Z 5, 1, cf Bornemann, A 189, 183)

Rea tions—1 Water decomposes ICl forming HCl, HIO₂, and I (Hanna), C = J = 11, 9.20)
According to Schutzenberger (lc) a compound ICl HCl is formed (besides HIO₂ and I) by the reaction of water with ICl (cf also Tripp, J = 1854 = 310), and Bornemann, 1 189, 181)—2 Potash solution produces KIO₂ and KI with separation of I (H, lc)—3 Ammonia solution forms NII,Cl, and N iodide which combines with a portion of the NH, (Bunsen, A = 84, 1)—4 Distilled repeatedly with potassium iodide, KCl and I are formed—5 Dissolves in carbon disulphide, when a saturated solution is distilled CCl₄ and CSCl are formed (H, lc)—6 With many metals ICl reacts to form chlorides and iodides (H, lc), cg with Hg, Sn, Sb, Bl, Al, Mg, Na—7 With mercuric oxide, cupric oxide, and lead peroxide, founs chlorides and iodides

with evolution of O and separation of L—8 Hypochlorites and chlorates produce iodates with evolution of Cl (Henry, B 3, 892)—9 Mercuric cl loride forms a pp of HgI₂ (Kane, J pr 11, 250)—10 Stannous chloride produces SnCl₄ and SnI

Combination —With hydrogen chloride to form HCl ICl, a yellow, volatile, unstable compound, produced by dissolving ICl in water, extracting with ether, and evaporating (Schutzenberger, C R 84, 389)

IODINF TRICHLORIDE ICl, Mol w unknown, decomposed by heat to ICl and Cl S G c d 1107 (Christomanos, B 10, 789) [25°] (Trapp, J 1854 310), [33°] (Christomanos, lc) H F (Berthelot, A Ch [5] 21, 370) [I, Cl³] = 21,700 solid ICl, from gaseous constituents, 16,300 solid product from solid I and gaseous Cl, [ICl, Cl²] = 9,500 solid product from solid ICl and gaseous Cl According to Brenken (B 8, 487) ICl, is partially decomposed when it is melted Stortenbeker (R T C 7, 152) gives M P as varying from 20° to 60°, but says that at pic source of 16 atmos the M P is definite and = 101°

Preparation -1 By leading excess of dry Cl over I or ICl until yellowish red crystals are formed, and then subliming at as low a tem perature as possible in a stream of Cl (Brenken B = 8 + 1.7) - 2 by the action of HCl on warm powdered HIO, Clis evolved (Ditte, A 156,335) By the action of PCl, on IO, -1 Christo manos (B 10, 134, 789) recommends to lead dry Cl and dry HI into a well cooled glass receiver, keeping the Cl in excess (HI + $4Cl = HCl + ICl_1$, if HI is in excess the reaction $HI + ICl_s = HCl + 2ICl$ occurs) Io prepare small quantities of ICl, say in a bulb tube Christomanos leads dry Cl through the tube, cools the place where the ICl, is to be deposited, then allows dry HI to stream through the tube, and finally leads dry Cl again, all parts of the apparatus being gently warmed except that where the ICl, is to be formed

Properties - A citron yellow, crystalline, deliquescent solid Very disagreeable smell, attacks the eyes and nose Can be kept un changed only in dry Cl (Hannay, Christomanos) In air sublimation with partial decomposition begins even at -12 (C) Complete decomposition into ICl and Cl occurs at c $70^{\circ}-80^{\circ}$, even in an itmosphere of Cl at pressure of 760 mm (Melikoff, \vec{B} 9, 490) According to Brenken (B 8, 187) ICl, does not melt when heated, but decomposes even in an atmosphere of Cl into ICl and Cl at c 25°, the temperature varying according to the pressure ICl, is sol water, with pritial change to ICl, HCl, and HIO,, at 100° this change occurs suddenly and completely (Bornemann, B 10, 121, Christomanos, Ic) Sol benzene, sol conc H2SO4

Reactions—1 With water to form ICl, HCl, and HIO,, in cold water a part of the ICl, remains unchanged, in hot water the change is complete, at 100° it occurs very rapidly—2 With caustic all alis, chloride and iodide, chlorate and iodide, of the alkali are produced (Christomanos, lc)—8 With excess of ammonia, NH,Cl, NH,I, and NI, are formed (C)—4 itric acid produces Cl and I (C)—5 Hydrogen iodide in excess forms ICl and HCl (C)—6 Carbon disulphide produces some 8 chloride, the solution contains

C

SI, xI (0) (cf Weber, P 128, 459) -7 Carbon dioxide passed over ICl, forms a little COCl, (C) 8 ICl, Aq shaken with silver oxide forms AgĆl and $\mathring{H}\mathring{I}\mathring{O}_{s}$, heated with excess of $A_{b}O$, A_{g} periodate (Philipp, B 3, 4) -9 Hydrogen has no action at the ordinary temperature, when the ICI, is slightly warmed HCl+ICl are produced, at a higher temperature HCl, HI, and I are obtained (U) -10 Potassium and phosphorus burn in ICl₃, forming chlorides and iodides (C) -11 ICl₃ oxidises hot sulphurous acid solution to SO₂Aq, and hot ferrous sulphate solution to ferrie sulphate (C)—12 On carbon compounds the action of ICl₂ is to chlorinate, e.g C₂H₄O₂ even in the dark forms C₂H₃ClO₂ with simultaneous production of HCl and ICl

Iodine, cyanides of Better called Cyanogen todide, v vol 11 p 813, and Cyanuric todide,

e vol n p 320 Iodine, fluoride of IF, A colourless, strongly smelling and fuming liquid, does not solidify at -20°, obtained by decomposing AgF by I Attacks glass and Si at red heat, no action on Hg or Pt, decomposed by water to HIO, and HF (Gore, C N 24, 291, MacIvor, C N 32, 232)

Iodine, hydride of, v Iodhydric acid, p 11 Iodine, nitride of Better called NITROGEN **IODIDE** (q v in this vol)

Iodine, exides of The only exide of I which has been certainly isolated is I_2O_5 , the existence of IO2 is probable Other oxides have been c.scr. ed, but the proofs of their isolation are very meagre I and O do not combine directly, Wehsarg (B 17, 2896) passed I and O over spongy Pt heated to c 300° without obtaining any compound According to Ogier (C R 86, 722) when a mixture of I vapour and O is submitted to the silent electric discharge all the oxides of I are produced I₂O₅ is the anhydride of HIO, which acid is known as a definite stable solid, IO₂ (if it exists) is not an anhydride, it is said to combine with H₂SO₄. The hypothetical anhydride of periodic acid, I₂O₇, has not been isolated The heat of formation of I_2O_8 is a large positive quantity = c 45,000 I_2O_3 is a much more stable body than any of the oxides of Cl, no oxide of Br or F has been isolated

IODINE PENTOXIDE LO. (Iodic anhydride)
Mol w. unknown, as oxide has not been gasified SG -4487 (Ditte, A Ch [4] 21, 5), SG -90 47987 (Kammerer, J pr 79, 94) CE 0°-51° -000066 HF from solid I [I2, O3] = 45,029, [I², O³, Aq] = 43,237, [I²O⁵, Aq] = -1,792 (Th. 2, 164) S = 187 4 at 13°, S G of this solution = 2 1269 (Kammerer, P 138, 390) A white crystalline solid, crystals belong to trimetric system (Schabus, J 1854 310) Produced by slowly heating dry HIO, to 170° Melts when heated to c 300°, with decomposition into I and When HIO, crystallises from solutions con taining H2SO4, crystals of I2O4 are said to accompany the HIO, (Rammelsberg) Sol water, insol ether, alcohol, CHCl, CS, or C,H, (Ditte, C R 70, 621) LO, dissolves in water to form HIO. The general reactions of LO, are those of an oxidiser. CO passed over warmed I₂O₅ forms CO, and I, SO, gives SO, H₂S produces HI, H₂O, S, and I, HCl forms ICl, and H₂O, NH,

does not react with LO, (Kammerer, J pr. 79, 94)

Combinations -1 According to Kammerer $(J \ pr \ 83, 72)$ when dry SO_2 is passed over I O_4 heated to 100° a part of the SO_2 is oxidised to SO₃, a little J seing separated, and then a yellow crystalline compound 5I O, SO, 18 formed soon as the compound is formed the SO, must be stopped The compound is decomposed by mois ture, even by exposure to ordinary air (C R 70, 621) says that in this reaction only I and SO, are produced According to Weber (B 20, 87) the compound I,O, 38O, is formed by heating the constituents in a sealed tube to c 60°, and pouring off excess of SO₃, the compound is decomposed above 60° -2 By heating HIO, slowly to 30°-40, or more quickly to 130°, the hydrate 31,0, H2O is said to be formed Ditte, however, says this is only a mixture of I.O. and HIO,

Nitroso derivative (?) By treating perfectly dry finely powdered I with c 10 times its weight of the most conc HNO, Aq, or a mixture of equal parts of cone HNO, Aq and H.SO,, a loose flocculent yellow powder is obtained This sub stance was regarded by Millon (J pr 34, 319) to be a compound of I, O, and HNO₃, according to Kammerer (J pr 83, 65) it is I2O4(NO)2, but no analyses are given The substance is extremely unstable, it cannot be dried over CaO without decomposition it is decomposed by water to HNO, HIO, and I Heated in CO, NO, and

I₂O₄ are formed
Iodine dioxide or tetroxide IO₂ or I₂O₄ This substance probably exists as a definite compound One part of perfectly dry I is rubbed in a basin with 10-12 pts conc HNO, Aq S G at least 1486, until a loose flocculent yellow powder is produced (v supra), excess of soid is poured off, the powder is placed in a funnel stopped with asbestos, and is then died on a porous tile, and finally over lime, HIO, and I are then removed by washing with water and then with alcohol (Millon, J pr 34, 319, 337) IO, is described as a sulphur yellow powder, unchanged in air, decomposed to I and HIO, by heating in air to 170°-180°, insol cold water, but decomposed by boiling water giving I and HIO₃, not acted on by alcohol Warm HNO₃ produces HIO, and I, but H.SO, dissolves the substance, and on cooling crystals of H.SO. IO. separate, HClAq forms ICl and Cl, aqueous alkalı solutions produce iodates, but alcoholic solutions of alkalis are said to form red liquids containing very unstable compounds

Other compounds of rodine and oxygen have been described, but it is very doubtful shether any definite compound except I_2O_5 and probably IO_2 has been isolated. By the action of ozone on I, Andrews a Tait obtained a yellow powder. supposed by some chemists to be I₂O (A a T Pr 9, 608, no analyses given) Ogier (C R 85, 957) asserted the formation of I₂O₂ by the action of ozonised O on I, he described it as a yellow deliquescent powder, decomposing at 125°and I with evolution of I and O, giving HIO, and I with water Millon (J pr 84, 336) supposed he had obtained I₁₀O₁₉ by exposing to moist air the preduct of boiling I₂O, with cone H₂SO₄ H₂O, S, and I, HCl forms ICl, and H₂O, NH, until both I and O were coming off. Kammerer, on heating gives H₂O, N, and I (Ditte, i.e.). NO | (J pr. 83, 78) treated I₂O, with SO, and by

washing the product with alcohol and vater ob tained a brownish 'sllow powder supposed to be I₂O₁. These substances were probably mixtures Bengieser [in 1836] (A 17, 2°4) says that by heating H,IO₂ (v Periodic acta; to 160°; it loses water, and that at o 180° O is e. lived and I₂O₃ remains, possibly I₂O, may be formed at c 160°; but Rammelsberg (J pr 103, 278) says that decomposition of H,IO begins at 133°, and Lang lois (J pr 56, 36) puts the decomposition tem perature at 130°

Iodine, oxyacids of. The only oxyacids of I which are certainly known are HIO, and H, IO, both are solids There are indications of the existence of HIO in aqueous solution, but neither this acid nor any of its salts has been actually isolated The periodic acid corresponding with HClO, has not been isolated, but many salts of the form MIO, are known, the periodates form several complex series of salts whereas all the per HIO, 18 hlorates belong to the series M'ClO. a product of the action of many oxidisers on I, eg HNO, Cl in presence of H₂O, KOHAq This acid or ar iodate is also formed by digesting MgO, HgO, or Ag O with I and H2O, or by shak ing up AgNO, with an alcoholic solution of I Electrolysis of IAq or HIAq yields HIO, Iodides dissolved in water are oxidised by KMnO,Aq, and by bleaching powder, to iodates HIO, is produced by heating solutions of HClO₃, HClO₂, HClO, or HBrO₃ with I If the e reactions are compared with those whereby bromic and chloric acids are obtained (vol 1 p 537, and vol 11 o 15) it is seen that it is more easy to pass from less oxidised, or non oxidised, compounds of I to HIO, than from corresponding compounds of Cl or Br to HClO, or HBrO. The heat of formation of HIO, is much greater than that of HI, whereas the heats of formation of HClO, and HBrO, are considerably less than those of HCl and HBr -[H, I, Aq] -13,170, [H, I, O, Aq] = 55,800 (cf vol 11 p 605) Periodic acid and its salts are stable compounds, they are more readily formed by oxidation pro cesses then perchlorates, eq passing I vapour with O over heated BaO produces Ba periodate, and passing Clinto an alkaline iodate in presence of alkalı produces an alkalıne periodate anhydride of iodic acid, I₂O₃, is known as a stable solid, but the anhydride of periodic acid, I2O, has not been isolated (1 supra, Iodine, oxides of)

Detection and estimation of sodates and periodates - Iodates are detected by mixing with an alkaline iodide, adding a little starch paste, and a few drops of a weak acid, eg tar taric acid, when I is set free and colours the starch blue Periodates give a brown pp of AgIO, on addition of AgNO, in presence of HNO. Periodates may be separated from iodates by ppg both as Ba salts and digesting pp with NH, carbonate, when Ba periodate remains unchanged, but the iodate is converted into BaCO, Iodates may be estimated by reduction to iodides by means of SO, or SH, and ppn with AgNO,, or by digesting with KI and a little HCl, when Cl is set free and decomposes the KI, giving free I which is determined volu metrically Periodates may be estimated by a similar method (A Kimmins, O J 51, 301)

Hypo monous acm and Hypo-monres Neither the acid nor any of its salts has been isolated,

According to Köne (P 66, 802, Lippmann, B 7, 1773) the solution obtained by shaking an alcoholic solution of I with ppd HgO probably contains hypo iodous acid, but this acid quickly decomposes to HIO, and I When I is added to KOHAq or NaOHAq a yellowish liquid is obtained, which bleaches indigo, gives a blue colour with starch, and is decomposed by H2O2Aq with evolution of O, on heating, iodide and iodate are This solution probably contains KIO or NaIO (Schönbein, J pr 84, 337, Berthelot, B 10, 900, Van Deventer a Van't Hoff, C C 1888 362) Lunge a Schock (B 15, 1883), by the action of I on CaO suspended in water, obtained a colourless solution which bleached logwood, litmus, and cochineal, gave no colour with starch, addition of acids separated I, H2O2Aq caused evolution of O, the solution decomposed slowly in the dark, more rapidly in sunlight, but even on boiling for some hours it was only partially decomposed L a S suppose this solution to contain an I compound, analogous with bleaching powder, probably Ca OI I

IDDIC ACID, and *Iodates* HIO₃, MIO₂ The acid seems to have been first obtained by Connel by oxidising I by cone intric acid (New Edin Philos Journ 10, 93, 337, 11, 72, 13, 284)

Occurrence — Sometimes in commercial nitric acid (Pettenkofer, J 1857 581)

Formation -1 By oxidising I by very conc HNO, Aq, or by HBrO, Aq (Kammerer, J 79, 94), or HClO, Aq (Davy, S 11, 68, 234, 16, 343) -2 By decomposing Ba(O₃) by the proper quantity of H SO, Aq -3 By suspending AgIO, in water, adding an equivalent quantity of I, filtering from AgI, and evaporating to dryness $(10\text{AgIO}_2 + 12\text{I} + 6\text{H}.O + \text{Aq} = 12\text{HIO}_2\text{Aq} + 10\text{AgI}$, Kammerer, P 138, 390) The AgIO, is prepared by ppg NH,IO, by AgNO, and the NH,IO, is made by digesting Ba(IO₄), with solution of NH, carbonate—4 By digesting an aqueous or alcoholic solu tion of AgNO, with I (10AgNO, Aq + 12I + 6H O = 10HNO,Aq + 10AgI + 2HIO,Aq, Lassaigne, J Chim méd 9,508, Weltzien, A 91, 43) -5 By decomposing KlO, Aq by H, SiF, Aq, filtering, and evaporating to dryness, the product is impure -6 By leading Cl into water containing I in suspension, the greater the dilution the greater the quantity of Cl required to change all the I into HIO, (of Bornemann, A 199, 183, Sodini, B 9, 1126) -7 By electrolysing solution of I or HI (Riche, C R 46, 348) -8 By the action of Au,O, on I in presence of water (6I + 5Au₂O₃ + 3H₂O + Aq = 6HIO₂Aq + 10Au₃, Colin, G A 48, 280) -9 By moistening ICl₂ with a little water and then shaking with ether or alcohol (Liebig, P 24, 363) -10 Alkaline iodates are obtained by acting on I with caustic alkalis, or by oxidising alkaline iodides by KMnO Aqor solution of bleaching powder (Hempel, A 107, 100, Reinige, Fr 9, 89, Reichardt, Ar Ph [3] 5, 109 KIAq+2KMnO₄+H₄O $= KIO_2Aq + 2MnO_2 + 2KOHAq,$ 2KIAq + 6CaOCl2Aq

= Ca(IO₂)₁ + 5CaC(I,Aq + 2KCIAq) —11 Hg(IO₂)
18 obtained, along with HpI₂, by shaking I with
ppd HgO suspended in water (Colin, G. A 48

Preparation —1 About 5-10 grams finely powdered I is placed up a large flask, twice it

weight of cone nitric acid S G 15 (not furning acid) is added, and the bottom of the flask is gently warmed, the I is gradually oxidised, by keeping the upper parts of the flask cool any I which volatilises is prevented from escaping After a time the acid becomes diluted, it is then poured off, fresh acid is added, and the oxidation is continued until the whole of the I has been converted into white crystals of HIO, greater part of the acid is poured off, the semi-liquid mass is evaporated to dryness in a basin, and the remaining acid is removed either by repeated evaporations with water or by heating to 100°-130° in an air current The crystalline mass may be dissolved in water and slowly evaporated to the crystallisation point, and the crys tals heated to 170° -2 Two pts cone H2SO. and c 8 pts water are added to 9 pts finely powdered Ba(IO,)2, the whole is boiled for half anhour, after settling, BaSO, is removed by filtration, and the filtrate is evaporated until HIO, separates on cooling, the crystals are dissolved in water, a very little Ba(IO₃)₂ is added, and the liquid is evaporated and filtered Stas says that pure HIO, cannot be obtained by this me thod, the crystals always contain either $Ba(IO_3)_2$ or H_2SO_4 The $Ba(IO_3)_2$ required may be prepared (1) by adding BaCl, Aq to NaIO, Aq obtained by passing Cl into water containing I in suspension, till the I is all dissolved, then adding Na,CO, till neutral, and again passing in Cl (Liebig, P 24, 363), (2) by suspending I in hot sat rated BaOAq and passing Cl into the liquid (Kammerer, J 1860 94), (3) by adding tather more than the equivalent quantity of I to hot cone KClO, Aq, and then a few drops of nitric acid, Cl is freely evolved, and KIO, crystallises on cooling, the salt is recrystallised once and decomposed by BaCl₂Aq -3 NH₄IO₄ is prepared by digesting Ba(IO₃), with NH, carbonate solution, filtering, and crystallising, AgNO₃Aq is added to a solution of the NH₄IO₃ and the AgIO, obtained is collected and washed, the AgIO, is suspended in water and I is added in the ratio of 1 gram to 1 857 grams of the AgIO,, the reaction $10 \text{AgIO}_s + 12 \text{I} + 6 \text{H}_2 \text{O} = 12 \text{HIO}_s + 10 \text{AgI}$ proceeds when the liquid is warmed on the water bath, AgI is removed by filtration and the liquid is evaporated to dryness and the residue heated to c 170° (Kammerer, P 138, 390)

Properties—HIO, forms colourless tilmetric crystals, a b c = 589 1 1 1903 (Rammelsberg, P 90, 12), a b c = 9388 1 1 3181 (Schabus, J 1854 310) It is doubtful whether HIO, shows dimorphism or not (v Rammelsberg, Handbuch der Krystall-physikal Chemie, 1 41) Thomsen gives the following thermal data (Th 2, 163)—[H, I, O³] = 57,963, [HIO³, Aq] = -2,166, [I²O³, H²O] = 2,540 S G 2 4 629 (Ditte, C R 70, 621) Very soluble in water, most conc solution, according to Kammerer, contains 68 51 pc HIO₃, boils at 100°, and has S G 2 1629 Kammerer gives the following table—

S G at 14° 1 4428 S.G at 14° Po HIO, 1054 Pc HIO. 1 0058 36 89 1 0263 5 27 1 5371 42 16 1 0525 10 54 1 6315 46 98 1 1223 15 8. 52 70 17356 1 2093 21 08 1 8689 57 97 12,73 26 35 19954 63 24 1 3484 81 62 2 1269 68 51

Thomser has determined the volume change attending the dilution of HIT, Aq He expresses

It by the formula $Va = 18a + 39 \left(1 - \frac{a}{a+18} 13 1\right)$; the composition of the solution is represented by HIO₃ aH_2G , the volume of one molecular weight of water is taken as 18 For optical properties of HIO₃ crystals v Lang, W A B. 31 SH of HIO₃ = 1625 (Ditte, A Ch [4] 21, 52) Electrolysis of HIO₃ produces I and O (Magnus, P 102, 1, Buff, A 110 257)

Reactrons—HIO, reacts as an energetic oxidiser 1 Most non metals are oxided by HIO, \(\hat{A}\)Q, eg P to H3PO As to H3ASO, B to HBO, \(\hat{S}\) is at 250° to SiO2 (Ditte, Bl 1870 318), S, Se, and C are oxidised by heating in scaled tubes with HIO3AQ, S to H2SO, Se to H2SO, gas coke at 180° and anthracite a 210° to CO, diamond is not acted on—2 All metals, except the Pt metals and Au, are oxidised by HIO3AQ—3 Sulphurous acid is oxidised to HSO, sulphuroted hydrogen to S and HI, the lower oxides of nutrogen to HNO3—4 Hydrochloric acid forms ICl, and Cl

Combinations—1 With water to form 2HIO₃ 9H₂O, obtained by cooling saturated HIO₃Aq to -17°—2 With sulphure aced, by dissolving HIO, in hot cone H₂SO₄ and cooling, crystals of 2HIO₃3H₅SO₄ are said to be obtained, the mother liquor deposits other compounds of the .vo acids, if H SO₄2H O is used crystals of 3(H₂SO₂2H₂O) 2HIO₃2H₂O are formed, these compounds are decomposed by water (Millon, J pr 34, 321) Crystalline bodies, supposed to be compounds (Davy), are obtained by mixing cone HIO₃Aq with solutions of H₃PO₄ and HNO₃

Basicity and formula of rodic acid -HIO, is generally looked on as a monobasic acid, analogous to HClO, and HBrO. Besides the normal K salt there exist two acid salts, KHI O. and KH,I,O,, there are no chlorates or bromates similar to these Iodic acid is easily decomposed by heat to water and the anhydride I,O,, such a reaction does not usually occur with monobasic acids Iodic acid is isomorphous with the dibasic The chlorates and acids, succinic and itaconic bromates as a class are easily soluble in water, the iodates are very slightly soluble The ther mal phenomena attending the formation of the three acids, HClO₂, HBrO₃, and HIO₃, mark off HIO, from the two others, thus -

$$\begin{array}{lll} [H,Cl,Aq]=39,320 & [H,Cl,O^3,Aq]=23,940 \\ [H,Br,Aq]=28,380 & [H,Br,O^3,Aq]=12,420 \\ [H,I,Aq]=13,170 & [H,I,O^3,Aq]=55,800 \end{array}$$

The heat of formation of the acid HX decreases as the atomic weight of X increases, whereas in the series of oxyacids the heat of formation decreases from Cl to Br, but then increases very largely from Br to I A similar variation is shown in the K salts, thus—

The lodates are not generally isomorphous with the chlorates and bromates. Thomsen says the only case of isomorphism is presented by the Ba saits. There is no doubt that the constitution of periodic acid is very different

IODATES. 21

from that of perchloric acid, but indic acid shows some fairly marked analogies with periodic Thus, if one molecular proportion of H,IO, (228 grams) is dissolved n 80H,O (1,440 grams), the volume of the solution is 1,440+602= 15002 cc, if the molecular veight of rodio acid is taken as H₂I₂O₆, and this quantity in grams (352) is dissolved in 80H2O, the volume of the solution is 1440 + 599 = 14999 cc other words, one molecular proportion of H,IO,, dissolved in 80 molecular proportions of water, produces the same expansion of the liquid as is produced by one molecular proportion of iodic acid, provided the formula of this acid is tal en to be H2I2Os The foregoing are the chief arguments brought forward by Thomsen for establishing a difference between the constitutions of iodic acid on the one hand and chloric and bromic acids on the other hand, and for showing that nodic and periodic acids are closely related (Th **3, 168, 42**3)

The heats of neutralisation of HClO, HBrO, and HIO, are practically identical (Th When NaOHAq is added to NaIO, a ver, small quantity of heat is developed, about 4 pc of the total heat of neutralisation, but the reaction of NaOH with the monosodium salt of an undoubted dibasic acid is always accompanied by the production of as much, or nearly as much, heat as attends the addition of the first molecular weight c' NaOH to the acid If iodic acid is regarded as dibasic, then the salt $KH_2I_1O_9$ must be looked on as either a compound of the normal salt $K_2I_2O_6$ with $2H_1O_9$ ($2KH_2I_3O_9 = K_2I_3O_6$) or as the acid salt of a hypothetical acid H,I,O,

On the whole there appear to be marked dif ferences between the oxyacids of I and those of The oxyacids of I form more com-Cl and Br plex salts than those of the other halogens The constitution of the iodates and periodates cannot be settled by defining the basicities of the acids HIO, and H₅IO₆ Several series of period ates certainly exist, and there is probably more

than a single series of iodates

The salts KHL₂O₆ and KH₂I₂O₉ may of course be formulated as K₂O 2I₂O₅ H₂O and

K₂O 3I₂O₅ 2H₂O respectively
IODATES These salts are formed by neutraining HIO, by bases, or in some cases by oxidising I in presence of a base (v Iodic acid, Formation, Nos 10 and 11), or by double decom position from the alkali iodates. The iodates are go ierally insoluble or slightly sol in water, the alkalı nodates are readily soluble, KIO, however, is only slightly soluble (S at 20° = c 8) The iodates are decomposed by heat, generally giving a mixture of metallic iodide and oxide, sometimes iodide only Solutions of iodates are more easily reduced than chlorates, reduction of KIO, Aq is brought about by SO, Aq or SH, Aq, with HIAq i dates give I and metallic iodide, with HClAq they give ICl₃, Cl, H₂O, and metallic chloride, dilute H₂SO, produces HIO₃ The following are the chief memoirs on

iodates, they are referred to by numbers in the following descriptions.—(1) Bell, J 1871 298 (2) Berthelot, C R 84, 1408 (3) Cameron, J 1876 284 (4) Clarke, J 1877 48, 267 (5) Connel, S 62, 498 (6) Ditte, C. R 70, 622: (7) Flight, J 1864 147 (8) Gay-Lussac, G. 4.

Ammonium vodate NH, IO, Lustrous plates,

Ammonium iodate NH, IO₂ Lustrous plates, decompose at 150°, S 26 at 15°, 145 at 100° 8 G 331-334 Formed by action of NH, Aq on I, or of HIO3Aq on NH3Aq or (NH4)2CO3Aq (4, 24, 28)

Barium iodate Ba(IO3)2 H2O By dissolving I or ICl, in BaOAq, or by ppg NaIO, Aq by BaCl₂ or Ba(NO₂) Lustrous monoclinic crystals, which lose H₂O at 130°, and when strongly heated form Ba periodate Ba₂I.O₁₂ S G 5 18-5 28 S 07 at 135°, 15 at 100° (4, 8, 10, 12,

13, 16, 18, 24, 27)

Calcium vodate Ca(IO3)2 Occurs in seawater Formed by adding CaCl Aq to KIO, Aq, or HIO, Aq to Ca(NO,), Aq By action of bleaching powder on KIAq crystallises with 6H.O, and from KIO, Aq + Ca(NO₃) Aq with 4H₂O (Flight) Efflorescent rhombic crystals, on neating gives mixture of CaO and Ca periodate, v insol. water (6, 16, 18, 24, 27)

Copper iodates -1 Cu(IO3)2 2H2O, greenish. blue pp by mixing cone NaIO3Aq and CuSO,Aq, salt with H.O iemains on warming S 33 cold, 65 at 100° -2 3Cu(IO₃)₂3CuO 2H₂O, by action of HIO₃Aq on strongly heated CuO By dissolving (1) in respect to Cu(IO₃)₂ 4NH₄ 3H O is formed (18)

**Cu(IO₃)₂ 4NH₄ 3H O is formed (18)

**Codata Hg(IO₃)₂ By warming NH,Aq

Cu(IO₃)₂ 4NH₄ 3H₂ 0 Is located in Mercury rodate Hg(IO₄)₂. By warming freshly ppd HgO with HIO₅Aq, or adding HIO₄Aq to Hg(NO₃)₂Aq or Hg(C H₁O₂)₂Aq (not HgO₄)₃ to HgCl₂) White powder,

insol water (3)

Potassium vodates -Normal iodate KIO. Prepared by dissolving I in KOHAq, evaporating to dryness, and dissolving out hi by alcohol S G 81, also by passing Cl into I suspended in water, neutralising by KOHAq and evaporating Stas adds 11 pts KClO, to semi fluid KI in a crucible, dissolves, on cooling, in hot water, and recrystallises the KIO, which separates (8, 16, 17, 28) Crystallises in cubical forms SG 18 8 975, KIO Aq SG 1.0741 at 19 5° contains 9 08 KIO, to 100 water (13) S at 5° 5 3, at 9 5° 6 7, at 14° 7 7, at 22 2° 9 2, at 45 8° 16 6, at 69 2° 27 (8) Insol alcohol S G 81 Poisonous Decomposes, at higher temperature than KClO. to KI and O, without production of KIO. heated with MnO₂ forms I, O, and K₂O (8, 24 25) KIO, Aq shaken with finely-divided Fe gives KI (21) From solution in hot dilute H₂SO, Ac rhombic crystals of 2KIO, H₂O separate, which KIO, KHSO, is obtained by heating KIO, it large excess of dilute H₂SO, Aq, evaporating at 25° until KH₂I₂O, crystallises out, and further 22 IODATES

erystallising the mother liquor (16) —2 Diodate or acid codate KHI, O₄ (or K₂O 2I₂O₃ H₂O) Obtained by half neutralising HIO₄Aq by KOHAq; also by acidifying KIO₄Aq by HOl and ppg by alcohol, also by disolving KIO₄ in hot dilute HNO₄Aq (6, 18, 26) Crystallises in three forms, one rhombic and two monoclinic (16) S 133 at 15° (26°) Solution reacts acid Insol alcohol Loses H₄O at 200° (6) Forms a double alt KHI₂O₄ 2KCl, obtained by heating KIO₄ with dilute HClAq, or by adding to ICl₄Aq less than enough KOHAq to saturate it (c ratio KOH 2ICl₂) and allowing to evaporate (16, 24, 26) 3 Tri-lodate KH₄I₃O₅ (or K₂O 3I₂O₅ 2H₂O) Formed by adding a large excess of HIO₄Aq to KIO₄Aq and evaporating, also by heating KIO₅ with large excess of dilute H₂SO₄Aq and evaporating at 25° Large transparent triclinic crystals, lose all H₂O at 200° S 4 at 15° (6, 16, 24, 26) Berthelot (2) describes a basic lodate KIO₅ K₄O obtained by heating KI in O

Silver iodate AgIO, Formed by ppg AgNO₂Aq by HIO₂Aq or NaIO₂Aq Crystallises from NH₂Aq in monoclinic crystals S G 5 4 Soluble without decomposition in dilute HNO₂Aq

(4, 14, 16, 24, 28)

Sodium iodate NaIO, Prepared by saturating 10 pts water holding 1 pt I in suspension, with Cl, neutralising by Na, CO, again passing Cl, again neutralising by Na₂CO, and passing Cl, and so on, finally the solution is evaporated to 110 th its bulk and mixed while warm with half its volume of alcohol, the crystals which separate are pressed and washed with alcohol till free from NaCl (15) Crystallises at under 5° with 2H₂O, above 5° with H₂O, at 70° crystals of NaIO, form, hydrates with 8, 6 and 3 H,O are also described (6, 18, 24) S 2 52 at 0°, 33 9 at 100° (13) Loses O and I when heated (15) According to Rammelsberg (24), a compound of NaI with Na₂O₂ (6NaI Na₂O₃) remains on heating NaIO, With conc HClAq, Cl is evolved, and a compound of HIO, and NaCl remains (6) Double salts with NaI are obtained by evaporating mixtures of NaIO, Aq with NaIAq, NaI NaIO, 8H,O, NaI NaIO, 10H.O. and and **8NaI 2NaIO, 20H₂O are described** (6, 16, 19, 24) The existence of acid iodates is denied (6, 32, ef 18, 22, 26)

Besides the foregoing lodates, the following have been prepared — Cd(IO₃)₂ (24), CO(IO₃)₂ H₂O and Co(IO₃)₂ 6H₂O (4, 24), various Fe lodates (1, 5, 24), Pb(IO₁)₂ (23, 24), Mg(IO₃)₂ 4H₂O (6, 16, 18), Ni(IO₃)₂ H₂O and Ni(IO₃)₂ 6H₂O (4, 24), Sr(IO₂)₂ (24), Zn(IO₃)₂ 2H₂O lodates of Al, Bl, Ce, Cr, Dl, Au, La, Li, Mn, Sr, Sn, U, Y, and Zn also seem to exist, but they have not been fully investi-

gated
PERIODIC ACID and PERIODATES — The only acid which has been isolated is H₁IO₂, but at least five distinct series of periodates are known The anhydride of periodic acid has not been obtained, when the acid is heated it loses H₂O, O, and I, and iodic anhydride, I_{O₃}, remains, Bengieser in 1836 (A 17, 254) stated that by heating periodic acid to 160° it lost water of crystalliss ion, and that O comes off rapidly at 180°, but according to Rammelsberg (J pri-103, 278) and Langlois (J. pr. 56, 36) decomposition begins at c. 130°.

Periodic acid was first prepared by Magnus a Ammermiller (P 28, 514), they prepared it by reacting on AgIO₄ with cold water, whereby the Loid went into solution and another Ag periodate, Ag₄I₂O₂, 8H₂O₃, remained

Formation, -By the action of I on cone HClO₄Aq (Kammerer, P 138, 406, 410)

Preparation -1 Na₂H₃IO₆ is prepared by saturating a hot solution of equal parts NaOH and NaIO, with Cl. concentrating, and allowing to cool (Langlois, A Ch .4, 257) This process yields a mixture of Na,H,IO, and Na,H,IO,, the latter salt is more soluble and may be removed by long continued washing with cold water (Kimmins, C = 51, 357), but it is not necessary to do this in preparing H, O. The Na salt is dissolved in water with addition of just enough HNO, to form a clear solution, and AgNO, Aq is added, a brown pp of Ag.HIO, is thus obtained (Kimmins, C J 51, 358, former observers said that Ag, IO, or Ag, H, IO, 18 produced) brown Ag salt is suspended in water, and shaken with Br, AgBr ppts, and H₅IO₆ along with HBrO, goes into solution, the filtrate is eva porated to the crystallising point, whereby HPrO, is decomposed, and is then placed over H,SO, in vacuo (Kammerer, P 138, 390) -2 Ag HIO, prepared as described in 1 is dissolved in conc HNO₃Aq, and the solution is evaporated at 100°, orange red crystals of AgIO, H,O separate, by treatment with cold water this salt decomposes to H₅IO₆Aq, and Ag₄I₂O₉ 3H₂O which may be again converted into AgIO, by solution in conc HNO₃Aq and evaporation (Magnus a Ammer muller, P 28, 514)—3 Na₃H₃IO₄ prepared as described in 1, and mixed with Na₃H₃IO₄, is dissolved in as little dilute HNO, Aq as possible, Pb(NO,) Aq is added, the pp of Pb periodate (Pb,(IO,), Kimmins) is digested with rather less dilute H,SO,Aq than suffices to decompose it all, and the liquid is filtered and evaporated (Ben gleser, A 17, 254)

Properties — H, IO, crystallises in transparent, colourless prisms, probably monoclinic (Rammels berg) MP 133° (Rammelsberg, J pr 103, 278), 130° (Langlois, J pr 56, 36), melting is accompanied by partial decomposition (Bengieser, A 17, 254, put the temperature of decomposition at 180°) H, IO, does not lose weight at 100°, nor by keeping over H₂SO, Very deliquescent; fairly sol in alcohol, slightly sol in ether. Thomsen (B 7, 71, Th 2, 427) gives the following data for S G and expansion of H, IO, Aq —

Ratio of H ₄ IO ₄ H ₄ O	SG of solution	Expansion for each formula-weight of acid
H,10, 20H,0	1 4008	59 77
,, 40 ,,	1 2165	59 30
, 80 ,,	1 1121	59 9 9
n 160 n	1 0570	6 0 2
,, 820 ,,	1 0288	60 0

The volume when aH,O is present is expressed by the formula Va=18a+596 The following thermal data are taken from Thomsen (Th 2, 166) —[H³,I,O⁴]=185,780, [H³IO⁴,Aq]=-1880, [I⁴,O,Aq]=27,000 H,IO₄Aq exposed to air becomes yellow, and smells strongly of bzone

Reactions —H.IO.Aq reacts as an energetic oridiser, with HÖl it gives Cl and HIO. (M a. A., Lo), with P and Bi it forms P.O. and Bi.O.

Kämmerer, i.e); C₂H₄O₂, C₂H₂O₄, and many other Cacids are oxid sed to CO₂, SO₂Aq, SH₂, and HI are also oxidised, with Zn, Fe, Hg, and Cu t forms ZnO, Fe,O4, HgO, and Cu(IO2)2 respec

Periodates Most of the peri dates are in soluble in water, they are generally prepared from the Na or K salts by double decomposition from solutions acidified with HNO. Many of them are decomposed by heat giving O and metallic iodides eg KlO4, AgIO4, others evolve O and I, and leave either oxide, eg salts of Ni and Mg, or a mixture of oxide and iodide, g salts of Pb, Cu, Cd Hg salts give iodide and Hg, NH, salts decompose explosively to I, N, O, and H,O Very many periodates are known, they may be divided into several classes, the following sche ie presents the chief classes and the chief salts in each class The nomenclature is that adopted in Gmelin Kraut's Handbuch All the acids except H, IO, are hypothetical, formulæ of salts are given here without water of cry stallisation -

Ba₃(IO₄)₂ is obtained, and Ca(IO₃)₂ undergoes a similar reaction The salts obtained by double decomposition from alkali salts of the orthoseries, c. of the dimeso- series, usually belong either to the ortho- or mesc series, thus the following salts are obtained -

Starting from Na,H,IO. Starting from K,I,O. Cu2HIO4 Cu HIO. FeH,10. Fe,(IO,) ortho Pb,H,(IO,)2 Pb,H,(ĬŌ,), (Ag₂H,ÌO Ag₂H,IO₄ CdHIO. CdHIO, Ag,HIO, meso Ag.HIO. N1,(IO,)2)

When a salt is obtained by ppn from an acidified solution of an alkali salt, the series to which the ppd salt belongs is conditioned by the relative quantity of soid present, thus when AgNO, is added to a solution of Na,H,IO, k,I.O. or KIO, acidified by a little HNO. Ag, HIO, is obtained, when more HNO, is present the pp is Ag.H.IO., and when conc acid is pre-

The series to which a periodite belongs seems to depend partly on the nature of the base, and to a large extent on the conditions of preparation By neutralising H,IO,Aq by NaOHAq Rammelsberg (P 134, 368, 499) ob tained NaIO, , by neutralising the same acid by various carbonates the following salts have been obtained

By passing Cl into a hot mixture of KIO, and KOH, KIO,, K,I,O,, and K,HLO, are produced, but the Na salts formed under similar conditions

sent the salt AgIO, is obtained Boiling salts of the ortho, meso, or dimeso series with HNO, Aq as a rule produces salts of the meta series Acid salts of the ortho series are changed to normal salts of the meso or dimeso- series by heating, and acid salts of the meso series are changed to normal salts of the dimeso series, thus Pb,H,(IO,), at 275° gives Pb,(IO,), and H.O, and Ag,HIO, gives Ag.I.O. and H.O at 300° Some of the periodates show very distinctly the difference between so called 'water of crystallisation' and 'water of constitution', thus Ag,HIO, (which might be written Ag,I,H,O,e) and Ag,I,O,H,O (which also might be written Ag,I,H,O,e) are quite different bodies, the change 2Ag,HIO,=Ag,I,O,+H,O occurs at 300°, but Ag.I.O, H.O loses H.O at 130°, again Ag.H.1O. (which might be written are Na,H,IO, Na,H,IO, Na,II,O, and pe Ag,I,H,O,;) is a dark red pp, obtained by alding haps NaIO, By heating Ba(IO,), the salt AgNO, to Na,H,IO, in a slight excess of HNO,Aq, whereas Ag, I2O, 3H2O (which also might be written $Ag_4I_2H_8O_{12}$) forms light yellow crystals, and is obtained by treating $AgIO_4H_2O$ with water As a rule water of crystallisation is removed at 100°, thereas the temperature of acid salts must be raised to 270°-300° before change begins with evolution of water (For a comparison of the classes of periodates, v Kimmins, C J 55, 152) Thomsen (Th 1, 244) has determined the heat of neutralisation by KOH of Halo, with the following results .-

" 1	[H°10°Aq, n KOHAq	d(f
•	•	21,440
2	2 6,590	8,150
8	29,740	2,800
5	32,0 40	-,

From these results Thomsen concludes that H,IO, is dibasic, but that basic salts are produced when more than 2KOH reacts plain the existence of many of the periodates, Thomsen prefers to double the formula of the acid and to represent it as normally tetrabasic, thus H₄I₂O₉.3H₂O. he classifies the chief periodates as follows

> Normal salts R140, 3H20 Basic salts (1) R¹¹, L₂O₁₀ 2H₂O (2) R¹¹, L₂O₁₁ H₂O (3) RII, I,O,,

The existence of undoubted acid salts, s.e salts in which the H is not combined with O in the form of H2O, militates against the classification of Thomsen The reaction of KOHAq with H.IO.Aq is almost certainly a complex occurrence

In the following description of periodates only one or two salts in each series are described ın detail

The following are the principal memoirs on periodates, they are referred to in the following paragraphs by numbers (1) Atterberg, J 1873 257, (2) Bengieser, A 17, 250, (3) Blomstrand, B 3, 317, (4) Fernlund, J 1867 165, (5) Groth, P 134, 536, (6) Kimmins, C J 51, 356, 55, 148, (7) Langlois, J 1852 345, (8) Lautsch, J pr 100, 65, (9) Magnus a Ammermuller, P 28, 514, (10) Philipp, B 3, 4, (11) Rammelsberg, P 44,545, 46, 159, 62,416, 90,12, 115,584, 125,147, 184, 368, 499, 137, 305, (12) Ritter, Gm -K (6th ed), 1 [2] 303

Ortho-series, salts derived from H,IO, Barum orthopervolate $Ba_s(IO_s)_s$. Prepared by heating $Ba(IO_s)_s$ in a current of dry air (Sigiura a Cross, C J 85, 118), by passing I vapour and dry air over heated BaO (S a C), by heating Bal, in a current of dry air so long as I is given off (S a C) Insol water, sol

HNO₃Aq, heated in H gives BaI, and BaO
Silver orthoperiodates—1 Ag₃IO₆ said to
be ppd as a brown salt by adding AgNO₃Aq to a neutral solution of an alkaline periodate, also by shaking Ag₄I₂O₆ 3H₂O with cold AgNO₂Aq (11), Kimmins (6) failed to obtain this salt, sol in HNO,Aq and in NH,Aq -2 Ag,H,IO, dark red pp by adding AgNO,Aq to Na,H,IO,Aq or K.I.O.Aq in slight excess of HNO. (6) -

8 $Ag_2H_2IO_4$, slate coloured pp by adding $AgNO_3Aq$ to $Na_1H_3IO_4Aq$ or $K_4I_4O_4Aq$ in presence

of a fair amount of HNO, (6)

Sodium or thoper odates Na,H,IO, Na, H, IO, , white granular pps , formed by passing Cl into a bo ing solution of equal weights of NaIO, and NaOH, the second salt is less soluble than the first, from which it may be sepa rated by long continued washing with small quantities of cold water (b)

For descriptions of the other salts of this series v (1) for Be salt, (6) for Cu and Fe salts, (8) for Hg salt, (11) for Ca, Sr, and Zn salts (for for

mulm of salts, v p 23)

Meso series, salts derived from hypo thetical H,IO,

ppg the corresponding K salt by Ba2NO₁Aq (11)

Potassium mesoperiodate K, IO, 4H,O KiO, is prepared by saturating with Cl a hot cond solution of equal weights of KIO, and KOH, and repeatedly crystallising, the salt is dissolved in water and the solution is ppd by alcohol (11)

Silver mesoperiodate (acid salt) Ag TIO, A dark brown pp by ppg Na₂H₁IO or K₁I₂O₃ in just enough dilute HNO₃Aq to form a solution

For description of other salts of this series (formulæ given on p 23), v (6) for salts of Pb and Ni, and (1") for salts of Cd (crystallises with 5H2O) and Sr

Dimeso series, salts derived from hypo

thetical H.I.O.

Barrum dimesoperiodate Ba,I,O, Obtained by ppn from alkali periodates in presence of HNO, By neutralising H₃IO,Aq by BaO \(\frac{1}{3}\), a salt with 7H2O is obtained, which loses 4H2O at 100°, and on strongly heating goes to Ba IO. (11, 7, 8)

Ferric dimesoperiodate (acid salt) Italiao. By ppg solution of Na.H. IO. or K.I.O. by FeCl.Aq and drying at 100° Boiling with Boiling with dilute HNO, Aq does not change this salt (6)

Potassium dimesoperiodates K.I.O. and K.HI.O. Both salts are obtained by passing Cl into KIO₃ mixed with KOHAq (6) If equal weights of the KIO, and KOH are used, and the KIO, which separates is removed by filtration, the filtrate on concentration gives K, I,O,, if this filtrate is exactly neutralised by HNO, the ilt $K_4I_2O_9$ 3H O (v also 11) crystallises out without concentration, if excess of HNO₂ is u ed, $K_3HI_2O_9$ is obtained A solution of I IO, to which KOH is added is said to give triclinic crys tals of K₁I₂O₂ 9H₂O on concentration (5, 9) K₄I₂O₆ is soluble in KOHAq, S 10 3 cold water, solution has alkaline reaction, Cl led into boil ing K₄I₂O₂Aq produces KIO₄, with I, KI and KIO₃ are produced strongly heated leaves 2KI K₂O (11)

Silver dimesoperiodate Ag, I,O, 3H2O Light yellow crystals, obtained by treating AgIO, H.O. with cold water (6, 9) Heated to 100° for 12 hours claret coloured crystals of Ag, I2O, H2O are formed, and when the temperature is raised to 130° and kept there for many hours a chocolate coloured powder, Ag,I₂O₉, remains (6) When Ag,I₂O_q is seested with NH₂, q, Ag,I₂O₁₁ is pro

&uced (11)

For descriptions of other salts of this series

(formulæ given on p 28\ v (2) for salt of Ca (crystallises with 7 and 9 H₂O), (6) for salts of Ni and Zn, (7) for Sr salt (crystallises with 3H₂O), (8) and (9) for Na salt (c-ystallises with 3H2O), and (11) for salts of Cd (crystallises with 9H₂O), Cu (with 6H₂O), Mg (with 1 and 15 H₂O)

series, salts derived from hypo Meta

thetical HIO,

Ferric metaperiodete Fe(IO,). Bright yel low, produced by boiling FeHI,O, for some time with conc HNO, Aq (6)

Potassium metaperiodate KIO, Prepared by saturating with Cl a boiling cone solution of equal parts KIO, and KOH, cooling, and crys tallising repeatedly from water (6, 7, 9, 11) S 35 cold we er, almo 'rsol KOHAq KIO,Aq shows acid reaction At 300° forms KIO,, de composed by I at 160° Reduced in solution by kI to KIO, and I, which is then oxidised to KIO, (8, 9, 10)

Silver metaperiodate AgIO, By dissolving Na₂H₃IO₄ or Na₃H IO₄ or K₄I₂O₅ in cone HNO₃Aq and adding AgNO₃, also by treating Ag,H₃IO₆, Ag₃H₃IO₆, or Ag,I₂O₆ with conc HNO₃Aq and evaporating on steam bath Orange coloured Ciystals are AgIO, H2O, heated to crystals 130 for 6 hours AgIO, remains as a bright yellow powder (6) Decomposed by water giving Ag, LO, 3H,O (11)

For descriptions of other salts of this series (formulæ given on p 23) v (11) for salts of Ba, Cd, Ca, and Sr (crystallises with 6H2O), (5), (7), (3), (9), and (11) for salt of Na (crystallises with

2 and 3 H.O)

Di series, salts derived from hypothetical H_aI₂O₁₁

Cadmium diperiodate Cd_I_O_1 3H2O ppg a slightly acidified solution of NaIO, by a coluble Cd salt (11)

Silver diperiodate Ag, LO11 By treating $Ag_1I_2O_0$ with NH_1Aq (8, 11)

For descriptions of the other salts of this series (formulæ given on p 23) t (11) for salt of Cu (crystallises with H O and 7H₂O), (11) for salt of Mg (with 6 and 9 HO), (11) for salt of Hg (cf 8), (7) for salt of Zn (cf 11)

Dimeso di and Tri meso series, salts derived from hypothetical H1. I.O1., and H1. I.O2.

respectively, v (8) and (11)

Iodine, phosphides of, better called Phos phorus wodules, v Phosphorus

Iodine, selenides of, better called Selenion todides, v Selenion

Iodine, silicides of, better called Silicon wodides, v Silicon

Iodine, sulphides of, better called Sulphur todides, v SULPHUR

Iodine, tellurides of, better called Tellurium MMPM

iododes, v Tellurium M 10D0 ACETIC ACID C2H2IO2 s.c. CH_I CO_H '(ol w 186 [82°].

Formation -1 By digesting bromo acetic other with KI and alcohol, for about two hours in the dark, distilling off the resulting iodoacetic ether and decomposing it with baryta-water (Perkin a Duppa, P M [4] 18, 54) -2 By boiling Ac₂O with iodine and iodic acid (Schützenberger, J. pr. 107, 108) -38. By the exidation of iodo-acetic aldehyde (Chautard, A Ch [6] 16, 152)

Properties - Trimetric plates, decomposed by heat

Reactions —1 Moist silver oxide yields glycollic acid -2 Resolved by HI, even in the cold, into acetic acid and free iodine (Kekulé, $C \ J \ 17, 207$)

Salts The NH, and K salts are very soluble, orystalline, and non deliquescent.—BaA'₂ crystalline, m sol water, ppd from aqueous solution by alcohol—PbA'₂ prisms In solution it easily splits up into PbI, and glycollic acid

Methylether MeA' (170°) Pungent liquid (Aronstein & Kramps, B 14, 604)

Ethyl ether EtA' (180°) From scetic ether, KI, and alcohol (P a D) From bromofrom chloro acetic acid, KI, and alcohol (96 p c) by heating on the water bath in the dark Easily obtained by heating chloro acetic ether with Cal, 3 aq at 75° (Spindler, A 231, 272) Pungent heavy oil Decomposed by LtI at 230° giving acetic ether and ethylene iolide (Aronstein a Kramps, B 13, 489, 14, 604) With Me,S it forms MeS CH, CO,H and, finally, S(CH,CO,H).

Chloro ethyl cther CI CH, CH, O CO CH I SG 10 1954 chloro ethyl chloro acetate by gently heating with an alcoholic solution of NaI (Henry, C R 97, 1308) Very pungent oil Turns brown in

davlight

Propyl ether Pra' (198°) 8 G I 1 679 From propyl chloro acetate and alcoholic NaI

(Henry, C R 100, 114) Pungent oil

Amide CH I CO NH, [158°] Formed from methyl rodo acctate and alcoholic NH, (Henry Also from chloro acetamide and alcoholic KI, by standing a few days in the cold (Menschutkin a Jermolajeff, Z 1871, 5) Small needles or prisms

Nutrule CH, I CN Iodo acetonitrile (187º) S G 12 2 307 I iom chloro acetonitrile and alcoholio NaI (Henry, C R 103, 413) Colourless, very pungent oil, which becomes brown in daylight V sol alcohol and ether Slightly decomposed on distillation, with liberation of some lodine and HCy AgOAc forms CH (OAc) CN

Di 10do acetic acid CHL.CO.H Formed by heating di bromo acetic ether with KI, converting the resulting di iodo acetic ether into a Ca salt with milk of lime, and adding HCl (Perkin a. Duppa, C J 13, 1) Crystalline sulphur yellow compound, volatile in the cold, sl sol water Does not blister the skin The K and Na salts are deliquescent—BaA', trimetric crystals, giving off iodine when heated—CaA', silky yellow needles - PbA', crystalline pp - AgA' yellow crystalline powder

Ethyl ether EtA' Formed by treating di chloro acetic ether with Cal, 3 aq at 75° (Spindler, A 231, 273) Formed also by adding iodine to a solution of diazo acetic ether in ether (Curtius, J pr [2] 38, 433) Oil, volatile with

steam, reddens on exposure to air

Amide CHL CONH, [202°] Formed by the action of rodine upon a cold alcoholic solution of diazo acetamide (Curtius, B 18, 1285) Formed also by the action of conc NH, Aq upon di-iodo-acetic ether Greenish-white prisms (from hot water), v sl sol. water. Very stable towards acids and alkalis.

IODO ACETIC ALDEHYDE CH,I CHO S G

Formation -1 By boiling an aqueous solution of chloro acetic aldehyde with KI, allowing to stand for 12 hours, and then extracting with ether (Glinsky, Z [2] 4, 618) -2 By the oxida tion of a solution of iodine in alcohol

Preparation -By mixing iodine (50 g), iodic acid (20 g), aldehyde (30 cc) and water (60 cc) and leaving the closed flask to stand for about a week (in summer) Water (500 cc) is then added, when the 10do acetic aldehyde separates as an oil (Chautard, A Ch [6] 16, 145, C R 102, 118, C N 54, 87, cf W P Bloxam a E F Herroun, C N 53, 301, 54, 133)

Properties -Limpid colourless oil, unin flammable Blacken's rapidly when exposed to Its vapour is excessively irritating Cannot be distilled even in vacuo Decomposes at 80° Miscible with alcohol, ether, chloroform, and CS₂ Sl sol water Forms a crystalline Forms a crystalline compound with hydrate

NaHSO,

Reactions -- 1 Dilute aqueous KOH forms iodoform Conc KOHAq resinifies it -2 Am monta either aqueous or alcoholic forms ammo nium iodide and various bases, e.g. oxytiialdine (O2H3)2N C2H,OH -3 Chlorine and bromine at ordinary temperatures displace iodine giving chloro and bromo acetic aldehydes and resins 4 All mineral acids decompose 10do acetic aldehyde - 5 Reducing agents (Na amalgam, Zn and HCl) remove the iodine -6 Oxidation with have yields CH2I CO2H [82°] -7 NaOLt and KOEt yield only resinous matters -8 Silver acetate yields acetic ether (74°) —9 AgCN gives CH₂(CN) CO H —10 AgSCN similarly gives CH2(SCN) COH -11 The amines form crystal line bases with elimination of water Thus amiline gives CH₂I CH(NH C₂H₃),, and p tolu idine gives CH I CH (NH C,H, CH,)

Tri-iodo acetic aldehyde CI, CHO (above 200°) From chloral or bromal and HI (Bertrand, J 1881, 588)

IODO-ACETO ACETIC ETHER

CH, CO CHI CO₂Et SG 14/14 1 7053 From cupric aceto acetic ether and iodine in ether (Schönbrodt, A 253, 178) Yellowish oil, v sol ether Begins to decompose at 25° AgCl gives chloro aceto acetic ether AgCy gives di oxy-terephthalic ether dihydride AgNO₂ forms nitro aceto acetic ether Reduced silver gives di acetyl-fumaric ether Sodium aceto acetic ether in benzene forms di acetyl succinic ether

IODO ACETONE C.H., IO ic CH., CO CH., I S.G. 12 217 Formed by the action of KI on chloro-acetone (Glutz a E Fischer, J pr [2] 4, Prepared by mixing acetone (200 cc) with iodine (100 g) and iodic acid (10 g), and, after a week, boiling for three hours, adding water (500 cc), drying the separated oil over CaCl, and distilling in vacuo in the dark (De Clermont a Chautard, C R 100, 745) pungent oil Not inflammable Decomposes slowly in sunlight, but more rapidly when heated Reduces Fehling's solution Mineral acids con vert it into CH, I CO CH, I Silver chloride forms, chloro acetone LOAc gives CH, CO CH, OAc

Di iodo-acetone C.H.I.O 10 CH.I CO CH.I (62°) (M Simpson, J. pr 102, 880, O Völker,

4 192, 90).

Formation -1 From acetone (48 g), water (1000 g), and ICl₂ (96 g) a* 68° As soon as reaction begins the liquid is cooled The oil that separates is exposed to the air till crystals separate (eight weeks), these are recrystallised from alcohol -2 Trom CH,Cl CO CH,Cl and aqueous

Properties - White needles Violently attacks the mucous membrane Decomposed when heated Not very soluble in chloroform, CS2, or Sol benzene, v sol ether and acetone Cannot be distilled undecomposed

Reactions—1 Silver chloride gives solid CH Ol CO CH Cl [43°]—2 Decomposed by cold KOH, and by boiling K₂CO₃—3 Not converted into acrolein or acrylic and by Ag₂O, AgCy, or HgO -4 Hg.I. forms acetone, todc acetone, HI, and acetic acid, but no acroleir -5 Zinc and acetu acid reduce it to acctone

p IODO ACETOPHENONE

[14]C H,I CO CH, [79°] Obtained by diazotising p amido acetophenone, and heating the diazochloride with excess of HI (Klingel, B 18, 2692) White flat needles or plates Easily sol alcohol and ether, and to a certain extent in hot - ater By CrO, it is easily exidised to p iodo benzoic acid [266°]

IODO-ACETOTHIENONE V IODO THIENYL METHAL KETONE

10D0 ACETYLENE HC CI Formed by passing a current of steam through a solution of barium iodopropargylate (CICO) Ba (Baeyer, B 18, 2274) Crystalline solid Sol water Vola tile with steam Very poisonous It gives a purple red pp with ammoniacal CuiCl2, which is soon converted by an excess of the copper solution into copper acetylene and cuprous iodide It soon polymerises on keeping

D1 10do acetylene IC CI [78°] Formed by the action of iodine upon acetylene silver By treatment with an excess of ammoniacal Cu Cl. it is converted into copper acetylene and cuprous iodide It readily polymerises (Baeyer, B 18,

Di 10do diacetylene IC C C CI [101°] Co lourless crystals Odour resembling 10doform Formed by the action of a solution of iodine in aqueous KI upon silver diacetylene By treat ment with an excess of ammoniacal Cu₂Cl₂ it yields copper diacetylene and cuprous iodide It explodes violently on heating, with a brilliant red flash It soon polymerises on keeping (Baeyer, B 18, 2276)

IODO ACETYLENE CARBOXYLIC ACID .

IODO PROPIOLIC ACID

IODO ACIDS v IODO COMPOUNDS

IODO ACRYLIC ACID C,H,I CO,H Large, colourless, four sided prisms [65°], or plates Easily soluble in water, alcohol, and ether Formed by the addition of HI to propiolic acid (Bandrowski, B 15, 2703, Stolz, \hat{B} 19, 542) The Pb and Ag salts are white crystalline

as Di iodo-acrylic acid CHI CI CO.H [106°]. Formed by treating propiolic acid with an ethereal solution of rodine (Homolka a Stolz, B 18, 2284) Colourless prisms, or long needles Volstile with steam Easily soluble in alcohol, ether, and hot water

β Di iodo-acrylic soid I_cC CH CO_cH [133°]. Formed by addition of HI to rodo proprolic acid ICiC CO.H (Homolka a Stolz, B 18, 2284) Prisms Easily soluble in alcohol and ether, tolerably in hot water, very sparingly in cold

Not volatile with steam

Tri-iodo-acrylic acid CI, CI CO2H [207°] Formed by the action of an etherea, solution of iodine upon iodo-propiolic acid CI C CO,H (Ho molka a Stolz, B 18, 2286) Large colourless prisms Easily soluble in alcohol and ether, insoluble in cold water

IODO-DI ALLYL-ACETIC ACID C.H.11102 te CI(C,H_s), CO₂H Iodo octinoic acid From C(OH)(C,H), CO₂H and fuming HIAq (Schat zky, J R 17, 78) Crystals, insol water, v sol From alcohol and other Easily decomposes

IODO ALLYL ALCO.YOL C.H.I OH [160°] Produced by the action of aqueous Na, CO, on di iodo propyl alco ol (Hübner a Lellmann, B 18, Highly volatile with steam 460) Needles Insol water, sol alcohol, chloroform, and HOAc

No attacked by Ac,C

IODO ALLYLENE C.H.I te CH. C CI (?) (98°) SG 17 From silver allylene and iodine in KIAq (Liebermann, A 135, 270) Pungent oil Almost insol alcohol With zinc and HCl it gives off allylene Combines with iodine (1 mol)

Iodó allylene CH, I C CH Propargyl woulde (115°) S (r 2 20177 From propargyl bromide and alcoholic NaI (Henry, B 17, 1132) Liquid V e sol alcohol and ether, m sol coiling water Readily combines with iodine, forming colourless needles of CHI CI CH₂I [41°] Combines with mercury

IODO ALLYLENE IODIDE v TRI-IODO PRO-

TRI-IODO-ALLYL ETHYL OXIDE C.H I,O t.e CI, CI CH, OEt From the silver derivative of propargyl ethyl oxide and iodine in ethereal solution (Liebermann, A 135, 285) Oil

DI IODO ALLYL IODIDE v TRI IODO PRO

TETRA-IODO-DI-ALLYL PHOSPHITE

(CHI CI CH₂O)₂P(OH) [49°] From propargyl alcohol, todine, and red phosphorus (Henry, B 8, 398, 17, 1133) Long slender needles (from alcohol) Very pungent

IODO-AMIDO-BENZOIC ACID C H, INO. 1 c C.H. I(NH2)CO2H [3 20r6 1] [1370] Formed by reducing iodo nitro benzoic acid [235°] dissolved in glacial acetic acid (Grothe, J pr [2] 18, 326)

Dark brown crystals V sol water By further reduction it forms o amido benzoic acid [148°] -

HA'HCl — BaA'₂ aq Iodo amido-benzoic acid C₂H₃I(NH₂)CO₂H [209°] From 10do nitro benzoia f8 6or2 11" acid [174°] Needles, al soi water May be reduced to o-amido benzoio acid -- CaA', 2aq --

SrA'₂ --BaA'₂.
Di-iodo-m amido bensoic acid

C.H.I.(NH.)CO.M Formed, together with N.(C.H.I.CO.H), by treating an alcoholic solu tion of m amido benzoic acid [173°] with iodine and mercuric oxide (Benedikt, B 8, 384) acids are separated by fractional ppn of their alcoholic solution by lead acotate. Long needles Decomposed by heat Insol water, v sol alcohol, ether, aqueous acids, alkalis, and Na,CO, -KA' long silky needles, obtained by mixing alcoholic solutions of the said and KOH.

Di-iodo-p amido-benzoic acid C₀H₂I₂(NH₂) CO₂H [above 300°] Obtained by dissolving p amido benzoic acid in dilute HCl and passing in the vapour of ICl (2 mols) (Michael a Norton, Am 1, 264) Tables Insol water, alcohol, and HOAc, sol nitro-be izene Does not combine with acids -NaA' 5aq long white needles, sol hot water.—BaA', 4aq needles, sol hot water -AgA'

DI IODO-p AMIDO PHENOL

C_eH₂I₂(NH₂)ÔH [222°] Formed by reducing the corresponding nitro phenol with SnCl, and HCl (R Seifert, J pr [2] 28, 437) Needles (from alcohol) or plates (from MeOH) With HCl and bleaching powder it gives di-lodo quinone chlorimide $(q \ v)$ With H SO, and K,Cr,O, gives di lodo quinone $(q \ v)$ —B'HCl Decomposed by water

IODO AMIDO THYMOL

C.HIMePr(OH)(NH) [6 5 2 1 4] From the oxim of 10do thymoquinone by reduction with SnCl, (kehrmann, J pr [2] 39, 392) Its stanno chloride forms large colourless prisms

IODO AMIDO-TOLUENE SULPHONIC ACID C₆H₂MeI(NH₂) SO₃H [1 4 2 5] Formed from the corresponding nitro toluidine sulphonic acid by diazotisation and treatment of the product with cone HIAq at 135° (Foth, A 230, 308) Slender silky needles (from water) V sl sol cold water

IODO AMYL ALCOHOL C, H, IO? Amylene glycol wodhydrin Formed by shaking un amylene with iodine, water, and HgO (Lippmann, Z 1867, 17, 4 Suppl 5, 124) Heavy oil, decomposed by distillation

IODO AMYLIDENE ANILINE

C,H,I CH \C,H, Formed by heating iodo iso valeric aldehyde with aniline (Chautard, A Ch [6] 16, 168) Yellow prismatic needles or rect angular tables Decomposed by heat V sol alcohol, sol water and other, v sl sol benzene and chloroform With HCl it forms an uncrystallisable salt

o IODO ANILINE C.H.IN te C.H.I(NH2) [1 2] Mol w 219 [56 5°] Formed by heating at 100° a mixture of o iodo nitro benzene (25 pts) with ferrous sulphate (250 pts) and a moderate excess of dilute ammonia. The product 18 extracted with ether, the extract distilled with sterm, the product dissolved in dilute H.SO. freed from 10do nitro benzene by shaking with ether, ppd by ammonia and the iodo aniline again distilled with steam (Korner a Wender, (, 17, 486) Long silky needles, with an odour resembling pyridine Sl sol hot water, v sol other solvents Exhibits an alkaline reaction. Turns brown on exposure to air and light Decomposes when heated, evolving iodine converts it into di-iodo aniline [96°]

Salts-B'HClaq small prisms or cubes, turning opaque on exposure, with loss of water of crystallisation —B'₁(H₂SO₄)₂ silky needles, m sol water —Nitrate small four sided tables.

Acetyl dersvative C.H.I NHAc [110°] Prisms or hexagonal tables, m sol hot water, wasol alcohol

m-Iodo-aniline C.H.I(NH2) [1 3] [27°] Formed by reducing m iodo nitro-benzems (Griess, Z 1866, 218) Silvery plates Acetyl derivative C.H.I(NHAc) [119 5]

Glistening needles; more stable than the o-isomeride (Körner a Wender, G 17, 486)

p-Iodo-aniline C.H.I(NH2) [14] 763°1 Formed by reducing p iodo-nitro-benzene [172°] (Griess, C J 20, 85) Formed also by adding iodine (3 pts) to aniline (2 pts) and mixing the solution with aqueous HCl (S G 111) when piodo aniline hy trochloride is ppd (Hofmann, A 67, 64) Prisms or needles, heavier than water Has no action on litmus SI sol cold water, v sol other solvents Bromine converts it into tri-bromo-aniline — B'HCl thin laminæ or needles (from hot water), sl sol cold water, almost insol HClAq, sol alcohol, insol ether -B'2H2PtCl, orange pp --B'2H2C2O, long needles, sl sol water and alcohol, insol ether -B'2H2SO4

Acetyl derivative C_eH₄I(NHAc) [183°] S (alcohol of 95 p c) 6 4 at 20 5° Small glistening tables or trimetric prisms (K & W) Formed by dissolving acetanilide in glacial acetic acid, and passing in vapour of iodine chloride, the yield being 85 pc (Michael a Norton, Am 1, 255)

Bensoyl derivative CaH, INHBz [180°] Long needles (Hubner, B 10, 1717) An 180 meride [210°] is formed from benzanilide and

Di iodo aniline C₆H₂I₂NH₂ [4 2 1] Formed by the action of iodine on phenylated white precipitate' NHPh HgCl (Rudolph, B 11, 78) Formed also by passing ICl (2 mols) into ___ ation of aniline in HOAc (Michael a Norton, Am 1, 255, B 11, 109) Needles Sl sol boiling water and ligroin, v sol ether, chloroform, CS2, acetic ether, and hot alcohol Volatile with steam It is slightly basic, but its hydrochloride is decomposed by cold water -B'HCl: long white needles, decomposed at 50°. — B'₂H₁PtCl₂—B'HNO₃—B'₂(H₂SO₄)₂

Benzoyl derivative C.H.I.NHBz [181°]

Slender needles (Rudolph)

Tri - iodo - anılıne $C_6H_2I_3(NH_2)$ [6 4 2 1] [185 5°] Prepared by the action of ICl (3 mols) on a solution of aniline in HClAq (Michael a Norton, Am 1, 255) Long white needles, sol CS₂ and acetic ether, insol water

IODO-ANISIC ACID v Methyl derivative of

IODO OXY-BENZOIO ACID

IODO-BENZENE C.H.I. Phenyl wodide Mol w 204 (188°) S G $\frac{2}{8}$ 1 8606, $\frac{152}{9}$ 1 8380 (Young, C J 55, 486), $\frac{9}{4}$ 1 8578, $\frac{19}{4}$ 1 8403, $\frac{19}{4}$ 1 8321 $\frac{19}{4}$ V 130 55 (R Schiff, $\frac{19}{4}$ 19, 564) $\frac{19}{4}$ = 1 6189 (Seubert, $\frac{19}{4}$ 22, 2520).

Formation - 1 By treating phenol with iodine and phosphorus The yield is bad (Williamson a Scrugham, C J 13, 244) -2 By the action of ICl on sodium benzoate (Schutzenberger, C. R 52, 963) -3 By heating benzene for some time with iodic acid (Peltzer, A 186. 194) -4 By the action of HI on diszobenzene salts (Griess, J 1866, 447) — 5 By heating benzene (20 g) with iodine (15 g) and iodic acid (10 g, at 220° (Kekulé, A 137, 157)—6 From benzene, rodine and FeCl, (Lothar Meyer, A 281, 195) -7 By the action of excess of iodina on phenyl hydrazine (E v Meyer, J. pr. [2] 86,

Preparation -By allowing chloride of iodine to drop slowly into a large excess of bensene

containing a small quantity of aluminium chloride (Greene, C R 9f, 40)

Properties — Colourless oil, insol Solidifies when cooled by solid CO. Easily reduced by sodium amalgam to benzene Aqueous HIAq at 250° reduces it to benzene Not affected by solid KOH at 250°, nor by alcoholic KOH or NH, (Kekı.lé)

Reactions -1 H2SO at 100° forms a mixture of 10do-benzene sulphonic acid, di 10dobenzene, and benzene sulphonic acid, in proportions varying with proportions of materials employed, strength of the said, temperature, and duration of the experiment (Neumann, A. 241, 47) -2 Silver nitrate does not act below 135°, but between 140° and 150° reaction takes place forming tri-nitro phenol, AgI, and metallic silver (Geuther, A 245, 99) —8 By heating with aluminium chloride there is formed ben'ene, di-10do benzenes, HCl, and 10dine (Dumreicher, B 15, 1868)

Dichlorade C.H.ICl. Formed by passing chlorine into liquid iodobenzene Formed also by passing chlorine into a solution of iodobenzene (5 g) in chloroform (15 g) (Willgerodt, J pr [2] 33, 154) Begins to decompose at 80°, and at 120° it is all broken up into Cl, and C,H,I may be kept in glass bottles, but if placed over H₂SO₄ it gives off chlorine It is decomposed by solution in alcohol, but it may be crystallised from chloroform as yellow needles It dissolves in benzene, glacial acetic acid, light petroleum, CS2 and ether As a reagent it displaces iodine by chlorine, turning KI, PbI₂, &c, into KCl PbCl₂, &c, with separation of iodine May therefore be used as a test for rodides It also converts alcoholic iodides (e.g. McI) into chlor ides. It is hardly attacked by cold aqueous NH, or NaOH

o Di 10do benzene C.H.I. [1 2] [27°] (287°) Preparation — Iodo aniline (10g) is dissolved in hot water (70 g) containing H₂SO, (9 g), KNO2 (45g) dissolved in a little water is added, and then an excess of solution of KI in aqueous HI (SG 11) After standing a few hours the oil that has separated is washed with KOHAq and distilled with steam (Korner a Wender, G 17, 486, cf Körner, G 4, 305) Long prisms or hexagonal tables Volatile with steam Sl sol water, sol alcohol

m D1 iodo benzene $C_aH_4I_2$ [1 3] [40°] (K), [37°] (R) (285°) From m 10do aniline by displacing NH, by I (Körner) Also from di 10do aniline by elimination of NH, (Rudolph)

Trimetric tables (from ether-alcohol)

p-Di-iodo - benzene C.H.I. [14] (Kekulé), [129°] (Körner) A product of the action of rodine chloride on NaOBz (Schutzenberger) and of 10dine and 10dic acid on benzene (Kekulé) Formed also from p 10do-aniline by the diazo- reaction (Kekulé, Z 1866, 688). Nacreous laminse Readily sullimed

Tri-iodo-bensene C.H.I.[124] Mol w 456. [76°]. A product of the action of iodine and iodic acid on benzene ("ekulé). Small needles May be sublimed

IODO-BENZENE-AZOXY- COMPOUNDS &

ABOXY- COMPOUNDS.

IODO-BENZENE O-SULPHONIC ACID C,H,LSO,H[1:2] From o-amido-bensene sulphonic soid by the disso-reaction (Bahlmann, 4. 186, 825) - KA'aq: crystals, sl. sol. water-BaA's. needles, sl sol. cold, v sol hot, water Ohloride C.H.I 50,01 [51°] Thick prisms (from ether)

Amide C.H.I.SO,NH, [170°]. White la-

minæ, sl sol water

Iodo-benzene p sulphonic acid C.H.I SO.H [14] From 10do benzene and fuming H₂SO₄ (Körner a Paterno, G 2, 448) Formed also from amido benzene p sulphonic acid by displacing NH, by I through the diazo- reaction (Lenz, B 10, 1135) Deliquezcent needles —NH, A'. minute needles —KA' needles —CaA'. —BaA'. minute needles—AA meedles minute plates, sl sol water—PbA'₂. a minute plates, sl sol water—PbA'₂. a minute plates, sl sol water—PbA'₂.

Chloride C.H.I SO Cl [87°] Lamine Amide C.H.I SO NH, [183°]. Crystalline Amide C.H. ISO2NH, [183°]. Crystalling powder, sl sol water, v so alcohol o IODO-BENZOIC ACID C.H. I CO2H [157°]

Formation -1 From o amido benzoic acid by the diazo reaction (Griess, C J 24,702) -2 By oxidising o iodo toluene with dilute HNO, (Kekulé, B 7, 1007) —3 From m iodo nitro benzene and alcoholic KCy at 200° (Richter, B

Properties -Long needles, may be readily sublimed SI sol hot water, v e sol ether and alcohol Gives salicylic acid when fused with potash

Salts - CaA', 2aq -BaA', 6aq ms Iodo benzoic acid CaHaI CO.H

[187°] Formation -1 From m amide benzoic acid by the diazo reaction (Griess, A 113, 334, 117, 1, Cunze a Hubner, A 135, 108, Grothe, J pr [2] 18, 324) —2 By heating benzoic acid (1 pt) with KIO, (2 pts) and dilute H₂SO₄ (Peltzer, A 136, 201) —3 By oxidising o iodo

toluene with chromic acid mixture (Korner, Z [2] 5, 637) -4 By heating dry silver benzoate with iodine at 150°-180° (Birnbaum a Reinherz, B 15, 456)

Properties - Needles, sl sol water, v sol alcohol May be sublimed Gives p oxy benzoic acid on oxidation Ammonia forms amido ben zoic acid

Salts — NaA'aq — MgA', 4aq — CaA', 2aq scales — CaA 3 nodules — BaA', 4aq needles sol alcohol.—MgA', 4aq needles.

Ethyl ether LtA'

Netrele C.H.I CN [41°] From m-amido

benzonitrile by the diazo reaction Needles p Iodo-benzoic acid C.H.I CO.H [20] (Beran, B 18, 137, Klingel, B 18, 2693) Formed by oxidation with chromic acid mixture from p ic lo-toluene (Körner, Z [2] 5, 327), from p 10do-phenyl acetic acid (Jackson a Mabery, Am 2, 253), or from p 10do acetophenone (Klin-Naureous scales (from alcohol) Nearly insol boiling water Converted by potash fusion into p oxy benzoic acid

Salts (Glassner, B 8, 562) — NaA' jaq colourless needles, v sol water — KA' — BaA', 1 jaq. long trimetric plates — CaA', aq — SrA', aq nacreous lamins. — ZnA', 4aq cubes

Methylether MeA' [114'] Long needles

(Schmidt a Schults, A, 207, 888)

Ethyl ether Eth' Oil

o IODO-BENZOIC ALDEHYDE C.H.I CHO [87°] Formed from o-nitro cinnamic acid by successive conversion into amido-, diazo-, and iodo cinnamic acid, and oxidation of the latter with KMnO, (Stuart, C. J. 58, 140).

p-Iodo-benzoic aldehyde C.H.I CHO. [73°]. Needles (Jackson a. White, B 11, 1042, P Am A

15, 269

p-IOD 3-BENZYL ALCOHOL C.H.,I CH.OH [72°] Prepared by heating p- odo benzyl bromide with NaOAc and aqueous NH, at 160° Formed also by heating p iodo benzyl bromide with water for a long time (Jackson, P Am A 13, 202, Jackson a Mabery, Am 2, 251, B 11, 56) Silky scales (from alcohol or CS,) or long needles (from water) Sl sol cold water, v sol alcohol, ether, benzene, and CS.

o IODO-BENZYLAMINE C H,IN te [2 1] C₆H₄I CH₂ NH₂ From o todo benzyl brom ide and alcoholic NH₂ (Mabery a Robinson, Am 4, 103) Liquid Absorbs CO, from the air -B',H,PtCl, minute yellow prisms

p Iodo benzylamine [4 1] C₄H₄I CH₂ NH₂ Formed by heating p 10do benzyl bromide with alcoholic NH, at 120° (Jackson a Mabery, Am 2, 257) Oil Absorbs CO from the air forming [240°], sol water and alcohol, sl. sol. ether — B'₂H₂PtCl₆ a carbonate[113°] —B'HCl slender white needles

D1-p-10do-d1 benzyl amine (C,H,I CH,),NH Formed, together with trip iodo tri benzylamine, by boiling p iodo benzyl bromide with alcoholic NH₂ (Jackson a Mabery, Am 2, 256, B 11, 58, P Am A 13, 209) White needles, insol water, v sol hot alcohol, ether, benzene, and C5

Salts - B'HCl thick white plates, sol. CS and HOAc, sl sol alcohol and benzene -B'HBr thick pearly prisms, insol water, sl soi aicohol sol ether, benzene, and CS₂ -B'₂H₂PtCl₂ minute yellow needles, almost insol water and alcohol

-B'_zH_zCO_z [113°] Crystalline

Tri-p iodo-tri-benzyl-amine (C,H,I CH2),N Formed as above (J a. M) needles (from ether), v sl sol hot alcohol, v sol ether, benzene, and CS. -B'2H2PtCl4 yellow needles, nearly insol water and alcohol

o IODO BENZYL BROMIDE C.H.I CH.Br Prepared by dropping bromine into o iodo toluene heated to 190°-200° (Mabery a Robinson, Am 4, 102, P Am A 17, 103) Thick flattened prisms (from ligroin), v sol ether, hot alcohol, benzene, CS, and chloroform, insol water Its vapour is very pungent Gives o iodo benzoic acid on oxidation with dilute

p Iodo bensyl bromide CaHaI CHaBr [79°] Prepared by heating p iodo toluene in bromine vapour at 115°-150° (Jackson, Am 1,93) Straw coloured needles, somewhat pungent Insol water and cold alcohol, sol hot alcohol, v sol ether Hardly attacked by CrO,

IODO-BENZYL CYANIDE v Netrele of Iopo-PHENYL-ACETIC ACID

o 10D0 BENZYLIDENE-MALONIC ACID C, H, IO, te C, H, I CH C(CO, H), [204°] Formed by heating equal weights of malonic acid and 10do benzoic aldehyde for several hours at 100° with half their weight of HOAc (Stuart, C J 53, 142) Decomposed on melting into GO, and q-iodo cinnamic acid

a-IODO-BENZYL-MALONIC ETHER

C.H. CH. CI(CO,Et), From sodium benzyl malonic ether and iodine (Bischoff a. Hausdo. fer, A. 239, 110). Oil. Decomposes on hydrolysis into benzoic aldehyde, alcohol, acetic acid, and

p-IODO BENZYL SULPHOCYANIDE C.H.I SCy [40°] Formed by boiling [40°] Formed by boiling p 10dobenzyl bromide with an alcoholic solution of potassium sulphocyanide (Jackson, P Am A 13, 207, B 11, 58) Long white plates (from alcohol) M sol hot alcohol, v sol ether, benzene, CS₂, and HOAc
IODO BETORCIN

C.HIMe(OH)2. [93°] Formed by the action of PbO and I (2 pts) on an ethereal solution (50 pts) of betorein (1 pt) Crystallised from light petroleum (Stenhouse a Groves, C J 37, 404) V sol ether, CS_2 , and

benzene

IODO BROMO- v BROMO IODO-

IODO BUTANE v BUTYL IODIDES

Di iodo butane C.H. i e CH, CHI CH2 CH2I (116° in vacuo) S G 2 291 From the corresponding di oxy butane and HI (Wurtz, Bl [2] 41, 362)

p IODO-ISOBUTYL BENZENE $C_gH_4(C_4H_9)I$ (256° cor) Formed by the action of HI on the diaro compound from p amido phenyl butane (Pahl, B 17, 1232) Colourless oil By HNO, it is oxidised to p iodo benzoic acid

IODO BUTYLENE C.H.I Crotyl vodide (132°) From tri oxy butane (butenyl glycerin), iodine, and phosphorus (Lieben a Zeisel, M 1, 836) Pungent liquid Combines with mercury forming an unstable crystalline compound

IODO-ISOBUTYL TOLUENE

 $\mathbf{C_6H_3}(\mathbf{CH_4})(\mathbf{C_4H_9})\mathbf{I}$ [1 3 6] [c 35°] Formed by diazotising amido tolyl isobutane and treating the product with HI (Effront, B 17,2325) Long white needles V sol alcohol On oxidation with HNO, at 200° it gives nitro tolyl isobutyric acid

a IODO n BUTYRIC ACID C,H,IO, CH, CH, CHI CO₂H [110°] (Fittig, B 9, 1194) From a crotonic acid and furning HI at 100° (Hemilian, A 174, 324, v infra) Monoclinic crystals (Haushofer, Z K 6, 135)

Ethyl ether EtA' (191°) Formed by boiling a bromo butyric ether with alcoholic KI

(Hell, B 6, 29)

β Iodo-butyric acid CH, CHI CH, CO,H Formed, in small quantity, in the preparation of

the preceding Liquid

According to Michael and Freer (J pr [2] 40. 95) HI unites with solid crotonic acid forming, contrary to the statement of Hemilian, only B 10do-butyric acid, of low melting point same acid is formed from liquid crotonic acid and HI Boiling water converts it into \$ oxybutyric acid Hot NaOHAq gives solid crotonic

γ-Iodo-butyric acid CH,I CH, CH,.CO,H [4]°] [41°] From the lactone of γ oxy butyric acid and HI (Henry, C R 102, 368, A Saytzeff, B14, 2826) Colourless plates, which become yellow in sunlight Sl sol warm water (difference from B isomeride), v. sol. methyl alcohol, ether, and

Methylether MeA' (199°) SG = 1666

Oil, with pleasant odour

Oil, with pleasant outer Iodo-isobutyric acid (CH₂)₂OI CO₂H (?) [36°] From me_hacrylic acid and furning HI at Ao / Futtic a Paul. A. 188. 58, 200, 67) Tables (from CS₂) or large prisms (from conc. HIAq) Sl. sol. water.

Di iodo isobutyrio acid C.H.I.O. [197°]. Formed by treating tri oxy isobutyric acid with HI and P and extracting the product with etner (E Fischer a Tafel, B 22, 108) Long needles, v e sol alcohol and ether

IJDO ISOBUTYRIC ALDEHYDE CH₂I)(CH₂)CH CO H or (CH₂)₂CI CO H

10 2 29

Preparation -By treating isobutyric alde hyde (22 5 c c) dissolved in 40 c c of alcohol, with iodine (25 g) and iodic acid (10 g) It is very difficult to obtain pure, 130 g of the crude body yielding not more than 1 g sufficiently pure for analysis Reduced silver removes the excess of rodine with the least loss of substance (Chautard, A Ch [6] 16, 160)

Properties —Her vy liquid, colourless when pure Its vapour 18, like its homologues, exceedingly irritating It is completely decom posed at 100°, and cannot be distilled even in Forms a crystalline compound with vacuo NaHSO, Is rapidly resinified by solutions of alkalis or mineral acids Combines with aniline, with elimination of water, giving a di amine Ag(C2H3O2) at 100° yields isobutyl acetate (114°) AgCN and AgSCN yield the corresponding cyano and sulphocyano derivatives

IODO CAMPHOR v CAMPHOR

IODO CAPROIC ACID v IODO HEXOIC ACID IODO-CAPRYL-BENZENE v Iodo octyl-

IODO CARBOSTYRIL v IODO OXY-QUINOLINE IODO CHELIDONIC ACID v CHELIDONIC

IODO CHRYSIN v CHRYSIN

o IODO CINNAMIC ACID C,H,IO, C₆H₄I CH CH CO₂H [214°] (G a H), [207°] (S) Formed by boiling o diazo cinnamic acid with aqueous HI (Gabriel a Herzberg, B 16 2037) Formed also by heating o iodo benzyl idene malonic acid to its melting point (Stuart, C J 53, 142) Crystals (from dilute alcohol)

m-Iodo - cinnamic acid CoH4I C2H2 CO2H [182°] Formed by boiling m diazo cinnamic acid with HI (G a H) Sol benzene, petro leum ether, and hot alcohol, sl soi water

p Iodo cinnamio acid C.H.I C.H. CO.H. [c 255°] Formed by boiling p diazo cinnamic acid with HI (Gabriel a Herzberg, B 16, 2040) Crystalline mass

IODO CODEINE v CODEINE

IODO - COMPOUNDS Organic compounds containing iodine attached to carbon

Formation -1 Unlike chlorine an 'bromine, iodine is not capable of directly displacing hy drogen, inasmuch as the HI produced would cause a reverse reaction But if iodic acid, mer curic oxide, or some other substance capable of removing HI be present, the substitution may take place (Kekulé, A 131, 281) In the case of aniline, the free HI combines with excess of ani line and thus iodo aniline may be formed Mercuric oxide will not induce the iodation of fatty compounds, but is especially useful in the case of phenols and oxy acids (Weselsky, A 174, 99). The operation is performed in boiling alcoholic solution, and an intermediate body appears to be mercuric iodate (Lippmann, B 7,1773) Aromatic hydrocarbons may be nodeted by heating with rodine and dry FeCl, (L. Meyer, A. 281, 195) — 2 By the action of HI on hydroxylic compounds. The alkyl rodides may be prepared in this way | does not act on acetyl p toluidine (B 11, 107) — by the action of HL or, better, of rodine and 8 By heating chloro-compounds with furning phosphorus, on the corresponding alcohols at HIAq (Lieben, Z 1868, 712) —9 Nitrogen rodide, The polyhydric alcohols give rise, in this way, to secondary alkyl rodides, the roding dis placing hydrogen attached to a penultimate atom of carbon thus glycerin gives isopropyl todide Iodides of acid radicles are formed by the action of iodide of phosphorus on the dry alkaline salts (Canours, A 104, 111) -3 By the union of HI with un aturated compounds This combination takes place more readily than in the case of HCl and HBr The rodine attaches itself to that one of the involved atoms of carron that is combined with the smaller amount of hy drogen, e g CH, CH CH2 + HI = CH, CHI CH3 4 From aromatic amido compounds by the diazo reaction This may be performed by heating the diazo compounds with HIAq, or with aqueous KI, $g = C_aH_s N_2 SO_4H + KI = C_6H I + N_2 + KHSO_4$ Also by Sandmever's reaction which consists in boiling the diazo compound with cuprous iodide, v Diazo coulot NDS -5 By gradually adding HNO, to a hot solution of the amine in HIAq (Losanitsch, B 18, 39) —6 By displacing Cl or Br by I by treatn ent with a metallic iodide The elements K, Mb, Ca, Sr Ba Al, Mn, and Co prefer chlorine and bromine to iodine and hence the iodides of these met ils when heated with chloro or bromo compounds produce iodo com pounds (köhnlein, 4 225, 194) Hhus propyl chloride is converted into propyl iodide by Cal, SrI₂, MnI₂, and CoI₂, while it is but slightly affected by Nil. and I el, is not affected by Snl, and is wholly decomposed by PI, The conver sion of benzyl chloride into benzyl iodide is par tially effected by BaI, at 15°, by ZnI₂ at 10°, by CdI₂ at 100°, and by PbI₂ at 160°. On the other hand isobutyl chloride is not converted into iodide at 70° by Bal, by ZnI or by CdI, while The substitution of CdI₂ at 135° decomposes it Cl in chloro acetic acid by I is partly effected by CdL, or TlI at 100°, and may be effected by Ba,I or ZnI, at 100° (Brix 1 225, 166) Potassium nodide is a very convenient reagent for the purpose (Perkin a Duppa, A 112, 125) but cannot be always depended upon, for though it displaces Cl by I in the case of epichlorhydrin, chloro lactic acid, dichlorhydrin, and mono and di chloro acetone, it does not act on di chlorinated ether, and it decomposes chloral into chloroform and CO2 Calcium iodide Cal, 3 aq is also an excellent reagent for converting chloro and bromo compounds into the corresponding iododerivatives (Spindler, A 231 257) Thus it con verts CH_Cl CH_Br into ethylene iodide, and CH_CHCBr into CH_CHI_2, but it fails with CH_2Cl CHCl_1 with CHCl_2CHCl_2 with CCl_1 CHCl_2. with C2Cl, with chloro benzene, and with chloral Dry Cal, requires a higher temperature (120°) before it reacts, and this decomposes many of the iodo compounds that should be formed— 7 Iodine chloride also acts as an iodating substance, especially upon aromatic amines it converts amiline (dissolved in HOAc) into di-iodo amiline (when 2 mols ICl are used) and tri-iodo-aniline (when 3 mols ICl are used) converts acetanilide into acetyl p-iodo aniline, m nitro aniline into di iodo m nitro-amiline, pnitro aniline chiefly into iodo-p-nitro-aniline, and p-toluidine into di-iodo-p-toluidine: but it

acting on dilute alcoholic solutions of the potassium derivatives of phenols, forms iodo phenols and ammonia (Willgerodt, J pr [2] 37, 446)

. Reactions -1 The displacement of iodine by chlorine or bromine may be effected by heating with the chloride or bromide of Hg, Cu, Ag, Sn, Pb, As, or Sb (v Chloro compounds and Bromo compounds) -2 Chlorine and bromine displace iodine directly -3 Sodium frequently removes iodine with case, $e \ g \ 2C_2H_3I + Na_2 = C_4H_{10} + 2NaI$ In like manner (by what is known as Fittig's re action) $C_6H_5I + C_2H_5I + Na_2 = C_6H_5C_2H_5 + 2NaI$

4 Water readily decomposes tertiary alkyl iodides, forming HI and a tertiary alcohol Methyl and ethyl alcohol at 100° act in like manner, forming a tertiary alcohol and MeI or I tI - 5 Silver obtained by reduction sometimes removes sodine eq 2CH, I CH, CO, H + Ag. = 2AgI + CO₂H CH₂ CH₂ CH CH₂ CO₂H

Some aromatic iodo compounds can take up chlorine, eq PhI gives PhICl, (Willgerodt, J pr
[2] 33, 154), C,H,Bri gives C,H,BriCl, while
C,H,Br,I gives C,H,Br,ICl, and C,H,(NO₂)I gives
C,H,(NO₁)ICl, C,H,(NO₂). I has no action

IODO m CRESOL C.H.MeI(OH) [1 x 3] Formed by adding rodine to a solution of mcresol in ammonia and alcohol (Willgerodt a

Kornblum, J pr [2:39, 289)

Iodo p cresol C₆H, Mc I OH [1 3 4] Formed by the action of dry iodine on sodium-georesol suspended in CS (Schall a Dralle, B 17, 2533) Inquid Volatile with steam

Methyl ether C.H.MeI(OMe) (238°), oil Di 10do o cresol C.H. MeI.(OH) [1342] Di 10do o cresol [70] Formed by the action of iodide of nitrogen upon the sodium compound of o-cresol (Will gerodt J pr 2] 37, 148 39, 289)

Acetyl derivative C.H.MeL(OAc) [56°] Tables

Picrate. [204°] Yellow crystalline aggregates

Di 10do m cresol C.H.MeI.(OH) I ormed to ether with 10do m cresol (W & K) Long needles, sol usual menstrua.

Di 10do p cresol C. H. MeI, OH [1 3 5 4] [61°] Formed together with the preceding (Schall a. Dialle, B 17, 2534) White tables soluble in alcohol, sparingly in water and ligroin. Volatile with steam

Acetyl derivative C.H Mel. (OAc) . [620] white tables

Benzoyl derivative C_cH₂MeL₂(OBz)

[130], glistening white prisms
Ethylether C.H.MeL.(OLt) [77°] White solid sol organic solvents (Willgerodt a Korn blum, J pr [2] 39, 289)

IODO CRESOL BULPHONIC ACID

 $[155^{\circ}]$ Formed C.H MeI(OH)SO,H [3 1 2 5] together with an isomeride, by the action of iodine on the potassium salt of o cresol sulphonic acid (kehrmann, J pr [2] 37, 338) plates (containing Saq) Converte Colourless Converted by attric acid into dinitro cresol [86°] Chromic acid forms iodo toluquinone [115°]

Salts - A'K hne needlos -A'Ba 4aq Di-iodo m cresol sulphonic acid $C_{e}HMeI_{r}(OH)(SO_{s}H)[3\ 6\ 2\ 1\ 4]$ [70°] potassium m cresol sulphonate by treatment with iodine (Kehrmann, J pr [2] 39, 892) Small

iodine (Louiziniani, γ γ [2] 57, 592) Similar meedles Oxidised by CrO₃ to di-todo-toluquinone 1000-ψ CUMENE O₄H₂IMe₃[1 2 4 5] Iodo-tri-methyl-benzene [37°] (258°) Formed by decomposing ψ cumene diazopiperidide with HIAq (S G 173) (Wallach a Heusler, A 243. 233) Formed also from ψ cumidine by dia o tising and herting the product, dissolved in H₂SO₄ with KI (Kurzel, B 22, 1586) Scales Treatment with H SO, forms two isomeric di 10do y cumene sulphonic acids y cumene sul phonic acid and iodo y cumene sulphonic acid One of the di 10do \(\psi\) cumenes melts at 74°, the other is an oil

10DO \(\psi\) CUMENE SULPHONIC ACID

C.HIMe.SO.H Formed as above Scales, m sol water

Salts —NaA'aq plates —BaA' aq ncedles IODO CYANETHINE v CYANLTHINE

IODO ETHANE v ETHYL IODIDE

D1-10do-ethane v ETHYLEVE IODIDE and ETHYLIDENE IODIDE

Tri-iodo-ethane C₂H₃I, ie CH, CI, [95°] Formed by the action of aluminium iodide upon CH₃ CCl₃ (De Boissieu, Bl [2] 19, 16) Yellow octahedra V e sol CS, benzene, and ether, v sol petroleum ether, m sol alcohol Smells faintly of iodoform

10D0-ETHYL ALCOHOL v GLYCOL todhydrin B-IODO ETHYL AMINE CH,I CH NH2

Hydriodide B'HI [194°] From vinylamine and cone HIAq (Gabriel, B 21, 1049)
Trime* crystals (from hot alcohol) V sol water When treated with KOH it gives a liquid, soluble in water, with a disagreeable odour

Picrate $B'C_0H_2(NO_1), \tilde{O}H_{\frac{1}{2}}$ aq [c 105°] (hydrated), [131°] (anhydrous) Short compact yellow prisms

Di-iodo ethyl-amine EtNI, v Ethyl di-iodo

amme, vol 11 p 474

wa DI IODO ETHYL BENZENE C,H,I, re C.H. CHI CH. I Styrene di wodide From styrene and a concentrated solution of iodine in KIAq (Berthelot, Bl 6, 295, 7, 277) Crystals, v sol Rapidly decomposes into iodine and metastyrene

10DO - ETHYLENE C2H3I 1 e CH, CHI (56°) SG 2 2 08 Vinyl rodide Formed by distilling ethylene iodide with conc alcoholic potash, the receiver being kept very cool, and the distillate finally mixed with water (Regnault, 15,69, E Kopp, C R 18,871) Also from ethylidene iodide (Gustavson, B 7,731) Formed also by the union of HI with acetylene (Beithelot, A 132, 122, Semenoff, Z 1865, 725) Oil, v sol alcohol and ether, with alliaceous odour

Di-iodo-ethylene C.H.I. 1e CHI CHI Acetylene di vodide [75°] (192° cor) SG 21 3 302 Formed by passing acetylene over iodine moistened with alcohol (Sabanejeff, A 178, 109, 216, 275, Plimpton, C J 41, 392) Elastic needles (from alcohol) It appears to be accompanied by a small quantity of a liquid isomeride S G 21 2 942 With alcoholic AgNO. it forms long needles of a compound C2H, I24AgNO3,

which is decomposed by HCl, giving off acetylene
Tetra - iodo ethylene Cl, Cl, Di carbo itetra-iodide [c 165°] Prisms Formed by the action of a solution of iodine in aqueous KI upon the cuprous compound of potassium propargylate. Formed also by the action of the

nodine solution upon setylene copper (Homolka a Stolz, B 18, 2283)

IODO-ETHYLIDENE DI-ETHYL DI SUL-PHONE CH₃ CI(SO₂Et)₂ [109°] From ethyl idene di ethyl di sulphone by boiling with iodine (Fromm, A 253, 146) Needles

IODO - DI - ETHYL OXIDE C.H.,IO 16 CH.I CH. OEt (175°) SG 2 1692 VD 691 (obs and calc) Formed by heating ethylene iodide with alcohol at 75° (Baumstark, B 7, 1172) Formed also from the mono ethyl den vative of glycol by treatment with iodide of phos phorus (Demole, B 9, 746) Pungent oil, not decomposed by water Alcoholic potash attacks it energetically, yielding CH_CH OEt (35°), and CH₂(OEt) CH₂(OEt) (1)² Be ling with re duced silver does not affect it

IODO-(B)-ETHYL-THIOPHENE

 $\mathbf{C}_{\mathbf{i}}\mathbf{H}_{\mathbf{2}}(\mathbf{C}_{\mathbf{2}}\mathbf{H})\mathbf{IS}$ Oil Formed by the action of iodine upon (8) ethyl thiophene in presence of HgO (Bonz, B 18, 551)

IODO-FLUORO-BENZENE v FLUORO 10DO BENZENE

IODOFORM CHI, w 394 [119°] S G 2 Tri rodo methane Mol

Depression of freezing point of benzene by rodoform Raoult, A Ch [6] 2, 88, Paterno, B 22, 465

Formation -1 By heating alcohol with iodine and caustic or carbonated alkalı (Serullas A Ch [2] 2c, 314) Indoform is formed in like manner by the action of iodine and potash or aldehyde, acetone, lactic acid, and many other substances (cf vol 1 p 96) —2 From chloro form and HI (Baeyer, B 5, 1094) 3 By heat ing chloroform with Cal, at 75° (Spindler, A 231, 263) -4 Together with carbamic ether, by the action of iodine on sodium carbamic ether

(Mulder, R T C 7, 333)

Preparation -1 Alcohol containing about 20 pc aldehyde is mixed with ten times its weight of aqueous NaOH, todine is added, and the mixture stirred from time to time iodoform quickly separates in the cold (Gunther, Ar Ph [3] 25, 373) -2 To prepare iodoform R Rother (Ph [3] 4, 593) heats 32 pts iodine, 32 potassium carbonate, 16 alcohol of 9) per cent and 80 water, till the mixture becomes colour less, then decants the clear liquid, collects the separated crystals of iodoform, and mixes the filtered liquid with 16 to 24 pts hydrochloric acid and 2 to 3 pts potassium dichromate liquid is then neutralised with potassium car bonate, and 32 pts more of that salt are added, together with 6 pts iodine and 16 alcohol reaction having been completed at the heat of the water bath, the product is treated as above, whereby a fresh quantity of iodoform is ob tained -3 By the action of excess of sodium hypochlorite on an aqueous solution of acctone (6 pts), potassium iodide (50 pts), and NaOH (2 pts) (Suillot a Raynaud, Bl [3] 1, 3)

Properties -Hexagonal yellow tables, a c= 1 9015 (Rammelsberg a Kokscharoff, C C 1857, 524, of Dogiel, N Petersb Acad Bull 20, 337) Above its melting-point it partly decomposes, giving off iodine and HI Has a peculiar per sistent odour Volatile with steam Insol water, acids, and alkalis, v so' alcohol, ether, and fixed and volatile oils An alcoholic solution of iodoform is decomposed under the influence of light. The decomposition is accelerated by dry oxalic acid, iodine and methylene iodide are produced (Mulder, R T C 7, 310, cf Humbert, J Ph [3] 29, 352) Does not in the least hinder the putrefaction of pancreas at 35° (Boillat, 7 pr 188, 308)

Detection -An alcoholic solution of iodoform warmed with aqueous KOH and a little phenol forms a red substance, which dissolves in dilute alcohol, giving it a crimson colour (Lust-

garten, M 3, 717).

Reactions —1 Heated in a sealed tube at 150°, either alone or with iodine, it yields methylene iodide and brown products (Hofmain, C J 13, 65) -2 Bromine gives bromoform (Löscher, B 21, 410), ut an excess of Br at high temperatures forms Cb., -3 Distilled with HgCl, it yields CTTCl, I (Schlagdenhauffen, J Ph [3] 29 247) -4 Mercuric oxide forms CO, formic acid, figl., and water -5 Boiling aqueous KOH forms a little potassium formate -6 Boiling alcoholic potash forms methylene iodide (Brun ing, A 104, 187, Butlerow, C R 47, 595) -7 NaOEt forms methylene iodide, NaI, aldehyde, acrylic acid, and CH, CH(OEt) CO,H (Butlerow, A 107, 110, 114, 204, 118, 325)—8 K,SO, forms CH₂(SO,K)₂ (Strecker, A 148, 90)—9 By the copper zinc couple iodoform may be reduced to methane (Gladstone a Tribe, C J 28, 508) 10 Unites with PEt, forming C₁₉H₄₆P₂I₂ (Hof mann, Pr 10, 189)—11 PCl, forms chloroform 12 When made into a paste with moist finelydivided silver, acetylene is at once given off mixture of ppd silver and copper is even more effective (Cazeneuve, C R 97, 1371) -13 Silver nitrate acts readily at ordinary temperatures, forming AgI, nitric acid, and CO, so that by nitrating the liberated acid an estimation of the quantity of iodoform present may be formed (Greshoff, R T C 7, 342)—14 Iodoform exposed to direct sunlight is completely oxidised by air, forming CO, iodine, and water (Daccomo, G 16, 247) -15 Mercuric acetate is reduced by iodoform to mercurous acetate, CO, being evolved It does not reduce mercuric nitrate (although chloral forms, in this case, mercurous chloride) (Cotton, J Ph [5] 16, 481) -16 Isobutyl alcohol (200 g) mixed with sodium (20 g) and iodoform (100 g) gives a violent reaction, the products being formic acid, isobutyric acid, pentenoic acid, CMe₂ CH CO₂H [70°], isobutyl oxy isobutyric soid C₄H₂O CMe₂ CO₂H, a lactone of an oxy octoic acid, isobutylene, methyl isobutyl oxide, methylene li isobutyloxide, a compound C12H26O30 and other bodies (Gorboff a Kessler, J R 1887,

10D0-FUMARIC ACID C2HI(CO2H)2 Iodomalero acid [184°] Formed by dissolving acetylene di carboxylic acid in strong aqueous HI (Baudrowski, B 15, 2697) Fine glistening Very soluble in water, alcohol, and orystals

Salts -A''HK small sparingly soluble stals $-A''Ag_2$ crystalline pp -A''Pb 2aq crystals -A"Ag,

crystalline pp ACID C₁₁H₂₁IO₂ 16
From hen-CH₂I CH₂ (CH₂), CO₂H decenoic soid and HI (Ph Brunner, B 19, 2224) Crystalline

10DO HEPTOIC ALDEHYDE C.H., I CHO. B.G 10 281 Vol. III. Formed by treating heptoic water excepting the silver salt.

(conanthic) aldehyde (75 g) diluted with alcohol (100 c c) with iodine (50 g) and iodic acid (20 g). The crude product is purified by treatment with reduced silver The yield is very bad (Chautard, A Ch [6] 16, 170) Very unstable liquid with arritating odour Decomposed by heat Easily decomposed by KOH, NaOH, ammonia, and mineral acids

Reactions -1 Nitric acid gives heptoic aldehyde and heptoic acid -2 Silver acciate forms octyl acetate (208°) -3 By heating iodo heptoic aldehyde (120 g) dissolved in alcohol with silver cyanide (67 g) there is formed C₆H₁₂Cy CHO (177°) S G ¹² 913 This is a colourless liquid which reduces Fehling's solution and ammoniacal AgNO, but does not form crystalline compounds with aniline or phenyl hydrazine -4 Silver sulphocyanide forms the corresponding sulphocyano heptoic aldehyde -5 Heating with

aniline forms C.H., I(NHC, H.).

IODO HEPTYLENE C.H., I v.e

Pr.CH., CI CHMe or Pr.CH. CI CH, Me 150°) From heptinene (q v) and HI (Morris, C J 41, 179)

1000 HEXANE v HEXYL TODIDE

Di 10do hexane C,H12I, 16 CH, CHI CH, CH, CHI ČH, Hexylene sodsde S G 2 2 024 Formed by heating di allyl in a sealed tube for 5 hours with excess of conc HIAq at 100° (Wurtz, A Ch [4] 3, 129), or better, by passing gaseous HI into strongly cooled diallyl (Sorokin, J pr [2] 23, 18) Oil, gives off iodine when heated With sodium it gives hexplane and hexenyl 10d1de Alcoholic potash forms diallyl Silver acetate forms hexylene acetate C. H 12(OAc)2, whence baryta forms di oxy hexane

Tetra 10do hexane C.H.10I. [above 107°] From diallyl and iodine (Berthelot a. De Luca,

4 100, 363)

TETRA IODO-HEXINENE v Tetra rodide of DIPROPARGYI

IODO-HEXOIC ACID C.H., IO, Formed by mixing hydrosorbic scid with cone HIAq at 0° (Fittig, A 200, 44) Oil, turning yellow on exposure to light May be reduced by sodium amalgam to n hexoic acid

IODO HEXYLENE C.H.,I t.s

CH, CH CH, CH, CHI CH, Hexenyl wodrde Diallyl hydroiodide (165°) SG 2 1497 Formed, together with di iodo hexane, by the action of HI on diallyl (Wurtz, A Ch [4] 8, 155) Formed also by the action of alcoholic potash or of an alloy of tin and sodium on di iodo hexane CH, CHI CH, CH, CHI CH, When treated for 24 hours with moist Ag₂O it forms diallyl, hexylene, and two liquids C₆H₁₂O (c 135°) and C12H22O (180°)

Iodo hexylene C_cH₁₁I (131°) SG 10 1 92 Formed from the hexenyl alcohol obtained by distilling glycerin with lime (Destrem, A Ch. [5]

27, 58)

Iodo hexylene C.H., I (142°-145°) pinacone hydrate and HI at 160° (Bouchardat, Z 1871, 699) Reduced by tin and HCl to hexylene.
Bromine gives crystalline C.H., Br.
10D0 HIPPUBIC ACID C.H., INO, 1.6

NHBE CHI CO2H (?) Formed by treating a boiling alcoholic solution of hippuric acid with nodine (Maier, Z 1865, 415) White needles De-composes at 90°. All its salts are soluble in Iede-hippuric acid C₆H₄I CO NH CH₂ CO₂H Formed by the action of aqueous HI on the sulphate of diazo hippuric acid (Griess, Z [2] 4, 725, B 1, 190) Laminæ, v sol cold alcohol and ether, m sol hot water, nearly insol cold water The iodine is not easily removed

IODO-HYDROCINNAMIC ACID v Ioro-

PHENYL PROPIO IC ACID

DI-10D0-HYDROQUINONE C₄H,I₂(OH)₂ [5 8 4 1] [145°] Formed by boiling di-iodo-quinone [180°] with a dilute solution of SnCl₂ (Seifert, J pr [2] 28, 438, Kehrmann, J pr [2] 37, 837) Long colourless needles (from hot water) Volatile with steam

Di-iodo hydroquinone C_eH₂I₂(OH), [142°] From di-iodo quinone [159°] and aqueous SO, (Metzeler, B 21, 2555) White needles, v sol hot water, alcohol, ether, and HOAc, m sol benzene Reoxidised by FeCl₂ to di iodo

quinone

Ds-acetyl derivative C_sH₂I₂(OAc), [148°] Needles or plates (from alcohol), insol water, v sol alcohol and ether, si sol cold HOAc

IODO HYDROTHY MOQUINONE

C_sHMePrI(OH)₂ [5 2 6 4 1] [74°] Obtained by reducing iodo thymoquinone with SnCl₂ (Kehrmann, *J pr* [2] 39, 392) Colourless prisms, v sol organic solvents

IODO HYDRO TOLUQUINONE

C.H.MeI(OH)₂ [6 2 4 1] [111°] From the corresponding quinone, by reduction with SnCl₂ (Kehrmann, J pr [2] 39, 392) Soft silky aggregates of needles, sol organic solvents

IODOL v Tetra iodo pyrrole IODO-LACTIC ACID v Iodo oxy propionic

IODO-MALEÏC ACID v Iodo fumaric acid

IODO MELLIOTIC ACID Methyl derwature $C_{be}H_{11}IO_{2}$ to $C_{e}H_{4}(OMe)$ $C_{2}H_{3}I$ $CO_{2}H$ From the methyl derivatives of (a) and of (b) coumaric acid and fuming aqueous HI in the cold (Perkin, C J 39, 429) Aqueous Na₂CO₂ forms $C_{e}H_{4}(OMe)$ CH CH₂ and CO_{2}

IODO METHANE v METHYL IODIDE
Di-iodo-methane v METHYLENE IODIDE

Tri-iodo methane v Iodoform

Tetra-iodo-methane CI. Carbon tetra iodide S G 22 4 32 Formed by mixing CCl. with alu minium iodide dissolved in CS. (Gustavson, A 172, 173, C R 78, 882) Formed also by heating CCl. with CaI. 3½ aq at 75° (Spindler, A 231, 264) Dark red regular octahedra (Friedel, BI [2] 21, 482) Sol CS., alcohol, ether, and MeI May be kept for some days, but gradually decomposes The decomposition is hastened by both CS. and CO. Above 80° it quickly splits up into carbon and iodine Converted into iodo form by boiling with aqueous HI, and even by boiling with water Scarcely attacked by aqueous potash or H.SO. Chlorine converts it into CCl. Br gives CBr.

IODO-DI METHYL AMINE v Di methyl-

sodo-amine under DI METHYL AMINE

INDO DI-METHYL-ANILINE C₂H₁₀IN te C₂H₁ NMc₂. [79°] Formed by adding rodine to a solution of di-methyl aniline in CS₂ (Weber, B 10, 765) Formed also by the action of cyan ogen rodide on di-methyl aniline in the cold, hieat being evolved and HCy given off (Merz a-Weith, B 10, 757). White lamine, sol alcohol

and HOlAq Not ettacked by caustic sods When heated above 80° it rives off HI and leaves a residue which forms a deep violet solution in alcohol—B' F.PtCl_k

ICDO-TRI METHYL-BENZENE v. Iodo V

IODO METHYL-BUTYL-BENZENE v IODO-BUTYL-TOLUENE

DI IODO METHYLE DI ETHYL DI-SULPHONE CI.(SO.Et). [177°] Formed from methylene di ethyl di sulphone I, and KIAq, by exposure to sunlight (Fromm, A 253, 161) Needles, si sol boiling water

DI-IODO DI-METHY. OXIDE C₂H,I₂O te (CH,I)₂O (219°) From dry 'oxymethylene' (formic paraldehydr' and gaseous HI (Tish-

tschenko, J R 1887, 464) Oil

IODO TRI METHYL PIPERIDINE C₂H₁₆IN [60°] Formed by heating ethylidene discettaine with HI (E Fischer, B 17, 1796) Colourless rectangular prisms Nearly insol water —B'HI very sparingly soluble

Iodo-tetra-methyl-piperidine C₈H₁₈NI [90°]. Formed by heating triacetonine with HI at 150° (E Fischer, B 17, 1791) Easily soluble in alcohol and ether, insol water Colourless tables (from ether)

IODO DI METHYL THIOPHENE C₆H,IS ι θ
CI CMe
S (97°) From di methyl thiophene

CH CMe (from coal tar), iodine, and HgO (Messinger, B 18, 1638) Oil

Iodo - tri - methyl - thiophene C,H,IS ie CMe CMe | S Formed by the action of iodine

CMe CI (48 g) and HgO (21 g) on tri methyl thiophene (12 g) dissolved in ligroin (24 g) (Zelinsky, B 21, 1837) Non volatile oil

(a) IÓDO NAPHTHALENE C₁₀H,I (305°)
Formation —1 By adding rodine to a solution of mercury dinaphthyl Hg(C₁₀H₁), +2I₂
= HgI₂+2C₁₀H I (Otto, A 147, 173) —2 From diazo naphthalene sulphate and LI (Nolting, B 19, 135)

Properties Thick yellowish oil, not solidified at -17° Miscible with alcohol, ether, CS, and benzene Alcoholic potash at 160° forms some naphthalene Boiling HIAq (127°) completely converts it into naphthalene When a solution in C5, is boiled with aluminium chloride there is formed naphthalene, iodine, and tarry matter, but no (β) iodo naphthalene (Roux, Bl [2] 45, 517)

Picric acid compound [127°]. Golden

yellow needles

(β) Iodo-naphthalene C₁₀H,I [55°] Pre pared by the action of HI on (β) diazo naphthalene sulphate (P Jacobson, B 14, 804) Colourless plates, sol ether, alcohol, and HOAc Volatile with steam

(a, a,) Di-iodo-naphthalene C₁₀H₄I₂ [1 4] [110°] From (a) iodo (a) nitro naphthalene by reduction, and treatment of the resulting iodo naphthylamine with H₂SO₄ and NaNO₂, followed by HI (Meldola, C J 47, 522) Needles (from alcohol)

 $(a_1\beta_2)$ -Di-iodo-naphthalene $C_{10}H_aI_1$ [1 2]. [81°]. From (β) -iodo- (α) -nitro-naphthalene in

the same way as the preceding (Meldola) Scales (from alcohol)

(β) - 10D0 - NAPLTHALENE SULPHONIC ACIDS C₁₂H₄I SO₂H Two isomerides are formed by sulphonating (β) iodo-naphthalene (Arm strong a Wynne, C J Proc 3, 22) One of the isomerides forms the salts KA' aq and BaA'₂4½aq, both crystallising in hexagonal scales, the other forms the salts KA' aq crystallising in lamine, and BaA'₂2aq in flat n edles

(1, 5) Iodo naphthal me sulphonic acid C_{1.}H₄I(SO₂H) [' 5] [129°] Formed from (a) diazo naphthalene sulphonic acid and warm HIAq (40) c) (Mauzelius, B 22, 2820) Colourless tables (containing Jaq) v so. water

Salts—A'K aq plates m sol water—A'Naaq ınııstınct n.edles—AAg plates S 66—A'₂Ca 2aq scales, sl sol water—A'₂Ba aq scales S 23 (ın the cold) S 1 at '00°—A'₂Mg needles sl sol water—A'Zn 6aq scales, m sol water—A'₂Cu 4aq glenish white needles, sl sol water—A'₂Pb 4aq sl sol. water—A'Mn 4aq ındıstınct crystals sl sol water

Methyl ether MeA' [60°] Prisms v sol Lt₂O, al sol cold EtOH

Ethyl ether EtA' [74°] Six sided tables

▼ sol It,O

n Propyl ether PrA' [67°] Colourless
tables

Isopropyl ether PrA' [90°] Prisms Chloride CieHellSO,Cl [114°] Monoclinic prisms v sol hot AcOH, sl sol ligroin

Bromide [153°] Prisms

A mide C₁₀H₄I(SO₂NH₁) [239°] Scales (a) IODO (β) NAPHTHOL C₁₀H₄I(OH) [12] [945°] (M), [c 100°] (W) Prepared by dissolving equal parts (20 g) of (β) naphthol, lead acetate, and dried sodium acetate in HOAc, cooling, and gradually adding iodine (35 2 g) dissolved in hot HOAc. The product is ppd by water and recrystallised from dilute alcohol (Meldola, C J 47, 527) Formed also by the action of iodide of nitrogen on a dilute alcoholic solution of sodium (β) naphthol (Willgerodt, J pr [2] 37, '48)

Properties — Long colourless needles, sl sol boiling water, v sol organic solvents Volatile with steam Sol cold dilute KOHAq, decomposed by hot alkalis Nitric acid liberates iodine

KMnO, gives phthalic acid
(a) IODO (a) NAPHTHYLAMINE

C₁₀H₄(NH₂) [4 1] From (a) node (a) nitro naphthalene, zinc dust, and HOAc (Meldola, C J 47, 521) Its solution rapidly oxidises in the air forming a red colouring matter —B'₂H₂SO₄ tolerably stable white needles

Acetyl derivative C₁₀H₄I(NHAc) [196°] From the preceding by boiling with Ac₄O (M) Needles (from alcohol) Gives a nitro derivative

[286°]

10D0-0 NITRO ANILINE C₆H₁I(NO₂)(NH₂) [521] Formed by heating di nodo nitro-benzene [168°] with alcoholic NH₃ at 170° for several days (Körner, G 4, 386) Large steel blue laminæ (from alcohol in ealed tubes) yellow by transmitted light Does not melt at 220° Not attacked by nitrous ether

Iodo o-nitro-aniline C₄H₄I(NO₂)(NH₄) [4 2 1] [122°] Formed by warming a solution of the acetyl derivative of p iodo-aniline in HOAc with

HNO, (Michael a Norton, B 11, 109) Long orange-yellow needles (from alcohol)

Iodo-p-nitro-aniline C_eH₂I(NO₂)(NH₂) [2 4 1] [105 5°] Prepared by the action of iodine chlor ide (2 pts) on p nitro aniline (1 pt) dissolved in dilute HClAq (Michael a Norton, m 1, 26°2, B 11, 113) Long yellow needles —B'HCl [163°]

Di 10do-m-nitro-aniline C_eH₂I(NO_e)₂(NH_e) [4 2 3 1] (145 5°] Formed by passing iodine chloride (3 pts) into a solution of m nitro-aniline (1 pt) in HClAq (Michael a Norton, Am 1, 255, B 11, 112) Long slender yellow needles, v sol cold alcohol, sl sol acetic ether, insolwater Its hydrochloride is not decomposed by water

D1-todo-p-nitro-aniline C_eH₂I₁(NO₂)(NH₁) [6 2 4 1] [244°] Prepared by the action of iodine chloride (2 mols) on p intro aniline dissolved in chloroform (M a N) Yellow prisms with blue fluorescence (from alcohol) Sl sol hot alcohol, sol CHCl₂ and EtOAc, v sol hot nitro benzene It is not basic

o IODO NITRO BENZENE C. H.I(NO.) [12] [49°] Formed, together with the p isomeride, by treating iodo benzene with HNO. (Korner, G 4, 305) The p isomeride crystallises first from alcohol Long flat lemon yellow needles Gives a little o iodo amiline and much amiline on reduction

m Iodo-nitro benzene C_6H , $I(NO_2)$ [1 3] [36°] (c 280°) I ormed from m intro aniline by dis placing NH₂ by I through the diazo reaction (Griess, Z 1866, 218) Monoclinic plates, a b c = 2 296 1 1 129 (Panebianco G 9, 360) The same body is perhaps formed by the action of ICl on sodium m nitro benzoate (Schutzenberger a Segenwald, Rép Chim pure, 1802, 144)

a Segenwald, Rep Chim pure, 1862, 144)
p Iodo-nitro-benzene C₆H₄I(NO) [14] [171°]
The chief product of the action of fuming HNO₂
upon iodo benzene (hekulé, A 137, 129) Obtained also from p nitro aniline by the diazo
reaction Pale yellow needles

Di chloride C.H.(NO)ICl. Formed by passing Cl into a solution of iodo nitro benzene in chloroform (C Willgerodt, J pr [2] 33, 160) Hardly sol CS, Et.O, or light petroleum Sol. CHCl. and benzene At 150° it gives off Cl., leaving C.H.(NO₂)I With alcohol it reacts forming aldehyde, HCl and C.H.(NO₂)I.

Iodo-di-nitro-bensene C₄H₁I(NO₁)₂ [1 2 4] [899] Obtained by intrating o or p-iodo nitrobenzene with H SO₄ and HNO₄ (Körner, J 1875, 322) Yellow tricininc crystals, a b c = 1 63 t 1 940 (La Valle, G 10, 3) V sl sol cold alcohol. Hot dilute KOH forms di nitro phenol Alcoholic NH₁ gives di nitro aniline, though the de composition is incomplete in the cold

Iodo di-nitro-bensene C₄H₃I(NO₂)₂ [1 2 6] [114°] Formed in small quantity, together with the preceding, by treating o iodo nitro benzene with HNO₃ mixed with H₂SO₄ (Körner, G 4, 305) Orange triclinic tables (from alcohol) More sol alcohol and ether than the preceding Converted by heating with alcoholic NH₃ into di nitro-aniline [138] May be reduced to phenylene m-déamine.

Iodo-tri nitro-bensene C₄H₄I(NO₂), [1 2 4 6]. [164°] From chloro tri nitro-benzene and alcoholio KI (Hepp, A 215, 361) Golden needles

Converted by boiling aqueous KOH into picric

Di-iodo nitro-benzene C_eH₂I₂(NO₂) [1 3 4] [168°] Obtained from m di 10do belizene by dissolving in hot fuming HNO, (Körner). Trimetr γ octahedra, abc=6471 458 (La Valle, G 10, 2) Sl sol ether, v sl sol cold alcohol By heating for a few days with alcoholic NH, at 170° it forms iodo nitro aniline

Di-iodo-nitro-benzene C₆H₃I₂(NO₂) [1 2 4?] [112 5°] Formed by dissolving o di-iodo benzene in fuming HNO, and, after a few minutes, diluting with water (Körner a Wender, G 17, 491) Lemon yellow needles or small prisms

(from alcohol)

(a)-IODO-NITRO-BENZOIC ACID C,H,INO, $C_6H_3I(NO_2)(CO_2H)$ [3 2or6 1] Formed, together with the two following, by heating m 10do-benzoic acid with conc HNO3 (Grothe, pr [2] 18, 324, Cunze a Hubner, A 135, 106) Sl sol water, especially if HCl be present -Gives o amido benzoic acid on reduction NH, A'aq -NaA' 3aq -CaA' 2aq -SrA', 4aq -BaA'2 3aq Ethyl ether EtA' [84°]

(β)-Iodo nitro-benzoicacid C_eH₃I(NO₂)(CO₂H) [8 6or2 1] [174°] Formed as above water, especially if HCl be present Melts under May be reduced to o amido benzoic acid -NH, A'aq -LıA'aq -NaA' 4aq -KA'3aq -CaA' -SrA', -BaA', 6aq

[64°] Ethyl ether EtA' Yellow plates

(γ)-Iodo-nitro-benzoic acid

 $C_{\bullet}H_{\bullet}I(x, \mathcal{O}_{\bullet})(CO_{\bullet}H)$ [3 x 1] [192°] Formed as above \forall sol water, but does not melt under it —NaA'aq sılky yellow needles —CaA'₂ 3\2q -SrA'₂ 4aq —BaA'₂ 3aq

Iodo-nitro-benzoic acid C_sH_sI(NO₂)(CO₂H) [210°] Formed by heating p 10do [4 3 1] benzoic acid with fuming HNO, (Glassner, B 8, 562) Nearly insol water, v sol alcohol -NaA'aq —KA'aq —CaA', 1 aq

(a,a,)-10D0-NITRO-NAPHTHALENE O,H,1(NO₂) [4 1] [123°] Formed from acetyl-(a)-naphthylamine by nitration, saponification, diazotisation, and treatment with HI (Meldola, C J 47, 519) Minute white needles (from hot alcohol) Sol benzene, HOAc, and acetone May be reduced to (a) naphthylamine

 $(a_1\beta_2)$ -Iodo nitro-naphthalene C10HeI(NO) [12]. [1085°] Formed from the mother lauor of the preceding (Meldola) Yellow scales May

be reduced to (B)-napthylamine

 $(\beta_2 a_1)$ -Iodo-nitro-naphthalene C10HeI(NO2) [2 1] T [88 5] From acetyl (a) nitro (β) naphthylamine by saponifying with hot dilute H.SO., and subsequent displacement of NH₂ by I (Mel dola, C J 47, 520)

 (a_i) -IODO (β_2) NITRO- (a_1) NAPHTHOL $C_{10}H_3I(NO_2)(OH)[4\ 2\ 1]$ [146°] Form Formed by boiling acetyl (4, 2, 1)-iodo nitro-naphthylamine with strong caustic alkali (Meldola, C J 47, 524) Yellow needles (from alcohol) Insol cold water, si. sol hot water and hot benzene, v sol alcohol, scetic acid, and acetone Yields phthalic acid on oxidation Its K and Na derivatives form minute orange needles, m sol cold water — {C_{1.6}H_{.5}I(NO₂)},Ba 3aq bright red amorphous {C₁₀H₂I(NO₂)}₂Ba Saq bright red amorphous pcwder, almost insol. boiling water, deflagrates on ignition

(α_i) - IODO - (β_i) - NITRO - (α_i) - NAPHTHYL-AMIN - Acetyl derivative

 $C_eH_sI(NO_s)(NHAc)[4\ 2\ 1]$, [236°] From acetyl-10do naphthylamine by warming its solution in HOAc with HNO, at 75° (Meldola, C J 47, Straw coloured needles (from alcohol). Sublimes while melting More difficult to saponify by H₂SO₄ than the bromo-compound IODO NITRO-0 CXY BENZOIC ACID

 $O_7H_4INO_5$ 1 e $C_8H_2I(NC)(OH)(CO_2H)$ From (5, 2, 1) nitro oxy benzele acid by treatment in alcoholic solution with I and HgO (Weselsky, A 174, 108) Slender yellow needles -KA' 2aq -C,H2K2NO, 3aq —BaA', 6aq

Iodo nitro o oxy ben hic acid

 $C_6H_2I(NO_2)(OH)(CO_2H)$ [204°] From (5, 2, 1). iodo oxy benzoic acid by nitrai on (Hubner, B 12, 1347)

Iodo nitro m oxy benzoic acad

C_eH₂I(NO₂)(OH)(CO₂H) Formed by treating an alcoholic solution of nitro m oxy benzoic acid with I and HgO (Weselsky, A 174, 103).

Lemon-yellow crystals, sl sol water, v sol cold alcohol—BaA', 6aq minute red needles

Iodo nitro p oxy benzoic acid

C_sH₂I(NO₂)(OĤ)(CO₂H) From nitro p oxybenzoic acid, iodine, and HgO (W) Lemonyellow needles -- BaA'24aq flat red needles

BaC.H.INO. 2aq short dark red needles DI-IODO DI NITRO DI-OXY-DI-PHENYL SULPHONE C12HeI2N2SOs 2 6

 $SO_2(C_6H_1I(NU_2)OH)_2$ [205°] Formed by heat ing iodine (50 g) dissolved in alcohol with a mixture of di nitro-di oxy di phenyl sulphone (34 g) and HgO (21 6 g) at 100° (Annaheim, B 9, 660) Needles (from HOAc), insol water and alcohol Decomposes alkaline carbonates -

Na₂C₁₂H₄L_{N2}SO₂2aq IODO O NITRO PHENOL C.H.INO, too. C₂H₄I(NO₂)(OH) [110°] (Armstrong, Watts' Dict Ed 1 Suppl 2, 917, B 6, 649) Formed by the action of iodine and HgO on c nitro phenol dissolved in HOAc (Busch, B 7, 462, cf Armstrong) Short yellow needles, v sol hot water, alcohol, and ether Moderately volatile with steam — KA'aq garnet red plates with green lustre (A), v e sol hot water and alcohol

Iodo-p nitro phenol C₆H₃I(NO₂)(OH)[2 4 1]. [93°] (Körner, Armstrong) Formed by the action of iodine and HgO on p nitro phenol dissolved in HOAc (Korner, Bull Acad Belg [2] 24, 166, Busch, B 7, 462) Also from nitro amido phenol by the diazo reaction (K) Yellow needles —NaA'2½aq (K) —KA' ½aq (B) Nitrie acid converts it into iodo di nitro phenol [106°].

Iodo di-nitro phenol

C₆H₂I(NO₂)₂(OH)[6 4 2 1] [106°] (A), [108°] (W) Formed from (4, 2, 1) di nitro phenol by [106°] (A), [108°] treatment with iodine, potassium iodate, and potash (Körner, G 4, 397) or with iodine and HgO (Armstrong, B 6, 649, Weselsky, A 174, 111) Formed also from di nitio amido phenol by the diazo- reaction (A), and by the nitration of the preceding 10do nitro phenol (A) Long slender lemon yellow needles (from hot water) SI sol het water —KA deep orange needles, v sol hot, sl sol cold, water —CaA' 25aq: orange red plates, v sol. hot water

Iodo-di-nitro-phenol C_eH₂I(NO₂)₂(OH)[4 6 2 1] [113°] Formed from (6, 2, 1)-di-nitro phenol by treatment with sodine

and rodic acid (Körner, G 4, 897) or with iodine and HgO (Armstrong, B 6, 649) Long, lerron-yellow needles (from water), v sl sol water and alcohol The potassium derivative forms magnificent crimson needle. with green and golden lustre, sl sol water The silver and golden lustre, al sol water derivative forms small brownish red needles

Di 10do-o-nitro-phenol C.H.I.(NO.)(OH)[6421] [98°] From o nitrophenol, iodine, and iodic acid in alkaline solu tion (Körner) Slender dark yellow needles (from ether alcohol), sl sol water, v sol boil ing alcohol and ether —NaA'aq dark brown prisms, with golden lustre —KA' very soluble

reddish brown needles

Di iodo p nitro phenol C.H.I.(NO.)(OH\[6 2 4 1] [157] (K) From p nitro phenol, iodine, KIO, and potash (K., cf Seifert, J pr [2] 28, 437) Also from p nitro phenol o sulphonic acid iodine in alcoholic colution and Iodine in alcoholic solution, and HgO (Post a Brackebusch, A 205, 91) Formed also by treating nitro-o oxy benz oic acid with iodine and HgO (Weselsky, A 174, 177) Large colourless prisms (from ether) turning yellow on exposure to air Decomposes a little above its melting point -KA' golden needles with violet iridescence -NaA' 2aq efflorescent orange laminæ

Di 10do nitro phenols appear also to have

been obtained by Piria (A 198, 268)

TODO NITRO PHENOL BULPHONIC ACID C.H.INSO, 1 e C.H.I(NO2)(OH)(SO3H)[2 6 1 4] Formed when todine and HgO are added to an alcoholic solution of o nitro phenol p sulphonic acid (Armstrong a Brown, C J 25, 869) —KA' yellow scales, composed of short needles, sl sol water - K₂C₆H₂INSO₆ red crystals -BaA'₂4aq pale yellow silky needles, sl sol water

Iodo nitro phenol sulphonic acid $C_sH_2I(NO_2)(OH)(SO_3H)[6\ 4\ 1\ 2]$ Formed, to gether with di iodo p nitro phenol, by treating an alcoholic solution of p nitro phenol o sul phonic acid with iodine and mercuric oxide (Post a Brackebusch, A 205, 88) — Salts CaC, H₂INSO, 3aq coarse yellow needles, m sol water—BaC, H₂INSO, 3aq long yellow needles, m sol water—Pb₂(OH)₂C, H₂INSO, 2½aq yellow crystalline pp DI IODO NITRO-RESORCIN

C.HI. (NO2)(OH)2. From nitro resorcin in alco holic solution by alternate addition of iodine and mercuric oxide (Weselsky, A 174, 111) Golden n edles

10D0 NITRO-THIOPHENE C,H,I(NO,)S [74°] Formed by nitration of iodo thiophene (Kreis, B 17, 2073) Glistening yellow prisms IODO NITEO-TOLUENE C,H,INO,

O₆H₂MeI(NO₂)[1 4 2] [61°] (286°) From (4,2,1) di-nitro toluene (Heynemann, A 158, 337)

Pale yellowish crystals V e sol CS, and ether Iode - nitro - toluene C, H, MeI(NO,) [1 4 3] [56°] From p toluidine by nitration and displacement of NH, by I (Beilstein a. Kuhlberg, A 158, 844) Large flat needles, v sol. boiling alcohol

Iodo - nitro - toluene $C_{x}H_{x}MeI(NO_{x})[1\ 2\ x]$ [104°]. Formed by nitrating o-iodo-toluene (B Minute needles

Iodo nitro-toluene (?) [109°] Formed by nitrating m-iodo-toluene (B. a. K.). Small meedles.

Iodo di-nitro-toluene C.H.MeI(NO.),[1 4 5 3] [138°] Formed by nitrating p-iodo toluene (Glassner, B 8, 561) Crystals IODO-OCTINOIC ACID C. H., IO. i.e

C,H,)2CI CO,H Iodo-di-allyl acetic acid Arom (C.H.) C(OH) CO₂H (17 g) and cold fuming HIAq (45 g) (Schatzky, J R 17 78) Crystals, insol. water, v sol alcohol and ether Easily decomposed

p 1000 n-0CTYL-BENZENE $C_{14}H_{21}I$ s.e $C_{5}H_{4}(C_{5}H_{1})I$ [1 4] (319°) Heavy oil. Formed by diazotising p amido phenyl octane, and treating the diazo-octyl benzene with HI (Beran, B 18, 136) On oxidation with CrO, it gives ptodo benzoic acid Iodo octyl benzene obtained by the action of iodine and HgO upon n-octylbenzene is described by Ahrens (B 19, 2720) as an oil, solidifying at -4°, and completely decomposed by distillation

p-Iodo sec-octyl-benzene C_cH₁(C_cH₁₇)I [1 4] p Iodo capryl-benzene (305° uncor) Formed by diazotising p amido phenyl sec octane and treating the diazo capryl benzene with HI Heavy oil. V sol ether and acetic acid, sl sol alcohol It is oxidised by CrO, to p iodo benzoic

acid (Beran, B 18, 142)

IODO (a) OCTYL THIOPHENE C, H, IS se $C_4H_2SI(C_8H_{17})$ [c 0°] SG $\frac{29}{20}$ 1 2614 From octyl thiophene (10 g) in ligroin by treatment with iodine (10 g) and HgO (11 g) (Schweinitz, B 19, 644) V sol ether, cannot be distilled IODO OLEIC ACID v IODO-STF-RIDENIC

IODO ORCIN C,H,IO, s.e C,H,MeI(OH)... Formed by dissolving orcin (1pt) and iodine (2 pts) in ether (6 pts), and gradually adding finely powdered litharge (9 pts) The ether is distilled off, and the residue recrystallised from benzene (Stenhouse, Pr 22, 53) Prisms, decomposing when heated alone or with water Sl sol cold water, v sol hot water, alcohol, and ether Has not the astringent sweet taste of orcin

Tri iodo-orcin C,H,I,O, se C,MeI,(OH). Formed by adding to a dilute aqueous solution of orcin a quantity of ICl,, not quite sufficient to ppt all the ordin, and crystallising the pp first from CS_2 and then from boiling alcohol (Stenhouse, C J 17, 327) Large transparent plates, tinged with brown V sol CS_2 , V e sol ether, m sol alcohol, msol water Becomes brown at 100° Dissolves with decomposition ın aqueous KOH Decomposed by hot H.SO. and by hot HNO.

Iodo-(B)-orcin v Iodo betorcin

DI-IODO-ORSELLIC ACID Methyl ether C.H.I.O. te C.H.I.O.Me Methyl dr-rodo-dr-oxytoluate Formed by adding a dilute solution of chloride of iodine, containing excess of iodine, to a cold saturated aqueous solution of methyl orsellate (Stenhouse, A 149, 295) Needles from CS2), sol benzene, CS2, alcohol, and boiling water Decomposed on fusion

Ethyl ether C.H.I.O.Et Formed 12 like manner Small needles, almost insol.cold water, m. sol benzene, CS, and boiling alcohol Decom-

posed on fusion

10DO-0 OXY-BENZOIC ACID C,H,1O, 1.4. C₄H₂I(OH)(CO₂H)[3 2 1] Iodo-salicylic acid. [198°] Formed, together with the following compound, by boiling a solution of salicylic acid

and iodine in alcohol, and separated by frac tionally crystallising the product from water (A Miller, C J 41, 406, A 220, 124) Long needles, v sol water Gives a violet colouration with FeCl, Gives the corresponding di ony benzoic acid on potash fusion —BaA', 3 mq
concentrically grouped needles S 5 at 8°

Iodo-o-oxy benzoic acid C.H.I(OH)(CO,H)
[5 2 1] [196°] (G), [193 5°] (F), [197°] (M)
8 11 at 20°, 1 at 100° (L)

Formation -1 As above -2 Together with di- and tri-iodo oxy-benzoic acids, by fusing salicylic acid (1 mol) with iodine (1 mol), and treating the product with aqueous KOH (Kolbe a Lautemann, A 115, 157) -3 By dissolving equal weights of rodine and salicylic acid in 80 p c alcohol, boiling for 3 hours, evaporating, and dissolving in aqueous Na_2CO , (Lautemann, A120, 299) -4 From salicylic acid, iodine, and HgO (Hlasiwetz a Weselsky, B 5, 380, A 171, 99) -5 By agitating a hot solution of salicylic acid (1 pt) in water (25 pts) with a mixture of nodine (1 pt) and nodic acid (1 pt), keeping the liquid hot for some time The resulting acid is converted into sodium salt, and the satingneedles of the salt of the di iodo acid separated, if necessary by hand picking, from the lancet shaped laminæ of the mono iodo acid (Liechti, **A** Suppl 7, 129, H Fischer, A 180, 346) —6 From the corresponding nitro oxy benzoic acid by reduction to oxy amido benzoic acid and ex change of NH2 for I by the diazo reaction (Gold berg, J pr [2] 19, 368, P F Frankland, C J 37, 749) -7 By warming dry silver salicylate with iodine (Birnbaum a Reinherz, B 15, 458)

Properties -Long needles (from water), sl sol water, v sol alcohol and ether violet colour with FeCl, On potash fusion at 200° it gives di oxy benzoic acid [197°] When suddenly heated it splits up into CO2 and iodo

phenol

Salts -NaA'aq S 77at 20° (L) -KA'3aq Salts—NaAaq S 77at20' (L)—RA saq laminæ S 19 at 20° (L)—NH₄A' $3\frac{1}{2}$ aq needles S 95 at 20° (L)—BaA'₂4aq waity scales S (of BaA'₂) 8 at 8° (M), 13 at 20° (L)—BaC₂H₄IO₂ 2aq tufts of small needles (L)—CaA'₂6aq—MgA'₂baq—PbA'₂—AgA' yellowish

Ethylether EtA' [71°] (Schmitt, Z 1864,

821).

Iodo-m-oxy-benzoic acid C₆H₄I(OH)(CU₂H) by alternately adding iodine and HgO to oxy benzoic acid dissolved in 90 pc alcohol, and separated by solution in boiling water (Weselsky, A 174, 105) Slender needles, sl sol cold

Iodo-p-oxy-benzoic acid C_eH₃I(OH)(CO₂H) [841] [160°] (P) S 18 in the cold

Formation -1 By boiling a solution of poxy-benzoic acid for a few minutes with iodine and rodic acid (Peltzer, A 146, 288) -2 From p oxy benzoic acid dissolved in alcohol by alternate addition of iodine and HgO (Weselsky, A 174, 99)

Properties - Small needles (from water) Decomposes at 1.2° May be sublimed below its melting-point V e sol alcohol and ether

Gives with FeCl, a dingy brown pp Salts.—NaA' 6aq monoclinic efflorescent erystals.—Na₂C,H₂IO, 6aq. hygroscopic silky

needles (from alcohol) -BaA', 7aq tarles - AgA white pp

C_eH_sI(OMe)CO,H Methylderivative Iodo anisic acid [235°] S (cold ether) 7 Formed by leating anisic acid with iodine and iodic acid at 150° (P) Formed also by oxidation of the methyl ether of 10do p cresol (Schall a Dralle, B 17, 2533) The same, or an isomeric acid, is formed from amido anisic acid by the diazo reaction (Griess, Pr. 10, 309) Plates (S a D) or needles (G) Nearly insol boiling water, m sol alcohol —NaA'2aq concentrically grouped needles -BaA', 3aq vitreous prisms CaA', 3aq nacreous laminæ—PbA', (at 100°); ourdy pp —AgA' micro-crystalline laminæ

D1-iodo-o oxy-bel-zoicacidC,H I (OH)(CO,H) Di rodo salicylic acid S 07 at 15°, 15 at 100° (L) Formed, together with iodo o-oxy-benzoic acid, by the action of iodine and aqueous potash, of rodine and rodic acid, or of rodine and HgO upon salicylic acid (Lautemann, A 120, 304, Liechti, A Suppl 7, 141, Demole, B 7, 1439, Weselsky, A 174, 103) Formed also by heating dry silver salicylate with iodine (Birn baum a Reinherz, B 15, 459) White felted mass (from hot water) V sol alcohol and At 197° (L) or 220° (W) it begins to de compose, giving off iodine It gives a violet colouration with FeCl. On potash fusion it gives

tri oxy benz_ic (? gallic) acid and pyrogallol Salts -NaA'2 aq long flat needles, mostly grouped in druses S 2 at 20°, much less soluble in water than iodo o oxy benzoic acid —KA' aq minute thick prisms S 553 at 20° V sol alcohol, sl sol ether —NH,A' aq arbo rescent groups of small needles S 32 at 20°—BaA'₂3aq needles S 074 at 18° V sl sol alcohol—BaC,H.I,O, 1½aq small silky tablets, v sl sol water, forming an alkaline solution -CaA', 5aq needles S 086 at 18°

Di 10do-p oxy benzoic acid

C₆H₂I₂(OH)(CO₂H) Formed, together with 10do p oxy benzoic acid, by iodation of p oxy benzoic acid (Peltzer) Small needles (from dilute al cohol) Nearly insol boiling water, v e sol Decomposes when heated alcohol and ether without previous fusion Cannot be sublimed -NaA'7aq tufts of delicate, iridescent, efflores cent needles, v sol water - Na C,H,I,O, 6aq trimetric tables —BaA'₂ gelatinous pp got by adding alcohol to its aqueous solution — CaA', 2aq nacreous laminæ —PbA', bulky pp Swells up like mercuric sulphocyanide when heated $-AgA' - Ag_2C_7H_2I_2O_8$

Tri lodo o oxy benzoic acid $C_0HI_s(OH)(CO_2H)$ [c 157°] Obtained in small quantity in preparing mono , and di iodo o oxy benzoic acids by the action of iodine and KOH Weselsky (A on salicylic acid (Lautemann) 174, 104) could not obtain it by treating salicvile acid with iodine and HgO. Tufts of needles (from alcohol). Insol water, sol alcohol and ether Decomposed by alkalis into CO, and a red body C_eH₂I₂O (?) Its sodium salt is a

grey-green mass, v sl sol water

IODO p-OXY-BENZOIC ALDEHYDE C,H,IO, i.e C.H.I(OH) CHO [199°] Formed by heating the dilute alcoholic solution of p oxy benzoic aldehyde with iodine for some hours (Herzfeld, B 10, 2196) Sl sol, water and benzene, v sol

alcohol and ether Converted by potash fusion into protocatechuic said

Iodo di-oxy-benzoic aldehyde Methyl 1erivative C.H.IO, s.e C.H.I(OH)(OMe) CHO Iodo vanillin [174°] Formed by warming vanillin with an alcoholic solution of iodine (Carles, Bl [2] 17, 12) Needles Sl sol cold alcohol and ether

Di iodo-di-oxy-benz ic aldehyde Methyl derivative C.HI.(OL.)(OMe) CHO Formed like the preceding, using more iodine (C) Crys tals, insol chloroform, sol alcohol and ether

a IODG 8-OXY-PHENYL PROPIONIC ACID C.H.O. re C.H. CH(OH) CHI CO.H Formed by treating cinnamic acid with an aque ous solution of rodine ch'oride, the compound CaH, CHCl CHI CO2H being probably first formed (Erlenmeyer a Rosenhek, B 19, 2464) Large crystals (from benzene) With HCl it gives the compound C₁₈H₁₆ClIO₄, which may possibly be C.H. CH-CH.C(OII) CO C(OH) CHLCHCLC.H.

Exo Iodo-o oxy phenyl-propionic acid Methyl derivative C.H. (OMe) C.H. I CO.H Formed by the combination of the methyl derivative of (a) or (B) coumaric acid with HI (Perkin, C = J = 39, 429) Decomposed by aqueous Na.CO, into CO₂, HI, and C_bH₁(OMe) C₂H₃

TETRA IODO-DI OXY DI PHENYL **PHONE** C₁₂H₄I₄SO₄ i e SO₂(C₆H₂[†] OH)₂ [260°-270°] S G $\stackrel{11}{\sim}$ 2 797 From di oxy di phenyl From di oxy di phenyl sulphone by treatment in alcoholic solution with iodine and HgO (Annaheim, B 9, 1150) Minute needles (from HOAc) Decomposes on fusion Insol cold alcohol, nearly insol boiling alcohol and HOAc

β IODO-α OXY-PROPIONIC ACID C,H,IO, re CH,I CH(OH) CO,H Iodo lactic acid [101°] (M), [85°] (G) Formed by treating \$\beta\$ chloro a oxy propionic acid with KI at 10° ((rlinsky, B Prepared by the addition of HI to 6, 1257) sodium glycidate (Mclikoff, B 14, 937) prisms, v sol water, alcohol, and ether verted by alcoholic KOH into glycidic acid -AgA' white unstable pp — ZnA', crystalline powder (M) or tables (G)—CaA', 3aq amor crystalline phous (M)

DI IODO-OXY-PYRIDINE C,NH,L,(OH) [2 4 5] (?) [209°] Formed by heating an al kaline solution of pyridine di carboxylic acid (quinolinic acid) with iodine and KI at 180°-200° Small flat needles Sol hot acetic acid and am j l alcohol, v sl sol boiling water, alcohol, ether, or chloroform Dissolves in dilute alkalis -C,NH,I,(ONa) 3aq colourless glistening scales, al sol aqueous NaOH (Pfeiffer, B 20, 1352)

10D0-(Py 3)-OXY QUINOLINE C.H.NOI: c. CI CH CH CI or C.H. (OH) Iodo 'N C(OH)

carbostyril [276°] Formed by boiling o amido phenyl propiolic acid C,H,(NH2) C C CO,H with dilute HI (Baeyer a Bloem, B 15, 2149) Sublimable

ORSELLIC ACID

IODO-PENTANE v AMYL IODIDE Di-iodo-pentane C.H., I. . c (CH, CHI), CH (c 182°). Formed by heating methylene di-

methyl diketone (CH, CO), CH, with HI at about 90° (Combes, A Ch [6] 12, 235) Liquid, begins to decompose at its boiling point

IODO-PENTINENE C,H,I+ e (CH,),CH C CL (140°) Formed from the silver derivative of (CH₂)₂CH C CH by treatment with a solut on of iocine in KI (Eltekoff, J R 9, 225) Laquid Gives (CH₂)₂CH C CH when heat'd with NaOEt.

DI-IODO DIPHENIC ACID v DI-IODO-DI-PHENYL DI CARBOXYLIC ACID

o IODO-PHENOL C.H.,IO to [2 1]C.H.,I(OH) [4301

Formation -1 Probably occurs among the products of the iodation of phenol (Schutzen berger a Sengenwald, C R 54,197, Körner, A 137, 197, Hlasiwetz a Weselsky, Sitz W 60 [2] 290, Lobanoff, B 6, 1251) -2 By the action of iodine on sodium phenol suspended in CS_2 (Schall, B 16, 1897) -3 By heating the chloride or sulphate of o diazo phenol with KI, distilling the product with steam, and recrystal lising from water (Nölting a Wrzesinsky, B 8, 820, Nölting a Stricker, B 20, 3018, Bl [2] 49,659, Neumann, A 241, 68) -4 By adding powdered rodine to a dilute alcoholic solution of phenol, mixed with ammonia (Willgerodt, J pr [2] 37, 446)

Properties - White needles, v sol water and other ordinary menstrua According to Schall (B 20, 3363) it forms in crystalline branches, melting at 43° or needles melting at 40° Nitric acid attacks it, setting iodine free, but chlorine does not do so, but forms chloro nodo phenol Potash fusion at 165°-250° yields pyrocatechin Not affected by air and light Cold conc H2SO4 produces di iodo phenol (Neumann, B 20, 581)

m-Iodo phenol [3 1] C.H.I(OH) [40°] Prepared from m 10do aniline by diazo- reaction.

The product is distilled with steam, extracted with ether, and recrystallised from ligroin (N a S) It hay be prepared in like manner from mamido p enol, by diazotising and heating the product with Sus KI Needles (from ligroin)
May be sublin. V sol alcohol and ether It does not give off ind a when treated either with HNO, or with chlorine It yields resorcin when fused with KOH

p Iodo phenol [4 1] C₆H₄I(OH) [94°] Formation -1 In the iodation of phenol -2 From p amido phenol by diazotising and heat ing the product with KIAq (N a S) -3 A by product, together with di and tri iodo-phenol, in the formation of o iodo phenol from iodine, ammonia, and an alcoholic solution of phenol

Willgerodt, J pr [2] 37, 446)
Properties - Long needles Nitric acid sets When iodine free, but chlorine does not do so heated with conc H,SO, it gives (1, 3, 6) di iodophenol [72°] Potash fusion gives resorcin at high temperatures

D1-iodo-phenol $C_0H_2I_2(OH)$ [4 2 1] [72°] Formed by mixing o iodo phenol (10 g) with H.SO, (30 g) at -10° (Neumann, A 241, 71) Formed also in like manner from p-10do phenol White needles (from water) Volatue with DI-IODO-DI-OXY TOLUIC ACID v Dr 1000- steam Boiling HNO, converts it into picric

> Acetyl derivative C.H.I.(OAc) Long flat trimetric prisms (from dilute alcohol); a.b.c = 7311832.

Di-iodo-phenol C₆H₂I₂(OH) [68°] Formed as a by product in the action of iodine upon phenol-sodium suspended in CS₂ (Schall, B 16, Apparently formed also 1899, 1902, 20, 3364) in the action of iod_ne chloride on phenol (S a S) White glistening plates Volatile with steam -C.H.l. ONa needles

Acetyl derivative C.H.I. (OAc) [107° un-

cor], small prisms

Bensoyl derivative C₆H₂I₂(OBz) [96°

uncor]

Di iodo phenol C₆H₂I₂(OH) [150°] Formed by the action of iodine and HgO on an alcoholic solution of phenol (Hlasiwetz a Weselsky, Sitz W 60 [2] 290, C C 1870, 63) Silky felted needles (from dilute alcohol), v sol alcohol, ether, and CS₂. May be sublimed Not affected

by boiling alcoholic KOH

Tri iodo-phenol C_eH₂I₃(OH) [6 4 2 1] [155°] Formation -1 By treating phenol with a considerable quantity of ICI, and exhausting the product with boiling alcohol in which tri iodophenol is not very soluble (Schutzenberger, Bl [2] 4, 102) -2 From phenol, iodine, and KOH (Lautemann, A 120, 307) -3 From phenol, iodine, and iodic acid (Körner, A. 137, 213) 4. From salicylic acid, iodine and iodic acid (Kekulé, A 131, 231) -5 Formed as a by product from the action of iodine on phenol sodium suspended in CS₂ (Schall, B 16, 1899) —6 By the action of iodide of nitrogen on a dilute alco holic solution of sodium phenolate (Willgerodt,

J pr [2] 37, 447)
Properties - Needles (from dilute alcohol) Decomposed on fusion M sol alcohol verted by excess of ICl into per chloro-phenol HNO, gives picric acid HCl and KClO, give

chloranil

DI-IODO-PHENOL SULPHONIC ACID

C.H.L.(OH)(SO.H)[6 2 1 4] [120°] Formed by adding a solution of KI and KIO, to one of phenol p-sulphonic acid in aqueous HCl (Kehrmann, J pr [2] 37, 11, 334, 359, Osterr ayer, J pr [2] 87, 215) Monoclinic prisir e sol water, but ppd by HCl or H, SO,, decomposes at 190° Converted by nitric acid; 'o pieric acid Chro mic acid oxidises it to di iodo quinone

Salts-KA' 2aq long needles or thick prisms —NaA' 3aq sol water, commercially known as 'sozodole'—C₆H₂K₂I₂SO₄ dimetric prisms — BaA', 3aq shining needles, v sl sol water — ZnA', 6aq long needles The copper

HI on the diazo- compound derived from benz idine (Schmidt & Schultz, B 12, 489) leaflets

o-IODO PHENYL-ACETIC ACID C.H.,IO. te C.H.I CH, CO2H [96°] Prepared by digesting its nitrile with fuming HCl for four hours at 126° The nitrile is formed by treating o-iodobenzyl bromide with KCy (Mabery a Robinson, Am 4, 102) Slender needles (from water), so hot water, alcohol, ether, CS,, and ligroin - AgA curdy pp; sl sol water Slender needles (from water), sol

p-Iodo-phenyl-acetic acid C.H.I CH2.CO2H. [185°] Prepared by heating its nitrile with fuming HClAq in sealed tubes at 100° (Jackson, Mabery, Am. 2, 253, P Am A 18, 205, B 11, 56). Narrow white plates (from water) with

agreeable odour like sweet allysium, v sol hot water, alcohol, ether, benzene, and CS, Gives p-1 do benzone acid on oxidation—BaA', aq minute white needles, v sol water—AgA' glistening plates, sl sol boiling water

Nitrile C.H.I CH, CN p Iodo benzyl cyan-ide [50 5°] Prepared by boiling p-iodo benzyl bromide with alcoholic KCy Pearly plates insol water, v sol alcohol, ether, and CS

IODO PHENYL-ACE, YLENE C.H. C CI Obtained from phenyl acetylene (Holleman, B 20,

8080) Brownish-yellow liquid^c
IODO-PHENYL-ACRYLIC ACID v IODO CIN

Exo-IODO-DI-PHENYL-AMYLIDENE-DI-AMINE C₁, H₂₁N₂I s.s C₂H₂I(NHPh), Formed by heating iodo isovale c aldehyde with aniline (Chautard, A Ch [6] 16, 169) Large brownish yellow needles, v sol water and alcohol, m sol other solvents Decomposed on fusion uncrystallisable salts

DI - IODO - DIPHENYL - DI - CARBOXYLIC ACID C_{1.}H_sI₂O_s to C_cH_sI(CO₂H) C_cH_sI CO₂H [262°] Prepared by the action of HI on the diazo-derivative of di amido di phenyl dicar boxylic acid (Schultz, B 11, 217, A 196, 21, 203, 95) Amorphous, v sl sol boiling water,

v sol alcohol, acetone, and ether

DI IODO PHENYLENE OXIDE so called Tetra 10do diphenylene quinone C,H2I2O Formed in the action of iodine and KOH upon o, m, or p oxy benzoic acid and on phenol (Lautemann, A 120, 309, Kammerer a Benzinger, B 11, 557) Formed also by boiling tri todo phenol with aqueous Na CO₂(L), and by distilling di 10do diphenyl dicarboxylic acid with lime (Schultz, B 11, 217) Reddish brown powder, insol water, alcohol, ether, chloroform, and benzene Dissolves in CS, with deep red colour Boiling KOHAq has little action on it Conc HNOs forms pierie acid It decomposes at 200° Aqueous SO, at 100° forms colourless $C_{12}H_{6}I_{4}O_{2}$

DI-exo IODO-DI-PHENYL-ETHYLENE O14H10I2 te CIPh CIPh Formed by heating diphenyl acetylene (tolane) with dry iodine and crystallising from chloroform (E Fischer, A 211, 233) Rose coloured plates, ▼ sl sol alcohol

Decomposed by heat

ω IODO DI - PHENYL - ETHYLIDENE - DI AMINE C14H15IN22 e CH2I CH(NHPh) Obtained by heating 10do acetic aldehyde with excess of aniline (Chautard, A Ch [6] 16, 155) needles or tables Cannot be melted wi' lout de composition V sol alcohol, sol ether, benzene and CS2 With strong acids it forms uncrystallisable salts, v sol water and alcohol

DI-p-IODO DI-PHENYL-GUANIDINE C₁₃H₁₁Î₂N₃ is CN₂H₃(C₆H₄I)₂? From p-10do-aniline in ethereal solution and CyCl (Hofmann, A 67, 148) Crystalline -B', H, PtCl

Tri-p-iodo-tri-phenyl-guanidine C, H, I, N, From di p-iodo di phenyl thio-urea and iodine

(Losanitsch, B 5, 158)

Exo-IODO-DÍ-PHENYL-HEPTYLIDENE-DIAMINE C.H., I(NHC.H.). Formed by heating todo heptoto aldehyde with aniline (Chautard, A Ch [6] 16, 178) Lemon yellow deliquescent tables, v sol alcohol, al sol benzene and CHCl. Decomposes on heating Does not give crystalline salts

p-10D0-PHENYL-HYDBAZINE $C_tH_tN_2$ to $C_tH_tNH_tN_1$ [10°°] Formed, by reducing the diazo-derivative of p-10d0 aniline [60°] with an excess of SnCl₂ (Neufeld, A 248, 98) Silky needles (from hot water), v sol alcohol, other, chloroform, benzene, and dilute HOAc With acetone it forms CoH, I N2H CMe2 crystallising from petroleum ether in white plates [114° With acetic aldehyde it gives C.H.I N2H CHMe [107°] crystallising from petroleum ether in yellow needles

Di-iodo-phenyl-hydrazine C.H.I.(N H.)
[4 2 1] [112°] From di 10do aniline by diazo C,H,I2(N H,) tising and reducing with SnCl, (Neufeld, A 248, White silky needles, v sol alcohol, ether, and benzene, al sol hot water and petroleum ether The hydrochloriue [162°] crystallises

from water in white needles

Di-iodo-s di-phenyl hydrazine C₁₂H₁₀I₂N₂ i e [81] C.H.I NH NH C.H.I [13] Hydrazo discoo benzene [90°] Formed by heating the azoxy compound C. H. I N.O C. H. I with alcoholic ammonium suiprade at 100° (Gabriel, B 9, 1408) V sol ordinary solvents

Di-10do-s di phenyl hydrazine

[41] C₆H₄I NH NH C₆H₄I [14] Formed by heating the corresponding azoxy compound with alcoholic ammonium sulphide at 100° (G) Flat needles, decomposed before melting

p IODO PHENYL OXAMIC ACID

C.H.I NH CO CO.H [c 200°] S 072 at 25° Formed by the action of a coholic potash on the di iodo di anilide of oxalic acid (Dyer a Mixter, Am 8, 357) Long white fibres Sol alcohol and ether -- *BaA'₂ white pp -- *AgA' pp -- KA' sol hot water white

p-10D0 PHENYL PHTHALIMIDE

$$C_rH$$

(2)C=N C_sH_sI [227°-228°] Prepared by heating p iodo aniline with phthalic anhydride (Gabriel, B 11, 2261) Needles V sol C_eH_e, less sol ether

o 10DO PHENYL PROPIONIC ACID

C.H.IO, s.e C.H.I C.H. CO.H o Iodo hydrocin namic acid [103°] Plates (from water) Formed by reduction of o iodo cinnamic acid (Gabriel a Herzberg, B 16, 2037)

m Iodo-phenyl propionic acid C.H.I C H. CO.H m-Iodohydro cinnamic acid [66°] Colourless plates Formed by reduction of m 10do-cinnamic acid (Gabriel a. Herzberg, B

16, 2039)

p-Iodo-phenyl-propionic acid C.H.I.O.H. CO.H. p Iodo hydrocinnamic acid [141°] White prisms Formed by reduction of p-10do-cinnamic acid with HI and P (Gabriel a Herzberg, B 16, 2010)

8-Iodo-phenyl-propionic acid

C.H. CHI CH. CO.H [120°] Formed by adding fuming HIAq to a concentrated aqueous solution of β oxy phenyl propionic acid (Glaser, A 147, 97) Formed also from cinnamic acid and cone HIAq in the cold (Fittig a. Binder, A. 195, 183) Small crystals (from CS₂) Decomposed on fusion Boiling with water converts it into HI and connamic acid Aqueous Na, CO,

Formed by heating \$\beta\$-iodo propionic aldehyde with excess of aniline (Chautard, A Ch [6] 16, 159) Brownish yellow needles or tables, v sol. all ordinary solvents Decomposed by heat with-Gives no crystalline salts out previous fusion

DI-IODO-DI PHENYL SULPHIDE C, d.I.S e e (C.H.I).8 [139°] Formed by heating di phenyl sulphide with rodine and rodic acid in sealed tubes Got also from di amido di phenyl sulphide by the diazo reaction (Krafft, B 7, Laminæ

p'IODO PHENYL THIOCARBIMIDE

C.H.INCS [65°] Formed by the action of nodine on an alcoholic solution of di p nodo diphenyl thio urea (Losanitsch, B 5, Crystals

DI p 10D0-DI PHENYL-THIO UREA

C₁₁H₁₀L₂N S *.e CS(NH C_eH₄I)_p [173°] From
p 10d0 annline, alcohol, and CS₂ (Losanitsch, B From V sl sol alcohol and ether

10DO 150 PHTHALIC ACID C.H.I(CO.H). [6 3 1] [204°] Formed by oxidation of 10dotolyl methyl ketone C.H.MeI CO CH. [1 2 5] with CrO. (Klingel, B 18, 2701) Fine white needles. Sublimable V sol alcohol, acetic acid, and ether, insol cold water

Salts - A"Ba very sparingly soluble fine white needles - A'Ca microscopic needles - $A''Ag_i^*$ white crystalline pp $-\bar{A}''Cu^*$ green crystalline pp

IODO PROPANE v PROPIL IODIDE

Di iodo-propane C,H,I, i.e. CH, CHI CH,I Propylene iodide S G 12 249 From propyl-From propylene and iodine (Berthelot a De Luca, C R 39, 743) From allyl iodide and gaseous HI at -18° (Malbot, C R 107, 114, Bl [2] 50, 449) Liquid Split up by alcoholic potash into iodine and propylene

Di-iodo-propane CH,I CH, CH,I Tra methylene todide (227°), (169° at 170 mm) SG \$\frac{1}{2}\$ 2 5631, \$\frac{1}{4}\$ 2 5962, \$\frac{25}{85}\$ 2 5614 Obtained by heating s di oxy propane (trimethylene glycol) with fuming HIAq at 100° (Freund, M 2, 640) Also from trimethylene bromide, alcohol, and

KI (Perkin, jun, C J 51, 12)
Di-iodo-propane CH, CL, CH, Allylene di-hydro-di todide (148°) S G 2 2 15 (O), 2 45 (S) Obtained by direct combination of allylene with HI (in conc solution) (Oppenheim, Bl [2] 4, 484, Semenoff, Bl [2] 5, 446) Heavy oil Partly decomposed by distillation, but may be distilled with steam or with any indifferent gas Sl sol alcohol, v sol ether Becomes coloured in air and light Alcoholic potash forms CH, CI CH, Ag,O gives acetone (Sorokin, Z 1871, 264)

IODO-PROPIOLIC ACID C.HIO, . s

ICCCO,H Iodo propargylic acid Iodo-acetylene carboxylic acid [140°] Small colourless prisms or glistening needles

Formation -1 By saponification of the ethyl ether -2 By the action of a solution of iodine in KI upon the cuprous compound of calcium or barium propargylate

Reactions —It combines with HBr to form brom 10do acrylic acid [96°], with HI it yields And node acrylic acid [133°], with bromine dis-solved in chloroform it yields di-brome-iodeacrylic soid [147°], with an ethereal solution of hodine, tri iodo-acrylic seid [207°], and with AMINE C13H1, IN 3 5.5 CH2I CH2 CH(NHPh), iodine bromide, bromo-di-10do acrylic acid [182°]. On the other hand, an aqueous solution of bromine converts it into di-bromo iodo ethylene

IBrC CHBr with evolution of CO2

Salts -A'K small glistening very hygroscopic needles - A'Ag white pp, decomposed by warming with water forming AgI -A'Ba easily soluble amorphous solid —A'2Cu

Ethyl et. er A'Et [68°], large colourless prisms Formed by the action of a solution of iodine in KI upon the cuprous compound of propargylic ether (Baeyer, B 18, 2274, Homolka

a. Stolz, B 18, 2282, 19, 536)
a-IODO PROPIONIC ACID C₃H₅IO₂ v e CH₃ CHI CO₂H Prepared by digesting syrupy lactic acid (1 mol) with PI₂ (1 mol), pouring the product into water and extracting with ether (Wichelhaus, A 144, 352) Oil, nearly insol water

β-Iodo-propionic acid CH,I CH, CO,H [82°] Formation -1 By the action of nodide of phosphorus on glyceric acid (Beilstein, A 120, 226, 122, 366, Erlenmeyer, A 191, 284) 2 From acrylic acid and cone HIAq (Wish-

cenus, A 166, 1)

Preparation -The product of the oxidation of glycerin with nitric acid is evaporated on the water-bath, and the syrupy residue diluted with water until it possesses S.G 126 This solution (30 cc) is then poured into a flask containing iodine of phosphorus prepared from iodine (50 g) and yellow phosphorus (65 g) After the vigorous action has taken place, the solid residue is recrystallised from water (V

Meyer, B 19, 3294, 21, 24)

Properties - Colourless laminæ, v sol hot, v sl sol cold, water, v e sol alcohol and ether May be converted into propionic acid by HI or by sodium amalgam (Moldenhauer, A 131, 328) By boiling with water it is converted into hy dracrylic acid and a little acrylic acid Boiling with water and Ag2O forms hydracrylic acid, para adıpı malıc acıd C6H10O3, dihydracrylic acid C₈H₁₀O₅, and paracrylic acid C₃H₄O₂ [69°] (Beilstein, Wislicenus, Z [2] 4, 683, Socoloff, Klimenko, Bl [2] 34, 321, v also ACRYLIC ACID) B-Iodo propionic acid is converted into adipic acid by heating with reduced silver (W) AgNO, gives in an aqueous solution of β iodo propionic acid an immediate pp of AgI

(188°) Methylether MeA' SG 11841 Colourless oil, turning (Henry, C R 100, 114) brown in light Is not pungent Formed from

the acid, alcohol, and H₂SO,

Ethyl ether EtA' (202°) (Fittig a Wolff,

A 216, 128) SG = 1707 (Henry) Formed by heating an alcoholic solution of the acid after adding a few drops of H.SO, Formed also by dissolving the acid (1 pt) in alcohol (3 pts) and saturating with HCl, the yield is only 50 pc. for much EtI is evolved (Lewkowitsch, J pr [2] 20, 167; Wichelhaus, B 1, 25, Wishcenus, A192, 129) Oil Partly decomposed on distillation

Amide CH₂I CH₂ CONH₂ [101°] Formed by the action of aqueous NH₃ on the methyl by the action of agents, ether in the cold (Henry) Colouriess tables, ether in the cold (Henry) V sol water Its solution gives a pp. with AgNO.
8-IODO PRO-IONIC ALDEHYDE

CH2I CH2 CO H S G. 15 2 21 Prepared by the action of rodine (25 g.) and rodic acid (10 g) on proprionic aldehyde (18 c c) diluted with alcohol

(50 cc) It is washed with KOH solution and poured into water (Chauta d, A Ch [6] 16, 157).

Properties -Heavy colourless liquid, not inflammable, with an exceedingly irritating vapour Miscrole with alcohol, ether, and acetone, al sol. Is totally decomposed at 100° dilute solutions of KOH, NaOH, or NH, HO attack it slowly in the cold Cone solutions resinify it Mineral acids behave similarly HNO, oxidises it to CH₂I CH₂ CO₂H [82°] forms propyl acetate (90°) AgC $Ag(C_2H_3O_2)$ AgCN and silver torms propyl accesse (30) 1861 and saves sulphocyanide give CH₂ (CN) CH₂ CO H and CH₂ (CNS) CH₂ CO H Anline gives the compound CH₂I CH CH (N^{**} C₆H₃)₂.

IODO PROPYL ALCOHOL v Iodhydrin of

PROPYLENE GLYCOL

Di 10do - propyl alcohol C,H,I,O Dr rodide of allyl alcohol CH I CHI CH,OH Prepared by dissolving iodine in allyl alcohol (Hubner a Lellmann, B 13, 460, 14, Colourless needles Easily decomposed by light or heat Sol alcohol, ether, and benz ene, insol water On heating the chloroform solution it gives a compound crystallising in colourless prisms [160°], which is probably an iodo allyl alcohol

Di 10do isopropylalcohol CH, I CH(OH) CH, I Glycerin di wdhydrin [c -18°] SG 15 24 Prepared by heating the s dichlorhydrin of glycerin with KI and water on a salt bath Nahmacher, B 5,353, Claus, A 168,24) Faintly yellowish oil Decomposes when distilled

p-IODO PROPYL-BENZENE $C_aH_4(C_2H_7)I$ [14] [250°] Formed by heating p diazo propyl benzene with HI (Louis, B 16, 110) Vola tile with steam Colourless oil Sol ether, in sol alcohol, almost insol water On oxidation with cold CrO, in acetic acid it gives piodo benzoic acid

p Iodo iso propyl benzene C₆H₄(C₃H₇)I (234°) Prepared by heating p diazo iso propyl benzene with HI (Louis, B 16, 114) Colourless oil On oxidation it gives p iodo benzoic acid

ω-IODO PROPYLENE v ALLYL IODIDE

a lodo propylene CH, CHI Cly, Allylene hydro vodude (82°) (S), (93°-103°) (O) SG 2 1835, 12 1803 Formed by decomposing di Allylene 10do propane CH3 CI2.CH3 (1 mol) with alcoholic KOH (1 mol), and mixing the distillate with water (Semenoff, Bl [2] 5, 446, Z 1865, 725, Oppenheim, Bl [2] 4, 434, Z 1865, 719)

Di iodo propylene C,H,I, 1e CH, CI CHI Allylene di vodide (198°) Obtained by expos-

ing allylene for two months to a solution of I in aqueous KI in sunshine (Oppenheim Turns brown in light Yields allylene ith alco-

holic KOAc

Tri iodo propylene CHI CI CH2I Dr rodo. allyl wodide Propargyl tri wodide [41°] Formed by the combination of propargyl iodide with iodine (Henry, B 17, 1132) Small colourless needles

Tri iode-propylene CH, CI CI. Iodo-allylene todide [64°] From silver allylene and di rodide iodine in echereal solution (Liebermann, A 135, Decomposes at 78° V e sol 273) Needles ether, m sol alcohol. Alcoholic potash gives 10do-allylene

IODO-PROPYLENE-GLYCOL v Iodhydrin of GLYCBRIN.

IODO-PROPYL-THIOPHENE C.H.IS te O₄H₂IS C₂H, From n propyl throphene (Rufer, B. 20, 1743) Oil, volatile with steam

Ita-IODO PYROTARTARIC ACID C,H,IO From itaconic acid and HI at 150° Z 1866,722) Nodules Reduced by [185°] (Swarts, Z 1866, 722) further treatment with HI to pyrotartaric acid

TETRA IODO PYRROLE C.I.NH 'Iodol' 8 02, S (90 pc alcohol) 6 at 15°, S (ether) 50 Formed by the action of an ethereal solution of iodine on pyrrole potassium (Ciamician a Dennstedt, G 13, 18, B 15, 2582), and by the action of iodine on an alkaline solution of pyrrole (Ciamician a Silber, G 16, 543, B 18, Lor; yellowish brown flat prisms or minute yellow needles (frc.n dilute alcohol) Sol ether, acetic ac d, and hot alcohol, nearly insol cold alcohol, insol water and aqueous acids Decomposes at about 140°-150° Gives a white pp with AgNO3 instantly blackening, green colouration with HgCl, Has no basic properties It is not decomposed by boiling water, but boiling HClAq blackens it It does not dissolve in aqueous kOH, but alcoholic potash dissolves it forming a potassium derivative which is decom posed by acids (even CO) but not by water Zinc dust and KOH reduce it to pyrrole (Ciami cian a Silber, B 19, 3027) When heated gently with conc H₂SO₄ it gives at first a green, then a dirty violet colouration Its alcanolic solution gives a red colour with nitric acid (Vulpius) is employed pharmaceutically as a substitute for iodoform for suppurating sores, fungoid growths, hay fever, &c, having the advantage of possess ing no odour, and exerting no poisonous effect upon the system

[63°] (above IODO-QUINOLINE C.H.IN 300) SG 193 Prepared by heating quinoline with a KI solution of iodine and HIO, (La Coste, B 19, 780) Monoclinic prisms, or long thin needles I asily volatile with steam

Salts -B'HCl 1aq small yellow needles -B',H PtCl, 2aq long orange needles, sl sol water -B H C1,0, sparingly soluble yellow needles or plates

Methylo rodide B MeI glistening golden plates, sol hot water v sl sol cold water and alcohol, insol ether

Methylo chloride B'MeCl aq fine yellowish needles or thick yellow prisms, dimorphous (Lehmann, Z K 12, 377), v sol water -(B'MeCl) PtCl fine orange crystals, sl sol cold water

Formed by heating $(Py\ 3)$ chloro quinoline with HI (Friedlander a Weinberg, $B\ 18,\ 1531)$ White needles SI sol water, $v\ sol$ other sol vents - BHI long needles -B',H,Cl,PtCl, aq red needles

[90° uncor] Di-iodo-quinoline CaH, IaN Formed by the action of sodine in CS, on quino line (Claus a Istel, B 15, 824), Dull-green metallic needles Sol alcohol, ether, and acetic acid

DI IODO-QUINONE C.H.I.O. [159°] Formed by the action of todic acid on the discetyl derivative of hydroquinone (Metzler, B 21, 2555) Yellow needles (from alcohol) Is converted by

the action of sulphurous acid into the hydroquinone [142°]

Di 10²0 quinone C₂H₂I₂O₂ [3 5 4 1] [180^o] From di-10do p amido-pheno! (q v), H₂SO₄ and K₂Cr₂O₂ (Seiffert, J pr [2] 28, 438) Formed also by exidising di 10do phenol sulphonic acid with CrO_s (Kehrmann, J pr [2] 37, 336) Golden plates (from benzoline) Readily sublimes, almost insol cold, v sl sol boiling, water With HCl and SnCl, it gives di iodo hydroquinone [145°]. FeCl, reconverts this into di-iodo quinone

Di iodo quinone chlorimide CaH2I2 From C, H2I2(NH2)(OH), hydric chloride, and bleaching powder solution (Seiffert, J pr [2] With NMe, Ph it gives 28, 438)

C_sH₂I₂<0>C_sH₁NMe₂ IODO RESORCIN C_sH₃IO₂ 16 C_sH₃I(OH), [67°] Formed by agitating an ethereal solution containing resorcin (10 pts) and iodine (24 pts) with PbO (110 pts), distilling off the ether and recrystallising from benzene (Stenhouse, C N 26, 279, A 171, 311). Trimetric prisms, sol. water

Tri iodo resorcin C,HI,(OH).. [145°] (M a. N), [154°] (C) Formed, together with a brown substance insoluble in CS2, when ICl is added to an aqueous solution of resorcin (Michael a. Norton, B 9, 1752) Formed also by adding an aqueous solution of resorcin to a solution of KIO., iodine, and KI (Classen, B 11, 1443). Prepared by adding bleaching powder to a dilute alkaline solution of resorcin (1 mol) and KI (7 mols), and then acidifying (Degener, J pr [2] 20, 324) Needles (from CS₂), al sol hot water, v sol alcohol and ether May be sublimed. Boiling HNO, gives tri nitro resorcin

Di acetyl derivative C.HI.(OAc)... [170°] Needles, v sol alcohol and ether

IODO RESORCIN SULPHONIC ACID $C_6H_2I(OH)_2(SO_3H)$ From potassium resorcin sulphonate and iodine (H Fischer, M 2, 340) kA' 3aq minute crystals

Iodo resorcin disulphonic acid

C_eHI(OH)₂(SO₂H)₂. Formed by digesting potas sium resolution disulphonate (30 g) with iodine (33 g) in dilute alcoholic solution at 100° (F) long needles

IODO SALICYLIC ACID v IODO O OXY-BENZOIO

10D0 STEARIC ACID C14H35IOr. From di oxy stearic acid and HI (A Saytzeff, J pr [2] 33, 309) Oil

Iodo stearic acid C, H, IO. From oleic acid, PI., and a little water The product is mixed with water and extracted with ether (M C a A Saytzeff, J pr [2] 35, 384)

Properties - Oil Resembles the preceding acid

Reactions -1 Reduced by Zn and HCl to stearic acid -2 Moist Ag₂O forms a substance that is unsaturated (taking up 55 pc I from its solution in HgCl₂Aq), but is converted by alcoholic KOH into oxy steams acid -3 Alcoholic KOH forms solid iso oleic acid [45°], and also ordinary oleïc acid

Iodo-stearic acid C18H351O2. Formed by heating iso cleic acid with tri iodide of phosphorus and water (Coust a Saytzeff, J pr [2] 37, 276, Bl. [2] 47, 169) Oil, sol ether.

Reactions -1. Yields an oxy stearic acid [85°] on treating with silver oxide —2 Alcoholic potash regenerates iso-cleic acid [40°-45°], but forms no cleic acid —8 Alkaline KMnO₄ oxidises it to di-oxy-stearic acid [78°]

10D0-STEARIDENIC ACID C18H33IO2 Iodooletc acid From ricinoleic acid O18H24O3, water, **P**, and 10dine at 100° (Claus, B 9, 1917) Oil Reduced by boiling with zinc and HClAq to steam acid Combines with bromine

DI-IODO-SUCCINAMIC ACID

CO.H CH, CI. CONH, Ethylether A'Et Ethylether A'Et [134°], long needles, alightly soluble in cold water Formed by the action of iodine upon diazo succinamic ether CO₂Et CH₂ CN₂ CONH, in ethereal solution (Curtius a Koch, B 19, 2462, J pr [2] 38, 485)

IODO-TARCONINE v NARCOTINE IODO-THIENYL METHYL KETONE

[129°] Iodo-acetothienone CASHAI CO CH. Formed by the action of acetyl chloride upon mono- or di iodo thiophene in presence of Al₂Cl₆ (Gattermann a Römer, B 19, 692) Long colourless needles (from alcohol) Very volatile with steam Strong odour By alkaline KMnO it is oxidised to iodo thiophene carboxylic acid [131°]

Phonyl hydraside C, SH2I C(N, HPh) CH, [184°], yellow tables, al sol alcohol

(a) IODO-THIOPHENE C.H.IS & 6

CH CH. S (182° cor). Oil Formed by the

CH CI action of iodine and HgO on thiophene at the ordinary temperature (Meyer a Kreis, B 17, 1558, Egli, B 18, 544) With sodium and EtI it gives ethyl thiophene With Na and n butyl bromide it forms n-butyl thiophene (182) Gives an iodo-nitro thiophene [74°] (Kreis, B 17, 2073)

Di-10do-th10phene C4H2I2S [404°] crystals Formed by the action of 2 mols of 10dine and HgO on thiophene at the ordinary temperature (Meyer a Kreis, B 17, 1558)

IODO-THIOPHENE CARBOXYLIC ACID C₄SH₂I(CO₂H) Iodo throphenic acid [131°] Formed by oxidation of iodo threnyl methyl ketone with alkaline KMnO, (Gattermann a Römer, B 19, 693) Colourless silky needles (from water) Sublimes in glistening tables — NHA' needles, sl sol cold water

(a) - IODO-THIOPHENE -(B) -DI BULPHONIC ACID C.HIS(SO.H). Formed by sulphonation of (a)-10do thiophene On reduction with sodium smalgam it yields thiophene (β) di sulphonic acid (Langer, B 18, 559)

IODO-THIOXENE 18 IODO DI METHYL THIO-PHENE (q v)

IODO - THYMOL C.H.MePr(OH)I [1436] Prepared by adding rodine (85g) to a solution of thymol (5g) in ammonia (6 cc) mixed with alcohol (2 cc) and distilling the oily product with steam (Willgerodt a Kornblum, J pr [2] 39, 289) Lustrous white needles, insol water, sol other solvents. Oxidized by Man and H SO dised by MnO, and H, SO, or by FeCl, to thymo-quinone Not attacked by aqueous KOH at 800° HNO, forms nitro thymol, displacing I by NO, H₂SO, forms a sulphonic acid.

Ethylderivative C.H.MoPrI(OEt) [520] Opaque white rimetric tables, insol cold water, al sol hot water and alcohol

Acetyl derivative C_cH₂MePrI(OAc) White needles

Bensoyl derivative C₆H₂MePrI(OBz). [95°] Large tables

Prcryl derivative [155°], yellowish crystalline aggregates

IODO THYMOL SULTHONIC ACID

C.HMePr(OH)ISO,H [1 4 3 2 6] From thymol by successive sulphonation and iodation (Kehrmarn, J pr [2] 39, 392) Gives an iodo thymo quinone on oxidation HNO, gives di nitro quinone on oxidation HNO, gives di nitro thymol [53°] —KA'2aq crystals melting in water of crystallisation at 80°, decomposed at

120° -BaA'2-AgA' 10D0 - THYMOQUINONE C.HMePrIO, [5 2 6 4 1] [61°] Formed by oxidising 1.dothymol sulphonic acid with CrO, (Kehrmann, J pr [2] 39, 392) Yellowish red prisms duces to an iodo hydrothymoquinone [74°

Oxim C_sHMePrIO(NOH) [5 2 6 4 1] [130°] Formed by heating the quinone with hydroxylamine hydrochloride in diluted (75 p c) alcoholic Long yellow prisms and needles, sol alcohol and ether, insol cold water Its acetyl derivative C.HMePrIO(NOAc) crystallises in golden needles [70°] Its sodium derivative crystallises ir greenish laminæ

Iodo thymoquinone CaHMePrIO, [5 2 3 4 1] From 10do carvacrol sulphonic acid by oxidation with chromic acid mixture (Kehrmann, J pr [2] 40, 188) Garnet red tables, sol alco hol and ether More volatile with steam than Smells like quinone Hydroxyl its isomeride amine slowly forms an oxini

o IODO TOLUENE C,H,I 16 C,H,I CH, [21] (205°) (B a K), (211° 1 V) (K) S.G 201697 (B a K) Formed from o toluidine by the diazo reaction (Beilstein a Kuhlberg, Z 8, 102, A 158, 347, Kekulé, B 7, 1007, Mabery a Robinson, Am 4, 101) Oil

Reactions -1 Oxidised by dilute nitric acid to o iodo benzoic acid [157°] -2 With CICO Et and Na it forms C.H.Me CO.Et -3 Cro.Cl. gives C.H.I CHCl, and a little C.H.I CHO (Stuart a Elliott, C J = 53,805) -4 When heated with H₂SO₄ it forms iodo toluene sulphonic acid, di 10do toluene, and tri 10do toluene (Neumann, A. 241, 62)

m Iodo toluene CaH, I CH, [81] SG 20 1 698 From m toluidine by the diazo

reaction (B a K) o Iodo-toluene C.H.ICH, [41]

(211 5°) From p toluidine by the diago- reaction (Körner, Bull Acad Belg 1867, 157) The same body appears to be formed from mercury ditolyl and iodine, although the melting point is given as 20° (Dreher a Otto, A 154, 171) Laminæ May be sublimed Gives p iodo benzoic acid when oxidised by chromic acid mixture H₂SO₄ forms iodo-toluene sulphonic acid and di- and tri-iodo-toluene (Neumann, A. 241, 58)

-lodo-toluene v BENZYL 10DIDE. o-IODO TOLUENE BULPHONIC ACID C,H,ISO, &c CH, C,H,ISO,H From o-todotoluene and SO₂ (Mabery & Palmer, Am 6, 170) Syrupy liquid —BaA'₂1½ aq : needles.—CaA'₂2½aq —PbA'₂2aq

p-Iedo-toluene (a)-sulphonic acid CH, CaH, I SO₂H Formed, together with the (β) isomeride, by gracually adding p iodo toluene to SO, both dissolved in chloroform (Glassier, B 8,560) - BaA'2 4aq needles, v e sol. water

p Iodo toluene (β)-sulphonic acid

CH, C,H,I SO,H Formed as above Deliquescent crystalline mass - KA'aq very soluble laminæ -NaA' aq dense aggregates of whetstone shaped very soluble cystals - CaA', 3aq very soluble silky needles - 3aA', aq thin lamınæ, al sol water - GuA', 6aq light blue needles, v sol water

Amide C.H.MeI SO,NH. [179°] Crystals, m. sol hot water, v so alcohol

Iodo-toluene disulphonic acid

 C_{u} - I_{2} MeI(SO₃H). [1 4 3 x]

From C₄H₂Me(NH₂)(SO₂H)₂ by diazo- reaction (E. Richter, A. 230, 325, Limpricht, B. 18, 2170) Slender white needles, v sol alcohol and water -BaA"6aq prisms, v sol water -

K,A"2aq small prisms
Chloride C,H2McI(SOCl), [143°] After one fusion it melts at 126° Long white prisms,

Amide [130°-132°] White needles (from water'

•IODO-o-TOLUIDINE C_uH₁MeI(NH₂) [1 4 2] [49°] (273°) From 10do o nitro toluidine by reduction (Heynemann, Z [2] 6, 402, A 158, 338) Needles Boils, with rapid decomposition, at 273° V e sol alcohol, ether, and CS, B'HNO, colourless nacreous laminæ S 95 at

Iodo-toluidine C₄H₂MeI(NH) [143] [189°] From p 10do toluene by nitration and reduction (Glassner, B 8, 561) Needles or plates, v sol alcohol -B'HCl needles -B'HNO, plates -B'H,SO, needles

Di-10do-p-toluidine C_eH.MeI₂(NH₂) [1 3 5 4] [124 5°] Formed by the action of ICl on p tolu idine dissolved in HClAq (Michael a Norton, B 11, 115, Am 1, 263) Ramified groups of slender needles, m sol cold alcohol, sl sol hot water IODO-TOLUIDINE SULPHONIC ACID

C_aH₂Me(NH)I(SO₃H) [1 2 4 5] From the diazo derivative of C.H.Me(NO,)(NH,)(SO,H) [1 2 4 5] and cone HI at 140° (Limpricht a Foth A 230, 308, B 18, 2185) Satiny needles (containing aq) Sl sol cold water, m sol hot water — BaA'₂" trimetric tables, v sol water

IODO-TOLUQUINONE C.H. MeIO, [6 2 4 1] [117°] Formed by oxidising a solution of iodo cresol sulphonic acid in sulphuric acid with chromic acid (Kehrmann, J pr [2] 37, 340, 39, 392) Long reddish yellow needles, m sol ether Reduced by stannous chloride to iodo hydrotoluquinone [111°] With hydroxylamine it gives the mono-oxim crystallising in short yellow prisms [156°]

Di-iodo-toluquinone C.H Mel.O. [36241] From di iodo m cresol sulphonic acid and CrO, (Kehr nann, J pr [2] 39, 392) Garnetred lamina, v sol organic solvents May be sublimed

DI-IODO-DITOLYL [3 4 1] C.H.MeI C.H.MeI [1-8 4] [100°]. From di amido ditolyl by Sandmeyer's modification of the diazo-reaction (Stolle, B. 21, 1096) Yellow needles

-- IODO - DI - TOLYL - ETHYLIDENE - DI -

heating 10do acetic aldehyde with p-toluidine (Chautard, A Ch [6] 16, 156) Orange yellow prisms or tables, decomposed by heat not furnish crystalline salts

IODO TOLÝL METHYL KETONE

C.H.Mel CO CH, [1 2 5] [39°] Formed by heating diazo tolyl methyl ketone (from amidotolyl methyl ketone [102°]) with an excess of HI (Klingel, B 18, 2700) Yellowish prisms V sol alcohol and ether, sl sol ligroïn and benzene, insol water By CrO, it is oxidised to

benzene, insol water 10do iso phthalic acid [204°]

\$\beta \text{IODO-VALERIC ACID C_H_IO_1e} \text{Solidines at 59°} \text{Solidines at 59°} Separates as crystals when HI is passed into a concentrated solution of \$\beta\$ oxy isovaleric acid (Schirokoff, J pr [2] 23, 285) Converted by

sodium amalgam to isovaleric acid

Iodo valeric acid CEtMeI CO,H (?) Hydronodide of tiglic acid [865°] Formed by the combination of tiglic (methyl crotonic) acid with HI which may be effected in the cold (Schmidt a Berendes, A 191, 117) Formed also, together with the following, when angelic acid is heated with HIAq (Schmidt, A 208, 254) Needles, sl. sol cold water, decomposed by boiling with water Converted by zinc and dilute H.SO, into CEtMeH CO,H Aqueous AgNO, gives AgI, tiglic acid and CO2.

Iodo valeric acid CH, CHI CHMe CO,H [46°] Hydro iodule of angelic acid From angelic acid and cone HIAq in the cold (Fittig, A 216, 162) Prisms, v sol water Zino and dilute H.SO, converts it into CEtMeH CO.H. Aqueous Ag O, gives AgI, tiglic acid, and CO. Aqueous Na,CO₃ at 0° gives CO₂, ψ butylene CH₂ CH CH CH₃, and HI V also Americ acid, vol 1 p 266

IODO-ISOVALERIC-ALDEHYDE C,H,IO ...

(CH,),CH CHI CHO (?) SG 17 2 17

Preparation - Isovaleric aldehyde (24 c.c) dissolved in alcohol (50 cc) is treated with iodine (20 g), and iodic acid (8 g) The reaction takes place at the ordinary temperature, and is complete in about 15 days. The liquid is poured into excess of water, and decolourised by alkali or reduced silver (Chautard A Ch [6] 16, 160).

Properties - Colourless liquid, blackening on exposure to light, and having an extremely irritating and suffocating odour It is completely decomposed at 100°, and is not solidified at - ?0° V sol alcohol and ether, less sol benz-

ene, CHCl, and CS Sl sol water

Reactions -Rapidly decomposed by alkalis. The action of ammonia is complex, giving valerie aldehyde ammonia, valeridine CieHi,N, and valeritrine C14H2-N Forms a crystalline compound with NaHSO, Ag(C2H2O2) at 100° yields amyl acetate (138°) AgCN and AgSCN react forming AgI and the corresponding derivatives. Forms a mono- and a di anilide with aniline.

IODO-VANILLIN v Methyl derivative of

IODO-DI OXY-BENZOIC ALDEHYDE

DI-IODO-VINYL-AMINECI, CH(NH2) [192° with decomposition] Formed by the action of cold aqueous NH₃, CO₂ and alcohol being eliminated upon the di iodo oxy acrylic ether CI, C(OH) CO, Et, obtained by treating diazooxy acrylic ether CN2.C(OH) CO2Et with an ethereal solution of nodine (Buchner a. Curtius, AMINE CH.LCH(NHC,H,Me),. Obtained by B. 19, 851) Small yellowish prisms. Very sparingly soluble in cold water and ether, more easily in hot water and hot alcohol Volatile with steam It is stable towards acids, but alkalis set free NH₃ in the cold

DI-w-IODO-o-XYLENE C₆H₄(CH₂I)₂, o-Xylyl ens-todide [110°] Prismatic crystals Formed by heating phthalyl alcohol (di ω oxy-xylene)

with HI (Leser, B 17, 1826)

Di-w-lodo p-zylene C₆H₄(CH₂I)₂ [c 170°]

Obtained by boiling [4 1] C₆H₄(CH₂OH)₂ with cone HIAq for a few minutes (Grimaux, Z 1870, Slender needles, sl sol ether, v sol boiling alcohol and chloroform Turns yellow in air Not very volatile with steam

IODOPLUMBIC ACID H.PbI., v LEAD,

todide of, Combinations, No 3

IONS. The elements or radicles into which a compound is primarily separated by electro lysis (v Physical methods, section Electrical

methods)

IPECUANIC ACID C, H, O, An acid exist ing, according to Willigk (A 76, 342), along with emetine (q v) in the root of Cephalis Ipecacu anha It is extracted by boiling alcohol, ppd. by basic lead acetate, and the pp decomposed by H.S Reddish brown, very bitter, amorphous mass, m sol ether, v sol alcohol and water Colours ferric salts green, the colour being changed to violet by ammonia Its dilute solu tion does not ppt Pb(OAc), but ppts basic lead acetate Its alkaline solution absorbs oxygen from the air It thus somewhat resembles gallic acid Podwyszotzky (Ph [3] 10, 642) by extracting specacuanha with ether and light petroleum obtained an acid ('Erythrocephalein'), which formed a purple red alkaline salt, and which crystallised from chloroform in coloured needles

IPOMIC ACID $C_6H_{10}O_4$ [104°] Produced by the action of nitric acid on jalapin (Mayer, A 83, 143, Poleck a Samelson, C C 1884, 813)

Resembles sebacic acid

IRIDIUM Ir At w 1925 Mol w un known [2200°] (Van der Weyde), [1950°] (Volle, C R 89, 702), [2500°] (Pictet, C R 88, 1317) S G 22 42 at 17 5° (Deville a Debray, P M [4] 50, 651) S H 0°-100° = 0323, 0°-1400° = 0401 (Violle, C R 89, 702) C E linear 000007 (Fizeau, C R 68, 1125)

Occurrence -As metal, alloyed with Pt, Os, Ru, Rh, and Pd Specimens of platin iridium, osm iridium, &c, contain from 25 to 78 p c. Ir (v Deville a Debray, A Ch [3] 56, 431, Berzehus, P 13, 435, 527, 15, 208) In 1802 Tennant (T 1804 411) noticed a metallic residue when he dissolved Pt ore in aqua regia, this residue was examined by Descotils (Gehlen's Journ Chem 2,273), and Fourcroya Vauquelin (Gehlen's Journ Chem 3, 362) In 1804 Tennant (lc) showed that the residue contained two new metals, to one he gave the name Iridium be cause of the varied colours of its oxides, and to the other the name Osmium because of the peculiar smell of its volatile oxide

Formation —1 By digesting Ir₂O₂ or IrCl₂ with ormic acid —2 By action of sunlight on an alcoholic solution of Ir sulphate

Preparation - When Pt ore is heated with aqua regia osm iridium and platin-iridium remain

Schneider (A. Suppl 5, 261) mixes the insoluble in aque regia with N.Cl, and heats to low redness in a stream of Cl, Os 3 thus removed The residual mixed chlorides are triturated with the smallest possible quantity of water, and then washed on to a filter, the solution is treated with Cl, mixed with a little HClAq, and shaken up with excess of KCl, the pp is washed with water, and then with saturated KClAq The pp is now nearly pure K, MCl, M=Tr, Ru, and Pt The pp is dissolved in much foiling water, and H is passed in for several days (the flask being closed by a caoutchouc cork) until the supernatant olivegreen liquid treated with potash becomes colour less and then blue or turbid Pt and Ru are thus wholly ppd as metals, and most of the Ir remains in solution as IrCl, His removed by a stream of CO,—otherwise explosions occur on opening the flask from the action of the ppd Pt and Ru on the H and O in the flask-the cork is removed, and the liquid is again saturated with H, Ir is ppd on the surface of the liquid in large lustrous laminæ -2 Matthey (Pr 28, 463) prepares Ir free from all metals except Pt as follows Ordinary Ir, finely divided, is fused with 10 times its weight of Pb, the Pb s dis solved in HNO, Aq, and the insoluble is digested for a long time with aqua regia, the insoluble is fused with kHSO₄ (to remove Rh), and then melted with 10 times its weight of KOH and 3 times its weight of KNO, in a gold crucible, the cold mass is treated with cold water, in which K iridate remains insoluble. The insoluble is well washed with water containing a little KOH and NaClO, and then with water, fairly conc cold NaClOAq is added to the residual blue solid . after a time the water is distilled off, the residue is again fused with KNO, and KOH, and treatment with dilute NaClOAq and KOHAq is re-The blue solid is now dissolved in aqua regia, the liquid is evaporated to dryness, and the residue is redissolved and filtered, the darkcoloured liquid is slowly poured into conc NaOHAq containing NaClO, and Cl is passed in, the liquid being kept in a distilling apparatus, the blue oxide of Ir thus obtained is collected, washed, dried, and reduced in a mixture of CO and CO2 (made by gently warming oxalic acid with sulphuric acid) Metallic Ir is thus ob tained, while any Fe present remains as oxide The mass is heated to redness with KHSO, and repeatedly washed with ClAq to remove Au, and with HFAq to remove SiO2, it is finally washed with water and dried Pt may be removed by dissolving in aqua regia, saturating wit i NH,Cl, dissolving the double NH, Ir and NH, Pt chlor ides in hot water, reducing by SO, when IrCl, 3NH,Cl is formed, and dissolves with olive green colour, while PtCl, 2NH,Cl remains in soluble, the reduction should be stopped before the whole of the IrCl, 2NH, Cl is reduced (the presence of a little of this salt gives a deep red colour to the mixed chlorides) The solution is oxidised by HNO,, NH, Cl is added, and the ppd IrCl, 2NH, Cl is washed with NH,ClAq, and strongly heated, when Ir remains as a grey metallic powder (Claus, J pr 42, 251) Wöhler a Muckle (A. 104, 368) reduce the mixed Pt NH, and Ir NH, chlorides by digesting with slightly warm KCNAq as black insoluble scales Ir is prepared from | till the undissolved is light vellow brown, taking the residue by various methods 1 W von care to avoid excess, IrCl, 3NH, Cl is formed and

dissolves, while PtCl, 2NH,Cl remains unreduced and insoluble For other methods of preparing Ir v Deville a Debray (A Ch [3] 56, 481), Claus (C C 1862 129), Wöhler (P 31, 161, 104, 363; 107, 357), Fremy (A Ch [8] 44, 385), Martius (A 107, 360), Bunsen (A 146, 274),

Properties -- As prepared by heating IrCl, 2NH, Cl, Ir forms a grey spongy mass, Ir as a grey powder is produced by heating IrCl, 2KCl with excess of Na, CO,, washing and reducing in H, by heat ng to whiteness and compressing, a compact lustrous mass is obtained When fused in a very powerful O H flame, Ir forms a white, lustrous mass resembling polished steel, brittle when cold, somewhat malicable at red heat (D a D) Harder than iron porous Ir varies from 16 to 19 Ir which has been very strongly heated is insoluble in all acids, Ir black is sol in aqua regia. Heated in Cl, Ir black forms IrCl.

The atomic wt of Ir has been determined by heating IrCl, 2kCl in H (Berzelius, P 13, 435, 527, 15, 208), by reducing IrCl, 2NH,Cl in H and weighing the residual Ir, and by reducing the double '- K chloride in H and dissolving out the KCl (Seubert, B 11, 1767) As no com pound of Ir has been gasified, the valency of the atom of Ir in gaseous molecules is not determined From the crystalline form of osm iridium G Rose (P 77, 143) concluded that Os and Ir are 180 morphous, and that both belong to the hexagonal system

In its chemical reactions, Ir is closely re lated to Os and Pt, and less closely but very distinctly related to Ru, Rh, and Pd, all these elements are metallic, but the instability of their salts, the solubility of the hydrated oxides MO. in alkalis, and the formation of acids H2MCl, and H, MBr, show the non metallic tendencies of the Pt metals (v Noble Metals)

Ir is used alloyed with Pt for making instru ments, &c, which remain unchanged in air, eq for making the normal metre preserved as the standard of reference Stylographic pens are sometimes tipped with Ir When Ir powder is heated to whiteness with 1 its weight of P the whole melts, on cooling, the mass may be readily | (simplest formula worked, by strongly hesting with lime, the P is

entirely removed

Reactions and Combinations -1 Heated in oxygen, compact Ir is not oxidised, Ir black is oxidised to Ir,O, which decomposes again at c 1000° (Deville a Debray, C R 1878 441, cf Dissociation, vol 11 p 397) -2 Ir black 18 oxidised by fusion with nitre, potash, potassium carbonate, or potassium hydrogen sulphate -8 Heated in chlorine IrCl, is formed, mixed with NaCl or KCl, and heated in Cl, soluble IrCl, 2Na(K)Cl is formed 4 Heated in an alcohol flame, Ir becomes covered with a black ish layer which disappears on heating in air, leaving a portion of the Ir combined with C (t IRIDIUM CARBID") -5 Ir probably combines with phosphorus when the elements are heated together, when the product is heated in air, Ir and a phosphate of Ir ere formed

Iridium, alloys of Faraday a Stodart (A Ch. 21, 73), Deville a Debray (C R 81, 839), Fineau (C R 78, 1205), Morin (C R 78, 1502),

Wöhler (A 146, 875)

Osmsum-sredsum alloy

America, California, Australia, Ural Mountains, Hexagonal prisms, lustrous, steel grey Slightly malleable, S G 19 3 to 21 1 Analyses show composition approximating to formulæ Ir Os, Ir Os and Ir Os, with Ir more or less replaced by Pt, Rh, and Ru, but it is probably non homogeneous (D a D) Heated in air, OsC, is given off, heated with KNO, and KOH K osmate and iridate are formed scarcely acted on by aqua regia Alloys with Fe (F)

Platinum iridium alloy Occurs native in octahedra 1 pt Ir heated in O H flame with 10 pts Pt gives a ductile alloy, Pt alloyed with 15-20 pc Ir is insoluble in aqua regia For accounts of the Pt-Ir alloy used for making the normal standard metre v D a D and also M Alloys of Ir with Pt and Rh, and with Pt, Rh, and Sn were prepared by D a D Alloys of Ir with Cu, Au, Pb, Hg, Ru, and Sn have been prepared

Iridium, ammonio salts of, or Irid am monium salts (Ammoniacal iridium bases) IrCl₂ dissolves in (NH₄)₂CO₂Aq and on neutralis ing with HClAq, the compound IrCl_2NH₃ is produced, treated with H₄SO₄Aq, this compound yields IrSO₄ 2NH₄ IrCl₂ 2NH₃ dissolves in boil ing NH, Aq, and the compound IrCl, 4NH, forms on cooling, this compound gives a sulphate and nitrate, SO, and 2NO, replacing Cl. From IrCl, 3NH, Cl is obtained IrCl, 5NH,, and this again yields a basic hydroxide Ir(OH), 5NH,, a carbonate Ir₂(CO₃), 10NH₃, and other salts Finally by treating IrCl, 2NH, with conc HNO, Aq the compound IrCl2(NO1), 4NH, is obtained, AgNO, Aq does not ppt Cl from this salt, treated with HClAq the salt IrCl, Cl, 4NH, is produced from which AgNO, Aq ppts only half the Cl The foregoing compounds may be formulated as double salts of IrCl2, IrCl3, IrCl4, &c , with NH3, but many of their reactions are better explained if we regard them as salts of condensed ammo niums containing Ir The following classifica tion is that usually adopted

1 IRIDOSAMMONIUM COMPOUNDS NH. Ir XI, and N,H₁₂Ir X¹₂, or NH (NH₄)Ir X₂, N₂H₄(NH₄)₂Ir \2, &c, obtained from IrCl.

Iridosammonium chloride N.H.Ir Cl IrCl_2NH3 = di-ammonioiridium dichloride) A yellow, curdy pp, ob tained by dissolving IrCl, in excess of (NH,),CO,Aq and neutralising the greenish yellow liquid with HClAq Insol hot and cold Heated gives NH,Cl, HCl and Ir (Skoblikoff, A 84, 275) Heated with H2SO, Aq, easily soluble orange coloured undosammonium sulphate, N.H. Ir SO., is produced

Iridoso diammonium chloride NaH12Ir Cl2 or N2H4(NH4).Ir Cl2 (simplest formula IrCl2 4NH, = tetrammonio iridium dichloride) IrCl, 2\H, is boiled with NH, Aq until almost all dissolved, the solution is filtered and allowed to cool Nearly white pp, insol in cold water, heated, or placed in boiling water, goes to IrCl. 2NH. (Skoblikoff, lc) The sulphate, N, H12Ir SO4, 18 obtained by the action of H.SO.Aq on the chloride, and the nitrate, N.H., Ir (NO1), by addition of Ba2NO, Aq to a solution of the sulphate in warm water

· 2 IRIDO AMMONIUM COMPOUNDS N10H20Ir2 XI or N.H.(NH4), Ir, XI, obtained from IrCl, Irido pentammonium chloride N. H. Ir. Cl. Occurs in South (simplest formula Ir.Cl. 10NH, = decammonioeridium trichloride) IrCl, 3NH,Cl is dissolved in water, an equal volume of conc NH,Aq is added, a flask is quite filled with the liquid, and allowed to stand for several weeks in a warm place until the olive green colour of the liquid has changed to deep rose red, after gentle warming, to remove excess of NH, the liquid is saturated with HClAq and evaporated to cryness, the greenish yellow salt which separates during evaporation is washed with cold water, and then crystallised from water accidited with HCl Flesh-coloured, crystalline, powder, v sl sol water (Claus, J pr 63, 99, A 98, 317)

Irido pentammonium hydroxide
N₁₀H₂₀Ir₂ (OH)₆ Known only in solution which
is obtained by digesting the chloride with moist
Ag₂O Solution is alkaline, neutralised by acids
gives carbonate, nitrate, and sulphate

8 IRIDI AMMONIUM COMPOUNDS $N_4H_{12}IrCl_2X^1_2$ or $N_2H_4(NH_4)_2Cl_2.IrX^1_2$, obtained from series 1

by oxidation.

Indi-diammonium chloride? better chlorırıdı - dıammonıum chloride N₄H₁₂IrCl₂Cl₂ IrCl, 4NH, = tetrammonio (simplest formula warming iridosammonium chloride (N₂H₈Ir Cl₂) with cone HNO, Aq, dissolving the salt which separates in hot water, adding excess of HClAq, and crystallising from hot water Violet octahedra, AgNO, Aq ppts only the Cl from this salt. The salt which separates after treating N2H6Ir Cl2 with HNO_s is the N₄H₁₂IrCl₂ (NO₃)₂, AgNO Aq does not ppt Cl from this salt When this salt is evaporated with dilute H2SO, Aq, the sulphate, N4H, IrCl, SO, is obtained (Skoblikoff, Ic) Palmaer (B 22, 15) describes N₂H_{1,3}Ir Cl Cl₂, N₂H_{1,3}IrCl SO, 2H₂O, N₂H_{1,4}IrCl (NO₂), N₂H_{1,2}IrCl₂Cl, and N₂H_{1,2}IrCl (NO₂)₂, N₄I (N₄H_{1,2}IrCl₂)₂SO₄ 2H₂O

References — For other memours besides those referred to, v Weltzien, A 97, 19, Gibbs a Genth, J 1858 214, Birnbaum, B 12, 1544

Iridium, boride of When Ir is heated with B to a very high temperature a fusible mass is obtained, no definite boride has been isolated (Wöhler a Deville, A Ch [3] 52, 71)

Iridium, bromides of (Birnbaum, A 133,161) Only one bromide has been isolated, IrBr, 4H,O, there are indications of the existence in solution of a tetrabromide, IrBr, Ir does not combine directly with Br, nor is it soluble in a mixture

of HNO, and HBrAq

IRIDIUM TRIBROMIDE IrBr, 4H.O (Iridobromide Iridium sesquibromide) When the blue hydrate IrO,H, (obtained by heating a solution of IrCl, with alkali) is dissolved in HBrAq and evaporated in vacuo, olive green six-sided crystals separate, and then steel blue needles. The olive-green crystals are IrBr, 4H₂O, and the steel-blue crystals are IrBr, 3HBr 3H₂O. The bromide loses 3H₂O at 100°-120°, it is sol water, insol alcohol or ether, aqueous solution is green, but becomes blue probably with formation of IrBr.

Irndo-bromhydruc acid Irng, $3H_0O$ Crystallises in steel-blue crystals which melt at 100° , giving off $8H_0O$, deliquescent, easily sol water, alcohol, ether, oxidised by HNO_3 , probably to Irng

Ammonium-viridium tribromide, or Ammonium widobromide or bromiridite

2(IrBr, 8NH,Br) 8H,O, is obtained by reducing IrBr, 2NH,Br (forme.1 by adding IrCl, 2NH,Cl to hot NaBrAn and cooling' by SO, and neutralising by (NH,)2CO. The following other double salts are described by Birnbaum (A 133, 161) IrBr,3HgBr, IrBr, 3AgBr, IrBr, 3KBr 8H,O, IrBr, 3NaBr 12H,O

IRIDIUM TETRABROMIDE (Iridibromide) When IrO, H, is dissolved in HBrAq, or when IrBr, 2KBr is decomposed by H,2SiF,Aq, a solution is obtained which loses Br on evaporation, and on addition of HNO,Aq, efter evaporation, gives a deliquescent, blue, crystalline mass, easily sol in water and alcohol The blue solution probably contains IBr, 2HBr (Birnbaum) This solution does not yield double compounds with other metallic bromides

Ammonium viriavium tetrabromide, or Ammonium viriavbromide or brominidate IrBr₄3NH₄Br ((NH₄)₂IrBr₈) Dark blue octahedra, by adding IrCl₄2NH₄Cl to hot NaBrAq, and cooling

Potassium bromiridats IrBr, 2KBr(K, IrBr,) When solution of IrCl, or IrCl, 2NaCl, or IrCl, 2NH,Cl is warmed with con KBrAq, a greenish blue liquid is obtained from which very

greenish blue liquid is obtained from which very dark blue crystals of K₂IrBr_s separate, the salt is recrystallised from hot water Sodium bromridate also exists

Iridium, carbide of (? IrC.) When a coherent mass of Ir is held in the flame of a spirit lamp, black masses appear on the surface, these burn when heated in air and leave 80 2 pc Ir (Berzelius, P 15, 213)

Iridium, chlorides of Three chlorides are known IrCl₂, IrCl₃, and IrCl₄, as none has been gashed the formulæ are not necessarily molecular (v. Iridium, haloid compounds of) When Ir black is heated in Cl. IrCl₃ is formed, when Cl is passed over a heated mixture of Ir black and KCl, IrCl₄ 2KCl is produced

IRIDIUM DICHLORIDE (Iridosochloride) IrCl, A blackish green, insoluble, solid By passing Clover Ir black heated to low redness (Berzelius, P 13, 470) The change is not complete, as the temperatures of formation and uecomposition are nearly the same (Claus, A 59, 219) By heating Ir sulphite in Cl (Fellenberg, P 50, 66) By carefully heating IrCl, (Skoblikoff, A 84, 275) Seubert (B 11, 1761) describes an acid IrCl, H₂SO₂ 4NH₄Cl from which salts of NH₄ and Na are obtained

IRIDIUM TRICHLORIDE (Iridochloride Iriduum sesquichloride) IrCl₂ Olive gi sen solid, unsol in acids or alkalıs (Claus, A 107, 129) Obtained by heating Ir black in Cl, also by strongly heating an alkalı double salt of IrCl₂ with cone H₂SO₄ and pouring into cold water (Berzelius, P 18, 470) A soluble hydrate IrCl₃ 4H₂O is obtained by dissolving IrO₄H₄ in HClAq, reducing by H₂S, and evaporating

Double salts Ammonism indium trachloride (Ammonium chloridite) 2(IrCl, 3NH,Cl) 3H,O, formed by slowly evaporating mixed solutions of IrCl, 3NaCl and NH,Cl, or by reducing IrCl, 2NH,ClAq by H,S, adding cone NH,ClAq, filtering if necessary, and slowly evaporating (Claus, J pr 42, 351; Seubert, B. 11, 1761), alive green, rhombe, plates

Potassium chloreridits IrCl, 3KCl 3H2O By reducing IrCl, 2KClAq by H.S, and evaporating with addition of KCl Olive-grien efflorescent prisms The following double salts are also known —2IrCl, (12NH, Co)Cl., IrCl, 3HgCl, IrCl, 3AgCl, IrCl, ENaCl 12H₂O (Claus, lc, Karmrodt a Uhrlaub, A 81, 120)

Iridium TETRACHLORIDE (Iridichloride) The solution obtained by decomposing IrCl, 2NH, Cl suspended in water by Cl contains IrCl. (Vauquelin, A Ch 89, 150, 225), a solution of IrCl, is also obtained by dissolving IrO,H, in HClAq, digesting IrCl, Aq with aqua regia, or decomposing IrCl, 2KCl with H,SiF, Aq (Ber.e hus, P 13, 470) By evaporating these solutions to dryness at temperatures not above 40°, IrCl, is obtained as a black mass, tr nslucent with darkred colour at the edges, very deliquescent, decomposed by heat to IrCl, and Cl, and then to Ir, combines with alkali chlorides to form double salts Ammonium iridium tetrachloride (Ammonium chloriridate) IrCl, 2NH, Cl, obtained by mixing conc solu-tions of NH, Cl and IrCl, or IrCl, 2NaCl Crys tallises from hot water in dark red brown octa hedra, isomorphous with PtCl, 2NH,Cl S 5 in cold water Reduced by SO, to the more soluble IrCl. 3NH,Cl.

Potassium chloriridate IrCl, 2kCl Formed by mixing conc solutions of its constituent salts, also by dissolving IrO,H, in HCl. q (solution probably contains H,IrCl, and adding KCl, also by passing Cl at a gentle heat over an intimate mixture of Ir black and KCl, dissolving in hot water, filtering from Ir, evaporating to dryness with addition of aqua regia, dissolving out KCl by small quantities of cold water, dissolving in hot water, adding a little aqua regia, and evapo rating to the crystallising point Black octa hedra, very sl sol cold water, much more sol hot water, insol alcohol Heated, goes to hot water, insol alcohol Heated, goes to IrCl, 3kCl and at higher temperature to Ir

and KCl

The following chloriridates have also been obtained -IrCl, 2(NH, CH, Cl) (Vincent, C R 100, 112), Ircl, 2NaCl 6H,O (Vauquelin, lc, Berzelius, lc)

Iridium, cyanides of, also Iridicyanides, v

vol n p 332

Iridium, haloid compounds of The only haloid compound certainly formed by direct union of the elements is IrCl, When an intimate mixture of Ir black and KCl is heated in Cl, or of Ir black and KI is heated in I, the double salt K2IrCle or K2IrIe is obtained. The following formulæ present the composition of the haloic compounds and the double salts which they form with alkali haloid compounds - probably with formation of studies, IrO, 2H,O

double alkalı-ırıdıum haloid salts are probably better regarded as salts of the acids H₂IrX₄, H₂IrX₅ and H₂IrX₆ The chlorizidates (salts of H₂IrX₆ and H₂IrX₆ The chloriridates (salts of H₂IrCl₆) are readily reduced to chloriridates (salts of HaIrCla)

Iridium, hydroxides of, v Iridium, oxides and hydrated oxides of

Iridium, iodides of (Oppler, Ueber Iodver bindungen des Iridiums [Göttingen, 1857], J 1857 263) Two iodides, IrI, and IrI, have been isolated There are indications of the existence of IrI, Ir and I do not directly com

IRIDIUM DI IODIDE (Iridoso iodide) brown solid obtained by leading SO, into IrI, suspended in water is perhaps IrI. When a solution of IrCl, 2NH, Cl in boiling KIAq is allowed to cool, a black crystalline powder separates, this is ammonium iridium di iodide, Irl, 2NH,I

IRIDIUM TRI IODIDE (Irido vodide sesqui iodide) IrI, A black crystalline pp , by adding NH Cl to IrI, 2kIAq cold water, more sol hot water Very slightly sol

Double salts - Ammonium iridium tri vodide (Ammonium vodiridite) 2(IrI, 3NH,I) H2O Crystalline needles, by dissolving IrCl, 2NH,Cl in boiling KIAq, cooling, filtering Irl, 2NH, I, concentrating, and recrystallising from hot water

Potassium iodiridite, Irl, 3KI Green lus trous crystalline powder, by reducing IrCl, by H.S with addition of KIAq Silver codiridite, AgI 3KI, has also been obtained

IRIDIUM TETRA IODIDE (Iridi todide) IrCl, black powder, by boiling IrCl, Aq with KI in presence of a little HCl

Double salts -- Ammonium iridium tetra vodide (Ammonium vodiridate) IrI, 2NH,I Se parates after some weeks from solution of IrCl, 2NH,Cl in cold conc KIAq, dark brown lustrous crystals, easily decomposed by heat, aqueous solution gently heated deposits Irl, and IrI, 2NH, I Potassium iodiridate, K, IrI, Sepa rates, after IrI,, from solution of IrCl, in KIAq Also formed by dissolving IrI, in KIAq, and allowing to crystallise, also, in small quantity, by action of I vapour on an intimate mixture of Ir black and kI at 60°-70° Sodium vodiridate, Irl, 2NaI, has also been obtained

Iridium, oxides and hydrated oxides of The only oxides of Ir which have been cer tainly isolated are Ir₂O₂ and IrO The former forms a hydrate with 3H₂O, and another hydrate probably with 5H,O IrO, forms the hydrate ÎrO, 2H,O Hydrated Ir,O, dissolves in alkalis

Double salts. IrX, 3MX IrX, 2MX IrX, IrX₂2MX Br, Br. ? Br, in solution Cl.

None of the Ir haloid compounds has been | dissolves in some acids, but no salts have thus gasified The formulæ are given from the anaother Pt metals The only binary compounds of Pt metals which have been gasified are OsO, and RuO, The and H,IrBr, has been obtained The decomposes again at c 1000°. IrO, is the most Vol. III logies between these compounds and those of

be n prepared Alkaline widates appear to exist. There are indications of the existence of an oxide stable oxide, Ir₂O₈ xH₂O rapidly absorbs O from

the air, and passes into IrO2.xH2O

IRDOUS OXIDE (Iridium monoxide) IrO When IrOl, is boiled with KOHAq a black powder separates, this is probably IrO (Berzelius, P 13, 479) Claus (4 59, 249) thinks that this oxide is obtained by heating one of the double salts of IrSO₂ with K₂CO₃ in a stream of CO₂. On adding KOlAq to IrCl₂ 3NaClAq, and filtering, a solution of IrCl₂ is obtained, when K₂CO₄Aq is added to this liquid (or to IrCl₂ 3KClAq) a greyish green pp is formed, which is probably a hydrate of IrO, the pp is sol in excess of K₂CO₂Aq (Berzelius, Ic) A few salts derived from IrO are known, eg IrSO₂4H₂O, they are not, however, formed directly from the oxide, but by reducing IrO₂2H₂O or chloridates by SO₂

IRIDIC OXIDE AND HYDRATE (Iridium dioxide) IrO, and IrO, 2H,O By adding excess of alkali to IrCl,Aq and heating, a heavy indigo blue pp IrO, 2H,O is produced The same compound is obtained by using IrCl, Aq in place of IrCl, and allowing the pp to stand in the air, when ıt absorbs O The pp is soluble in HClAq with formation of IrCl,, it is insoluble in dilute H₂SO₄Aq or HNO₂Aq When the hydrate is heated in a stream of CO₂, IrO₂ remains as a black powder quite insoluble in acids (Claus, A 59.249) No salts corresponding with IrO2 have been prepared By adding CaOAq to a solution of IrO,H, in HClAq a blue pp is obtained, which is a compound of IrO, with CaO When Ir black is fused for some time with KNO, and the blackish-green mass is treated with water, part dissolves, forming a deep indigo blue solution, and part remains as a black crystalline powder The quantity of K in this powder is variable, but the ratio of Ir O is always 13 (Claus, A 59, 249) The powder is probably an iridate of K, IrO, xK,O

IRIDO-IRIDIC OXIDE AND HYDRATES (Iridium sesquioxide) Ir₂O, and Ir₂O, xH₂O The oxide Ir.O. is obtained by heating IrCl, 2KCl with 2 parts K₂CO₂, or Na₂CO₃, in a stream of CO₂, washing the fused mass with boiling water, and then with water containing NH,Cl, heating to remove NH₄Cl, treating with acid to remove alkali, and again washing with water (Claus, A 59, 249) A hard blue black powder, decomposed by heating to c 1000° into Ir and O (Deville a. Debray, C R 1878 441, cf Disso ciation, vol in p 397) Reduced to Ir by H at the ordinary temperature The hydrate $Ir_2O_2 8H_2O(=IrO_3H_3)$ is obtained by adding to IrCl, 2NaClAq so much KOHAq that all remains dissolved, and then heating or ppg by alcohol Black pp insol in acids except conc HClAq, which dissolves it very slightly By adding a little KOHAq to solution of an alkaline chloriridate, and quite filling a flask with the liquid, a yellow green pp forms, which is probably $Ir_2O_3 5H_2O$, it oxidises very easily to the blue IrO.2H.O, easily soluble in the slightest excess of alkali De Boisbaudran (C R 96, 1236, 1400, 1551) describes a violet coloured pp, which is probably Ir,O, xH,O, obtained by adding alkali to Ir,(SO,), 3K,SO,Aq (this salt is formed by heating Ir compounds with KHSO, and treating the product with K2SO,Aq) salts, and some double and basic salts, corresponding with Ir.O. are known, they are pro-

duced indirectly. The sulphites and double sulphites are produced by reducing IrO₂2H₂O or information by SO₂. By adding CaOAq to IrCl₂Aq a yellow pp of Ir₂O₃ 3CaO is produced (Claus, 4 59, 249). Compounds of Ir₂O₃ with NO₂ and with intries are described by Gibbs (B 4, 280).

Iridium, oxychloride of An oxychloride of Ir is said by Berzelius (P 18, 484) to be formed as a yellowish-brown pp by adding a small quantity of HgNO₂Aq to IrCl₄2KClAq, HgCl₃ goes into solution, addition of more HgNO₃

causes ppn of HgCl

Iridium, phosphide of. When Ir is very strongly heated with 1 its weight of P, the whole melts By heating the product with CaO the P is removed Ir and P probably combine when heated together, but no phosphile of Ir has been isolated

Iridium, salts of Very few salts of 1r are known other than the haloid compounds Iridous sulphite, IrSO, 4H₂O, and some double sulphites, irido iridio sulphite, Ir₂(SO₂), 6H₂O, and several double and basic sulphites, and a few other salts (chiefly double and basic), corresponding with Ir₂O₂, have been isolated None of these salts is obtained from the corresponding oxide, the sulphites, which are the best known salts, are formed by reducing IrO₂.2H O, or chloriridates, by SO₂Aq

Iridium, sulphides of Three sulphides of Ir are known, IrS, Ir.S₁, and IrS₂ Ir combines

with S when heated with it

IRIDOUS SULPHIDF IRS (Iridium monosul phide) A blue black solid, by heating Ir S₂ or IrS₂ (Berzelius, P 13, 487, Böttger, J pr 8, 227) The pp obtained by passing H₂S into a solution of an iridous compound is probably IrS Does not decompose by heating in absence of air, roasted in air gives SO₂ and a basic sulphate The ppd sulphide dissolves in KHSAq

IRIDIC SULFHIDE IrS₂ (Iridium disulphide) A black powder, obtained by strongly heating Ir black with S and Na₂CO₃, and washing with water (Fellenberg, P 50, 66) Heated in air gives SO₂ and Ir Berzelius (lc) obtained a dark brownish-yellow pp by passing H₂S into IrCl₃Aq, heated, this gave IrS

IRIDO IRIDIO SULPHIDE Ir₂S. (Iridium sesqui sulphide) A brown black pp by passing H₂S into solution of an irido iridic compound Heated gives SO₂ and S, and leaves IrS (Berrelius, Ic)

M M P M

IRIDOLINE $C_{10}H_9N$ (252°-257°, S G 15 1072 A base occurring in coal tar oil (G Williams, Tr E 21, 377, C J 16, 375)

IRIDOSMIUM v Iridium, Alloys of, p 47
IRIS CAMPHOR C₈H₁₆O₂ Occurs in the root of Iris florentina (Dunas, A 15, 158) Pearly plates, volatile with steam Insol water Fluckiger (Ar Ph [3] 8, 481), by distilling iris root with steam, obtained crystals of myristic acid saturated with a fragrant oil

IRISH PEARL MOSS v Caragneen moss IRISIN $6C_aH_{10}O_s$ ag $[a]_D=-51^\circ$ A carbohydrate extracted from the rhizomes of the water lily (*Iris pseud acorus*) with water and then ppd with lead acetate Probably identical with graminin (Wallach, A 284, 384, B 21, 396)

Properties — More strongly laworotatory than inulin —1 Does not reduce Fehling's solu-

IRON. 51

tion Is very easily converted into sugar (chiefly levulose) by weak acids. Gives no colouration with iodine V sol strong HI solution from which solution NaOH separates iodoform. Also sol HCl, and NaOH. Irisin is nearly 4 times as soluble as inulin in water at 22°. Under the microscope the globules of irisin resemble those of inulin, but do not exhibit double refraction.

IRON Fe At w 559 Mol weight un known [1550°] (Poullet), [1587°] (Daniel), Tr 1880), [1600°] (Pictet, P M 1879 446) SG determinations vary from 6 95 (Roberts a Wrightson, A Ch [5] 30, 274) to c 82 Almost pure Fe has SG c 7 85 *t 16° according to Caron (C R 70, 1263), 8 139 according to Chandler-Roberts (C N 31, 137) SH 111641 at 0°, 112359 at50°, 118795 at 10° (Byström, Oefvers k Vetensk Forrhandl [Stockholm, 1860] 17, 307, v also Weinhold, P 149, 214) CE 0000, 233 at 13° to 100° (Kopp, A 81, 1, v also Fizeau, A Ch [4] 2, 143, C R 68, 1125) T C (Ag = 100) 11 9 (Wiedemann a Franz, P 89, 497) E C (Hg at 0° = 1) 9 68 at 0°, 6 19 at 100° (Lorenz W 13, 422, 582) Crystallises in regular system (Fuchs, A 84, 257) Emission spectrum is very complex (Angström, P 94, 141, Cornu, Spectre Normal [Paris, 1881], Liveing a Dewar, Pr 29, 402, 32, 402) Some of the thermal data for Fe are presented in the following table (Th 3, 293) —

 $X [Fe, X^2, Aq]$ Cl = 99,950 Br = 78,070 I = 47,650

 $\begin{array}{c} I = 47,650 \\ [\text{Fe,Cl}^{\bullet},\text{Aq}] = 127,720 \; , \; [\text{Fe',O'},3\text{H}^{2}\text{O}] = 191,150 \; , \\ [\text{Fe}^{2}\text{O'},\text{H}^{\bullet},3\text{H} \; \text{SO'},\text{Aq}] = 33,840 \; , \\ [\text{Fe,H'},\text{SO'},\text{Aq}] = 24,840 \end{array}$

For further details regarding physical properties v Rammelsberg's Hand der hyst physikal Chemie, 1, 193 For the physical properties of different kinds of pig iron, wrought iron, and steel, v Diotionary of Applied Chemistry

Occurrence — The metal itself is found in small quantities in rocks of volcanic origin and in lavas, it also occurs in meteorites. Compounds of iron are very widely distributed, and occur in immense quantities. The spectroscope shows the existence of iron (or iron compounds) in the sun and other stars. The chief ores of iron are hamatite, FeO, brown iron ore, FeO, H₂O, yellow ochie, FeO, 2H₂O, magnetic iron ore, FeO, spathic ore, FeCO, pyrites, FeS, (the 'ormulæ express approximately the compositions of the ores)

Preparation —Commercial iron, whether pig iron, malleable iron, or steel, always contains more or less C and Si, and generally small quantities of P and S, sometimes also traces of Mn, Ti, Ni, Co, Cu, Sb, and As 1 Wöhler (A 94, 125, 95, 192) prepares Fe₂O₅ by heating FeSO₄ crystals with 2-3 parts NaCl in a crucible and washing with water, and reduces the Fe₂O₅ by heating in H (cf G de Claubry, C C 1859 214, Luca, C R 1851 332, 1852, 202). Moissan (C R 89, 176) says the reduction must be carried out at c 700°—2 By reducing FeCl₂ in a stream of H (Peligot, C R 19, 670), or in neutral solution at b point by Zn (Capitaine, C R 9, 757), or by Zn vapour at a high temperature (Poumarèds, C R 29, 518)—3 Troost melts

pig iron in a lime crucible by the O-H flame (BL [2]9,250)—4 A mixture of dry Na,80, and FeSO, is heated in a Pt crucible so long as SO, comes off, the residue is washed with cold water, and the crystalline Fe,O, is reduced in H in a Pt crucible, and the Fe is melted in the O-H flame (Ma'thiessen a Prus Szczepanowski, C N 20, 501)—5 By electrolysing FeSO,4q saturated with NH,Cl, Fe appears at the negative pole (a large iron plate), it contains H and other gases, which may be removed by heating (Varrentrap, D P J 187, 152, Lenz, J pr 108, 438)

D P J 187, 152, Lenz, J pr 108, 438)
Properties —A lustrous, greyish white metal Crystallises in regular cubes or octahedra Annealed wrought iron wire is extremely tenacious. Such mechanical treatment as hammering, bending, or torsion changes many of the physical The physical properties properties of iron which have been determined are for the most part those of iron containing small quantities of foreign substances Iron is magnetic (cf Faraday, P 70, 24, Gore, P M [4] 40, 170) Pure, or almost pure, Fe is softer and more malleable, but less tenacious, than ordinary malleable iron The iron obtained by reducing Fe₂O₂ in H at temperatures below c 600° is pyrophoric, the powder obtained at c 700° is non pyrophoric (Moissan, C R 89, 176) By passing a weak electric current through FeSO₂Aq mixed with MgSO, Lenz (C C 1870 188) obtained a greyish, non crystalline, very brittle mass, easily pulverised by the finger, this iron contained c 200 times its volume of gases, chiefly H (v Iron, hydrides of), mixed with CO, CO2, N, and H2O vapour, by heating in vacuo the gases were removed, and the iron then resembled Pt in appearance Iron is unchanged in dry O, but in moist O or in ordinary air it is slowly oxidised to $\Gamma \in O_1 \times H_2O_1$, heated in air or O a mixture of Fe O, and Fe,O, is produced Iron combines directly with the halogens, also with S, C, B, Si, P, As, it forms alloys with many metals Iron dissolves in the common mineral acids with formation of salts Finely divided Fe decomposes water at 100°

The atomic weight of Fe has been determined (1) by analysing and determining V.D of FeCl₂ and FeCl₂, (2) by determining S H of Fe, (3) by reducing Fe,O₂ in H (Berzelius, P 8, 165, Svanberg a Norlin, A 50, 432, Erdmann a Marchand, J pr 33, 5, Rivot, A Ch [3] 30, 192), (4) by transforming Fe into Fe,O₃ (B, A 50, 432, S a N, lc, Maumené, A Ch [3] 30, 380), (5) by determining the Cl in FeCl₂ and in FeCl₃ (Dumas, A Ch [3] 55, 157) The atom of Fe is trivalent in the gaseous molecule FeCl₃, and divalent in the gaseous molecule FeCl₂ (v Iron, chlorudes of)

Iron is distinctly a metallic element, it replaces the H of most acids, forming two series of salts, the simplest formulæ for which are FeX_2 and FeX_3 respectively, X = Cl, NO_2 , SO_4 , PO_4 &c The ferrous salts, FeX_2 , are

 $\frac{SO_4}{2}$, $\frac{FO_4}{8}$ do The ferrous salts, FeX₂, are easily oxidised to ferric salts, FeX₂, very many salts, both normal and basic, of both series have been isolated, numerous double salts

have been isolated, numerous double salts are also known. Fe₂O₂ forms compounds with several oxides more basic than itself, eg with K₂O, BaO, CaO, MgO, these compounds may be

52 IRON

regarded as ferrites derived from the hydroxide $\mathbf{Fe}_2\mathbf{O}_4\mathbf{H}_2(=\mathbf{Fe}_2\mathbf{O}_3\mathbf{H}_2\mathbf{O})$ There are also some salts known as ferrates, e g K₂FeO₄ and BaFeO₄, which may be looked on as derived from the hypothetical ferric acid H2FeO4, but neither this acid nor its anhydride, FeO₃, has been isolated (v FERRATES and FERRITES, vol 11 pp 546-7) Fe₂S₃, like Fe₂O₄, forms some double compounds with more basic sulphides, these double compounds may be regarded as thioferrites (v Iron, sulphides of) Fe is closely related to Co and Ni, these three metals show some marked analogies with the Pt metals, Fe is also related to Cr and Mn, and it shows some resemblance to Al and the other earth metals (v Iron Group OF ELEMENTS, also Noble METALS, and cf CHROMIUM GROUP OF ELEMENTS, and EARTHS, METALS OF THE)

Reactions and Combinations -1 Heated in aw or oxygen Fe is oxidised to Fe₂O₃ and Fe₃O₄ 2 Unchanged in dry air at ordinary temperature, but rusts in moist air to Fe₂O₃ xH₂O -Finely divided Fe decomposes water at 100° (v Ramann, B 14, 1433), and rapidly decom poses steam Compact Fe decomposes steam at red-heat, Fe₃O, 18 produced Iron slowly rusts in contact with water and ordinary air, the formation of Fe₂O₃ xH₂O proceeds slowly at first, and then more rapidly, probably because the Fe and Fe₂O₂ exert an electrolytic action on the water, presence of ammoniacal salts increases the rate of rusting, alkalis and alkaline carbonates hinder the rusting According to Calvert (C N 23, 98) Fe does not rust in water if CO₂ is absent For an account of the retard ing or hastening action of various salts on the rusting of Fe v Wagner, D P J 218, 70 Various processes have been used for preventing iron rusting, covering the iron with Zn is frequently done, Barff a Bower heat the iron to c 650° in water vapour, whereby a hard protect ing film of Fe,O4 is formed on the surface of the iron —4 Fe decomposes solution of hydrogen peroxide, forming Fe₂O₅H₆, the Fe becomes covered with bubbles of O (Weltzien, A 138, 129) -5 Iron dissolves in dilute sulphuric or hydrochloric acid with evolution of H conc sulphuric acid is almost without action on Fe, when heated, SO₂ is evolved, and Fe₂(SO₄)₂ formed Dilute nitric acid dissolves Fe, forming Fe(NO₃)₂ and NH₄NO₃ with evolution of N oxides Conc nitric acid is almost without action on Fe, v infra, Passivity of iron -6 Heated repeatedly with caustic soda solution Fe forms crystals of Fe₂O₃ H₂O (Brunck a Graebe, B 13, 725) -7 When Fe is heated to redness in a stream of ammonia a nitride of Fe is formed, Fe, N, according to Stahlschmidt (P 125, 37) — 8 Fe heated in a closed tube with solution of sulphur dioxide to 200° forms solution of FeSO, and FeS₂O₂, and crystals of FeS₂ (Gentner, A 129, 350) —9 Fe is oxidised to Fe₂O₂, or K₂FeO₄ (v vol. 11 p 547) by fusion with potassium nutrate -10 Fe combines with the halogens, with arsenic, boron, carbon, hydrogen, nitrogen, phosphorus, and sulphur (v Iron, chlorides of, borides of, corbides of, &c), it also folms alloys with several metals (v Iron, alloys of)

Passesty of eron Iron is not acted on by cone nitric acid, iron which has been immersed in cone nitric acid does not dissolve in dilute

nitric soid, nor does t ppt Cu from CuSO, Aq; such Fe is said to be passive Co and Ni, and per laps B1, also show passivity According to Varenne (A Ch [5] 19, 251, 20, 240) immersion of iron in soid of 100 pc HNO, is not accompanied by evolution of any gas, if the acid has SG 1382 (c 63 pc HNO₃) NO is evolved coprously for 3 to 20 records and then ceases. in. both cases the Fe becomes passive Acid of less SG than 1 299 (c 47 nc HNO_s) does not pro duce passivity If part of a rod of Fe is dipped into conc acid, and then the whole is carefully immersed in a dilute acid, the whole rod is pas-These facts are e-plained by Varenne by supposing that a gaseous film is deposited on the surface of the iron, and protects the iron from the action of the ac 1, the gas dissolves in the more dilute acid, in the case of the partly immersed rod the gas bubbles are removed from one part and then adhere to the other part of the rod This view was also upheld by Mousson (P 39, 330), but was controverted by Faraday and Schönbein (P 39,342), and Beetz (P 67,286,365) Ramann (B 14,1430) considers the passivity to be due to a layer of Fe,O,, which is soluble in dilute, but insoluble in cone , nitric acid R thinks that immersion in the acid produces Fe(NO₃), and that this then reacts with the Fe to produce Fe₃O, and NH,NO₃, iron wire, according to R, becomes passive when partly heated, also by making it the positive electrode in an O containing liquid Various oxidising agents acting on Fe render it passive, eg HClO₃, CrO₃, H₂O₂ (Keir) The passivity of Fe 13 removed by strongly rubbing the iron, or heating it in reducing gases, also by bringing it into contact According to Saint Edme (C R 106, 1079) commercial sheet Ni is passive in ordinary HNO, Aq, Fe in contact with Ni becomes passive in the acid, passive Ni remains passive when heated to bright redness in H, whereas Fe loses its passivity

Detection and Estimation —Fe compounds are detected by giving a reddish green colour to the hot borax bead in the oxidising flame, which becomes bottle green to nearly colourless when cold, also by the ppn, of brown red Fe₂O₃xH₂O by alkalis from ferric compounds, K₃FeCy₆Aq gives a deep blue pp with ferrous salts, and no pp but a brownish colour with ferric salts Fe is estimated, gravimetrically, by ppn as Fe₂O₃xH₂O and weighing as Fe₂O₃, volumetrically, by titration with KMnO₄Aq or K₂Cr₂O₃Aq For details and for other methods v lanuals of Analysis

Metallurgy of von Pure iron is too soft and has too little tenacty for use in making machinery, &c Ordinary iron is divided into three kinds pig or cast iron containing from 2 to 5 75 pc C, bosides small quantities of Si, P, S, and traces of metals other than Fe (chiefly As, Ti, V, Cr, Mn, Cu), malleable or wrought iron containing less than 5 pc C, and steel containing about 1 pc C Pig iron is obtained by very strongly heating Fe ores with lime and coal in large furnaces, and blowing in air at the bottom of the furnaces, the C of the coal is burnt chiefly to CO, and this reacting with oxides of Fe produces Fe, which then combines with, or it may be only dissolves, carbon, the C seems to be produced by a reaction between the partly reduced Fe,O.

and CO (v Bell, C J [2] 7, 203) The reduction of Fe₂O₃ is probably sided by cyanides present in The greater part of the for agn the furnace matter of the iron ores is removed in the form of a fusible slag consisting of silicate of Fe, Ca, Mg, Al, Mn, &c Wlought iron is obtained by puddling cast iron, in this process the cast iron is strongly heated along with lumps of Fe.O. in a reverberatory furnace, the Fe₂O, is partially deoxidised, and the O is used in burning the C, Si, S, and P, the C being thus almost entirely removed as CO or CO, Steel is obtained by com pletely removing the C from wrought iron by blowing in air, and then adding a sufficient quan tity of Fe containing a known quantity of C Steel is also rometimes made by causing wrought aron to take up C by stro gly heating the iron with charcoal Cast iron is more fusible, harder, and more brittle than wrought iron, which is more ductile and malleable than cast iron Steel combines the malleability and ductility of wrought iron with the fusibility of cast iron, at is also very hard and elastic Cast iron is divided into two kinds grey cast iron, granular, with low malleability, SG c 71, melting at c 1600°, this variety contains C partly in combination with Fe and partly un combined as graphite, white cast iron, harder but not so strong as grey, SG c 75, melts at a lower temperature than grey, this variety contains only combined C By me ing grey, and cooling rapidly, white, cast iron is obtained, by melting white, and cooling slowly, grey, cast iron as produced I or details of the metallurgy of iron v Dictionary of Apilifd Chemistry

Iron, alloys of Iron alloys with many me tals, the softer metals—Ag, Sn, Zn &c—become harder and more tenacious when alloyed with a few parts of iron per thousand, the alloys may generally be prepared by fusing the various metals with iron wire, a little I e₂O₂ being added

to remove C from the iron

Alloys with aluminium have been described, approximately Al.Fe (Wohler, A 115, 102) ap proximately Al.Fe, and All'e, (Calvert a John son, J 185a 32b) Sonnenschein (J pr 66, 168) described an alloy with lead having a com position approximating to Ph.Fe An amalgam of iron is formed by mixing finely divided he with Na amalgam, adding a little water, and squeez ing out excess of Hg, the crystals correspond in composition to Hg, Fe, , they slowly undergo de composition, rapidly when much compressed (Raman., B 14, 1433) Alloys with the fol lowing metals have been described --Sb, Cu (Musket, P M [3] 6, 81), Mn (M, lc), Mo (Heine, J pr 9, 176, Stromeyer, P 28, 551, Wiggens, P 28, 565, Steinberg, J pr 18, 379), Ni, Pd (Faraday a Stodart, Tr 1822 254), Pt (Schönbein, P 42, 17, Boussingault, A Ch [2] 53, 441), K (Calvert, P M 1855), Rh (F a S, &c), Sn (Lassingne, J Chim med 6, 609), Ti (Riley, C J 16, 387), W (Bernouilli, P 21, 573), Zn (Percy, Metallurgy, 2, 153)
Iron, arsenides of The minerals arsenical

Iron, arsenides of The minerals arsenical pyrites and mispickel are compounds of Fe with As and with As and S respectively, their compositions approximate to the formulæ FeAs, and FeAsS Brittle masses are obtained by fusing together As and Fe out of contact with air, but

they have not been much examined

Iron, borides of When Fe is heated in a stream of BCl, vapour, a hard, white substance is obtained, which is decomposed by boiling water forming H₂BO₂ (? and Fe₂O₃), and evolving H (Fremy, Wurtz's Dict de clim 1, 1417) by heating ferric borate in H, Lassaigne (J Chim met 3, 535) obtained a similar compound, no analyses are given

Iron, bromides of Two exist, FeBr, and FeBr,, both are produced by the direct union of their elements. Neither has been gasified, the formula are given because of the analogues between these salts and FeCl, and FeCl, (v Iron,

chlorides of)

FERROUS BROMIDE (Protobromide of 1ron)
FeBr₂ A yellow solid, obtained by heating
excess of Fe in Br vapour, soluble in water,
solution deposits crystals FeBr₂ 6H₂O, decom
posed by heating in air to FeBr₃ and Fe₂O₃
(Scheufelen, A 231, 156) Thomsen gives
[Fe,Br²,Aq] = 78,070 (Th 3, 294)

Ferric Bromide (Sesquibronide of iron)
FeBr, Dark red crystals, obtained by heating
Fe in excess of Br vapour, may be sublimed,
with partial decomposition, out of contact with
air, deliquescent Aqueous solution very easily
partially reduced by heating to FeBr, (L de
koninck, Zeit anorgan Chemi, 1889 149)

Iron, carbides of Whether pig iron is a carbide of iron, or a mixture of carbides and free C, cannot yet be regarded as finally settled The presence of a few per cents of C in iron very much modifies the properties of the whole, by making it more fusible, if from 2 to 15 p C is piesent, the mass is only fusible with difficulty, but is very hard and tough, it has the properties of wrought iron or steel, according to the quantity of C Iron takes up C directly, and by so doing has its properties changed On the temperatures at which carburation of Fe occurs with amorphous C, diamond, and graphite, t Hempel, B 18, 998

The following carbides of Fe have been described, but the investigation of none of these bodies is complete —(1) Fe₁C, a brittle, fusible mass, by melting together an intimate mixture of equal parts of Fe and C (Faraday a Stodart, G A 66, 183), (2) FeC₂, a black pyrophonic powder, by heating H₄FeCy₅, or (NH₄)₄FeCy₅, out of contact with air (Berzelius), or by fusing K₄FeCy₅, and washing away the KCN produced (Rammelsberg), (3) FeC₅, was obtained by Karsten by the action of dilute acids on grey pig-iron (S 68, 182), (4) FeC, by the action of Br or I on pig iron (Berthier, J 1862 127)

Iron, chlorides of Two chlorides of iron, FeCl, and FeCl, have been isolated, and a third, Fe,Cl, perhaps exists When Fe is heated in a stream of Cl, both FeCl, and FeCl, are pro-

duced

Ferrous chloride FeCl₂ (Iron dichloride on protochloride) Mol w 126 64 (v infra) S G 2 528 (Filhol, A Ch [3] 21, 415), 2 988 at 17 9° (Clarke's Specific Gravity Tables [new ed] 24) V D 62 79 at 1300°-1400°, 61 55 at 1400°, 1500° (Nilson a Pettersson, C J 53, 828) V D at Jellow heat 94 4 (V Meyer, B 17, 1335), calc for FeCl₂ 63 32, for Fe₂Cl₃ 26 64 (v infra). H.F [Fe,Cl²] = 82,050, [Fe,Cl²,Aq] = 99,950; [FeCl²,4H²O] = 15,150 (Th 3,293)

Formation.—1. By heating excess of Fe filings

or wire in Cl.—2 By partially reducing FeCl, in H (Wöhler, A 4, 255) -3 By dissolving Fe in HClAq out of contact with air, evaporating, and drying in a stream of H—4 By heating Fe filings with NH Cl out of contact with air

Preparation — Fe wire is heated in a stream of dry HCl, and the product sublimed in the same

gas (Wöhler a Liebig, P 21, 258)

Properties and Reactions - White, lustrous, six-sided, deliquescent, tablets Heated very strongly in N forms FeCl, and Fe (V Meyer, B Heated in O, forms Fe,O, with evo-17, 1335) lution of Cl Oxidises readily in air to a mixture of FeCl, and Fe₂O₃. Heated to redness in steam forms Fe₃O₄, HCl, and H. Heated to red ness in a stream of NH, Fe, N, is produced (Fremy, C R 52, 321) Heated with PH, forms HCl and Fe phosphide A mixture of FeCl, and O is reduced by Zn vapour with separation of Fe ın crystals (Poumarède, C R 29, 520) S c 50 at 80°, less sol in HClAq

Molecular weight of gaseous ferrous chloride By volatilising in HCl at a yellow heat, V Meyer got values for V D which were about the mean between those calculated for FeCl, and Fe_2Cl_4 (B 17, 1335), calculated for $FeCl_2 = 6332$, for $Fe_1Cl_4 = 126.64$, observed 92.32 and 96.51 Meyer concluded that molecules of Fe,Cl, pro bably exist at lower temperatures and molecules of FeCl₂ at a very high temperature Nilson a Pettersson (C J 53, 827) obtained values for V.D at c 1400° agreeing with that calculated for FeCl₂, calculated = 6332, observed at 1300° $1400^{\circ} = 6279$, at $1400^{\circ} - 1500^{\circ} = 6155$ can be no doubt then that molecules of the com position FeCl₂ exist at c 1300°-1500°

Combinations -1 With water to form the hydrates FeCl, 2H2O and FeCl, 4H2O The for mer is obtained by saturating warm conc HClAq with FeCl₂ or by passing HCl into saturated FeCl, Aq, the latter is produced by dissolving Fe in HClAq and concentrating out of contact with air FeCl₂ 4H₂O forms blue green, monoclinic, deliquescent, transparent crystals, SG 193—2 With nitric oxide, solution of FeCl₂, especially an alkaline solution, absorbs NO forming a green-brown liquid which contains FeCl, NO, NO is removed by warming -3 With ammonia to form FeCl₂ 6NH, and 3FeCl₂ 2NH, (Rog stadius, J pr 86, 310) The former is a white powder, produced by passing NH, over FeCl, at the ordinary temperature, the latter is formed by slowly heating FeCl, 6NH, to melting strongly heating 3FeCl., 2NH, in NH, the nitride Fe, N, 1s formed (Fremy, C R 52, 321) -4 With ammonium chloride to form FeCl, 2NH, Cl, obtained by crystallising mixed solutions of FeCl, and NH,Cl, or, according to Hisinger a Berzelius (G A 27, 273) (with evolution of NH, and H), by boiling Fe filings with NH,ClAq (cf. Winkler, R. P. 59, 171, Vogel, J pr 2, 192) A compound FeCl₂2KCl 2H₂O is also known (Scha bus, W A B 1850 475) Compounds with CdCl, and HgCl, viz FeCl, 2CdCl, 12H,O and FeCl, HgCl, 4H,O are also described (v Hauer, W. A B 17, 331)

FERRIC CHLORIDE (Iron sesquichloride o perchloride) FeCl. Mol w 162 01, and probably also 324 02 (v mfra) (280°-285°) (Friedel a. Crafts, C. R 107, 801) S G 2804 at 10 8° (Clarke's Tables of Specific Gravity [new ed.], FeCl, is soluble in alcohol or ether, the solution

24) VD varies from c 165 at 320° to c 80 at 1000°-1800° (v infra) Crystallises in hexagonal forms a c = 1 1 235, Nordenskiöld (v. Rammels berg's Hand der Krystal physikal Chemie, 1, 260) H F [Fe,Cl*] = 96,040, [FeCl*,Cl] = 13,990, [Fe,Cl*,Aq] = 127,720, [FeCl*Aq,Cl] = 27,770 (Th 8, 293)

Occurrence —In the craters of volcanoes
Formation —1 By heating Fe in a stream of Cl -2 By heating FeCt, in Cl -3 By strongly heating FeCl, in a wide mouthed vessel, Fe₂O, remains and FeCl₃ sublimes —4 By passing HCl over strongly heated amorphous Fe₂O₃ (Deville a 1 roost, C R 45, 821) -5 By heating a mix ture of calcined FeSO, with CaCl2 or NaCl The product obtained by boiling dowr a solution of Fe₂O₃ in HCl always contains oxychloride

Preparation - Fine iron wie is strongly heated in a hard glass tube in a stream of dry Cl, and the product is sublimed in the same gas

To prepare a solution of FeCl, hydrated Fe O_3 is dissolved in hot $HCl\Lambda q$, the solution is decanted, Cl is passed in until K.FeCy, ceases to give any trace of blue colour, and excess of Cl is removed by warming, or 2 parts warm EClAq are saturated with Fe (filings or wire), to the clear decanted liquid 1 part HClAq is added, the liquid is warmed and HNO, Aq is added little by little until all FeCl, is oxidised to FeCl, excess of HNO, is removed by evaporation with a little HClAq Geissler (Ar Ph [2] 58, 159) recommends to evaporate the ferrous solution to S G 1 3 at 17° and then to add HNO, Aq to the cold solution, when oxidation proceeds rapidly

Properties -By slowly cooling the vapour, FeCl, condenses in hexagonal crystals which appear very dark red by transmitted, and green ish by reflected, light (Deville a Troost, C h As ordinarily prepared FeCl, forms a 45, 821) brownish black crystalline mass Volatilises at somewhat over 100° Melts at 306°-307° in a sealed tube (Carnelley a Williams, C J 37, 126) Deliquescent, conc solution in water is dark brown and somewhat viscid, it becomes limpid

and yellow on dilution, a very dilute solution is colourless when cold (v. Reactions, No. 4)

Franz (J. pr. [2] 5, 283) gives the following table showing S.G. and percentage composition of FeCl,Aq at 17 5° -

8 G	p c. FeCl.	8.G	p c. FeOl.	8.0	p c FeOl

easily decomposes in sunlight with formation of FeCl.

Molecular weight of gaseous ferric chloru. 3 Deville a Troost (C R 45, 821) found the V D of ferric chloride at 440° to be 1627, this corresponds to the formula Fe₂Cl₄ Grunewald a V Meyer (B 21, 687) made a series of determinations of V D, in an atmosphere of N, with the following results 151 75 at 448° (mean of 4), 138 5 at 518° (mean or 3), 121 3 at 606° (mean of 6), 78 66 at 750° (mean of 2), 71 2 at 1036°, 77 6 at 1077°, .43 at 1300° These numbers seem to indicate a gradual resolution of mole cules of Fe₁Cl₂ into FoCl₃, none of the results, however, agrees exactly with the value calculated for FeCl, (81 '005), but this was to be expected, as G a M showed that even at 518° ferric chloride is partially resolved into FeCl, and Cl in an atmosphere of N According to Friedel a Crates (C R 107, 301) ferric chloride is not dissociated at 440° in an atmosphere of Cl, F a C made a series of determinations of VD in Cl, using a modification of Dumas' method, the results are appended —165 1 at 321 6°, 180 4 at 325 2°, 174 2 at 356 9°, 171 5 at 357°, 168 7 and 163 5 at 412 23 These values are all somewhat greater than 1621, the value required by the The most probable conclusion formula Fe Cl from all the results seems to be that at high temperatures, c 700° and upwards, the vapour of ferric chloride consists of molecules of FeCl, but that as temperature falls these molecules are mixed with more complex molecules, some of which at any rate have the composition Fe,Cl,

(cf Young, N 39, 195)
Reactions -1 When FeCl, is heated in oxy gen, Fe,O, and Cl are produced (cf Schulze, J pr [2] 21, 407) -2 Heated in hydrogen, FeCl. is formed (Wohler, A Suppl 4, 255) -3 Heated in water vapour, Fe₂O₃ and HCl are formed -4 FeCl, dissolves in uater, the conc solution is a syrupy dark brown liquid, becoming yellow on dilution, and colourless when very dilute and By heating FeCl, Aq, colloidal soluble Fe,O, xHO and HCl are produced, fairly conc FeCl, Aq forms oxychlorides, Fe2O, xFeCl,, at o 100°, and at higher temperatures Fe₂O, is formed The amount of decomposition and the composition of the products depend on the con centration of the solution and the temperature, very dilute solutions, c 30,000 water to 1 FeCl,, are decomposed with formation of colloidal soluble ferric hydrate even without warming (cf Iron, hydrated oxides or hydroxides of, p 59) Krecke (J pr [2] 3, 280) gives the following table (cf Tichborne, C N 24, 123 199, 209, 230, 25, 133, Muller, J 1873 40, Fous sereau, C R 103, 42) —

FeCl, Aq containing \(\frac{1}{16} \) p c FeCl, or less is de composed by light at 5°-6° (Krecke, \(l \, c \)) When FeCl, Aq is heated in a sealed tube to 250°-300° it decomposes to Fe₂O₂ and HCl (Senarmont, C R 32, 762) From a very dilute cold colourless solution of FeCl, K, FeCy, Aq ppts a pure blue pp, and NaCl produces no change If the solution is heated it becomes yellow, and contains soluble ferric hydrate and HCl From this solution K, FeCy, Aq ppts greenish blue solid, and on addition of NaCl a soluble ferric hydrate separates, which, after long contact with NaClAq, becomes insol in water (Debray, C R 68, 913). Evaporation of FeCl.Aq is accompanied by evolution of some HCl, the residue contains oxychloride or hydrated oxide FeCl, is not volati lised from violently boiling FeCl, Aq containing HCl (Fresenius, Fr 6, 92) G Wiedemann con HCl (Fresenius, Fr 6, 92) nects the decomposition of FeCl, Aq, and also of other ferric salts, with the different magnetic behaviour of colloidal soluble Fe₂O₃.xH₂O, and that hydrate which remains in combination with the acid (W 5, 45) -5 FeCl, dissolves in alcohol or An ethereal solution mixed with alcohol and allowed to stand in sunlight loses its yellow colour, and FeCl, and chlorinated derivatives of alcohol and ether are formed.-6 An aqueous solution of FeCl, 18 readily reduced to FeCl, e g by As, Sb, Bi, Fe, Pb, or Zn, also by finely divided Pt, more slowly by Pd and Au (cf Béchamp, C R 52, 757, Saint Pierre, C R 54, 1077). 1077) Also reduced by stannous chloride, sul phurous acid, or sulphuretted hydrogen, hydriodis acid reduces dilute FeCl, Aq slowly (v Mohr, A Many organic compounds also reduce FeCl, Aq, especially in sunlight, eg alcohol and ether, or tartaric acid (v Schoras, B 3, 11, Poitevin, C R 52, 94) -7 A very little FeCl, 18 said to be formed by passing hydrogen for 48 hours through FeCl, Aq (Brunner, J 1864 125) — 8 FeCl, dissolves freshly ppd ferric hydrats forming oxychlorides (q v) — 9 When FeCl, Aq is dropped into solution of potassium nitrite, in an atmosphere of CO, brisk evolution of NO proceeds, and a pp of soluble ferric metahydroxide, Fe₂O₃HO, separates (Pesci, G 18, 183)— 10 FeCl₂Aq reacts with potassium todide to form FeCl₂, I, and KCl, probably FeI₁ is at first produced, and is then resolved into Fel. and I, and then the FeI, reacting with unchanged FeCl, forms FeCl, and I (v Carnegie, C N 60, 87)—11 When electrolysed, conc FeCl, Aq gives FeCl, at the negative, and Cl with a little O at the positive, electrode

Combinations —1 With water to form various hydrates (1) FeCl, 6H O, yellow solid, formed by dissolving 100 parts FeCl, in 63 5 parts H₂O (S G of solution 167 at 25°), or by slowly eva-

ing to crystallise, or by exposing FeCl, to the air (Mohr, A 29, 178), or by passing HCl over commercial ferric chloride, filtering the liquid which forms through glass wool, and evapora ting over KOH in vacuo (Engel, C R 104, 1708), melts at 35 5°, and solidifies again at 28° (Ord-way, Z 1866 23) (2) 2FeCl, 5H₂O, reddish tablets, melting at 31°, formed by melting the hexahydrate, warming to 100°, for some hours, and cooling slowly (Engel, lc), or by evaporating FeCl, Aq to a syrup (8 G c 15), with addition of a little HClAq, and crystallising (Fritzsche, J pr 18, 479, Gobley, J Ph [3] 5, 301, 25, 259) According to Wittstein (R P [2] 36, 30) and Ordway (Z 1866 23), the hydrate thus obtained is FeCl₃ 3H₂O. The hydrate 2FeCl, 5H,O is said to be formed by placing FeCl, 6H,O over H,SO,, the hexahydrate at first liquefies and then loses water —2 With hydrogen chloride and water, to form FeCl, HCl 2H2O thin, transparent, amber yellow laminæ, formed by passing dry HCl gas over 2FeCl, 5H2O, satu rating the liquid thus produced with HCl at 25°, and cooling to 0° (Engel, C R 104, 1708, Sa batier, Bl 1881 197) —3 With ammonia, to form FeCl, NH, When heated, this compound partly sublimes, and is partly decomposed, giving FeCl₂-4 With phosphoric chloride, to form a brown fusible compound, FeCl, PCl, (Weber, J pr 76, 410) -5 With hydrocyanic acid, to form a brown liquid, which then crystallises to FeCl₃ 2HCN (Klein, A 74, 87) —6 With cyano gen chloride, but the compound has not been ob tained pure (v Klein, lc) -7 With nitrosyl chloride, to form FeCl, NOCl, a dark coloured, very deliquescent mass, obtained by placing dry FeCl₃ in the fumes of aqua regia placed over CaCl, (Weber, J pr 89, 152) -8 With alkali chlorides, to form FeCl₃ 2MCl H₂O, M=K, Na, Rb, NH, The NH, compound forms garnet red crystals, by evaporating mixed solutions of the constituent salts The crystals are rhombic according to Fritzsche (J pr 18, 484), dimorphous according to Genth (J pr 71, 164) The double compounds FeCl, 2MCl H₂O are all decomposed by The K salt is described by Fritzsche (J pr 18, 483), the Na salt by Deville (C R 43,970), the Rb salt, said to be FeCl, 3RbCl, by Godeffroy (Ar Ph [3] 9, 343) According to Kremers (J pr 55, 191), a compound of the form FeCl, 2MCl H₂O, in which M is partly K (12 1 pc), partly Na (16 pc), and partly NH, (62 pc), is found in certain volcanic craters -9 With thallium chloride, to form FeCl, 3TlCl (Wöhler a Ahrens, A 144, 250) - 10 With magnessum and berylhum chlorides, to form FeCl, MCl, H₂O, formed by adding MgCl2 or BeCl2 to a cone hot so lution of FeCl, in HClAq (Neumann, A 244, 328) Ferroso ferric chloride Fe₃Cl₃(FeCl₂ 2FeCl₃) When Fe,O, H,O is treated with a little HClAq, FeCl₂ goes into solution, and Fe₂O₃ remains,

porating FeCl, Aq on the water bath, and allow-

but Fe₂O₄ H₂O dissolves wholly in considerable excess of cone HClAq When the solution is cooled and placed in vacuo over H2SO4, yellow crystals of Fe Cl. 18H2O are said to separate (Lefort, C R 69, 179) The crystals are del. quescent, at 50 they lose water, heated to 90° HCl is given off and O absorbed, by warming an aqueous solution of the crystals, FeCl, and FeCl,

are formed.

Iron, cyanides of. No cyanides of iron have been isolated, but ferri- and ferro cyanides are numerous, v vol ii pp 332, 334, 338

Iron, ferricyanide and ferrocyanide of, v

vol 11 pp 334 a 338

Iron, fluurides of Two fluorides of Fe are known, FeF2 and FeF3 The former is produced by dissolving Fe in HFAq, the latter by dissolving Fe,O, xH₂O in HFAq

FERROUS FLUORIDE FeF. Small green crystals of this composition separate from a solution of Fe in HFAq (Scheurer Kestner, A Ch [3] 68, 472) By careful heating, FeF₂ is obtained as a white solid FeF, is urchanged by heat, the hydrate is partly decomposed to HF and Fe₂O, Slightly sol in water, more easily on addition of The double salt FeF, 2KF is a green pp, obtained by adding KF/q to FeSO,Aq, the salts FeF, KF2HO, FeF 2NH,F, and FeF₂ NH₄F 2H₂O are described by Wagner (B 19, 896) The Silicofluoride FeF, Sil, (= FeSiF,) is said to be formed as blue green crystals by

dissolving Fe in H₂SiF₆Aq and crystallising (Wurtz, Dictionnaire, 1 1408)

Ferric fluoride FeF₂ Crystals of the hydrate 2FeF₁ 9H O are obtained by dissolving Fe O₃ xH₂O in HFAq and evaporating, or by oxidising FeF, in HFAq by HNO, The crystals are yellowish according to Berzelius, colourless according to Scheuler Kestner (A. Ch. [3] 68, 472) At 100° 3HO is removed, at higher temperatures H₂O and HF escape By heating the salt died at 100° in a Pt ciucible colourless crystals of FeF, are formed on the surface of the mass, isomor phous with AlF, (Deville, C R 43, 970) Slowly dissolved by water, addition of NH, Aq ppts the Feb forms oxyfluoride 3Fe,O, 2FeF, 4H,O double salts with K, Na, and NH, these are obtained by adding FeF, Aq to solutions of the alkalı fluorides, the salts described are FeF, 3KF (Berzelius, Wagner, B 19 896) FeF, 3KF (Berzeitus, Wagner, B. 17, 670), 2FeF, 4KF HO (Nicklés, Z. 7, 480), FeF, 3NaF (B, W, lc), FeF, 2NaF (Nicklés, J. 1869, 268), FeF, 2NH, F(N, lc), to this salt Manignac gives the formula FeF, 3NH, F(A Ch [3]60, 306) Iron, haloid compounds of Iron readily

combines with the halogens With each halo gen, two compounds are formed, ferrous FeX and ferric FeX3, ferric iodide, however, has not been isolated with certainty, the compound Fe₃Cl₈, corresponding to Fe₃O₄, also perhaps exists. The only compounds that have been gasified are ferrous and ferric chloride former has the molecular formula FeCl, at 1300°-1500°, but there are indications of the possible existence of molecules of Fe,Cl, at lower temperatures, the latter appears to exist as a gas both as Fe₂Cl₈ and FeCl₃ The haloid compounds of Fe are soluble in water, solu tions of FeBr, and FeCl, are decomposed by much water, the compounds all form several double compounds with the chlorides &c of the more positive metals

Iron, hydrides of No definite hydride of Fe has been certainly solated, but there are several indications of the existence of a com Fe heated pound or compounds of Fe and H to redness absorbs about 46 vols H (Deville a Troost, C R 57,965, 59, 102) Electrolytically deposited Fe contains H along with N, CO, and CO. (Lenz, P. Ergänsbd 5, 252, cf Meidinger,

D P J 163, 283, Chandler Roberts, C N 81, 137; Iron wns takes up H when mersed in dilute H₂SO₄Aq (Johnson, Pr 23, 168, Reynolds, C N 29, 118) According to Cailletet (C R 80, 319) Fe npd electrolytically from neutral FeCl,Aq containing NH Cl gives off 235-238 vols H when heated en vacuo Observations on the supposed existence of a gaseous l ydride of Fe were made by Thomson, Dupasquier (C R 14, 511), and Reinsch (J 1858 190) The non existence of such a gas was proved by Fresenius a Schlossberger (A 51, 415) and by Erlenmeyer (N J P 9, 97) Thoma has investigated the conditions under which H is absorbed by Fe (Z P C 3, 91) He finds that when Fe is made the negative electrode in a voltameter, or when it is placed in dilute H2SO, Aq, it absorbs much H, but that Fe a aced in an atmosphere of H does not absorb any of that gas, a certain portion of the H absorbed is given off again on exposure to air or immersion in water, the rest of the H is more firmly retained by the Fe According to Wanklyn a Carius (A 120, 69) when FeI₂ reacts with ZnLt, in presence of ether, various gases including C₂H₄, CH₆, C₄H₁₀, and H are evolved, and a metal like powder remains, which, after washing with ether, is decomposed by HO giving H and a mixture of H and FeO They regard this powder as a hy ride of Fe, perhaps I eH2, but no analyses are given

Iron, hydrated oxides or hydroxides of Compounds with water of each of the three oxides of iron are known. The compositions of the various hydrated oxides are differently represented by different chemists they appear to vary with small changes of conditions, so that it is impossible to say whether all the bodies described are true hydrates or not. The readiness with which most of the hydrated oxides undergo change of composition points to their being hydrates, i.e. compounds of OH. Thomsen (Th. 3, 293) gives the thermal data - [Fe., O', 3HO] = 191,1.0, [2FeO H', O, HO'-54,590, [Fe, O, H'O]=68,280, [FeO H, H SO'Aq]=24,920, [Fe'O'sH'' 3H SO'Aq]=33,840

Only one hydrate of ferrous oride, FeO H O, appears to exist, but it is doubtful whether any hydrate of this oxide has been obtained free from hydrates of le₂O₂. Descriptions are given of two hydrates of ferreso ferric oxide, viz Fe₂O₄ H₂O and Fe₂O₄ 4H₂O, but here again there is great doubt as to the composition of the substances described as definite hydrates Many hydrates of ferric oxide have been obtained, the following are known as minerals $(M = Fe_2O_1)$ M H₂O, M 2H₂O, M 3H₂O, 2M H O, 2M 3H₂O, 8M 5H₂O, the following are said to have been obtained artificially M H₂O, M 2H₂O, M 3H₂O, 2M H₂O, 2M 3H₂O, many of these appear to exist in different modifications each distinguished by special properties, broadly they fall into two classes, those which are insoluble in water, and those which dissolve in water

HYDRATE OF FERROUS OXIDE FeO H₂O The white pp obtained by adding air-free KOHAq to an air free solution of a ferrous salt, and washing out of contact wish air, is probably FeO H₂O To obtain the pp nearly free from ferric oxide Schmidt (A S6, 101) ppts in a closed flask,

allows pp to settle, draws off water by a syphon, carefully pours warm water which has been boiled for some time on to the surface of the cold water in the flask, withdraws water by a syphon, &c , he then quickly transfers the moist pp by a syphon to a retort containing ether, and having attached to it a long glass tube dipping under Hg, the ether covers the pp and drives the air out of the retort, on warming, the water vapour and condensed water escape through the Hg When the ether is removed and the retort is cold, dry air free H (not CO, as the hydrate combines with this gas) is passed through the apparatus, and portions of the solid are transferred in an atmosphere of H to small wide mouthed stoppered tubes Dried in this way, the hydrate is a pale greenish, friable solid, which rapidly oxidises and glows in the air

A de Schulten (C R 109, 266) states that FeO H₂O may be obtained in green six sided flat prisms, which almost instantly become red in air, by mixing 5 grams FeCl₂ dissolved in 100 c c air free water, and 200 c c NaOHAq, containing 20 grams NaOH, in a flask filled with coal gas, heating, and allowing to stand for 24 hours

According to Bineau (C R 41, 509) ferrous hydrate is soluble in c 150,000 parts water Ferrous hydrate is very easily oxidised, it is therefore an energetic reducer, eg it ieduces salts of Au, Ag, and Pt, and also HiO₂Aq It dissolves in acids to foim ferrous salts FeX₂,

$$X = NO_3$$
, $\frac{SO_4}{2}$ $\frac{PO_4}{3}$, &c (cf Ferrous oxide,

under Iron, oxides of)

HYDRATES OF PERROSO FERRIC OXIDE Fe,O, H2O and Fe,O, 4H O, composition of both doubtful Hydrates of Fe,O, are produced by ppg a mixture of equivalent quantities of a ferrous and ferric salt by alkali, and also by digesting ppd Fe₂O₃ xH₂O with Fe The black powder obtained by Wöhler (A 28, 92), by ppg a mixture of equivalent parts of ferrous and ferric sulphates by slight excess of NH,Aq, boiling, washing by decantation, and diving under 100° is said by Lefort (C R 69, 179) to be Fe,O, 4HO By ppg a mixture of equivalent quantities of a ferrous and ferric salt by hot cone kOHAq, Lefort (lc) obtained a hydrate more stable than that got by using NH₃Aq, to this hydrate he gives the formula Fe₃O₄ H₂O The black hydrate obtained by digesting le,O, rH O with Fe under water does not seem to have been analysed (v Preuss, A 26, 96) Ferroso ferric hydrates are described as brown black, magnetic, brittle, powders, when heated out of contact with air they give Fe₃O₄, heated in air, Fe O₃ is produced Ferroso ferric hydrates dissolve in acids to produce mixtures of ferrous and ferric salts, in some cases definite salts of the form Fe₂X₄, $X = SO_4$, &c, are formed, according to Lefort (C R 69, 179) (cf. Ferrosoferric oxide, under Iron, oxides of)

HYDRATES OF FERRIC OXIDE A great many supposed hydrates of Fe₁O₂ have been described, but there is much doubt as to the composition and properties of definite hydrates of the form Fe₂O₂ xH₂O. The following occur as minerals, the compositions of which more or less accurately agree with the formulæ—limonits Fe₂O₂ 2H₂O, Fe₂O₂ 3H₂O, and 2Fe₂O₄ 3H₂O;

gothete Fe_.O_. H_.O_., turgite 2Fe_.O_. H_.O and 3Fe_.O_. 5H_.O According to Ramsay (C J 32, 395), and Brescus (J pr [2] 3, 272), the pp obtained by adding alkali to a ferric salt, either hot or cold, washing, and drying at 100°, is Fe₂O₃ H₂O, by ppg FeCl₂Aq with NH₃Aq, washing first with water and then with alcohol and ether, and drying at 100° the hydrate Fe₂O, 2H₂O is obtained, according to Brescius (*lc*) Witt stein (C C 1853 367) says that the hydrate obtained by ppg a ferric salt by NH, Aq, washing with cold water, and drying at a gentle heat, or at 100° for a short time, is Fe₂O, 3H₂O. The experiments of Carnelley a Walker (C J 53, 89) on the dehydration of ppd Fe₂O₂ xH₂O through a range of temperature showed that the pp after diving at 15° for 18 days contained more water than is required by Fe₂O, 5H₂O, that when heated to 55° the residue had the composition Fe₂O₂ 3H₂O, but that water was gradually and continuously given off from 15° upwards until Fe₂O₃ was formed at 500°, the composition, however, remained constant from 385° to 415°, and corresponded with the formula 10Fe₂O₃ H₂O Van Bemmelen (R T C 7, 106) has examined the composition of the colloidal pp by adding NH, Aq to FeCl, Aq, his experiments, which were very extended, showed the great readiness with which the ratio of Fe₂O₅ to H O varies, e g exposed to air for a year the composition became constant with the ratio Fe₂O₃ 4 or 41H₂O, after 4 months in dry air the ratio was Fe₂O₂ 1 6H₂O, heated to 100° in dry air the ratio was Fe₂O. 96H₂O, the same sample kept for 6 years in a closed flask and then heated to 15° until constant gave Fe₂O₂ H₂O, at 100° Fe₂O₂ 45H₂O, between 100° and 300° the final state was Fe₂O₃ 25H₂O, and so on Besides the papers referred to above on the composition of ppd. Fe,0,xH,0, the following are of im portance —Lefort (J pr 54, 305), P de Saint Gilles (J pr 66, 137), Schaffner (A 51, 177), Muck (Z [2] 4, 41), Davies (C J [2] 4, 69), Tomması (B 12, 1929, 2834)

The monohydrate Fe,O, H,O is said to be obtained (1) by adding NaOHAq and KClOAq to boiling FeSO,Aq, washing, and drying at 100° (Muck, Z [2] 4, 41), (2) by keeping ppd Fe₂O₃ xH₂O in contact with boiling water for 6-8 hours (P de Saint-Gilles, A Ch [3] 46, 47), (3) by repeatedly melting NaOH in a cast iron vessel and washing (Brunck a Græbe, B 13, 725), (4) by keeping ppd Fe₂O₂ xH₂O under water for many years at the ordinary tempera ture (Schiff, C C 1860 1768) This hydrate This hydrate also occurs native as göthite Fe₂O₂ H₂O is described as a dark-red powder, slowly dissolved by dilute warm HClAq, H₂SO₄Aq, or HNO₂, insol in cold cone acids. The mono hydrate obtained by Brunck a Græbe was in the form of small tabular, brownish-violet, hexagonal crystals, S G 2 91 Göthite forms rhombic crystals, SG 38 to 42 The monohydrate obtained by Péan de Saint-Gilles, by keeping Fe₂O₃.xH₂O in contact with boiling water for 6-8 hours, is described as a brick-red powder, scarcely acted on by cone boiling HNO.Aq, slowly dissolved by cone hot HClAq, it dissolves in dilute HNO,Aq, HClAq, or acetic acid, forming a red liquid which appears clear by transmitted, but

turbid by reflected, light, and is ppd by a very smill quantity of an alkal, salt, on addition of cone HNO₂Aq or HClAq, this solution gives a red pp which dissolves on adding water. This modification of Fe₂O₃ H₂O does not form Prus sian blue with K₁FeCy₆ and acetic acid

The dshydrate Fe₁O₂ 2H₂O is said to be obtained by ppg cold Fe₂O₂Aq by NaOHAq and KClOAq or H₂O₂Aq, was 'ing, and drying at 100° (Weltzien, A 138, 125, Muck, lc) This hy-

drate also occurs native as limenite

The hydrates 2Fe,O, H,O and 2Fe,O, 8H,O are said to be formed by the action of water on ppd Fe,O, xH,O, the first by boiling for 100 to 1,000 hours, Davies (C J [2] 4,66), the second by long continued action of water at the ordinary temperature (Wittstein, Ar Ph 74, 158), or, crystalline, by freezing Fe,O, xH,O suspended in water (Limberger, C C 1853 783) By heating any of the hydrates in sealed tubes Fe,O, is eventually produced (Sénarmont, C R 32, 762)

Muck (Z 1868 41) thinks that the ferric hydrates obtained by oxidising ferrous hydrates or carbonate in air differ essentially in properties from the ferric hydrates obtained directly from ferric salts. Tommasi (Bl [2] 38, 152, T a Pellizzari, Bl [2] 37, 196) arranges the ferric hydrates in two classes the red hydrates obtained by present salts by alkali, and the yellow hydrates obtained by oxidising hydrates of FeO or Fe₂O₄, or by oxidising FeCO₂

Ferric hydrates give up 0 to readily oxidised compounds such as SO, Aq, $SnCl_2Aq$, in contact with decaying organic bodies the hydrates part with 0, but again take it up if exposed to air, they absorb gases eg NH₃ and CO_2 (v Rein hart, Fr 7, 187) They dissolve in acids to

form ferric salts FeX_s , $X = NO_s$, $\frac{SO_s}{2}$, $\frac{PO_s}{3}$ &c

These hydrates when freshly ppd also dis solve in FeCl.Aq forming oxychlorides (q v) (v Firric oxide, under Iron, oxides of, p 62)

SOLUBLE FERRIC HYDRATES A modification of Fe₂O₃ H₂O soluble in water was prepared by P de Saint Gilles in 1855 (A Ch [3] 46, 47) Ordinary ppd Fe,O, xH,O is dissolved in acetic acid, the solution is heated to 100° for a long time in a closed vessel, the blood red colour of the liquid changes to brick red, the liquid appears opalescent in reflected light, and the taste is no longer metallic but merely that of acetic acid, on now adding cone HClAq or HNO, Aq, or the merest trace of H2SO4Aq or an alkalı salt, the whole of the Fe is thrown down as a brown red curdy pp, which, when dried on a porous tile, appears as a brown, lustrous, /arnish like solid, having the composition Fe₂O₃ H₂O This modi heation of ferric hydrate, sometimes called ferric metahydrate, is insol in conc acids, but dissolves easily in water, forming a deep-yellow, opalescent, tasteless liquid, unchanged by K,FeOy, or KCNS Traces of H,SO, or alkalı salts, and also cone HClAq or HNO, A, ppt the hydrate from its aqueous solution. The same hydrate has been obtained by Scheurer Kestner by prolonged heating an aqueous solution of basic ferric nitrate in a realed tube at 100° (C R 48, 1160), also by Debray by heating dilute FeCl.Aq to 100° (C. R 68, 913, cf. Ferric chloride, Reactions, No 4, p 55) Another soluble modification of ferric hydrate, some ames called dialysed oil colloudal ferric hydrate, is obtained by dialysing a solution of FeČl, containing Fe $_{\circ}$ O, xH $_{\circ}$ O so long as the dialysate contains HCl (Graham, Tr 1861 183) The solution is prepared by digesting FeCl₂Aq with ppd Fe₂O₃ xH₂O, or by adding (NH₄),CO,Aq to FeCl,Aq so long as the pp dissolves on stirring, the solution should contain 4-5 p c of solid matter, and have 5-6 equivalents of ferric hydrate in it After dialysis a deep red liquid is left on the dialyser, this liquid gelatimises by exposure to the air for some days or by traces of H,SO,, alkalis, alkaline salts, but not by HCl, HNO,, or acetic acid, the jelly like mass thus outsined slowly becomes insol in water, and is then sol in dilute acids, it appears to be changed to the ordinary Fe₂O₂ xH₂O (Graham *l.c*, of Shuttleworth, *Ph* [3] 8, 545, Bec querel, A 126, 208)

Krecke (J pr [2] 3, 286) has examined the formation of soluble ferric hydrates from FeCl.Aq Formation of the colloidal hydrate occurs in FeCl, Aq cortaining $\frac{1}{10}$ to $\frac{1}{8}$ p c FeCl, at ordinary temperatures, solutions containing 8 to 32 p c must be heated to above 100° in closed tubes, on cooling the more conc solutions (if not heated too long and too highly) re formation of FeCl, occurs, but in solutions of less than 1 pc the base and acid remain uncombined ca cooling a solution containing less than 1 pc is boiled for some time formation of ferric metahy drate begins, and after a time the hydrate is ppd as an orange yellow powder A table showing the various products obtained by heating solutions of FeCl. Aq of different concentrations to different temperatures is given under Ferric chloride, Reactions, No 4 (p 55)

Iron, lodides of Only one iodide of iron,

Fel, has been isolated with certainty

FFRROUS HODIDF (Proto nodule of aron) Fel, **HF** $[Fe, I^2, Aq] = 47,650 (Th 3, 294)$ Fe and I combine by rubbing together with or without water, Fe and I heated together form a crystal line grey mai 3 which melts at 177° (Carius a Wanklyn, A 120, 69) According to De Luca FeI₂ is white, but goes green on addition of water $(C \mid R \mid 55, 615)$ Green deliquescent water (C R 55, 615) Green deliquescent crystals of FeI₂ 5H₂O, S G 2873, are obtained by digesting I part Fe filings with 3 4 parts I in presence of water, adding Fe filings, evaporating ΓeI₂, out of contact with air, and filtering especially Fel2Aq, rapidly absorbs O with formation of oxylodide $(q \ v)$ Addition of sugar syrup to FeL renders the solution more stable H₂O₂Aq decomposes FeI₂ with formation of Fe,O,xH,O and separation of all the I Fel,Aq dissolves I, addition of K₂CO, to a solution containing 3FeI₂ 2I forms KI and Fe₂O₄.xH₂O, the solution may contain Fe,I,

FERRIC TODIDE (?Fel,) This iodide has not been isolated, it is probably contained in a solution of FeI, to which I is added in the ratio Fel, I. Fel, Aq containing I is separated by heating to FeL and free I Fleury (J Ph [5] '16, 529) says that the action of I on Fe in presence of water soon ceases if the temperature is kept down to 15°, on filtering, only Re is obtained, if, however, the mixture is Boiled the red colour of the liquid disappears and a considerable quantity of Fe₂O₂ is found in the re-

sidue A large excess of I is required to dissolve all the Fe, and a large excess of Fe is required to'convert all the I into FeI, F sup. poses that FeI, is at first formed and is then decomposed by the heat to Fe₂O₂ and HI, and the HI then acts on the free Fe forming FeI. Mohr observed that a very dilute solution of FeCl, (1 in 12,300) gives a blue colour on addi tion of starch and KI only after a considerable time (A 105, 53) Nickles found that a solu tion of Fe O, xH2O in HIAq in presence of ether did not at once give a blue pp with K.FeCy. (A Ch [4] 5, 161, cf Ordway, Am. S [2] 26, A solution made by digesting 126 parts I 197) with sufficient iron, filtering, and adding 63 parts I, gives an apple green pp on addition of 201 parts citric acid previously neutralised by alkali carbonate (Creuse, Ph [3] 3, 953) According to Carius a Wanklyn (A 120, 70) if Fe is heated According with excess of I until a little I is vaporised, and the mass is allowed to cool in a covered crucible. I is suddenly evolved, and the residue consists of

Iron, nitrides of A nitride of Fe, Fe, N, is found as a silver like lustrous deposit in the lavas of Ltna (Silvestri, P 157, 165), heated in H it yields Fe and NH, Finely divided Fe, prepared by heating ferrous oxalate or reducing Fe O, by H, takes up about 2 pc N when heated in N (Geuther a Brieglet, A 133, 228, Rogstadius, J pr 86, 307, Remsen, Am 3, 134) By heating Fe in NH, the Fe increases in weight 12-13 pc and becomes brittle (Berthollet, G A 30, 378) By electrolysing a mixture of NH₂Cl and a ferrous salt a lustrous deposit is obtained, supposed by Kramer to be a nitride of Fe with 15 pc N (Ar Ph [2] 105, 284), but said by Meidinger (D P J 163, 283) to be an Fe NH. A nitride (or nitrides) of iron seems amalgam to be produced by heating FeCl, or FeCl, in NH, The product is a brittle, grey white, solid, heated alone it gives N and Fe, heated in H it gives NH, and Fe, it is slowly and partially decomposed by boiling water, in acids with formation of H, ferrous and NH, salts, not acted on by Cl, Br, or I in presence of HO at ordinary temperatures, but when heated ferric and NH, salts are formed, and H, and probably also N, are evolved The formula Fe,N, agrees with most of the analyses, the forraula Fe, N, was given by Stahlschmidt (P. 125, 37, cf Rogstadius, J pr 86, 307, Fremy, C R 52, 321)

Iron, nitroprusside of, v vol. 11 p 340 Iron, nitrosulphides or nitrososulphides of. In 1858 Roussin obtained a salt by the reaction of NH.HS and KNO₂ on FeCl.Aq, which contained Fe, but in which Fe could not be detected by the ordinary tests (A Ch [3] 52, 285) Proczinsky (A 125, 302) obtained the same compound by adding NH, HS to a solution of a ferrous salt saturated with NO A similar salt was obtained by Pavel by using K2S in place of NH, HS (B 12, 1407) By treating these salts with alkali others were obtained more or less closely related to the original salts The compounds thus obtained were analysed and examined by Roussin (lc), Proczinsky (lc), Rosenberg (B 8, 812, 12, 1715), Demei (B 12, 461), and Pavel (B 12, 1407, 1949, 15, 2600) Roussin's analyses of the compound formed by using

NH₄HS led to the formula Fe₃S₃H₂(NO)₄, to the same compound Proczinsky gave the formula Fe₂S₃(NO), 2H₂O, and Rosenberg assigned the composition Fe₂S₁(NO), 4H₂O In his second paper R showed that the compound prepared by using K2S contained K, this was confirmed by All the observers admitted the presence

of the NO group in these compounds Pavel (B 15, 2600) has given an account of the compounds of which Roussin's salt is the type, and has indicated what appear to be their relations to other compounds of iron As the compounds contain the group NO in addition to S they are better called nitroso than nitrosulphides Pavel regards the nitroso sulphides of Fe as salts of acids, the acidic radicles of which are composed of Fe, NO, and S, the salts may be formulated generally as derived from the acids $\mathbf{H}_{w}\mathbf{Fe}_{x}(\mathbf{NO})_{y}\mathbf{S}_{z}$ P compares the ferrontroso sulphides with the ferronitrosocyanides or nitroprussides, which are salts of H, Fe(NO)Cy, (v Nitroprussides, vol 11 p 340) According to P there are two series of ferronitroso sulphides derived from the two acids HFe, (NO), S, (or $H_2Fe_s(NO)_{14}S_s$), and $HFe(NO)_2S$ (or $H_2Fe_2(NO)_4S_2$) The former acid has been isolated, the latter is not as yet known in the The two series may perhaps be called ferrinitroso and ferronitroso sulphides In the following account of the salts Pavel's formulæ are adopted -

Series I Ferrinitrososulphides

M'Fe (NO) S.

Potassium ferrinitrososulphide KFe, (NO) S, A solution of KHS, made from 44 grams KOH in 400 cc water, is added to a boiling solution of 35 grams pure NaNO2 in 400 cc water, the mix ture is heated just to boiling, and a solution of 159 grams ferrous sulphate in 1200 cc water, to which a drop of dilute H,SO,Aq has been added, is allowed to flow into it with constant stirring, the liquid is kept warm on a water bath, and is shaken from time to time until a greenish red pp (of Fe₂O₃, FeO, and S) forms on the sides of the flask, when the liquid is rapidly filtered, a little dilute KOHAq is added to it when cold, and it is allowed to stand for 48 hours The salt which separates is dissolved in water at 70°, a little KOHAq is added as the liquid cools, and the crystals thus obtained are recrystallised in the same way, after standing 48 hours; the crystals are then dried over H,SO, in vacuo pro tected from the light About 30 grams of the pure salt are thus obtained (Pavel, B 15, 2601) If more KHS is used than directed above double sulphides of Fe and K are obtained and no nitrososulphide

KFe (NO), S, crystallises in large, nearly black, lustrous, rhombic prisms, it is fairly stable in the air, decomposition begins at c 115° with evolution of NO, at c 130°S, (NH₄)₂SO₄, NH₄NO₅, &c , sublime , heated in air H₂O, NO₅, N, SO₅ are evolved, and the residue consists of FeS, Fe,O,, Fe₂Q₃, and K₂SO₄, strong mineral acids evolve H₂S Various metallic salts form metallic sulphides and NO, while Fe salts remain in solution, heated with alkali, crystalline Fe₂O₂ is ppd, NO evolved, and ferronitrososulphide KFe(NO), S is formed (Pavel, lc) KFe4(NO),S1 is soluble in about 2 parts hot water, slightly sol in cold water, very sol with decomposition (Pavel, B.

12, 1410) in alcohol or ether, the salt is ppd by The talts of this series do NI Aq or KOHAq not react with K.FeCy.

The following salts of this series have been isolated NH,X, BaX, CsX (the most stable salt of the series), CaX_2 , FeX_2 , L_1X , MgX_2 , RbX, TlX (X = $Fe_1(NO)_2S_3$) The Na salt is formed similarly to the K salt, also by the reaction of Na₂CS with NaNO2, the comp und Fe4S(NO)6 CS, said by Low (C C 1865 \$48) to be formed in this reaction does not exist according to Pavel (B 15, 2603) For other reactions of the salts of the series v Pavel, B 15, 2604

Ferriniti ososul phydi w acid HFe,(NO),8, seems to be obtained by adding a slight excess of dilute H, SO, Aq to a dilute solution of the Na salt, it is insol in water, alcohol, and ether, The acid has not been sol in CHCl₃ or CS

obtained pure (P, lc)

Ferronitrososulphides Series II MIFe(NO), S These salts are formed by the action of dilute alkali solutions on the salts of Series I . in these reactions NO is evolved and Fe O, ppd, but NH, is not evolved except from the salt NH, Fe, (NO), S, The salts of Series II are very unstable, they easily pass into Series I, the Cs salt is the most unstable of all, these salts are insol in ether (except the Fe salt), CS, and CHCl3, they decompose in the air with separa tion of S and Fe₂O₃ and evolution of a little H S, the solutions then have an alkaline reaction, and contain salts of Series I along with alkaline ni trite and thiosulphate If CO is passed into a solution of K₃ FeCy, and the K salt of Series II is then added, NO is evolved, S and Prussian blue are ppd, and the filtrate contains k, FeCy. and some KNO

Potassium ferronitrososulphide KFe(NO)2S 2H2O is obtained by warming KFe,(NO),S, on the water bath with dilute KOHAq, washing, and drying in vacuo over H SO, and CaO in the dark, it is very unstable, and can be obtained approximately pure only with difficulty (P, B 15, 2606) By warning an alcoholic solution of KFe(NO)₂S with considerable excess of EtI, quickly distilling, washing the re sidue first with water and then with aqueous al cohol, and crystallising from benzene, ethyl fer ronitrososulphide (C2H2)Fe(NO)2S is obtained in black, lustrous, monoclinic crystals (P, lc) For a discussion of the probable constitution of these nitrososulphides and a comparison of them with

the nitroprussides t Pavel, B 15, 2613

Iron, oxides of Three oxides of iron have been isolated, FeO, Fe₂O₄, and Fe₂O₃ The molecular weight of none is known with certainty, as none has been gasified FeO and Fe₂O, are basic oxides, they produce salts by reactions with acids, of the forms FeX_2 and FeX_3 , X = Cl, NO_3 ,

 $\frac{SO_4}{2}$, $\frac{PO_4}{3}$, &c , Fe₂O₅ also combines with some

more positive metallic oxides to form compounds Fe₂O₃ xM¹¹O, which are usually called ferrites (v vol 11 p 547) Fe₈O₄ eacts with acids to form both ferrous and ferric salts, FeX2 and FeX4, according to Lefort a few salts corresponding with Fe₂O₄ are known, eg Fe₂Cl₁, Fe₂(SO₄), 2SO₂ 15H₂O (v Ferroso ferric oxide, p 61) Besides the ferrites a series of ferrates is known (v. vol. 11 p 546), these salts are of

the form MI, FeO, , they may be regarded as salts of the hypothetical ferric acid H₂FeO₄, the anhydride of this soid would be FeO, this oxide of iron has not been isolated, but the corresponding oxide of Mn, MnO₂, is known All the oxides of Fe form hydrates (v Iron, hydrated oxides of, FeO very readily and rapidly absorbs O and changes to Fe₂O₁, at a very high tempe rature Fe₂O₂ parts with O, and is reduced to Fe,O,

FERROUS OXIDE (Protoxide of iron) FeO This oxide cannot be obtained free from Fe₂O₃ by ppn from ferrous salts and dehydrating the

Preparation -1 Pure Fe₂O₃ is heated to c 300° in a stream of pure H (Wackenroder a Stromeyer, Ar Ph 36, 27) -2 By heating fer rous oxalate out of contact with air (Liebig, A 95, 116, Moissan, A Ch [5] 21, 199) -3 By heati g Γ e O₃ for 20 minutes to c 500° in H or CO, or in CO at 440° for 6 hours (Moissan, lc) 4 By heating Fe in CO₂ to c 1000° (Moissan, lc) -5 By adding ferrous oxalate to boiling KOHAq (Bottger, J pr 76, 239)
Properties and Reactions -An ivory black

powder According to Moissan (lc) FeO ob tained by heating ferrous oxalate, or reducing Fe.O. in CO at 500°, is pyrophoric, burns to Fe O2, and decomposes water at ordinary tem peratures, while the FeO obtained by heating I e in CO2 at c 1000° is non pyropheric, burns to Fe₃O₄, and does not decompose water at 100° Siewert (J 1864 266) says that pyrophoric FeO, produced by reduction of he,O, in H, becomes non pyrophoric by remaining in an atmosphere of H for 12 hours after cooling FeO is readily oxidised to Fe₂O₂ (cf Moissan, supra) It dis solves in acids to form ferrous salts FeX2, X = Cl,

$$NO_3$$
, $\frac{SO_4}{2}$, c

Combinations — The compound FeO Al.O.oc curs native as hercynite, and FeO Cr2O, as chrome ironstone, magnetic oxide of iron may be regarded as FeO Fe₂O₃ The hydrate FeO H₂O has been 180 sted (v Hydrate of ferrous oxide, p 57)

FERROSO FERRIC OXIDE (Black or magnetic oxide of iron) Fe,O, This oxide occurs native in large quantities as magnetite According to Spring (Bl [2] 50, 215) it is produced on the surface of iron which has been subjected to great pressure, the formation of a film of this oxide on iron rails is the reason why the surfaces of the rails of railroads do not rust (Spring, lc) When iron is strongly heated in air a film (hammer scale) is produced consisting of Fe,O, mixed with, or combined with, ke2O1, the outer layer of this film contains a large quantity of Fe O₂, the inner layer, which is blackish grey and magnetic, is approximately 6FeO Fe,0, (Mosander, P 6, 35, cf Berthier, A Ch [2] 27, 19, Beaujen a Mène, C R 61, 1135, Maumené, Bl 16, 25, Völcker, W A B 66, 193, Glasson, A 62, 89) 8 G 5 458 (Playlair a. Joule, C S Mem 3, 81), 5 8 at 16 5° (Herapath, P M 64, 321) S G of magnetate 5 1 to 5 18 (Kopp, Rammelsberg) According to Moissan (A Ch [5] 21, 223) two varieties of Fe₁O₄ exist, one having S G 4 86 obtained by reducing Fe₂O₄ at 500°, the other having 5 135 (Playfair a Joule, C S Mem 3, 80), ppd. S G 5 18 obtained by reducing Fe₂O₄ at a higher 5 959 at 16 5° (Herapath, P M 64, 321) S.H.

temperature Berthelot (A Ch [5] 23, 118) describes two varieties, one with S G 4 86 obtained by heating FeCO, to 350°, the other with SG 5-59 obtained by highly heating the first in N. Magnetite crystallises in regular octahedra, isomorphous with Mn,O, (Rammelsberg) CE, 000029 (Kopp) SH 24°-99° 16779 (Regnault, A Ch [3] 1, 129) HF [Fe³,O¹] = 26,900. $[FeO, Fe^2O^3] = 8,800$ (Berthelot, A Ch [5] 23.

Preparation -1 By heating FeCO, to c 350° in a current of CO₂ (Berthelot, A Ch [5] 23 118) -2 By heating FeCl₂2NH₂Cl in air (Hauer, W A B 13, 456) -3 By heating FeO in a gentle stream of HCl (Deville, C R 53, 199) -By melting ferric phosphate with 3-4 pts. Na. SO, (Debray, C R 52, 985) -5 By melting CaCl₂ with ferrous sulphate in a closed crucible (Kuhlmann, C R 52, 1283) -6 By the action of FeF_s on borne and at a high temperature in absence of air (Deville a Caron, A 108, 56) -7 By heating FeCl₂ with excess of Na₂CO₂ to low redness and washing with water (Liebig a Wohler, P 21, 582) -8 By heating Fe in steam 9 By long continued heating Fe₂O, to white-heat (Sidot, C R 69, 201) -10 By reducing Fe,O, in CO at 350° for about an hour (Moissan, A Ch [5] 21, 223, cf Birnie, R T C 2, 273, Ackermann a Sarnstrom, B 16, 783) -11 By dehydrating Fe₁O₄ xH₂O at as low a temperature as possible (v Hydrates of ferroso ferric oxide, p 57)

Properties and Reactions - A black, magne tic powder, the crystals obtained by methods 4-7 (supra) are black octahedra According to Moissan (A Ch [5] 21, 223) and Berthelot (A Ch [5] 23, 118), Fe₄O₄ obtained by heating FeCO₂ in CO₂ at 350°, or by reducing Fe₂O, by CO at 350°, or by heating reduced Fe in H saturated with H2O, or in CO, at 440°, has a lower SG than Fe,O4 produced by reductions at higher temperatures, or by strongly heating the first variety in N, the first variety is said to be easily soluble in conc HNO, Aq, and to give Fe,O, when heated on Pt foil, the second variety is described as almost unacted on by boiling conc HNO, Aq and as un changed to Fe₂O, by heat Fe₃O, is reduced to Fe by heating with C, or by strongly heating in With a little HClAq it gives FeCl, Aq and Fe₂O₂, with more HClAq it gives a solution showing the reactions of both ferrous and ferrie chloride According to Lefort (C R 69, 179) Fe₂Cl₂ is obtained by cooling a solution of Fe,O, xH,O in excess of conc HClAq and evaporating in accuo over H.SO. (1 Ferroso ferric chloride, p 56) Lefort (l.c.) also describes a ferroso ferric sulphate -Fe, O, 6SO, 15H2O-obtained by evaporating, over H SO, solutions of Fe₂O₄ in H₂SO₄, he says that arsenates and phosphates of Fe₃O, also exist, the solutions of these salts are decomposed to a mixture of ferrous and ferric salts by warming to 60°-70° (for hyrates of Fe₂O₄ v. Hydrates of ferroso-ferric oxide, p 57)

(Peroxide, sesquioxide, or) Fe.O. Occurs native in FERRIC OXIDE brown oxide, of iron) Fe₂O, large quantities widely distributed as red hæmaute, specular iron ore, and martite 8 G native 15°-98° ·16695 (Regnault, A Ch [8] 1, 129) CE 00004 (Kopp) Crystallises in hexagonal forms, a c = 1.186537 (Rammelsberg)

Preparation —1. By ppg a ferric salt by NH₂Aq, thoroughly washing, and strongly heating the pp -2 By strongly heating ferrous exalate in air, Vogel $(J \ pr \ 63, \ 187)$ says this method gives a very pure product —3 By heating ferrous carbonate in air —4 By strongly heating ferrous sulphate in air, the product seems always to contain a little basic sulphate unless the temperature is kept very high for a long time

The oxide is obtained in crystals by the following methods -5 By heating a mixture of equal parts ferrous sulphate and NaCl, and washing with water, the temperature must not be too high, else some Fe₃O₄ is produced —6 By heating Fe₂O₃ in a slow stream of HCl gas (Deville, O R 52, 1364), in a rapid current of HCl, FeCl₃ is produced —7 By melting Fe₂O₃ with CaCl₂ (Kuhlmann, C R 52, 1283) —8 By the action of FeCl, vapour on strongly-heated lime (Daubré, C R 49, 143) —9 By melting Fe₂O₃ with borax and treating the fused mass with warm dilute HClAq (Hauer, W. A B 13,

Properties - A reddish-brown, very hard, non magnetic powder, extremely hygroscopic, slightly volatile at c 3000° (Elsner, J pr 99, 257) According to Malaguti a magnetic variety of Fe,O, exists (A Ch [8] 69,214, cf Lallemand, A Ch [3] 69, 233, Lawrence Smith, B 8, 183)

Reactions -1 Heated to a very high temperature Fe₂O₃ is partially deoxidised to Fe₃O₄ (Sidot, C R 69, 201) —2 Reduced by heating in hydrogen, according to Moissan (C R 74, 1296) Fe₂O₃ (prepared from ferrous oxalate) is reduced to Fe₃O₄ by heating to 350° for an hour in H, reduced to FeO by heating to 500° for 20 minutes in H, and to Fe when heated in H at 700° (cf Siewert, J 1864 265) Wright a Luff (C J 33, 1) found that the temperature at which reduction of Fe₂O, by H begins varies from 195° reduction of re₂O₃ by In begins value and are to 260° according to the physical state of the Fe₂O₃ used --3 Reduced by heating in carbon monoxide, to Fe₃O₄ at 350°, to FeO at 500°, and to Fe at 700°-800° (M, Ic, cf Gruner, CR 73, 28) Temperature at which reduction begins varies from 90° to 220° according to physical state of Fe₂O₃ used (W a L, lc)—4 Reduced by heating with carbon to Fe₃O₄, and then to Fe which combines with part of the C (v Iron, carbides of, p 53) Reduction begins at 430°-450° (W a L, lc) According to Parry (C N 27, 313) reduction of Fe₂O, by C in a vacuum begins at above 400°, at 1200° c 3 of the oxide is reduced.—5 Reduced to FeO by heating in a mixture of equal volumes of carbon monoxide and dioxide (Debray, C R 45, 1018) -6 A mixture of carbon dioxide and cyanogen (6 vols partially reduces Fe₂O₃ to Fe at c 600°-700° (Bell, J. 1874 266)—7 Heated in ammona Fe₂N₃ is produced (v Iron, nitrides of, p 59) 8 Chlorine forms FeCl, slowly at full red heat (Weber, P 112, 619)—9 Heated with sulphur 80, and FeS are produced (Brescuus, D P J 192, 125).—10 Heated strongly in a rapid stream of hydrogen chloride FeCl, and H,O are formed (Deville, C R 52, 1264) -11 Sulphuretted hydrogen does not act on dry Fe,O,; with

moist Fe₂O₂ (Fe₂O, xH₂O) FeS, S, and H₂O are formed (Wright, C J. 43, 156, Brescius, D P J 192 125)—12 Phosphor c chloride produces FeCl, which then combines with part of the PCl, forming FeCl, PCl, (Weber, J pr 76, 410) -18
Fe₂O₃ is slowly dissolved by acids, the more slowly the denser the specimen of Fe₂O₃, most easily dissolved by 16 times its weight of a boiling mixture of 5 pts H₂SO, and 3 pts H₂O (Mitscherlich, *J pr* 8¹ 108) After strongly heating with alkalis, alkaline carbonates, or acid sulphates, Fe₂O₃ is readily dissolved by acids -14 Fe O, readily parts with O when heated with oxidisable organic compounds, on exposure to air O is again taken up (Robin, C R 49, 500, Grager, A 111, 124) Moist Fe,O, (Fe₂O₂ xH₂O) in presence of ordinary air serves as an oxidiser of various vegetable matters, e g wood (Kuhlmann, D P J 155, 31, cf. P Thénard, C R 49, 289)

Combinations -1 Fe₂O₃ is extremely hygro scopic, it forms several hydrates by combining with water For conditions of formation, composition, and properties v Hydrates of ferric oxide, p 57—2 With some more ositive me-tallic oxides to form ferrites (q v in vol 11 p 547)

HYPOTHETICAL FERRIC ANHYDRIDE (? FeO.) This oxide has not been isolated, but a number of salts are known, which are best regarded as derived from the hypothetical acid H, FeO, of which FeO, would be the anhydride These salts are described under the heading Ferrates (vol 11 p 546) In addition to the descriptions there given it is to be noted that when air is blown into hot cone NaOHAq containing c 34 pc NaOH, a perceptible quantity of Fe is dis solved to form a colourless liquid, from which Fe₂O, xH₂O slowly separates (Zirnité, Chem Zeitung, 12, 355), possibly the solution con tains a ferrate of Na, or, according to the sug gestion of Z, a perferrate NaFeO, (?)

Iron, oxybromides of Oxybromides of Fe are said to be formed by evaporating FeBr,Aq, and by the action of Fe₂O₃xH₂O on FeBr₁Aq or HBrAq (Ordway, J pr 76, 19, Bcchamp, A Ch [3] 57, 296, Scheufelen, A 231, 1'7)

Iron, oxychlorides of The oxychlorides of

Fe are numerous and of complex composition, they belong to the form xFeCl, yFe,O, zH2O They are divided into two classes, those which are soluble in water, and those which are in soluble

Soluble oxychlorides Prepared by di gesting freshly ppd Fe₂O₂xH₂O in FeOl Aq, also by digesting excess of Fe₂O₃xH₂O in HclAq By the former method Ordway obtained 2FeOl₂28Fe₂O₃ (J pr 76, 19) By the second method Bechamp (A Ch [3] 51, 296) obtained liquids containing FeCl, and FeO, in ratio 25, 13, 14, and 15 All these solutions evaporated at c 40° give residues soluble in water, solutions containing more Fe₂O₃ than the foregoing (up to 10Fe₂O₃) give residues on evaporation which are insol in water Solutions of soluble oxychlorides are not decomposed by dilution or heating, but addition of various acids and salts causes ppn. of Fe₂O₂ xH₂O, mixed with oxychlorides, which are soluble in water From solutions of soluble oxychlorides NH, Aq ppts Fe₂O, xH₂O free from chloride, whereas the pp obtained from the insol oxychlorides contains chloride

Insoluble oxychlorides Prepared by exidation of FeCl2Aq, by exposure to air or by HNO, in presence of a little HCl (Béchamp, la) I o saturated FeCl, Aq, HCl is added in less propor tion than 3HCl to FeCl,, the solution is heated to 100°, and HNO, Aq is graduall, added, a violent reaction occurs, the nearly black liquid becomes yellow, and oxychlorides separate which are insol in water The composition of these exychlorides varies acco ding to the tempera ture and the proportion of HCl used Insol oxychlorides are a so formed by adding alkali to FeCl.Aq in quantity insufficient for complete ppn These oxychlorides vary in colour fro n yellow to brown, they are slowly soluble in HClAq, when heated they lose HO and HCl

Iron, exyfluoride of B adding NH,Aq to a solution of FeF, a yellow salt of the composition 2FeF, 3Fe,O, 4H,O is obtained (Deville, A Ch 13 149, 85)

Iron, oxysulphide of According to Ram melsberg (P 121, 339) the product obtained by heating Fe₂O₂ in H₂S gas to near redness is 3Fe₂S₄ Fe₂O₃

Iron, reduced Ferrum redactum Very finely divided Fe is obtained by reducing Fe O, in a stream of pure H Reduced iron is very readily oxidised, commercial specimens generally contain 40 p c or more of oxide

Iron, phosphides of Meyer ir 1780, and Bergmann somewhat later, obtained a phosphide of 1 e, supposing it to be a new metal they called it Hydrosiderim (Berl Ges d naturforsch Freunde [1781] 2, 334, Bergmann's Opusc 3, 109) Several 1 e phosphides have been described According to 1 reese (P 132, 225) only three exist, I e,P, heP, and Fe,P. They are non magnetic and almost infusible, unchanged by cold HClAq, slowly acted on by boiling HClAq giving \(\frac{1}{2}\) of their P as phosphoric acid and \(\frac{2}{2}\) as BH, oxidised at ordinary temperature by HNO, and uqua regia

Fe₂P₄ By heating FeS₂ in PH₃ gas (H Rose, P 6, 212, 24, 333), also by heating reduced Fe or I cCl₂ in PH₄ (Freese lc) \(\lambda\) blue grey powder, S G 504, loses P by heating in H or CO, probably forming FeP

FeP By heating FeS in PH, for a long time (Freese, lc), also by passing a mixture of H and P vapour over strongly heated Fe₂O₄, and by the action of PH, on FeCl₂(H Rose, l.c) A black crystalline mass, not acted on by HNO₂ or HClAq, nor by I

Fe.P / parts dry FePO, with 1 part lamp black are covered with a layer of NaCl and heated to whiteness, and the fused mass is treated with HClAq, Fe P remains as a grey crystalline solid, S G 574, unchanged by heating in H, CO, or CO₂ (Freese, lc)

The following phosphides have been described in addition to those mentioned, according to Freese they are not definite compounds—Fe,P (Hvoslef, A 100, 99), Fe,P, (Schenk, C J [2] 11, 826), Fe,P, (Struve, J pr 79, 321), FeP, (Sidot, C R 74, 1425)

Iron, salts of Two series of Fe salts, obtained by replacing H of acids by Fe, are known, ferrous salts FeX, and ferric salts FeX, $(X - Cl, 4c., NO_s, 4c., \frac{SO_s}{2}, 4c., \frac{PO_s}{3}, 4c.)$. The ferric

salts are the more stable, as a class ferrous salts are readily oxidised to FeX. Both series contain many well marked and very definite compounds Lefort (C R 69, 179) asserts the ex istence of a few salts, eg chloride, sulphate, phosphate, corresponding to Fe₂O₄ (v Ferrosoferric oxide, p 61) Ferrous salts are usually obtained by dissolving Fe in various acids, or in the cases of the insol salts by double decompo sition from FeSO,, they are for the most part sol in water, a few basic ferrous salts are known. but the greater number are normal salts Many double ferrous salts, especially with the alkali sulphates, have been isolated, many ferrous salts are isomorphous with the corresponding salts of Co, N1, Mn, Zn, and Mg A double ferrous alu minium sulphate, FeSO, Al, 3SO, 24H,O, is said to exist and to be isomorphous with the alums Ferric salts are generally prepared by dissolving Fe₂O₄ xH₂O in the different acids, many basic, and numerous double, ferric salts are known, the double salt (NH,)2SO, Fe (SO,), 24H,O be The ferric salts are longs to the class of alums generally analogous to the persalts of Al, Cr, Co, Ni, and Mn (cf Iron GROUP OF ELEMENTS) following list comprises the more important salts of Fe derived from oxyacids, for details t CAR BONATES, NITRATES, SULPHATES, &C antimonates, arsenates and ites, borates, bromates, carbonates, chlorates, chromates, hypophosphite, iodates, molybdates, niobates, nitrates, perchlorates periodates, phosphates and ites, selenates and -ites, silicates, sulphates and -ites, tantalates, tellurates and ites, thiosulphates, titanates, tungstates, vanadates

Iron, selemides of Selemides of Fe seem to be obtained (1) by passing Se vapour over strongly heated Fe, (2) by heating the product obtained in (1) with Se (Berzelius), (3) by method (2) covering the mass with borax, Little (A 112, 211) obtained Fe,Se, thus, SG 638, (4) by ppg Fe salts by H,Se (Reeb, J Ph [4 9, 173) By heating Fe filings with Se to it liness Divers a Shimidzu (C J 47, 441) obtained FeSe, resembling FeS in appearance, with acids yields H.Se

Iron, selenocyanides of None has been iso lated, Crookes (C J 4, 12) mentions various reactions which do not yield a definite salt

Iron, silicide of It is doubtful whether any definite compound has been isolated Silicides are apparently formed (1) by heating Fe with Si (Deville a Caron, C R 45, 163), (2) by the action of molten Fe on silicates Hahn (A 129, 57) obtained a body approximately Fe,Si by fusing 60 parts Na. Sile,, 20 parts Na, 60 parta Zn, and 22 parts steel, under NaCl Other bodies, approximately Fe Si and Fe, Si, are described by Deville a Caron (lc) and Hahn (lc, ct Bous singuilt, A Ch [3] 16, 15)

Iron, silicofluoride of, FeSiF, v Ferrous fluoride, p 56

Iron, sulphoeyanides of, v vol 11 p 350 Iron, sulphides of Four are known, FeS, Fe,S., Fe,S., and FeS., a subsulphide, Fe,S. also probably exists According to Gautier a Hallo peau (C R 108, 806) a yellow grey lustrous body, Fe S., 1s formed by heating Fe in CS. for several hours at 1300°-1400°

IRON SUBSULPHIDE Fe.S Said by Arfvedson (P. 1, 72) to be produced, as a greyish-black powder, by heating dry FeSO₄ in H.

or protosulphide) Occurs sometimes in meteor-

ites, also in combination with NiS

Formation - 1 By heating FeS₂ with Fe until the mass is thoroughly molten - 2 By reducing FeS₂ in H - 3 By the reduction of Fe₂O₃ or ferric salts by decomposing organic matter in presence of sulphates (Chevreul, C R 43, 218) 4 By gently heating a mixture 1 part S with 13 parts Fe filings moistened with water, if a con siderable quantity of such a mixture is made into a paste with water and covered with earth, the mass after a time becomes red hot and evolves much steam which throws up the earth with some violence—5 By strongly heating Fe₂O₃ or a ferric salt in H₂S (Sidot, C R 66, 1257, cf Carnot, Bl [2] 32, 162) - 6 By heating a mixture of Fe₂O₂ and S in H (Rose, P 110, 120) -7 By heating to redness a mixture of Fe₂O₃ and excess of Na₂S₂O₃ (Gibbs, Am S [2] 87, 346)

Preparation -1 A mixture of 8 parts Fe filings and 2 parts S is strongly heated in a covered crucible until the whole mass is thoroughly melted, if the temperature is not high enough some Fe remains and some Fe,S, is formed -2 A white hot rod of iron is plunged into molten S, the FeS formed flows off, the operation is repeated as long as any S remains (Gahn, Rammelsberg, B B 1862 681) -3 By ppg a ferrous salt by an alkalı sulphide, pre-

ferably NH, sulphide

Properties -FeS prepared in the dry way is yellow-brown, lustrous, metal-like solid, crystallising in hexagonal prisms, S.G. 469 Non magnetic, not changed by heating out of contact with air or in H FeS prepared in the wet way is an amorphous, greenish black powder, which on gently heating in air is partly changed to FeSO,, it is slightly soluble in water By ppg FeS in a very dilute solution, and then dialysing away the other products of the reaction, Winssinger (Bl [2] 49, 452) obtained a very dilute solution of colloidal FeS, the solution was greenish brown, oxidised and coagulated very readily

Reactions -FeS prepared in dry way 1 Heated in hydrogen, or out of contact with air 18 unchanged -2 Heated in steam evolves H and H.S. and leaves a black magnetic mass con taining Fe₈O₄ (Regnault, A Ch [3] 62, 379) -3 Heated strongly in air forms Fe₂O₃ and SO₂-With dilute hydrochloric or sulphuric acid evolves H2S, and forms FeCl2 or FeSO, -5 Ox1 dised by nitric acid -6 Heated with chlorine

from S2Cl, and FeCl,

FeS prepared in the wet way 7 Oxi dises in air at ordinary temperature, forming Fe₂O₂ xH₂O₂ S, and a little basic Fe sulphate (Wagner, D P J 192, 131) -8 Slightly soluble in water, re-ppd by NH, HS -9 Soluble in sulphurous acid solution, also in potassium cyanide solution (Goueront, O R 75, 1276) — 10 Slightly soluble in solutions of alkaline sul phides -11 Very easily decomposed by acids, with evolution of H2S

FEBROSO FERBIC SULPHIDE Fe,S. (Magnetic sulphide of iron) Occurs native as magnetic pyrites in he agonal crystals, SG 451 to 464, the composition may be expressed as xFeS.Fe.S., x is very seldom = 1, generally = 5 and 6 The first product of the action of H2S on strongly

FERROUS SULPHIDE FeS (Iron monosulphide | heated Fe,O, is Fe,S, but this decomposes to FeS (Sidot, C R 66, 1257)

(Sesquisulphide of L'ERRIC SULPHIDE Fe2S, sron) By heating a mixture of powdered FeS and S to redness, or by passing H₂S over Fe₂O₂ at 100° (Berzelius, P 7, 393) A greenishyellow mass, magnetic according to Proust (Scher J 10, 54), non magnetic according to Berzelius (Ic) When heated, gives Fe,S, when moist soon chang s to a mixture of S and Fe₂O₃, decomposed by dilute acids forming ferrous salts, H,S, and H,S xS

Combines with Fe.O, when heated with it. The product of the reaction of HS on Fe,O, at somewhat above 100° is Fe O, 3Fe,S, according to Rammelsberg (P 121, 337) Combines with CuS to form CuS Fe2S3, also with K2S, Na2S, These compounds may be regarded as $Ag_{s}S$ sulphoferrites, they belong to the form M'zFe,S,, and are produced by fusing 1 part Fe filings with 5-6 parts S and 5-6 parts alkaline carbonate. the Ag salt is obtained by adding AgNO, to the K salt suspended in water (v Schneider, P 136, 460, Preis, J pr 107, 10) Fe,S, is said to form a hydrate, Fe,S, 3H,O, a greenish black pp ob tained by adding NH, HSAq to a ferric solution containing an oxidiser such as Cl or a hypochlorite (Phipson, C N 30, 139)

IRON DISULPHIDE FeS, (Iron pyrites) Occurrence -In large quantities, in regular crystals as · ollow pyrites, and in rhombic crys

tals as white pyrites
Formation -1 By slowly heating a mixture of Fe₂O₃, S, and NH,Cl (Wöhler, P 37, 238) -2 By the action of CS₂ on Fe₂O₂ (Schlagden hauffen, J Ph [3] 34, 175) -3 By heating Fe, or Fe,O₃, with SO₂Aq in a sealed tube to 200° (Geitner, A 129, 350) -4 By passing H₂S over an oxide or chloride of Fe at a temperature above 100° but below redness -5 By the action of organic matter on water containing Fe and sulphates in solution —6 Glatzel (B 23, 37) obtained crystals of FeS, by strongly heating FeCl, with P.S.

Preparation -1 An intimate mixture of 2 parts FeS and 1 part S, or of \ part Fe with \\ \frac{1}{4} \ parts S, is heated in a retort to a temperature somewhat under red heat, and the product is treated with dilute HClAq (Berzelius), below 100° the chief product is Fe S, and at red heat Fe,S4 is formed -- 2 By mixing an alkaline per sulphide solution with FeCl₂Aq at 180° or with FeSO₄Aq at 165° (Senarmont, A Ch [3] 30, 129)

Properties - A bulky dark yellow powder, or crystallised in small brass yellow cubes and octa hedra Not magnetic The rhombic form of FeS. oxidises in moist air forming FeSO,, S, and H2SO.

Reactions -1 White iron pyrites, finely-divided yellow pyrites, or FeS, prepared in the wet way, oxidise in aw, forming chiefly FeSO. and at higher temperatures SO, and Fe₁O₂ — 2 Calcined with carbon, gives CS₂ —8 Not acted on by dilute acids, by decomposed by conc hydrochloric acid, giving H₂S and S —

4 Oxtdised by heating with conc nitric acid

Iron, telluride of Produced by reducing fer-

rous tellurite in H (Berzelius)

IRON ALUMS

 $K_2[or (NH_4)_2]SO_4.Fe_2(SO_4)_2.24H_2O_7$ ALUMS, vol i. p 148, and SULPHATES. M M P. M.

elements, IRON, NICKYL, COBALT, and MANGAN ESS, are more or less closely connected. Fe, N1, and Co occur in meteorites, some of which also contain minute quantities of Mn. The chief ores of Fe and Mn are oxides, carbonates, and sulphides, of N1 and Co sulphides and arsenides Fe has been known and used for ages, N1, Co, and Mn have been known from about the middle of the eighteenth centur. The name won is probably a form of the Sanserit word ayas (= metal), the names nuckel and cobalt are derived from terms used by miners in the Middle Ages to express false or spurious metals, or minerals from which no useful metals could be obtained, man ganese is sai to be a corruption from mag-

nesta nigra, a name long given to the mineral pyrolusite Compounds of Fe occur in large quantities, widely distributed, compounds of Mn are not so common, "or so widely distributed, and compounds of Ni and Co occur only sparingly Fe, Ni, Co, and Mn are obtained by reducing the oxides with char coal at high temperatures. The metals are all hard, lustrous, fairly malleable and ductile, they crystallise in the regular system, they are more or less magnetic, they are unacted on by dry air, but oxidise slowly in moist air, they decompose steam, and react with acids to form salts. The following table presents some of the characteristic properties of the four metals.—

	MANGANESE	ibon	NICKEL	COBALT			
Atomic weights	55	55 9	58 6	58 8			
	One compound of Mn (MnCl ₂), and two of Fe (FeCl, and FeCl ₃) have been gasified, no Ni or Co compounds have been gasified, specific heats of the four metals have been directly determined. Molecular weights unknown						
Melting points (approx)	1800°-1900°	1600°	1500°	1500°			
Spec gravs (approx)	8	78	8 9	86			
Spec grav (approx)	6-9	72	6.6	68			
Occurrence and Preparation.	Occurs chiefly as MnO ₂ . Obtained by reducing the oxides by C at a high temperature, Also by reducing the chloride or fluoride by Na.	Chiefly as Fe ₂ O ₁ , Fe ₂ O ₄ , and FeCO ₂ . Obtained by reducing Fe ₂ O ₂ by C, or CO, at a high tem perature, also by reducing Fe ₂ O ₃ or Fe ₃ O ₄ in H, and by electrolysis of 1 eSO ₄ Aq	Chiefly as NiAs and NiAsS Ob tained by reducing Ni ₂ O ₂ by Cata high temperature, or by heating in H.	Chiefly as CoAs, and CoAsS Obtained by reducing Co ₂ O ₄ by heating with Corin H.			
Physical pro- perties			Silver white, very tenacious, hard, ductile, malleable, magnetic up to c 250°, crystallises in regular cubes and octahe dra.	Steel grey, lustrous, hard, very ductile at red heat and up wards, somewhat malleable, magnetic, crys talhises in regular cubes and oc tahedra			
Themscal pro perties	Oxidises easily in air, Mn obtained by reducing chloride by Na is said not to tarnish in ordinary air Oxidised by heating in air Decomposes steam, said to decompose	Unchanged in dry air, in moist air forms Fe ₂ O ₂ xH O ₅ , heated in air or O, burns to Fe ₃ O ₄ and Fe ₃ O ₅ Decom- poses steam, form- ing Fe ₃ O ₄ and H Dissolves in dilute	temperature De- composes steam at red heat Dissolves in dilute soids, but	dinaryair; heated in air or O burns to Co ₂ O ₄ Decom poses steam at red heat, decomposes NH ₂ to N and H Dissolves in di- lute acids, but is unacted on by

TABLE—continued

1 ABLE—continued								
	MANGANESE	IBON	NICKEL	COBALT				
	cold water slowly Dissolves in dilute acids, hardly acted on by cold cone H ₂ SO ₄ Combines directly with Cl and Br No simple cyanide of Mn is known, but the acid H ₄ MnCy ₅ and salts derived from it, and also salts of the hypothetical acid H ₂ MnCy ₅ , have been isolated With acids forms two series of salts, MnX ₂ and MnX ₃ , of which the manganous salts (X = Cl, SO ₄ , &c) are the more stable Besides the oxides corresponding to the salts (MnO and Mn ₂ O ₃) other acid acid H ₂ MnO ₄ , and numerous salts of this acid, are known, salts of the hypothetical acid H ₂ MnO ₄ are also numerous Atom of Mn is divalent in the gaseous molecule MnCl ₂ .	sol in cold cone H ₂ SO ₄ , unacted on by cold cone H _N O ₂ , combines directly with Cl, Br, and I, also with C, and probably with H and N No simple cyande is known, but a large number of ferro and ferri cyanides, and also the acids H ₄ FeCy ₈ have been isolated Some ammonic compounds are known Reacts with acids to form two series of salts, FeX ₂ and FeX ₃ , of which the ferric salts (X = Cl, SO ₄ &c) are the more stable Ferrates, M ⁴ ₂ FeO ₄ , are also known, but neither the corresponding acidnor anhydride has been isolated Atom of Fe appears to be divalent and trivalent in gaseous molecules (FeCl ₂ and FeCl ₃), perhaps also tetravalent (Fe ₂ Cl ₄ and Fe ₂ Cl ₆)	cold cone HNO, Coribines directly with Cl, Br, and I. Probably forms a nitride by heating NiOin NH, A Cy2 and many double cyanides are known, but no acids or salts corresponding with ferro, ferri, mangano, and mangani cyanides have been isolated Some ammonio - com pounds are known With acids forms two series of salts, NiX, and NiX, of which the nickel ous salts (X = Cl, SO; &c) are much the more stable No salts in which Ni forms part of the acidic radicle have yet been certainly isolated	cold conc HNO. Combines di rectly with Cl, Combines di rectly with Cl, Br, and I, also probably with C CoCy, is known, also the acids T.CoCy, and H.CoCy, and H.CoCy, and many salts de rived therefrom Very many ammonio - com pounds are known With acids form two series of salts CoX, and CoX, of which the cobaltous salts (Y = Cl, SO, & & c) are much the more stable By the action of molten KOH on CoO a salt is obtained in which Coseema to form part of the negative radicle				

pounds —O xides — MO, M₂O₃, M₂O₃, also MnO₂, MnO₈, Mn₂O₇, Sulphides — MS, M₃S₄, M₂S₄, MS₄, MCl₃, MnCl₄, Salts — MX_2 and MX_3 , $X = NO_3$, $\frac{SO_4}{2}$, $\frac{PO_4}{3}$, &c Salts containing M in the acidic radicle- $N_{2}MO_{4}$, where M = Mn or Fe, also $N_{1}MnO_{4}$ (? NaFeO₄), also $xMOyFe_2O_3$, where M= decidedly positive metal $Acids-HMnO_4$ The oxides MO are basic They react with

acids to form salts MX2 MnO and FeO are readily oxidised by standing in air, FeO very rapidly. NiO and CoO, on the other hand, are obtained by heating the higher oxides in air The oxides M_2O_4 are basic, forming salts MX_4 In the case of Mn only a few salts corresponding to M₂O₂ are known, eg Mn₂(SO₄). In the cases of Ni and Co the salts of M₂O₂ are hardly known, the cudes dissolve in cold cone solds, probably forming salts, but on warming salts of MO are obtained Both Fe₂O₃ and Mn₂O₄ show feebly acidic properties, as they combine with some more basic oxides, eg CaO, BaO, ZnO

General formulæ and character of com | The oxides M3O4 react with acids, for the most part, as compounds of MO with MO, Ye,O,, however, is said to produce a few corresponding salts, eg Fe,Cl, and Fe,(SO,). It is doubtful whether MnO, form any corresponding salts. with acids it usually evolves O, and forms man ganous salts MnX, It combines with several more positive oxides, eg CaO or BrO, to form compounds $xM^{11}OyMnO_2$ MnO, and Mn₂O, are extremely unstable acidic oxides The acid of Mn₂O₇, vis HMnO₄ or H₂Mn₂O₈, is known, and from it a large series of salts has been obtained The acid of MnO, (H,MnO,) has not been isolated, but the manganates Mi MnO, are well known salts Ferrates, M'2FeO4, corresponding to the manganates, are known although neither the acid H₂FeO, nor the annydride FeO, has been isolated

> The sulphides MS are basic, but MnS shows slightly acidic properties MnS forms a com pound with the very positive K₂S (K₂S MnS), CoS, on the other hand, combines with the slightly negative As₂S, (2CoS As₂S,) Fe₂S, forms compounds with Ag₂S, CuS, &c, which may be regarded as sulphoferrites

The haloid compounds MX₂ or .I₂X₄ are generally formed by direct union of the elen'ents, also by dissolving the oxides MO in the haloid acids HX and evaporating. Fe is the only member of the group which certainly forms haloid compounds containing more halogen than MX₂. There are, however, indications of the existence of MnCl₂, and MnCl₄. The haloid compounds which have been gasified are MnCl₂, FeCl₂ and FeCl₃. The eare no indications of the existence of gaseous molecules Mn₂Cl₄, but the V D s of ferrous and ferric chlorides point to the existence of the gaseous molecules FeCl₂ and FeCl₃ at high tempera ures, and Fe₂Cl₄ and Fe₂Cl₄ at lower temperatures

The salt. of the metals of the iron group be long to the series MX_1 and MX_2 , where $X = NO_3$, $\frac{1}{3}SO_3$, $\frac{1}{3}CO_3$, $\frac{1}{3}PO_3$, $\frac{1}{3}CO_3$, $\frac{1}{3}PO_3$, $\frac{1}{3}CO_3$, $\frac{1}{3}PO_3$, $\frac{1}{3}CO_3$, $\frac{1}{3}PO_3$, $\frac{1}{3}CO_3$, $\frac{1}{3}C$

The only member of the series which forms acidic oxides that have been isolated is Mn (v supra) Permanganic acid, HMnO., has also been isolated, but no oxyacid of Fe, Ni, or Co

The iron elements exhibit analogies with several other families of elements. Their relations with the elements of Group III, especially with Al, Ga and In, are shown in the composition of the salts M_{N_a} , in the existence of alums, $eg \in K_{N_a} M_{N_a} M_{N_a}$, where M = Al, Ga, In, Fe, or Mn, also in the existence and dissociation of the gaseous molecules Fe₂Cl₂, Al Cl₃, and Ga,Cl₄. The analogies shown by Ni and Co to the Al family are very slight

The iron family is distantly connected with the halogens. This is shown in the existence of the salts $N^{\dagger}MO_4$, where M=Mn (°1 c), Cl, or I

The relations between the iron family and the chromium family of Group VI are fairly well marked, the MN salts are similar to the CrX, salts, MnO, resembles CrO, in being acidic and forming salts M12MnO, analogous to and isomorphous with the chromates Ferrates, M1, FeO, are also known, a hough neither FeO, nor H.FeO, has been isolated MnO₂ is not unlike CrO₂ in some of its reactions. The sulpho ferrites, e.g. CuFe2S4, resemble the sulpho chromites, eg The relations of Ni and Co to the ZnCr,S Or family are chiefly shown in the formulæ of the nickelous, cobaltous, and chromous salts, MX₂, in the existence of many ammonio cobalt and ammonio-chromium compounds The formation of the cyanogen acid H,MCy, and of salts of H₂MCy₆, where M = Mn, Fe, Co, or Cr, is a point of similarity between Cr and the iron family

The composition of the salts MX, is similar to that of the salts of Group II, so far as properties go these salts most resemble those of the odd series members of Group II, Mg, Zn, and Od, the ammonio-compounds of To also recall

the ammonio-compounds of Hg which is an odd series member of Group II

There are some resemblances between Cu which belongs to Group I and the iron elements, thus the salts MX, resemble in many respects the cupric salts CuX₂, there are many ammonic-copper compounds, numerous double cyanides of Cu exist and some of those are probably derived from a cyanogen and H₂Cu₂Cy₄.

Finally some of the physical properties of the iron family resemble the properties of the two other families of Group VIII, viz Rh, Ru, Pd, and Os, Ir, Pt, this resemblance is carried out in the formulæ of some of the salts, and in the existence, and in some cases the composition and properties, of numerous complex cyanides; these complex cyanides are indicated in the following table—

 $\begin{array}{ll} H \ MC_{3} \ \ and \ salts. \\ M = Mn, Fe, Co, Os, Ru \\ & M = Fe, Co, Ir \\ Salts \ of \ H_{3}MC_{3} \ \ (acid \ not \ isolated) \\ & M = Mn, Rh \end{array}$

The acid H₂PtCy₄ and salts of this acid exist, salts of H₂PdCy₄ are known. It should be noted that Ni does not form nickelo or nickeli cyanides analogous to any of the complex cyanides formulated above, but only ordinary double cyanides.

The position of the iron family of elements in the classification based on the periodic law is somewhat peculiar (v Table on p 204 of vol 11.) Mn is placed in the even series of Group VII, the only other members of this group as yet known are the halogens Fe, Ni, and Co form a division, or family, of Group VIII, the other families of this group are (1) Rh, Ru, Pd, and (2) Os, Ir, Pt The iron family should therefore, strictly, include only he, Ni, and Co, Mn has been included in this family because of its close relations to Fe, but because of its position in Group VII, Mn has also been included in the halogen family (v Halogen elements, vol 11 p 664) Each of the three families which together con stitute Group VIII is separated from the others by many elements, the analogies between these families cannot be very close The iron family is preceded in order of atomic weights by a series of elements, which begins with the very positive element K and ends with the element Or which is both metallic and non metallic, the iron family is succeeded by series 5 which begins with the undoubtedly metallic Cu and ends with the no less undoubted non metal Br The iron family forms one of the turning points in the swing of properties from very positive to very negative, the next similar turning point is marked by the second family of Group VIII, Rh, Ru, Pd, and the third turning point is marked by the last family of Group VIII, Os, Ir, Pt Recent researches show that Co and Ni ire perhaps separable each into two other elements, v NICKEL in this volume In connection with this article v Chromium group of elements, vol 11 p 168, Copper group of elements, vol 11. p 250, Eabths, metals of the, vol 11 p 424, HALOGEN ELEMENTS, vol 11 p 664 NOBLE METALS, in this vol For detailed properties of the members of the iron group v CoBALT, vol ii p 217, IRON, this vol p 51, Manganese and Nickel, MMPM F 2

ISAMIC ACID v ISATIN. ISATANE v ISATYDE ISATIC ACID C.H.NO. 1.6

C.H. (NH.) CO CO.H o Amido phenyl glyoxylic acid Formed, as potassium salt, by boiling isstin with cone KOHAq (Laurent, A Ch [3] 8, 871, Erdmann, J pr 24, 13) Obtained synthetically by reduction of an alkaline solution of onitro-phenyl-glyoxylic acid with ferrous sulphate (Classen a Shadwell, B 12, 353) By decom posing the lead salt with H2S and evaporating at atmospheric temperature in vacuo isatic acid may be obtained as an amorphous white powder, soluble in cold water The acidified solution deposits, after a while, crystals of isatin, which is its anhydride, and the separation may be hastened by warming With acetone in alkaline solution isatic acid forms (Py 3)-methyl quino line (Py 1) carboxylic acid [241°] Its silver salt forms microscopic needles (W Phtzinger, J pr [2] 33, 100, Beyer, J pr [2] 33, 416) Acetophenone gives, in like manner, phenyl-

quinoline carboxylic acid
Salts - KA' faint yellow crystals, which Salts -KA dissolve in conc KOHAq, forming a deep violet red solution, turned yellow on dilution with water Its solution gives a yellow flocculent pp with lead acetate, and, when concentrated, it is also ppd by BaCl₂—BaA'₂ (at 150°) scales.—AgA' beautiful yellow prisms, sol water

Acetyl derivative C.H. (NHAc) CO CO.H [160°] Obtained from acetyl-isatin by dissolving in cold dilute NaOHAq and ppg with dilute H₂SO₄ (Suida, B 11, 586) Needles (from alcohol) Sl sol cold water, m sol alcohol, ether, and benzene Boiling HClAq converts it into isatin Sodium amalgam reduces it to the acetyl derivative of α oxy o amido phenyl acetic acid $C_0H_4(NHAc)$ CH(OH) CO_2H , which forms colourless needles [142°] converted by HI into oxindole

Chloro satic acid CaHaCl(NH2) CO CO.H From chloro isatin by warming with KOHAq (Erdmann, J pr 19, 339, 24, 5, A 33, 129, Laurent, A Ch [3] 3, 378) Not known in the free state, since, when its salts are acidified, chloro-isatin is formed — KA' light yellow flattened needles (from alcohol), v sol water — BaA', aq pale yellow needles —BaA', 3aq bril hant deep yellow lamine -PbA', 2aq brilliant yellow gelatinous pp, which in a few minutes changes to scarlet PbA'₂aq —AgA' light yellow pp, sol boiling water—The cupric salt is ppd as a brownish red powder, which changes to blood red

Di-chloro-isatic acid C_eH₂Cl₂(NH₂) CO CO₂H Formed by dissolving di chloro isatin in hot Separates on addition of HCl as a yellow pp, which, even when exposed over sulphuric acid in vacuo in the cold, splits up into water and di chloro isatin It dissolves in water forming a light yellow solution, which becomes turbid at 60° and deposits di chloro isatin -KA'aq yellow laminæ — BaA', 2aq golden needles — CuA', reddish brown pp changing to greenish yellow and crimson — AgA', small yellowish needles (from hot water)

Bromo-isatio acid C₆H₃Br(NH₂) CO CO₂H Formed by warming bromo isatin with aqueous caustic potash (Gericke, J pr 95, 176, 257) The free acid splits up at once into water and bromo-

ısatin — L.A' easily sol ible cauliflower like crystals - NaA' warty crystals - BaA'₂ 8aq yellow prisms — CuA'₁ 2aq red granular pp — PbA'₂2aq yellow pp, changing to a scarlet crystalline powder —ZnA'22aq brownish pp, changing to red granular powder -AgA' light yellow needles (from hot water)

D1-bromo-1satic acid C,H,Br2(NH,)CO,H From di bromo isatin and hot KOHAq (Erdmann, J pr 19, 360) The free acid is ppd by adding HCl to a cone solution of the K salt as a light yellow powder, soluble in a large quantity of water By desiccation, even at 15° in vacuo, it is decomposed into di bromo isatin and water —

KA'aq pale yellow needles, v sl sol water Ethylether EtA' [105°] I com the silver salt and EtI (Baeyer a. Oekonomides, B 15, 2099) V sol ordinary solvenus At 110° it gives di bromo isatin

Sulpho-isatic acid

C₆H₈(SO₅H)(NH₂) CO CO₂H From isatin sul phonic acid and excess of alkalı (G a A Schlie per, A 120, 12) Only known in its salts, which are converted by mineral acids into isatin sul phonic acid —K,A"aq waxy yellow prisms, v sol water —BaA"3aq long silky lemon yellow needles, v sol boiling water, insol alcohol -PbA" $1\frac{1}{2}$ aq yellow needles, v sol water $-4g_2A''$ $1\frac{1}{2}$ aq pale yellow needles, sl sol water

Isomeride of isatic acid v m Amido-Phrnyl

GLYOXYLIC ACID

p Methyl isatic acid Acetyl derivative C₆H₃(CH₃)(NHAc)CO CO₂H [172°] white needles, soluble in alcohol and hot water. very sparingly in ether, benzene, ligroin, and CS, Formed by the action of cold aqueous al kalıs upon acetyl p methyl pseudo ısatın

Ethyl ether of the acetyl derivative C.H.(CH.)(NHAC)CO CO.Et [79°] White glistening plates, insol water Formed by boiling acetyl p methyl pseudo isatin with dilute

alcohol (Duisberg, B 18, 198)

Amide of the acetyl derivative C_eH₃(CH₃)(NHAc) CO CONH₂ [141°] Formed by the action of alcoholic NH₃ on the acetyl de rivative of methyl ψ isatin (Panaotović, J pr [2] 33, 72) Trimetric prisms (from alcohol), insol water

ISATILIM v ISATIN ISATIMIDE v ISATIN

C_sH_sNO₂ ie C_sH_s< CO OH ISATIN

(stable form) or $C_{\bullet}H_{\bullet} < \stackrel{CO}{NH} > CO$ (transition form Anhydride of isatic acid or pseudo isatin o-Amido phenyl glyoxylic lactim [201°]

Formation -1 Discovered simultaneously by Laurent (A Ch [8] 3, 371) and by Erdmann (J pr 24, 11) as a product of the oxidation of indigo by nitric acid (L) or chromic acid (E) -2 By oxidising amido oxindole with FeCl. nitrous acid, or CuCl₂ (Eaeyer, B 11, 1228) The oxindole may be obtained from phenyl acetic acid by nitration and reduction (Baeyer, B 11, 583), and converted successively into nitroso oxindole and amido oxindole -8 Prepared by boiling o nitro phenyl propiolic soid with alkalis (Baeyer, B 13, 2259) The reaction possibly takes place as follows.

ISATIN 69

$$C_{e}H_{i} < C_{C}C_{CO_{i}H} + 4H_{e}O$$

$$= C_{e}H_{i} < C_{C}C_{CO_{i}H} + CO_{e} + 4H_{e}O$$

$$= C_{e}H_{i} < C_{C}C_{CO_{i}H} + CO_{e} + 3H_{e}O$$

$$= C_{e}H_{i} < C_{C}C_{CO_{i}H} + CO_{e} + 4H_{e}O$$

(Michael, J pr [2] 25, 255) —4 Together with $N_2(C_8H_4 CO_1H)_2$, by dissolving isatogenic ether in aqueous Na_2C_3 (Baeyer, B 15,55) —5 From isa togenic acid by dissolvin. in H_2SO_4 and adding water (Baeyer B 14, 1742) —6 By oxidising carbostyril with alkaline KMnO₄ (Friedlander a Ostermaier, B 14, 1921) —7 By boiling nitroso (γ) oxy carbostyril with cone HClAq (Baeyer a Homolka, B 16, 2217) —8 By heating anthroxanic acid with FeSO₄ and dilute ammonia (Schillinger a Wleugel, B 16, 2224)

Preparation —1 Finely powdered indigo (50g of 65 pc) is made into a thin paste with boiling water, and a dilute solution of CrO, (30 g) is added The liquid is boiled till it begins to froth strongly, and is then filtered hot, when isatin separates on cooling The yield is moderate (9 g) (Sommaruga, A 190, 369) —2 A mixture of indigo (100 pts), boiling water (300 pts), and nitric acid (70 pts of S G 1 35) is boiled for two minutes, diluted with boiling water (2000 pts), boiled for five minutes more and filtered The isatin separates on cooling It may be purified by dissolving in aqueous KOH, adding HCl as long as it forms a black or brown pp, filtering adding more HCl to the clear yellow filtrate, and washing the red pp of isatin (Forrer, B 17,

976, Hofmann, A 53, 11)

Properties — Yellowish - red monoclinic prisms, a bc = 4251 503, B = 85° 18' (Bodewig, Z K 4, 65) Has no odour, but a bitter taste Sl sol cold, m sol boiling, water, forming a reddish yellow solution V e sol alcohol, sl sol ether The alcoholic solution imparts an unpleasant odour to the skin

Reactions —1 It is not attacked by dilute natric acid, but a stronger acid forms into o oxy benzoic acid, while conc HNO, forms oxalic acid —2 Nitrous acid, acting upon isatin sus pended in water, forms nitro-o oxy-benzoic acid (Hofmarn, A 115, 280), while, in presence of alcohol, nitrous acid forms benzoic acid (Baeyer, a Knop, A 140, 4)—3 Chromic acid in presence of acetic acid forms isatoic acid

$$C_eH_e < {}^{CO}_N > 0 \text{ oh } + O = C_eH < {}^{CO}_N \text{ co.H}$$
 On

the other hand, acetyl isatin C_sH_sCO_{NAc}CO, being a derivative of pseudo isatin, yields acetyl o amido benzoic acid C_sH_s(NHAc) CO H on similar treatment (E v, Meyer a J Bellmann, J pr [2] 33, 30)—4 Chlorine and bromine form products of substitution—5 Cold aqueous caustic potash forms a red solution, which on boiling immediately becomes yellow, and then contains potassium isatate If the solution be concentrated by distillation, decomposition suddenly takes place, aniline and hydrogen being

given off -6 Aqueous ammonia forms isamio Alcoholic NH, gives a variety of products, acid called by Laurent imesatin, imasatin, amisatin, isatimide, and isatilim. Ly heating isatin with alcoholic NH, in sealed tubes Sommaruga (A 190, 371) obtained di imido isatin, oxy-di-imidoisatin, and deoxy imido isatin -7 Isatin combines with alkaline bisulphites -8 SO, has no action -9 H2S gives di thio isatyde -10 So dium amalgam reduces it to isatyde C16H12N2O4 and doxindole C₂H,NO₂—11 Ammonium sulphide reduces it to isatyde —12 Zinc and dilute H₂SO₄ form isatyde—13 Zinc-dust and a little dilute HCl form isatyde and dioxindole (Baeyer, B 12, 1309) —14 Zinc-dust added to a cold solution of isatin in HOAc forms a colourless solution (? of isatin hydride) which becomes coloured again on exposure to the air, isatin being reproduced -15 Aqueous HI (S G 14) at 100° forms isatyde At 140° it forms a darkgreen insoluble mass, whence boiling alcohol leaves a dark grey residue, isatochlorin (C₁₂H₁₄N₁O₂, 2), whilst the alcoholic solution, mixed with water, gives a pp, whence ether extracts red isatopurpurin (C₂₂H₂₂N₄O₂?), while white isatone (C₃₂H₂₄N₄O₃?) remains un dissolved (Schutzenberger, Bi [2] 4, 170) — 16 PCl, forms 'isatin chloride' (Baeyer, B 12, 456) -17 Hydroxylamine forms nitroso oxin dole or isatoxim -- 18 Alcoholic KCy has no action -19 A solution of isatin, warmed with phenyl hydrazine, forms a pp of the phenyl hy drazide —20 In presence of H₂SO, or ZnCl₂ isatin forms condensation products, with (2 mols of) toluene, phenol, di methyl aniline, thiophene, &c, by elimination of water (1 mol) Thus, phenol and H_2SO_1 give di oxy-di phenyl oxindole $C_4H_4 < \frac{C(C_6H_4OH)_2}{NHCO}$, toluene gives di tolyloxindole, while di methyl aniline gives tetra methyl di-amido di phenyl oxindole (Baeyer, B 18, 2642) -21 When heated with phenyl cyanate, for three hours at 130°, it forms the anilide of isatin v carboxylic acid, which crystal lises from alcohol in needles [180°-185°] (Gum pert, J pr [2] 31, 120, 32, 283) -22 Phenyl mercaptan, added to a hot alcoholic solution of isatin, forms silky needles of a compound (C6H3NO2)(C6H3SH), insol water, but decomposed by hot benzene into its components (Baumann, B 18, 890) -23 By boiling with m-amido-benzoic acid and alcohol there is formed an acid which is termed isat amido-benzoic acid $C_eH_e < C_NC_eH_eCO_rH > CO_rGO_T$

benzamide gives, in like manner, the corresponding amide [c 280°] (Schiff, A 218, 192)—24 Heating with tolylene diamine forms C₁₃H₁₁N₂ [290°], which is probably a quinoxaline (Hinsberg, A 237, 344)

Metallic derivatives — C_sH₄AgNO₂ obtained by mixing isatin with water at 0°, adding KOH (1 mol) followed immediately by AgNO₂ (1 mol) (Baeyer a Oeconomides, B 15, 2093) Red pp — C_sH₄AgNO₂NH₃ Formed in presence of ammonia (L) — Cu(C_sH₄NO₂NH₃). From cupric acetate and an ammoniacal solution of isatin (Laurent) Brown pp — Potassiumisatin is present in the violet red solution obtained by dissolving isatin in conc KOHAq

Indophenine reaction - A solution of isatin

70 ISATIN.

in cone H.SO., shaken with benzene containing thiophene, is coloured blue, through formation of indophenine $(q \ v_i)$. A similar reaction is given by most derivatives of thiophene

Combinations with bisulphites C_bH_bNO₂KHSO₃2aq Formed by boiling isatin with aqueous KHSO₃ or by saturating a solution of potassium isatate with SO₂ (Laurent) Large, pale yellow tables, v e sol water and boiling alcohol, sl sol cold alcohol Gives with lead sectate a pp of isatin and lead sulphite—C_bH_bNO₂(NH_a)HSO₃ pale yellow tables, sl sol cold water—C_bH_bNO₂(NH_cO₂H₁)HSO₃ (Schiff, 4.144, 49)—C_bH_bNO₂(NH_cPh)HSO₃ Crystals, v. sol water (S)

Acetyl-\psi-ssatanCoH_\circ CO \ NAc \ CO \ [141°]

Prepared by heating isatin (1 pt) with Ac O (2 pts) for 4 hours (Suida, B 11, 584) Yellow needles (from benzene) V sol benzene and alcohol, sl sol cold water Resolved into isatin and acetic acid by boiling with water, or, more readily with HClAq Cold NaOHAq dissolves it, forming CoH_\((NHAc)\) CO CO_\(Na\) and, on warming, isatic acid Chromic acid in HOAc oxidises it to NHAC CoH_\((CO)\)

Benzoyl- ψ -ısatın $C_eH_4 < CO \atop NBz > CO$ From ısatın and BzCl (Schwartz, C R 56, 1050)

Oxem C₈H₈N₂O₂e C₈H₄ C(NOH) Isat oxem Netroso oxendole [c 202°] Formed by passing nitrous acid into a 1 p c aqueous solution of oxindole (Baeyer a Knop, A 140, 34) Formed also by boiling diazo nitroso oxindole chloride with alcohol and HCl (Gabriel a R Meyer, B 14, 2332) Obtained by treating isatin with hydroxylamine (Gabriel, B 16, 518, Baeyer a Comstock, B 16, 1706) Very slender golden needles Decomposed by fusion V sl sol water, sl sol alcohol Dissolves in KOHAq, forming a dark reddish brown solution Not decomposed by boiling aqueous KOH—C₂H₂AgN₂O₂ orange pp, got by adding dilute NH₂ to an alcoholic solution of isatin and AgNO₃ Dries up to a brick red powder

Mono-ethyl-ether of the oxim

C.H. C(NOEt) C(OH) Isato-ethyl oxim

[188°] Fine yellow needles, soluble in caustic al kalis, formed by the action of ethyl iodide on the silver salt of isatoxim By successive treatment with zinc-dust and HOAc and with FeCl. it is converted into isatin

Onverted into isatin Di ethyl-ether of the oxim $C_{\bullet}H_{\bullet} \subset C(NOEt) \longrightarrow C(OEt)$ Ethyl-isato-ethyloxim Crystalline solid, formed by the action of
ethyl iodide on the silver salt of the mono ethylether (Baeyer a Comstock, B 16, 1706)

Oxim of ψ -isatin $C_0H_1 \subset CO \setminus C$ NOH

Isonitroso- ψ indoxyl Formed by the action of nitrous acid on ethyl indoxylic acid $C_0H_1 \subset C(OEt) \setminus C$ OCO₂H Flat yellow needles

Percompages at about 200° Sol alkalis and

Decomposes at about 200° Sol alkalis and reppd by CO₂ With phenol and H₂SO₄ it does not give Liebermann's reaction Reduction with sinc-dust followed by oxidation with Fe₂Cl₆ yields isatin.

Ethyl ether of the oxim of ψ isatim $C_*H_* \subset CO$ (NOEt) From ψ isatoxim, KOH, and Etl yellow plates, dissolves in sodium ethylate with a blue colour, reduction with zinc dust followed by oxidation with Fe/Cle yields isatin Forms a violet solution when warmed with aqueous NaOH

Dr-ethyl-derivative of the oxim of ψ -isatin $C_0H_i \subset CO \setminus C(NOEt)$ [99°], yellow needles, sublimable, easily soluble in alcohol and ether, sparingly in hot water, insol alkalis. On reduction with zine dust and oxidation with Fe,Cl, it yields ethyl-pseudo isatin (Baeyer, B 15, 782, 16, 2191)

Phenyl hydrazide $C_{11}H_{11}N_1O$ [211°] Fine yellowish red needles Foi med as a yellow crystalline pp by boiling a solution of isatin in 1,000 pts of water with phenyl hydrazine hydrochloride $(q \ v)$, the pp is quite distinct with a solution of 1 in 20,000 (E Fischer, B 17,577)

Chloride C₈H₄CINO ie C₈H₄⟨CO⟩ CCl [c 180°] Formed by warming isatin (5g) with PCl₂ (7g) and benzene (9g) (Baeyer, B 11, 1296, 12, 456) Brown needles Decomposed on fusion V sol ether, forming a blue solution Decomposed by moist air Potash converts it into isatin HI gives indigo, zinc dust and HOAc do the same

Chloro-natin C₂H₂ClNO₂ [243°] S 1 at 0°, c 5 at 100° Obtained by passing chlorine in sunlight into boiling water containing isatin in suspension The mono and di chloroisatin are separated by recrystallisation from alcohol, in which the former is much less soluble (Hofmann, A 53, 12, Laurent, A Ch [3] 8, 452, Irdmann, A 33, 129, Dorsch, J pr [2] 33, 49) Orange prisms (from alcohol) V sl sol water and alcohol Its solution imparts an unpleasant odour to the skin Decomposed on fusion Hot KOHAq forms potassium chloro isatate Distillation with NH, gives p chloro annine An am moniacal solution of AgNO₃ added to an alcoholic solution of chloro isatin ppts C₆H₂ClAgNO₂NH,

Di chloro isatin C,H3Cl2NO, [186°] tained from the alcoholic mother liquors that have yielded chloro isatin Small, reddish yellow needles or short laminæ (from alcohol) When thrown upon solid M sol alcohol potash, moistened with alcohol, a red solution is formed which solidifies to a violet black magma of C₈H₂KCl₂NO₃, the solution of which gives a pp with AgNO₃ Hot aqueous KOH forms potassium di chloro isatate Distillation with KOH forms di chloro aniline Chlorine does not act on its aqueous solution, but with its alcoholic solution it forms tetra chloro quinone and other bodies KHSO, forms light yellow needles of C,H,Cl,NO,KHSO,, sl sol boiling water Di chloro isatin (10 g) oxidised by CrO₂ (15 g) in glacial acetic acid (60 g) as described under Bromo isatin toims di chloro

Isatoic acid (q v)
Bromo isatin C,H,BrNO, s c.
CBr CH,C CO

CH CH CN COH [255°] Formed, to gether with di brome isatin, by the action of bromine and water on isatin (Eidmann, J. pr.

ISATIN 71

19, 858, Hofmann, A 53, 40) The product is exhausted with boiling water and the crystals that separate on cooling are recrystallised from alcohol whence bromo-isatin crystallises first Aqueous KOH converts it, Orange prisms even in the cold, into potassium bromo-isatate Distillation with KOH yields p bromo aniline When mixed with alcoholic ammonium sulphide and exposed to the air it yields bromoindigo Bromo isatin (10 g) is oxidised by a mixture of gla ial acetic acid (90 g) and CrO. (15 g) to bromo-isatoic acid The mixture must first be kept ice-cold but after 12 hours it may be slowly raised to 10° The product, when cold, is poured into cold dilute H₂SO₄ and the yellow sandy powder crystallised from a mix ture of alcohol and acetone (Dorsch, J pr [2] 33, 45)

cetyl derivative C.H.BrAcNO. [172°]
Formed by boiling brome isstin (5 pts) with
Ac.O (8 pts) (Baeyer a Oeconomides, B 15,
2096) Long straw-yellow prisms (from benzene)

Chloride C.H.BrClNO Formed by treating bromo isatin with PCI, (Baeyer, B 12, 1315) Reddish brown needles, sol hot benzene and ether HI gives bromo-indigo

Oxim C₈H₄BrNO(NOH) From isatoxim and bromine water in the cold (Baeyer a Knop, A 140, 35) Crystals, sl sol wat r

Di bromo isatin | | | CBr CH C CO CBr CH C N

[250°] Formed as above or by digesting bromo isatin or isatin with bromine in sunshine Formed also by heating bromo isatin (1 mol) with bromine (2 mols) in HOAc for 20 hours (Baeyer a Oeconomides, B 15, 2098) Orange prisms (from alcohol) Gives di bromo aniline when distilled with KOH —C₄H₂Br KNO₂ bluish violet scales, sl sol water Very stable but converted into di bromo isatate by warming with KOHAq -AgA' brownish violet powder -C,H,Br,NO,KHŠO, yellow solid, v sl sol water

Oxim C₈H₄Br₂O₄N₂ or C(NOH) C(OH) Formed by the

action of hydroxylamine on di bromo isatin (Baeyer a Comstock, B 16, 1708) Yellow pointed needles Carbonises without melting at about 255° Sol caustic alkalis but precipitated by CO₂

Mono-ethyl-ether of the oxim

O₆H₂Br₂ C(NOEt) N C(OH) Di-bromo isatoethyl oxim. [252°] Yellow needles, formed by the action of ethyl iodide on the silver salt of di bromo isatoxim

Diethyl ether of the oxim

C.H.2Br.2 C(NOEt) C(OEt) Diebromo ethylisato ethyl oxim [116°] Long yellow, silky needles, formed by the action of ethyliodide on the silver salt of the mono ethyl ether

Tri brome isatin Ox*m $C_8HBr_2 < C(NOH) > [162°]$ From the exim of isatin and bromine in excess (B a K) Dirty violet needles (from alcohol) Insol

water, v sol boiling alcohol. At 190° it sublimes as red needles

Mitro isatin C_sH_sNO_s(NO_s) [226°-230°] Prepared by nitration of isatir dissolved in H_sSO_s by addition of powdered KNO_s (Baeyer, B 12, 1312) Sparingly soluble in water, more easily in alcohol

Bromo nitro isatin

C₆H₂(NO₂)Br<CON COH [237°] From bromosatin, KNO₂ and H₂SO₄ (Dorsch) Clumps of orange crystals (from alcohol) Sol acetone, glacial acetic acid and alcohol, al sol benzene and chloroform, v sl sol water and ether Forms a dark red solution in NaOH,Aq, whence an orange powder presently separates

ALKYL DERIVATIVES
Alkyl derivatives of isatin are either derived from the stable form $C_4H_4 < {}^{CO}_N > C$ OH

or from the transition form $C_eH_e < \stackrel{CO}{NH} > CO$ (pseudo isatin) Alkyl iodides acting on silverisatin form alkyl derivatives of stable isatin $C_eH_e < \stackrel{CO}{N} > C$ OR

Alkyl derivatives of pseudo-isatin C_cH_s, CO_{NR} CO are formed by the action of an alkaline solution of bromine or chlorine followed by alcoholic NaOH on the methyl-, ethyl, phenyl, &c indole carboxylic acids which are obtained by the action of HCl on phenyl methylhydrazine pyruvic acid, cc (Fischer a Hess, B 17, 559)

Methyl derivative of isatin C₂H_sO₂N(CH₂)

Methyl-isatoid C₁,H₁₂N₂O₄(?) [219°] Formed by spontaneous change by keeping methyl isatin (Baeyer a Oeconomides, B 15, 2094) Small yellow needles, sparingly soluble in all solvents Dissolves in dilute NaOH on boiling, and on adding acid isatin is precipitated

Methyl derivative of brome-isatin C₂H₂BrO NMe [147°] Formed by the action of MeI on the silver compound of brome-isatin (Baeyer a Oeconomides, B 15, 2095) Red needles

Bromo-methyl-isatoid [231°] Formed by spontaneous change of methyl bromo-isatin by keeping (B a O)

Methyl-pseudo-isatin C,H,NO, i.e C,H,
CO (134°) Red needles

Formation —1 By the action of a cold alkaline solution of bromine or phlorine followed by hot alcoholic NaOH on methyl indole-carboxylic acid [212°], which is obtained by heating phenyl methyl hydrazine pyruvic acid with HOl (Fischer a Hess, B 17, 563)—2 By boiling di-

78 ISATIN

bromo-methyl oxindole with water (Colman, O J 55, 5, A 248, 118)

Reactions — Dissolves in alkalis with a yellow colour With H₂SO, and benzene containing thiophene it gives the indephenine reaction Gives a crystalline compound with phenyl-hydrazine Yields the same product on oxidation in alkaline solutions as in acid solution, viz methyl-di-oxindole

Oxim $C_eH_4 < C(NOH) > CO$ [180°-183°] From methyl-pseudo isatin and hydroxylamine sulphate in hot aqueous solution (Colman, CJ55, 6) Tufts of small pale yellow needles, m sol. hot water, sl sol cold water, v sol alcohol, acetone, ether, and benzene

[146°] Formed by the action of phenyl-hydrazine hydrochloride and NaOAc on an aqueous solution of methyl wisatin A less pure product is produced by the action of phenyl hydrazine hydrochloride on dibromomethyloxin dole (Colman) Fascicular group of small yellow needles, insol water and petroleum ether, sl sol. ether, v sol hot alcohol or benzene

p-Methyl-isatin C,H,NO, te

$$C_oH_oMe < CO \atop N$$
 COH (stable form) or $C_oH_oMe < CO \atop NH > CO$ (transition form)

Tolisatin Anhydride of amido tolyl-glyoxylic acid [184°] (P), [187°] (M)

Formation — From p toluidine and di chloroacetic acid by digestion in alcoholic solution, the resulting p toluide (p-tolyl methyl imesatin) C=NC_cH₄Me

Co.H.Me CO being decomposed by

HCl, and the crude product purified by boiling with aqueous KOH, ppg with HCl, and crystal lising from alcohol and afterwards from water (P J Meyer, B 16, 2261, Fr Baeyer a Co, B Ref. 17, 367, Panaotović, J pr [2] 33, 57)

Properties—Red crystals or glistening red

Properties—Red crystals or glistening red plates Sol hot water and alcohol, sl sol cold water, v sol hot HClAq Dissolves in cold alkalis with a deep-violet colour, and on heating or standing it then takes up water, becoming yellow and forming methyl isatic acid Dissolves in cone H₂SO₄ with a red colour Gives the in dophenine reaction CrO₃ in acetic acid forms methyl isation acid Boiling with Ac₂O for three hours forms the acetyl derivative of methyl-ψ-isatin

Acetyl derivative of methyl- ψ isatin C_eH₂Me CO NAc CO [172°] Formed by boiling p-methyl- ψ isatin with Ac₂O for 3 hours (Panaotović, J pr [2] 33, 71) Formed also by the action of HCl upon the acetyl derivative of p-methyl- ψ -isatin p toluide (Duisberg, B 18, 197) Lemon-yellow needles (from benzene), sol chloroform and benzene, sl sol water, alcohol, ether, ligroin, and CS₂. Converted by cold dilute alkalis into acetyl-p-methyl-isatic acia Alcoholic NH₂ converts it into the amide of acetyl-p-methyl-isatic acid C₂H₂Me(NHAc) CO CONH₂, which crystallises from alcohol in trimetric columns [141°] CrO₂

in HOAe exidese it to methyl esatore seed, which crystallises from boiling sloohol in trimetric plates and, when heated, decomposes at 245° with great increase in bulk, finally melting at 800°

 $Oxim C_iH_iMe < C(NOH) > Isomtroso$ methyl oximole [226°] Formed by the action of hydroxylamine (base' on p methyl isatin (P J Meyer, B 16, 2268, Long yellow prisms, sol alcohol and NaOH, sl sol weter

Phenyl hydraside of methyl isatin $C_sH_sMe < C_s(N_sHPh) > COH$ From p methyl isatin and phenyl hydrazine (P) Golden needles (from chloroform) Nearly insol water, sol al cohol May be sublimed at 240°, but melts above 300° with evolution of gas

Disphenyl-hydraside of methyl visatin C.H.Me (N.HPh) C(N.HPh) [255°]

Formed by warming the acetyl derivative of methyl-visatin with phenyl-hydrazine (P) Yellow trimetric columns (from alcohel) decomposed by fusion Nearly insol water, sol chioro

form $Imide\ C_bH_sN_2O\ or\ C_{1e}H_{1e}N_4O, \quad p\ Methyl$ $imsatin\ Formed\ by\ heating\ p\ methyl\ isatin\ p\ tolunde\ with\ alcoholic\ NH,\ at <math>100^\circ\ (P\ J\ Meyer,\ B\ 16,\ 2264)$ Nearly colourless fine silky needles V al sol hot alcohol and hot water Insol cold alcohol and water Is not re converted into p\ methyl\ isatin\ by\ acids or\ alkalis

Phenyl imide C18H12N2O 1e

 $C_sH_s(CH_s) \subset C(NPh) \supset COH$ Methyl - ssatun anilide Phenyl - methyl imesatin [240°] Formed by heating p methyl isatin with an absolute alcoholic solution of aniline (Meyer, B 16, 2267) Thick yellowish red tables or prisms Sol hot alcohol, al sol cold alcohol and water Heated with acids or caustic alkalis it is resolved into its constituents

o Tolyl ımıde C₁₆H₁₄N₂O s.s

C₆H₃(CH₃) $\stackrel{\frown}{\sim}$ C(NC,H₃) $\stackrel{\frown}{\sim}$ C OH o Tolude of methyl-ısatın o-Tolyl p-methyl imesatın [191°] Red prismatic crystals Formed by heating p-methyl isatın with an absolute alcoholic solution of o toluidine By HCl or hot NaOH it is resolved into its constituents (Meyer, B 16, 2268)

p-Tolyl-smide $C_{1e}H_{1i}N_2O$ s.e $C_{e}H_{4i}(CH_{2i}) < C(NC_{e}H_{2i}) > C$ OH p Tolunde of methyl satin p Tolyl p-methyl smesatin [259°] Formed by heating di chloro acetic acid (1 mol) with p tolundine (4 mols) at 100° C, either alone or in aqueous or alcoholic solution, the yield is 70 pc p Tolyl amido p

tion, the yield is 70 p c p Tolyl amido p

methyl-oxindole C₆H₂Me

CO

is

CH

NH(C,H₂)

first formed and then undergoes oxidation by

absorption of oxygen from the air Formed also by heating dichloracetamide (1 mol) with p toluidine (8 mols), and by heating p methylisatin with an absolute alcoholic solution of p-toluidine (Meyer, B 16, 2261) Glistening yellow needles or plates Sol ether and hot alcohol, sparingly sol cold alcohol, insol water By cold

HCl it is resolved mto p toluidine and p methylisatin Hot HCl or hot NaOH gives p methylisatic acid—Sodium salt crystallises in red prisms, decomposed by water

Acetyl derivative

C.H.Me CO [122°] Glistening red

needles, insol water By HCl it is split up into p toluidine and the acetyl derivative of pmethyl pseudo isatin (Duisberg, B 18, 190)

Bromo p toluide C₁₈H₁₁BrN₂O [210°] Red needles or prismr By heating with ands or alkalis it is split up into its constituents (P J Meyer, B 16, 2267)

 ν o D methyl ψ -isatın \cup_{\bullet} H₃Me<CONMe>CO

Methyl \$\psi\$-o tolisatin [157°] Formed by adding pyruvic acid to a solution of methyl-o tolyl hydrazine in dilute HCl, and warming the resulting oil with a large quantity of phosphoric acid (S G 1 17) The resulting di methyl indole carboxylic acid is then warmed with NaOCl in slightly alkaline solution, when a product [152°] is obtained, which when warmed with water yields the di methyl isatin (Hegel, \$A\$ 232, 221) Brick red needles (from water)

rp D1 methyl ψ isatin C_cH₁Me CO NMe CO [148°] Formed in like manner from methyl p tolyl hydrazine and pyruvic acid, the di methyl indole carboxylic acid giving with alka line hypochlorite a chlorinated compound crystallising in yellow needles [135°] which yield the di methyl isatin on dissolving in water (H) Red needles

Ethyl pseudo isatın $C_0H_4 < \stackrel{CO}{NEt} > CO$ Lac-

Formation -1 By the action of a cold alka

tam of ethyl isatic acid [95°]

line solution of chlorine followed by hot alco holic NaOH on ethyl indole carboxylic acid [183°] which is obtained by the action of HCl on phenyl ethyl hydrazine pyruvic acid (E Fischer a Hess, B 17, 566)—2 By reduction of the di ethyl derivative of pseudo isatin-w-oxim C_eH₄ CO C(NOEt) with zinc-dust and oxidation of the product with Fe₂Cl₄ (Baeyer, B 16, 2193) Large red plates, sol hot water, alcohol and ether With thiophene and H₂SO₄ it gives a blue colouring matter soluble in ether It dissolves in alkalis with a yellow colour, at once forming a salt of ethyl isatic acid C_eH₄ CO CO₂H NHEt

Ethyl pseudo isatin a-oxim

C.H. C(NOH) CO [162°] Yellow four-sided prisms Formed by the action of hydroxyl amine on ethyl pseudo-isatin On reduction with zinc dust followed by oxidation with Fe₂Cl₂ it yields ethyl pseudo isatin It does not yield indigo on treatment with ammonium sulphide (Baeyer, B 16, 2196)

Ethyl pseudo-isatin w-oxim Ethyl ether C₄H₄ CO C(NOEt) [99°] From the ethyl ether of the w-oxim of \(\psi \)-isatin by further ethylation (Baeyer, B 16, 2191) Yellow needles. v.

sol alcohol and ether, sl sol hot water May be sublimed Insol alkalis After reduction with zinc dust, on oxidation with FeCl, it yields ethyl \(\psi\) isatin

Bromo-ethyl-isatin C.H.BrO.NEt s.c.

 $C_*H_*Br < {}^{CO}_N > COEt$ [109°] From the silver compound of bromo isatin and Eti (Baeyer a Oeconomides, B 15, 2095) Long red prismatic needles (from benzene) On keeping it slowly changes into bromo ethyl isatoid

Bromo-ethyl isatoid C₁₈H₁₂Br₂N₂O₄ [245°] Fine needles Sparingly soluble in all solvents, most easily in hot alcohol and acetone Formed by spontaneous change of ethyl bromo isatin by keeping, also by the action of acetic anhydride on ethyl bromo isatin (Baeyera Oeconomides, B 15, 2095)

p Ethyl-isatin C10H2NO2 s.e

C_sH_sEt $\stackrel{CO}{N}$ C OH [137°] Long red needles (Paucksch, B 17, 2805) Formed by heating with HClAq the product of the action of dichloro acetic acid on p-amido phenyl-ethane C_eH_sEt(NH_s) [14]

Di-bromo-ethyl-isatin C₂H₂O₂NBr₂Et : e

 $C_sH_2Br_2 < {C_N \choose N} > C$ OEt [89°] From silver dibromo isatin and EtI (B a O) Red crystals p Methyl ν ethyl- ψ isatin

C_sH_sMe CNLt CO [110°] Ethyl \(\psi -p\)-tolusatin Formed from the p-toluide by treatment with cone HClAq (Duisberg, B 18, 197) Formed also from methyl ethyl indole carboxylic acid by treatment with a weak alkaline solution of NaOCl, and warming the resulting pp with water (Hegel, A 232, 219) Red needles or prisms, v sol alcohol, ether, benzene, and CS, sl sol water and ligroin Sol aqueous alkalis. Gives the indophenine reaction

p-Tolylimide C_eH₃Me C(NC_eH₄Me) CO

p Toluide [152°] Formed by boiling the p tolylimide of p methyl isatin with NaOEt and EtBr (Duisberg, B 18, 198) Large orange-red prisms, v sol alcohol, acetic acid, benzene, and CS_n, al sol ether, insol water Split up by HCl into p toluidine and methyl ethyl-\psi isatin

Isobutyl-bromo-isatin

 $C_{\bullet}H_{\bullet}Br < \stackrel{CO}{N} > COC_{\bullet}H_{\bullet}$ Crystallises with difficulty Is converted by $Ac_{2}O$ into iso butylbromo isatoid $C_{20}H_{10}Br_{2}O_{\bullet}$ [210°] which crystallises in slender needles, sl sol all solvents (Baeyer a Oeconomides, B 15, 2097)

Bensyl \$\psi\$-isatin \$C_sH_s\$\bigce\frac{CO}{N(CH_ph)}\$\bigce\$ [131°]. Formed by adding a solution of sodium benzyl indole carboxylate to one of NaOCl The pp is dissolved in alcoholic NaOH, warmed gently, diluted with water, freed from alcohol by distillation, and ppd with water (Antrick, \$A_227, 364) Long silky red needles (from water) \$A most insol cold water, \$v\$ sol alcohol and ether

Phenol-1satin v DI OXY-DI PHENYL-OXINDOLE.
Tolu-isatin v DI TOLYL-OXINDOLE

(a)-Maphth-isatin C.H. COO or

C₁₀H₀<0 OH [255°] Formed by dissolving (a) naphthoxindole in alcohol and adding HOAc and NaNO. The isonitroso derivative so obtained is reduced with Sn and HCl, and subsequently oxidised with Fe₂Cl_e (Hinsberg B 21, 117) Red needles Forms a compound with phenyl hydrazine [270°]

(β)-Naphth-isatin $C_{10}H_6 < N_{CO} > COH$ [248°]

Formed by dissolving (3) naphthoxindole in HOAc and adding sodium nitrite The isonitrosobody formed yields on reduction with Sn and HCl, and subsequent oxidation with Fe₂Cl₆, the isatin (Hinsberg, B 21, 115) Red needles, v sol ordinary solvents

AMMONIACAL DERIVATIVES OF ISATIN

Imesatin $C_8H_8N_2O$ to $C_6H_4{\stackrel{CO}{<}}C_N>C$ NH_2 or

 $C_eH_4 < CO > C NH$ (?) or $C_eH_4 < C(NH) > C OH$

Isatin imide (?) Obtained by Laurent (J pr 25 457) by passing dry NH, into a boiling alco holic solution of isatin containing a little isatin in suspension Could not be obtained by Sommaruga (B 10, 432) Rectangular prisms insol water, v sl sol ether, m sol boiling alcohol Readily decomposed by heating with alcohol and HClAq into isatin and NH, KOH acts in like manner

Chloro-imesatin C.H.CINO From chloroisatin and alcoholic NH_3 (Laurent) Yellow six-sided prismatic tables, v sl sol boiling alco hol, insol ether Dissolves in KOH, giving a red liquid

Brome-imesatin C₈H₅BrN₂O From brome-isatin and boiling alcoholic NH₃ (Gericke, Z **1865**, 593) Yellowish brown crystalline mass

Iso-amyl-imesatin $C_8H_5(C_5H_{11})N_2O$ is

 $C_6H_4 < \stackrel{CO}{N} \subset NHC_5H_{11}$ or $C_6H_6 < \stackrel{C(NC_3H_{11})}{N} \supset COH(?)$ Formed by heat ing isatin with isoamylamine (Schiff, A 144, 53, Z [2] 4, 13) Yellow lamine, sl sol ether, v sol alcohol Decomposed by dilute acids or by prolonged treatment with water into isatin and isoamylamine

Phenyl-mesatin C₈H₅(C₆H₅)N₂O Anrlide From isatin and aniline in boiling alcoholic solution (Engelhardt, J 1855, 541) Formed also by heating the compound of isatin with bisulphite of aniline, and crystallising from ether alcohol

Chloro - phenyl - imesatin $C_8H_5(C_9H_4Cl)N_2O$ From isatin and chloro aniline (E) Yellowish crystals

Bromo-phenyl-imesatin C₈H₅(C₆H₄Br)N₂O Resembles the preceding (E)

Phenyl - chloro - imesatin C₄H₄Cl(C₅H₅)N₂O Formed by adding aniline to a boiling solution of chloro isatin in alcohol (Engelhardt, J pr 65, 260) Yellow needles, insol water, v sol lot alcohol Resolved by boiling dilute acids into chloro-isatin and aniline Potash gives aniline and potassium chloro-isatate.

Phenyl-bromo imesatin C.H.Br(C.H.)N.O Resembles the above (E)

Di-phenyl-di-ethyl-di-amide isatin C.H. CONPhEt), or CaHan,NO

C.H. C(NPhEt)2>COH(?) So-called phenyl From isatin by heating with ethyl ı**m**esatın ethyl aniline (Schiff) Yellow laminæ, sl. sol. ether, v. sol. alkalis. Split up by acids, alkalis, or hot water into isatin and ethyl aniline

p-Methyl-imesatin v Imide of p Methyl

ısatın (supra)

Phenyl-p-methyl-imesatin v. Anilide of p-

multhyl isatin (supra)
Imasatin C₁₆H₁₁N₂O₃ Formed by passing NH, into a boiling saturated solution of isatin in dilute alcohol (Jaurent, A Ch [3] 3, 483) Greyish yellow granules, insol water and ether, v sl sol boiling alcohol Not attacked by boil ing aqueous HCl Caustic potash dissol es it, and the solution is ppd by dilute HClAq

Di-chloro-imasatin C18H2Cl2N3O2 chloro satin and alcoholic NH, (L) Slightly

reddish powder

D1-bromo-imasatin C14H,Br2N,C3 Formed by heating an alcoholic solution of bromo isatin with ammonia (Gericke, Z 1865, 593) Brownish yellow crystalline granules

Tetra-bromo-imasatin C_{1s}H₁Br₄N₅O, From tetra bromo isatin and alcoholic NH₄ Reddish From

yellow scale. (L)

Amasatin C₁₆H₁₄N₄O₃ Isamıde Amide of Isamic acid? One of the products of the action of ammonia on isatin Prepared by heating ammonium isamate till water is given off, and washing the residue with water (Laurent, A Ch [3] 3, 488, J pr 35, 117) Yellow powder, insol water, nearly insol ether, v sl sol alcohol, m sol boiling alcoholic NH₃ Cold KOHAq dissolves it, giving off NH₃, and forming a yellow liquid containing potassium isamate HClAq forms a violet solution containing isamic acid

Di-chloro-amasatın C₁₆H₁₂Cl N₄O₃ powder, formed by evaporating a solution of

ammonium chloro isatate (L)

Tetra - chloro - amasatın JIGHIOCLNIO. Formed by heating ammonium di chloro isatate

Di bromo amasatin C₁₈H₁₀Br₂N₄O₃(?) Formed by evaporating an aqueous solution of ammonium bromo isatate and treating the pasty residue with water (Gericke) Orange vellow substance, sl sol water, insol alcohol and ether Dissolves with violet colour in acids

Amisatin $C_{18}H_{39}N_{11}O_9$. A product of the action of dilute alcoholic ammonia on isatin and ppd by adding water to the solution after isatimide and isatilim have crystallised out (L) Minute needles, insol alcohol, sol alcoholic

potash

Isamic acid C16H13N3O4 Produced by the action of warm ammonia on isatin, but is best prepared by dissolving isatin to saturation in aqueous KOH, evaporating the solution to dryness, dissolving in alcohol, adding a very concentrated solution of ammonium sulphate, fil-The resi tering, and evaporating to dryness due contains amasatin and ammonium isamate, and the latter may be dissolved in alcohol, whence, after addition of HCl, isamic acid crys tallises (Laurent, A Ch [8] 8, 490) Ruby coloured hexagonal tables or scarlet trimetric lamins. Sl. sol. boiling water, forming a yel

low solution, v sol hot alcohol, m sol ether silvery scales -CieH10KN3O, 12aq silvery plates Aqueous HCl dissolves it with violet colour, and it separates again from the solution in violet crystals turned red by water Boiling dilute acids split it up into isatin and ammonia mine forms 'indelibrome,' a yellow substance

C_{1e}H_sBr₄N₂O₃ insol water Salts - NH₄A' small needles, or very acute minute rhombs When strongly heated it gives off water and forms amasatin Its solution does not ppt salts of ba, Ca, or Mg, but gives a yel low pp with lead acetate and with AgNO, and a red pp with HgCl₂.—The potassium salt may be boiled without decomposing -AgA'

Di chloro is mic acid CieHiiCl2N2O4 Formed by adding HCl to a solution of di chloro ama satin in dilute KCH and crystallising the brick red pp from alcohol (L) Bright red elongated hexagonal laminæ More sol alcohol and ether than isamic acid Forms yellow solutions Decomposed by distillation HClAq forms a violet solution, but on boiling it is split up into NH, and chloro isatin

Tetra chloro isamic acid CieH,Cl,N,O, boiling tetra chloro amasatin with alcohol and adding silver nitrate a flocculent precipitate of

C14H8AgCl4N3O4 is formed (L)

Di bromo isamic acid C₁₆H₁₁Br₂V₃O₄ Formed by dissolving di bromo amasatin in KOHAq and neutralising with dilute HCl (Gericke) Red powder, nearly insol water, v sol alcohol and ether HClAq gives a violet solution Boiling KOHAq gives brome isatic acid —KA' yellow needles, si sol water —BaA'₂
Isatimide C₂₄H₁₇N₅O₄ Formed by passing

dry NH, over isatin moistened with alcohol When absolute alcohol is (86 to 100 pc) used, imasatin first crystallises out, and the filtrate deposits isatimide as a yellow crystal line powder Insol water, scarcely sol boiling alcohol or ether, v sol boiling alcoholic NH, Potash dissolves it with yellow colour and evolution of NH3, the liquid then containing isatin

Isatılım C, H₁₆N₄O₅ (?) Sometimes formed when dry NH3 is passed over isatin moistened with alcohol, separating from the alcoholic fil trate from which isatimide has separated (Laurent, J pr 35, 121) Yellow amorphous flocks, easily decomposed by KOH

Di isatin diamide C1. Hi. N.O2. Formed by saturating an alcoholic solution of isatin with dry NH, and heating to 100° for 24 hours product is filtered boiling, the filtrate contain ing deoxy imido isatin, while the di isatin di amide and oxydiamidoisatin diamide which re main on the filter are separated by treatment with water in which the di isatin diamide is the less soluble (E von Sommaruga A 190, 867, B 11, 1082, 12, 980) Pale yellow crys tals, al sol alcohol and water Nitrous acid forms some di isstin amide

Salts - B'HCl yellow crystalline powder, almost insol cold water --B'HNO, yellow needles --B'H₂SO₄ yellow needles Not de composed by heating with water at 100° --

B'H,CrO, orange powder

Di isatin amide C₁H₁₁N₂O₂ [252°] Formed by warming di isatin diamide with dilute KOH and ppg with HCl (Sommaruga, M 1, 579) Small yellowish needles (from alcohol) Scarcely sol. water, v. sol alcohol —C₁₀H₁₀(NH₄)N₂O₂.

or needles

Dihydride C16H13N2O, [213°] Formed by treating di isatin amide or di ie tin diamide with sodium amalgam (Sommaruga, A 194, 88) Slender needles (from alcohol), scarcely sol water and other Oxidised by boiling with HgO or aqueous FeCl, to di isatin amide Not affected by aque ous KOH (S G 1 27) at 100° -NaC, H, N,O, long colourless needles, v sol hot water -KC1. H12N,O, broad needles with silky lustre

Oxy diamido di isatin diamide C₁₆H₁₄N₆O₃ Oxydiimidodiamidoisatin [295°-300°] Formed as above (S) Large colourless needles water, v è sol alcohol Dissolves readily in acids, and is not reppd from these solutions by NH, Boiling with water and sodium amalgam converts it into di amido di hydrindic acid The solutions of its salts show intense red fluorescence -B'HNO, granules, v sol hot water -B'H.SO, prisms

Di amido di hydrindio acıd C16H16N4O2. [217°] Formed as above Crystalline granules Decomposed on fusion V sol hot water. Oxidised by chromic acid mixture to 'di imidodi hydrindin dicarboxylic acid C1.H12N4O4 which crystallises from hot water in needles

[210°] Deoxyimido diisatin C₁₆H₁₁N₂O₂ Formed as mentioned under dissatin diamide (S), and purified by solution in aqueous KOH and ppn by an acid. Yellowish powder Decomposed by fusion V sol alcohol, hot water,

Oxy amido hydro-isatin, so called, CisH13N3O30 Formed by treating the preceding body with sodium amalgam or by heating it with KOHAq in sealed tubes at 100° (S) Yellowish amorphous powder, insol water, v sol alcohol. Decomposes at 188° without fusion

ISATIN CARBOXYLIC ACID C_{1.}H₁₀N₁O₂ te C₈H₄NO CONPhH, probably CO

C'H' V CONH by Carbanılıdo ısatın

Formed by heating isatin for 3 hours at 130° with phenyl cyanate (Gumpert, J pr [2] 32, 283) Crystallises from benzene in canary yellow needles Sol alcohol, ether, and glacial acetic acid

Reactions -1 When fused it forms isatin

and phenyl cyanate (compare the formation of isatin from acetyl isatin) -2 With H2SO, and crude benzene it gives the indophenin reaction Dissolves in warm dilute kOH forming potassic carbanilo isatate HCl throws down sparingly soluble carbanilido isatic acid, NPhH CO NH C.H. CO CO.H. [170°-180°, with decomposition] The acid is very stable, but by heating at 110° for a long time it loses H.O. changing back to carbanilido isatin Carbanilido isatic acid, when heated with ethyl or methyl alcohol, splits off CO2 and H2O forming $C_{16}H_{16}N_2O_2$ [175°], and $C_{15}H_{14}N_2O_2$ [197°], respectively – 4 Converted by amines into am des of carbanilido-isatic acid, thus alcoholic NH. at 0100° forms NPhH CO NH CaH, CO CO NH, [229°], orystallising from alcol.31 in needles. It dissolves in dilute NaOH, but is reppd unaltered by HCl When dissolved in glacial acetic acid it is converted by N₂O, into an indifferent body, C₁₄H₁₂N₂O₂, [270°] —5. NEtH₃ forms NPhH CO NH C.H. CO CO NEtH [210°] It forms needles (from alcohol) and is a Phenyl hydrazine forms weak acid -- 6 NPhH CO NH C, H, CO CON(NH2)Ph [193°] -Hydroxylamine forms

NPhH CO NH C.H. CO CO NH OH [225°] ISATIN DIHYDRIDE v DIOXINDOLE

ISATIN INDOGENIDE v Indigo IBATIN SULPHONIC ACID C.H.NSO, .e

 40° H 6° H 6° H 6° O OH Isatosulphuric acid

Preparation —Commercial indigo carmine (18 pts) is stirred up into a thin paste with water (18 pts), H2SO4 (11 pts) is added, and the mixture heated to boiling while K₂Cr₂O₂ (1 pt) is gradually thrown in, as long as decolourisation ensues The hot solution is filtered and KNO₂ added, which facilitates the deposition of potassium isatin sulphonate The K salt is mixed with resinous matter, which can be got rid of by dissolving in hot baryta water, ppg excess of baryta by CO₂, and then ppg by K.SO₄ (G a A Schlieper, A 120, 1) Yellow radio crystalline mass (containing 2aq) Insol ether and benzene, m sol alcohol, v sol water Powerful acid, separating HCl from its salts Not decomposed by H₂SO₄ or HNO₂, even on boiling Aqua regia slowly forms tetra-chloro quinone Alcoholic NH, forms dark brown bodies Hydric iodide does not reduce it Ammonium sulphide forms SO, H C, H, CH(OH) > COH Hot potash forms

sulpho isatic acid Salts - NaA' 2aq Salts — NaA' 2aq deep-red tables, ppd from its aqueous solution by NaCl — KA' aq small golden needles S 5 in the cold Insol alcohol Ppd by KNO, from its aqueous solu water, sl sol NH₁Cl—BaA'₂4aq scarlet powder, usol alcohol, sl sol water—CaA'₂2aq small golden needles, m sol water—AgA' aq. yellow needles, sl sol water

DIISATOGEN C₁₆H₈N₂O₄ 1.6 Q—Q Q—Q

 $C_{\bullet}H_{4} < N = N > C_{\bullet}H_{4}$ (Michael, J pr [2] Prepared by the action of fuming H.SO, on di-o-nitro di-phenyl-diacetylene (Baeyer, B 15, 52) Red needles Sol nitro benzene, sl sol chloroform, insol alcohol and ether With H2SO, and FeSO, it gives indoin It is very readily reduced to indigo by cold NH, HS, by zinc-dust, and NH, NaOH or AcOH, by glucose, and alkalis, &c It combines with ammonium bisulphite ISATOGENIC ETHER C.H.O.N CO.Et to.

or (CO₂Et CO CO C₆H₄)₂N₂ (Michael, J pr [2] 85, 255) [115°] Formed by an isomeric change from o nitro phenyl-propiolic ether by the action of cold H₂SO, (Baeyer, B 14, 1741, 15, 780) Yellow needles By most reducing agents it is reduced to indoxylic ether, but ferrous salts give

genic acid is perhaps formed by shaking o nitropnenyl propiolic scid with H.SO,, but if so, it is decomposed on diluting with water into CO, and

ISATOIC ACID C,H,NO, s. C,H, Anthranil carboxylic acid [230°] S (acetone) 4 4 at 55°

Formation -1 By the oxidation of isatin by CrO, in HOAc (Kolbe, J pr [2] 30, 469) -2 By heating anthranil with chloro formic ether at '30° (Friedlander a Wleugel, B 16, 2227) — 3 By boiling o amido benzoic acid with excess of chloro formic ether (Niementowski a Rozanski, B 22, 1672)

Preparation - (H Kolbe, J pr [2] 30, 469) Isatın (100 g) is powdered and mixed with glacial acetic acid (600 g) A solution of $CrO_3 (200 g)$ in glacial acetic acid (600 g) is slowly added, the temperature being kept below 50°. The flask is left for 12 hours in cold water, and then in water at 50°, and finally at 60° Isatoic acid then be gins to separate as a yellow powder, the separation is completed by pouring into 500 c c cold dilute H₂SO₄ Yield 72 per cent

Properties - Nearly rectangular prisms, which are yellow (through some impurity) when pre pared from isatin Decomposed at 230° ringly soluble in alcohol, ether, and glacial acetic acid, rather more soluble in chloroform and benzene

Reactions -1 Boiled with water it forms o amido benzoic (anthranilic) acid $C_7H_4NOCOH+HO=C_6H_4(NH)CO_2H+CO_2-$ 2 Conc HCl, H₂SO, and dilute HNO, behave in the same way —8 Gaseous HCl passed into an alcoholic solution forms the hydrochloride of o amido benzoicether -4 Aqueous baryta forms, on warming, o amido benzoic acid -5 Ammo nia (aqueous or dry) forms o amido benzamide 6 Aniline at 60° forms the anilide of o amido benzoic acid -7 HNO, (S G 148) forms nitro isatoic acid -8 Nitrous acid gas passed into water, containing isatoic acid suspended, forms Anthranilic acid is (a) nitro salicylic acid doubtless first formed, and this is then nitrated and exchanges NH, for OH -9 Heated with methyl or ethyl alcohol it unites, forming crys talline compounds, carboxylic acids of the methyl or ethyl ethers of o amido benzoic acid.

$$C_eH_4$$
 $CO_{N CO_2H}$
 $CO_{N H CO_2H}$
 $CO_{N H CO_2H}$

The acid CO₂H NH C₆H₄ CO₂Me crystallises in needles [176°], while the corresponding CO,H NH C,H, CO Et forms needles [126°] 10 With benzoyl chloride at 210° it partly reacts

$$-CO_2 + HCl + C_6H_4$$

CO

NBz

forming benzoyl an-

thranil [123°] -11 Bromine forms bromo isatoic acid, which gives with HCl (\$) bromo anthranilio acid [208°] -12 It dissolves in cold dilute NaOH with a blue fluorescence, but on standing the fluorescence vanishes and the solution then contains anthranilic acid (Friedlander a Wledgel, undoxanthic ether (Baeyer, B 15, 780) Isato- B 16, 2227) -18 Phenol at 180° gives phenyl

2-amido benzoate crystallising in needles '70°] (G Schmidt a E v Meyer, J pr [2] 36, 370)—14 Long boiling with glacial acetic acid forms an amorphous compound $C_{34}H_{si}N_{si}O_{si}$, v sl sol ordinary solvents, which yields o amido benzoic acid when heated with HCl or di'ute $H_{si}SO_{si}$ (G Schmidt, J pr [2] 36, 380)—15 Heating with Ac₂O gives acetyl o amido benzoic acid [180°] (S)—16 With hydroxylamine it forms o amidobenzoyl hydroxylamine (E v Meyer a T Bellmann, J pr [2] 33, 19) $C_{si}H_{si}$ + $H_{si}NOH$

mann, J pr [2] 33, 19) C₆H, + H₂NOH N CO₂H = C₆H₄(NH₂)CO NH(OH' + CO₂ - 17 With phenyl hydrazine it forms o amido benzoyl phenyl-

hydrazine C.H. CO.H + PhNH NH.

= C₄H₄(NH₂)CO NPh NH₄ + CO₂.—18 It does not react with boiling di-methyl andline — 19 Pyrocatechin at 180° reacts thus (M a. B).

C,H,(OH)2+C,H,(NCO,H

= CO₂ + C₆H₄(NH₂)CO O C₆H₄OH, forming o oxyphenyl o amido benzoate -20 Boiled with formic acid it forms formyl o amido benzoic acid and a weak base, C31H20N4O4 This crystallises in rhombohedra (from alcohol) It melts at [280°], with decomposition Sparingly soluble in water, alcohol, benzene, and chlo.oform S (ether) 03 at 15°, S (alcohol) 11 at 19° Readily soluble in NaOH, Aq, forming a crystal line salt Its hydrochloride forms prisms, but is decomposed by water Heated with conc HCl at 140° it forms CO2, formic acid, and the hydro chloride of anthranilic acid (M a B) -21 By treatment with PCl, in presence of POCl, a pro duct is got whence methyl alcohol and ethyl alcohol respectively form crystalline products The former gives $C_{16}H_{16}N_2O_3$ [210°], small needles The latter gives $C_1H_{16}N_2O_3$ [170°], With conc HCl at 140° the latter gives needles LtCl and anthranilic acid (M a B) -22 Bleach ing powder suspended in chloroform changes some of the isatoic acid into an isomer [240°], soluble in alcohol, acetone, and benzene dissolves in NH, Aq without forming anthranil amide (unlike isatoic acid), but when HCl is added to the solution an acid [260°] is ppd (M a B) - 23 Heated with glacial acetic acid and bromine (1 mol) it forms brome isatoic acid, but with more bromine CO, is evolved, and di, tri , and te'-a bromo amido benzoic acids are got.

Chloro-isatoic acid CaHaCl

[c 268°] From chloro isatin (10 g), CrO, (20 g) and glacial acetic acid (120 g) as described under bromo isatin (Dorsch, J pr [2] 33, 49)

bromo isatin (Dorsch, J pr [2] 33, 49)

Propertus — Pearly plates (from alcoholether) Sl sol alcohol, acetone, and glacial acetic acid, insol benzene, chloroform, ether, and water

Reactions —1 Conc HCl forms chloro-oamido-benzoic acid [204'] —2 Hot NH, Aq forms the amide of chloro amido benzoic acid

Formation.—By exidation of di chloro-isatin. Properties—Yellow prisms (from alcoholacetone) Melts at 254°-256° with decomposition V soi acetone and glacial acetic acid, sol alcohol and chloroform, v sl sol ether and benzene Boiled with water it partly changes to di chloro o amido benzoic acid, as shown by its violet fluorescence (Dorsch, J pr [2] 33, 51).

Reactions —1 Cone HCl slowly converts it, on boiling, into di chloro amido benzoic acid [224°] —2 With NH,Aq it gives di-chloro-amido benzamide

Bromo isatoic acid C.H.Br

[c 275°]

Formation —1 By oxidising brome isatin.

2 From Br and isatoic acid suspended in glacial acetic acid at 90° (R Dorsch, J pr [2] 33, 32)

Properties —Pearly plates (from a mixture of alcohol and acetone) Sol acetone Sl sol. alcohol and glacial acetic acid Insol water, chloroform, ether, and benzene

chloroform, ether, and benzene

Reactions—1 With boiling cone hydrochloric acid it forms (β) brome amide benzeis
acid C₂H₂Br(NH₂)CO₂H—2 With hot NH₂Aq
it gives brome amide benzamide

Di bromo isatoic acid C_eH₁Br₂CO N CO₂H

[255°] Obtained by oxidising di bromo isatin (10 g) by CrO₂ (10 g) in presence of glacial acetic acid (60 g) as described under bromo Isatin

Properties — Flesh coloured prisms (from alcohol acetone) Sol glacial acetic acid and acetone, sl sol alcohol, chloroform, and benzene, hardly sol ether, insol water Much more stable than bromo isatoic acid

Reactions—1 Boiled for a long time with cone HCl it gives off CO_r leaving di bromo camido benzoic acid—2 It does not dissolve in NH₂Aq But if heated with it at 100° for a long time it forms di bromo amido benzamide C₄H₄Br₄(NH₄)CO NH₂ [197°]

C,H,(NO,)NO CO,H. Nitro-isatoic acıd [220°-230°] Formed by the action of HNO. (5 G 148) on isatoic acid Insol water and ether, sl sol alcohol Crystallises from equal parts of alcohol and acetone in pearly plates It resembles isatoic acid, splitting up readily into CO, and nitro-o amido benzoic acid, when boiled with HCl or even with water Nitro-isatoic acid is converted by aqueous NH, into nitro amido benzamide By Sn and HCl it is reduced to diamido benzoic acid, CO, escaping Bromine (in glacial acetic acid) converts it into mono, di-, and tri- nitro-amido benzoic acids (q v)

Methyl-isatoic acid C.H.Me

Preparation — Methyl-isatin (10 g) is mixed with glacial acetic acid (60 g) and cooled well while a mixture of CrO, (21 g) in glacial acetic acid (60 g) is slowly added — After 12 hours at 0° the mixture is heated for 2 hours at 40° and thin to 70°— It is poured into water containing H,SO,, and the yellow powder crystallised from absolute alcohol (Panaotović, J pr [2] 31, 122, 33, 58)

Properties -Pale-yellow crystalline plates

1256°]

(from boiling alcohol) or trimetric columns (from acetone) At 245° it suddenly increases in bulk, but it melts above 300°, giving off CO, V sl sol. water, readily sol boiling alcohol, ether, benzene, and chloroform

Reactions -1 Is more stable than isatoic scid, not being decomposed by dilute mineral acids.—2 HNO_s (S G 148) dissolves it in the sold After 12 hours water is slowly added, and the pp crystallised from benzene It forms pale yellow trimetric plates of nitro methylisatoic acid [175°] This acid is reduced by Sn and HCl to a diamido-toluic acid -8 Warmed with HCl (SG 12), CO2 is given off, and the hydrochloride of amido p toluic acid [207°] formed —4 Warmed with NH, Aq it gives the amide of amido toluic acid [178°] -5 With aniline in alcohol it forms the corresponding anilide [243°]—6 With phenyl hydrazine it forms the corresponding hydrazide—7 With MeOH at 180° it forms methylic amido-toluste

Methyl-isatoic acid C.H.NO. se **CO** C.H.Me [226°] Formed by boiling ∕ү со'н

amido - toluic C₆H₃Me(NH₂)CO₂H acid [5? or 3? 1 2] with chloro formic ether (Niemen towsky a Rozansky, B 22, 1675) Needles or scales, v sl sol benzene and ether, sl sol alcohol Decomposed on fusion Acids and Acids and alkalıs decompose it into CO, and amido toluic acid [177°]

Isomeride of isatoic acid & Anthroxanic

ISATYDE C16H12N2O4 Produced by the reduction of isatin by zinc and dilute H2SO, by alcoholic ammonium sulphide, or by zinc dust and HOAc (Laurent, A Ch [3] 3, 382, A 72, 285, Erdmann, J pr 24, 15, 25, 438, Baeyer, B 12, 1309) Formed also by atmospheric oxi dation of an aqueous solution of dioxindole (Baeyer a Knop, A 140, 10) White powder, with slightly greyish tint, almost insol water, v sl sol boiling alcohol and ether Separates from boiling alcohol in minute scales Decomposed by heat, becoming at first violet-brown Alcoholic potash forms isatic acid, indin, and other products

 $\textbf{Di-chloro-1satyde} \ \textbf{C}_{16} \textbf{H}_{10} \textbf{Cl}_2 \textbf{N}_2 \textbf{O}_4$ Formed by the action of ammonium sulphide on chloro-White powder, crystallisable, insol cold, v sl sol hot, water, m sol boiling alcohol, sol. hot aqueous potassium sulphide 180° it is resolved into chloro-isatin and chloroındın Boiling aqueous or alcoholic potash forms potassium chloro isatate and the salt $C_8H_3Cl(NH_2)$ CH(OH) CO_2K

Tetra-chloro-isatyde C16H8C14N2O4 Produced by the action of ammonium sulphide on di-White powder, insol water chloro-ısatın De composed by heat into di-chloro isatin and dichloro indin Alcoholic potash forms di chloro ısatın and dı chloro-o amido-a-oxy phenyl acetic (di-chloro hydrindic) acid

Tetra-bromo-isatyde $O_{10}H_{0}Br_{4}N_{2}O_{4}$ From dibromo isatin and ammonium sulphide Resolved by heat into di-bromo-isatin and di-bromo-

Thio-isatyde C16H12N2O2S Formed by slowly adding alcoholic potash to an alcoholic solution of di thio isatyde (Laurent, A Ch [8] 8, 463)

White crystalline powder May be crystallised as minute rectangular scales from hot alcohol Insol water, v sl sol boiling alcohol and ether. Cold potash forms indin and other products Hot potash forms the hydride of indin

Di-thio-satyde C₁₆Hi₁₂N₂O₂S₂ When H₂S is passed into a cone alcoholic solution of isatin the liquid becomes pale yellow and on cooling deposits crystals of sulphur and of isatvde The filtrate when mixed with water deposits di thioisatyde (Laurent) Yellowish grey amorphous powder Decomposed by heat Insol boiling water, v sol warm alcohol and ether Ammo Lum bisulphite converts it into 'ammonium sulphisatanite' NH₄C₈H₆NSO₄ aq, which crystallises in large pale yellow tabler v sol water, m sol alcohol

D1-bromo-di-th10-isatyde C10 H10 Br2 N2O S2. Formed, together with di bromo tri thio isatyde, when H2S is passed into a boiling anoholic solution of bromo isatin (Gericke, Z 1865, 595). Yellowish white powder, insol hot water, sol hot alcohol and ether

Di-bromo-tri-thio-isatyde C₁₆H₁₀Br₂N₂OS₃

Formed as above Yellowish white powder Isatane C₃₂H₂₈N₄O₄ Formed, as a white pp, when di-thio isatyde is boiled with a solution of ammonium bisulphite (Laurent, J pi 28, 346) Formed also by the action of sodium amalgam on an acid solution of isatin (Knop, J pr 97, 65) Small white cubes (from ether or hot alcohol), Decomposed by hot alcoholic insol water potash into dioxindole and indiretin holic solution gives with ammoniacal AgNO, a

white pp of Ag,C,,H,2,N,O, ISETHIONIC ACID C,H,SO, 16

HO CH, CH, SO, H Oxy ethane sulphonic acid Sulphonic acid of ethyl alcohol Mol w 126

Formation -1 Discovered by Magnus in 1833 (P 27, 378, A 6, 163) as a product of the action of SO, on alcohol or ether Hence it is found among the residues in the preparation of ether -2 By boiling ethionic acid with water (Magnus, A 32, 251) -3 By the action of SO, on barium ethyl sulphate (Meves, A 143, 196) 4 By the action of nitrous acid on taurine NH₂CH CH₂SO₃H (W Gibbs, Am S [2] 25, 30) 5 By heating chloro ethyl alcohol (chlorhydrin of glycol) with aqueous Na, SO, at 175° (Coll mann, A 148, 101)—6 By heating ethylene oxide with aqueous KHSO, at 100° (Lrlenmeyer a Darmstadter, Z 1868, 342)—7 Probably formed by boiling ethylene bromide with aqueous Na_2SO_3 (James, C J 43, 44) -8 P_J oxidising thio glycol HO CH2 CH2 SH with nitric acid (Carius, A 124, 260)

Preparation —SO₃ is added, with shaking, to an equal weight of ether at 0° As soon as a sample mixed with water gives a heavy oil the whole is poured into water and the ethyl sulphate washed with water till neutral, dried over H2SO4, treated with its own weight of SOs, and then poured into water The two aqueous liquids are boiled for a long time to decompose ethionic acid, and then neutralised by baric carbonate, on evaporating baric isethionate is got (R Hubner, A 223, 212)

Properties - Viscid, strongly acid syrup, which gradually dries up to a deliquescent radio crystalline mass Is not decomposed at 150°, but blackens at a higher temperature Its salts are not decomposed by boiling with vater. and may even be heated to 200°, above which temperature, however, they lose water and change to di isethionates Potash fusion gives potassium carbonate, oxalate, sulphate, and sulphite Berthelot (Z 1869, 622) obtained acetylene, K2803, and hydrogen PCl, yields CH2Cl CH, SO2Cl, which is converted by heating with aqueous ammonia into taurine (Kolbe, 112, 241) Chromic and oxidises isethionic acid to sulpho acetic acid CO2H CH2 SO4H

Salts -NH, A' octahedra [130°] (Strecker), [185°] (Seyberth, B 7, 391) At 235° it changes to ammonium di isethicuate (Carl, B 12, 160-) -KA' rhomboidal prisms, melting between 300° and 350° witho t loss of weight May be crystallised from alcohol —BaA', transparent six sided plates [32^o] V sol water S (60 pc alcohol) 6 at 14° —CuA', 2aq pale green prisms AgA very hygroscopic pearly needles

Double salts with Et, SO, (Engelcke, A 218, 270) From NaA', H2SO4, and alcohol, and conversion into barium salt BaA'2Et,SO4(?) -

NaA'Ft,SO.

Double salt with Me₂SO₄—NaA'Me₂SO₄, Silky monoclinic tables (from alcohol), very hygroscopic Decomposed by water at 80°, thus

C,H,(OH)SO,NaMe SO,+2H O $= C_1H_1(OH)SO_1H + 2MeOH + NaHSO_1$

EtO Ch, CH SO, H Ethyl derivative S G 21 1 359 Sulphonic acid of ether sodium salt is obtained by the action of chloro ethane sulphochloride on excess of NaOEt (R Hubner, A 223, 218) Also from CH₂Cl CH₂ SO, Na and NaOLt The free acid is got by boiling with water the product obtained by acting with H2S on the (molecular?) compound of its lead salt with lead ethyl sulphate It is a syrup

Salts —NaA' Plates S (alcohol) 27 at 15° —NaA' aq Columns —BaA' aq —ZnA 26aq

Hygroscopic plates -CuA'.6aq

Double compounds with the salts of ethyl sulphuric acid EtSO,H Got by adding H SO, and alcohol to EtO CH CH2 SO, Na, filtering from Na₂SO₄, and neutralising with a metallic carbonate. The general formula is C2H3SO4H, C H3O C2H4 SO4H or C H14S2O4H, e q BaA" aq Sılky scales — (NH₄). A'₁A'₂.—PbA', A'₂ — Na A'₁A'₂ aq — Zn A'₁A'₂ 5aq — CuA'₁A'₄ 4aq These salts are very soluble in water The free acid splits up on boiling with water, in the follow ing manner C₂H SO₄H,EtO C₂H₄ SO₃H + H₂O

= EtO C₂T₄SO₂H + H₂SO₄ + EtOH Ethyl ether HO CH, CH SO₂Et From AgA' and EtI (Stempnewsky, J R 1882, 95)

Ethyl derivative of the ethyl ether EtO CH. CH. SO, Et SG 15 1168 (impure) From CH2Cl CH SO Cl and NaOEt in ether Not obtained quite pure

Benzoyl derivative BzO CH2 CH2 SO, H From potassium isethionate and BzCl (Engelhardt a Latschinoff, Z 1868, 235) -KA' lets, v sol boiling water, sol hot alcohol-BaA', aq Large thin tables, m sol cold water,

sol boiling alcohol

Chlorede HOCH, CH, SO,Cl Probably formed, together with CH₂Cl CH₂SO₃H and CH₂CH₂O SO₂Cl, by the action of SO₂ on ethyl chloride, or of ClSO, H on ethylene (Purgold, B 6, 504) Excess of SO, converts it into the

chloride of cthionic scid (Claesson, J pr [2] 19.

Di-isethionic acid O(CH, CH, SO, H), Di phonic acid of ether The ammonium salt of sulphonic acid of ether this acid is obtained by heating ammonium isethionate to 210° (Carl, B 12, 1604) — (NH₁)₂A" [198°] Slender leaflets or scales, v e sol, water —BaA"aq prismatic tables Formed by water —BaA"aq prismatic tables heating barium isethionate to 200° (Carl, B 14,

ISINGLASS v PROTEIDS, Appendix C.

I80-Compounds whose names begin with 180 are usually described either under the name to which iso- has been prefixed or else under their systematic names as described in the Introduc tion to Articles Relating to Organic Chemistry,

ISOMERISM. Even a superficial reader of chemical literature will soon become aware that the term isomeric and the kindred expres sions allotropic, metameric, and polymeric are by no means always used in consistent senses, and he will have considerable difficulty in clearly realising their exact and relative import, it, therefore, appears desirable to discuss the mean ings of these terms, especially from the historical side, and as far as possible to define the sense in which they are severally applicable. The follow ing extracts from the article Isomerism in the first edition of this Dictionary, vol in p 415, 1865, by J A Wanklyn, serve to show what views were held at the very outset of the period when the investigation of isomeric substances began largely to engage the attention of chemists

'Isomerism.-This term is derived from look equal, and $\mu\epsilon\rho\sigma_0$ a part, and its employment by chemists is an expression of the fact that very different chemical compounds soon of the 1800 that very different chemical compounds have sometimes identically the same ultimate composition. Two or more different bodies which are composed of the same elements (i.e. which have the same proportions of these elements (i.e. which have the same proportion) are said to be tomeric. Isomerism is sometimes used in a nerrower sense, being made to signify equality of molecular weight, as well as identity in percentage composition. When the compounds have the same percentage composition but different molecular weights, the term polymeric is employed. Thus there are the terms Isomeric (in its wide sense), signifying that the different bodies have the same percentage composition, Polymeric, signifying that these different bodies have the same percentage composition, but different molecular weights, Isomeric (in its restricted sense), sometimes called Metameric, signifying that the bodies have the same percentage composition, and likewise the same molecular weight.

As examples, Wanklyn then cites butyric acid, ethylic acetate, aldehyde, and ethylenic oxide as esomeric compounds, using the term in its widest sense of these butyric acid and ethylic acetate are said to be polymeric with aldehyde and ethylenic oxide, butyric acid being isomeric (in the restricted sense) or metameric with ethylic acetate, aldehyde and ethylenic oxide being also metameric compounds Subsequently, throughout his article, Wanklyn uses the term isomeric in its wide sense, substituting the term metameric for isomeric used in its restricted sense, thus he speaks of methyl, the simplest alcohol radicle, as metameric with ethyl hydride (I is article was written at a time when Schorlemmer's investigation was not fully recognised as affording proof of their identity), he points out that several metameric hexanes are possible, and even quotes 'as a very remarkable example of metamerism' the different varieties of tartaric acid and racemic acid

The term allotropy is made use of by Wank lyn in an unusually wide sense. Thus he says—

'Closely related to the term isomerism is the term allotropy Both of them have reference to the same substantial fact, viz that different substances have sometimes the same ultimate composition, but they differ in their manner of stating it. Isomeric and allotropic are in fact complementary terms, "isomeric" being employed to predicate identity of composition between different bodies, whilst "allotropic" expresses difference between bodies of identical composition. Such being the force of these words, there is a certain propriety in their usage thus, whilst it is correct to say "butyric acid and acetic ether are isomeric," it should be "there are allotropic bodies of the formula C.H.N". The same reason which enjoins the use of allotropic in this case prescribes it in the instance of single elements thus, for example, we read of "allotropic in this case prescribes it in the instance of single elements thus, for example, we read of "allotropic in this case of isomerism occurring in in organic chemistry are usually described by employing the word allotropy or allotropic, while the reverse obtains in organic ohemistry. This may be partly ascribed to there being always a very wide difference—or else no difference at all—in the composition of any definite inorganic substances, and hence the fact of identity or non identity of composition being so easily ascertainable, it is implied in the form of expression, whilst the fact of difference of properties alone needs to be made the subject of formal predication. Among organic bodies, on the other hand, it continually happens that the differences of composition are quite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the utmost equite decided, and yet so very minute as to tax the ut

He then cites the olefines as examples of polymerism, and afterwards discusses numerous cases of metamerism, several of which were referred to above

Under the heading Isomers among Inorganic Substances the following interesting passages occur at the conclusion of the article —

'As before remarked, the instances of inorganic isomerism are usually called instances of allotropy—isomeric substances and allotropic substances being nearly equivalent expressions. The elementary substances themselves offer many examples of isomerism. Ozone and oxygen are isomeric bodies. Experiment has shown that the molecular formula for ozone is higher than that for oxygen, but how much higher remains an open question. Sulphur, phosphorus, carbon, and many other elements present somehat similar examples of allotropy or isomerism. Inorganic compounds, such as the various forms of silicio acid, of sesquioxide of thron, of sesquioxide of chromoum, of alumina, must be classed among substances afording examples of isomerism. The explanation of the existence of isomerism will have become sufficiently clear from the course which has been followed in describing the different examples of it. "It is of consequence how the atoms of a compound are arranged, as well as what kind of atoms they are, and hence there may be very many totally different substances composed of the same ultimate atoms. This is in fact the whole philosophy of isomerism.

The definitions given in Kekulé's Lehrbuch (1867) are substantially the same as those adopted by Wanklyn, but he specially draws attention to the existence of compounds isomeric in a restricted sense, which, according to the state of knowledge of the time, were to be represented by the same rational formulæ, although they either were possessed of different properties—as in the case of the CipHie hydrocarbons and of maleic and tumaric acids, or they were in all essential te spects chemically identical but physically different—such as the tartanc acids, mucic and such as these latter, in fact, gave rise to the re-

cognit on of a distinct kind of isomerism, termed physical isomerism

In the latest edition of Watts' Founes by Tilden (1886), polymerism is included under isomerism, but compounds of the same mole cular weight are sub-divided into (1) metameric bodies, namely, those which exhibit dissimilar transformations under similar circumstances propionic acid, methylic acetate, and ethylic formate are quoted as examples, and (2) isomeric bodies, strictly so-called, namely, those which exhibit the same or closely similar decompositions and transformations when subjected to the action of the same reagents, such as the C_{1e}H_{1s} hydrocarbons, the glucoses, the tartaric acids, &c

It will be noted how incompatible are the definitions given by Wanklyn and in Fouries of the term metameric, it has, however, undoubtedly been customary of late years so employ the term metameric in the sense indicated in Fouries

In M'Gowan's translation of Bernthsen's Organic Chemistry (1889), the most modern book of its kind, polymerism is not reckoned under isomerism, but the definition given of metamerism is on the whole more in agreement with that quoted from Watts' Fouries, after it has been explained that ethers such as methyl amyl ether, ethyl butyl ether, and dipropyl ether are isomeric, we read—

'Such isomerism which depends upon the grouping together by a polyvalent element of alcohol radioles which are individually unequal, but the sum of whose elements taken together are equal, is called metamerism. One of the alcohol radioles may here be replaced by hydrogen. Alcohols and ethers containing an equal number of carbon atoms are therefore metameric.

We further learn that the isomerism of the higher paraffins, since it is based upon the dis similarity of the carbon chains, is often termed chain isomerism, that the isomerism between ethylene and ethylidene chlorides, or between primary and secondary propyl alcohols, as it depends upon the difference in position of the substituting halogen or hydroxy in the same carbon chain, is termed isomerism of place or position, and that there is the third kind of iso merism, viz metamerism But obviously two different kinds of relationship are thus included under metamerism that of position isomerism, which obtains among the ethers themselves, which are necessarily all compounds of one primary type, and that which obtains between the typically different 'equi moleculai' alcohols and ethers, or true metamerism, if the Watts Fownes definition be adopted

If we consider the origin of the four terms under consideration we find that they were all devised by Berzelius The term isomeric is proposed in his Jahresbericht, handed in to the Swedish Academy of Sciences, March 81, 1831 (cf Wohler's German translat on, 1862, ii pp 44-8), in the following words —

'Da es nothwendig ist, für gegebene Ideen bestimmte, und so viel wie möglich cor sequent gewählte, Ausdrücke zu besitzen, so habe ich vorgesohlagen, Körper von gleicher Zusammensetzung und ungleichen Rigenschaften isomerische zu nennen, vom griechischen crousepig (aus gleichen Thellen zu sammengesetzt)'

In the next volume of his Jahresbericht (Wöhler's translation, 1838, p 63) he gives a

further all important defin.tion of the use he would make of the term, thus —

'Um jedoch nicht Erscheinungen von nicht vöillig gleicher Art mit einander zu verwechseln, ist es nothwendig den Begriff vom Worte Isomerie genau zu bestimmen. Ich erwikhnte dass ich darunter Körper verstelt, die aus einer gleichen absoluten und relativen Atomen-Ansahl derselben Elemente zusammengesetzt sind und gleiches Atomgewicht haben womit nicht der fall zu verwechen ist, wo die relative Anzahl der Atome gleich ist, die absolute aber ungleich. So ist z B die relative . nzahl von Kohlenstoff und Wasserstoff-Atomen im ölbilde .den Gas und im Weindi absolut gleich, allein in einem Atom vom Gase eind bloss 1 Atom Kohlenstoff und. 2 Atome Wasserstoff enthalten, CH_w wihrend dagegen im Weindi 4 Atome Kohlenstoff und 8 Atome Gleichheit in der Zusamn nsetzung, bet Ungleichheiten in den Biyenschaften beseichnen zu können, möchte ich für diese Körper die Benenung polymerische (von πολυτ, mehrere) vorschlagen.

It will be clear from this quotation, especially from the words which I have italicised, that Berzel is never intended that polymerism should be regarded as a form of isomerism

The following passage from the same source clearly exhibits Berzelius's intention as to the use which should be made of the term metameric—

'Allein es gibt noch andere Verhältnisse, wo Körper, in eigentlichen Sinne des Wortes, isomerisch scheinen, d. h. dieselbe relative und absolute Atomenanshi derselben Elemente enthalten konnen, ohne espedoch volltidadig zu zein Ein solcher Fall ist wenn K. riper aus zwei zusammengesetzten Atomen der ersten Ordnung bestehen, die sich auf verschiedene Weise gegen einander un zeen und in Folge dessen ungleiche Korper bilden konnen, s. B. Snå(SnOSO_a) schwefelsaures Zinnoxyd, enthalten eine gleiche absolute und relative Annahl derselben Elemente, und haben disselbe Atomgewicht, können jedoch nicht als ein und derselbe Korper betrachtet werden. Bei solchen Körpern ist es der Fall, dass wenn sie eine gewisse Zeit lang bestanden haben, oder wenn die Temperatur geändert wird, eine Umlegung der Bestandthele in ihnen vor sich geht, ohne dass etwas hinzukommt oder davonweggeht, und dass daurch eine anders beschaffene Verbindung entsteht, welche Verlinderung nicht selten von einer Temperatur Erböhung begleitet ist. Um solche Fälle bestimmt von Isomerie zu unterscheiden, können wir dafür die Beselchnung metamerische Körper gebrauchen (von µera in der selben Bedeutung wie in McLamorphose)'

Berzelius also cites cyanic and cyanic acids, which were not then regarded as compounds of different molecular weight, as instances of meta meric compounds, regarding the conversion of the latter into the former on heating as a case in which 'die Cyanicsaure von einem zusammengesetzten Atom der ersten Ordnung, oder einem Oxyd eines ternaren Radicals, in ein zusammengesetztes Atom der zweiten Ordnung, nämlich in Cyansaure mit chemisch gebundenem Wasser übe geht' Cyamelide, into which cyanic acid spontaneously changes, and cyanica acid, in Berzelius's opinion, were (wenigstens vor läufig) isomeric oxides of the same radicle

It is clear therefore that the conception involved in the definition of metamerism given in Watts' Founes, and in the first edition of this dictionary, is scarcely in conformity with the use of the term by Berzel'us, indeed, in 1840 he speaks of ethylic formate and methylic acetate as isomeric. From the example afforded by the two tin compounds, as well as from the explanation given of the nature of the change from cyanura to syanic acid, it is to be supposed that the compounds which he intended should be included in the category of metameric substances were such as we should now term typically different, and with this conclusion the modern practice is in Vog. III.

distinct accord, yet the modern and the original application of the term are far from being equivalent, the meta- in metamorphosis denoting change the conversion of the one metameride into the other being expressly referred to, it would appear, in fact, that Berzelius distinctly intended to apply the term to those compounds which are capable, in modern phraseology, of undergoing 'isomeric change,' and perhaps to these alone

It was not until 1840 that Berzelius proposed to substitute the term allotropic (von allotropic swelches bedeutet, von ungleicher Beschaffenheit, BJ 1841 inorg sec p 13) for isomeric, in the cases of the existence of modifications of elementary substances. He appears, however, to have contemplated its extension to compounds, judging from the following passage.

'Es kann dann mehr als eine Ursache von dem was wir Issemerie nennen, geben, namilch (1) Allotropie, wenn namilch das vorhin angeführte Beispiel von den beiden Schwefelkiesen darauf beruht, dass der eine davon Sa und der andere Sø enthält , (2) die ungleiche relative Lage der Atome in der Verbindung , und (3) kann sowohl Allotropie als ungleiche Stellung der Atome in gewissen Fällen zugleich stattfinden '

The existence of compounds containing allotropes of one of the constituent elements is distinctly suggested here, but there is nothing to indicate in what way allotropes may be regarded as related, that Berzelius had realised that the re lation might be that of polymerides would appear to follow from his reference to Frankenheim's experiments on sulphur, in which it is suggested that the different modifications of sulphur form corresponding gases, and that the dark yellow gas of sulphur, weighing thrice as much as sulphur gas should according to calculation, is not that of the modification occurring in the ordinary sulphur compounds (v Allotropy, vol 1 p 128 the view here taken is somewhat wider than that adopted by Prof L Meyer in that article)

As the term allotropic has a general signification, implying only another condition, and involves no assumption either regarding the molecular weights of, or as to the nature of the relationship which obtains between, the allotropes, it may with great advantage be employed in place of the term isomeric used in a wide sense, this latter term being preferably restricted to those cases in which there is the very closest similarity in structure Polymerism, metamerism, and isomerism may in fact all be regarded as varieties of allotropy, there is certainly no reason why carbon compounds should be considered apart from those of other elements, or from elementary substances

The rational formulæ which are ordinarily made use of are condensed symbolic expressions affording more or less complete information as to the characteristic chemical properties of the compounds which they represent, especially with regard to the manner in which they are formed, and in which they undergo change when submitted to the action of various agents, and equimolecular allotropes which differ either in their mode of formation or in their behaviour under similar circumstances are, as a rule, necessarily represented by different rational formulæ The formulæ devised for any class of compounds, however, will vary according to the views which

ISOMERISM.

are held as to the valencies of the constituent atoms At present, formulæ are almost invariably constructed on the hypothesis that the several units of affinity—the valencies—of a polyad atom, such as that of carpon, nitrogen, or sulphur, are of the same value and have identical functions, this conclusion being based on the fact that lone of the simple derivatives of methane, ammonia, &c . exist in a greater number of modifications than the hypothesis requires But it cannot be too positively stated that, notwithstanding the extent to which experimental investigation has been carried, we are yet but on the threshold of the temple in which the mysteries of valency are enshrouded The valency of the hydrogen atom is determined ex hypothesi to be unity, and when the facts generally are passed in mental review, it would seem that this conclusion is no mere hypothesis, it is not improbable also that the valencies of the atoms of at least the majority of metallic elements are invariable, but the valencies of the atoms of the non metals are apparently variable By valency is here understood atom fixing power

Most discussions on valency are dialectical rather than scientific, in consequence of our powerlessness at present to decide what constitutes 'a valency,' the deduction from Faraday's law of electrolysis, to which Helmholtz has directed the attention of chemists (Faraday lect, C J Trans 1881 p 277), that definite, as it were atomic, charges of electricity are associated with the atoms of matter—that a monad bears a single charge a dyad two, a triad three—is the only approach yet made to a theory of valency, but hitherto chemists have avoided the discussion of the subject from this point of view

Oxygen and sulphur, nitiogen and phosphorus carbon and silicon, form gasifiable hydrides, from the composition of which we infer that the atoms of these elements are divalent, trivalent, and tetravalent, respectively, in the case of carbon and silicon there is no reason to suppose that either element ever manifests a But both water and ammonia higher valency readily combine with other molecules the form ation of such compounds from water is rarely interpreted as evidence of the possession by oxygen of the power of acting as a tetrad, but the water molecule is usually supposed to func tion in some occult manner as a whole, and to enter into a state of 'molecular combination' dif ferent from that of 'atomic combination' in which its constituent atoms exist The formation of ammonium compounds, however, is more usually regarded as due to the manifestation of a higher degree of valency by the nitrogen But there is no good reason for explaining the behaviour of oxygen in one way, and that of nitrogen in an other

The question to be decided is, whether a given element may possess two or more degrees of valency, and whether the so-called atomic and molecular forms of combination differ merely in degree and not in kind Or, to put it in

anothe. way —is the number of atomic charges ass clated with a given atom invariable or variable, is it possible for an oxygen or sulphur atom, for example, to carry more than two, or for a nitrogen or phosphorus atom to carry more than three, charges? The writer has endeavoured to explain the exhibition of varying degrees of valency on the assumption that, while the number of charges which any given atom can carry is invariable, a single charge may operate in promoting the union of more than two atoms (cf P M January 1888), that in water, for example, the two charges of the oxygen atom are not fully engaged by those of the hydrogen atoms, and that consequently the oxygen atom is still possessed of a certain amount of residual affinity It may be contended that, according to this hypothesis, a compound formed of say trimethylamine and ethyl iodide, Me,N IEt, would be an allotrope of a compound of ethyl dimethylamine and methyl iodide, EtMe,N MeL The most careful experimental study of such compounds (cf V Meyer a Lecco, Ber 9, 309, Ladenburg, Ber 9, 561, 1634, Klinger a Class son, A 243, 193) has been made, however, with the result that, in the case of ammonium compounds, it is immaterial in what order or manner the radicles are introduced, and the same is true in the case of sulphine compounds hence it is supposed that nitrogen has five, and sulphur four, affinities of equal value But this by no means follows, as the occurrence of 'isomeric change' in such cases is in the highest degree probable-the compound abcNId may alone be the stable form into which the allotropes abd NIc. acdNIb, bcdNIa, all spontaneously undergo con version immediately on formation little doubt that such 'isomeric changes' occur far more frequently than is commonly supposed, and it is most important that the possibility of 'isomeric change' should be very carefully kept in view in determining the constitution of com pounds from the study of their behaviour in a limited number of interactions As valency cannot be determined from any a priori con siderations, and can only be deduced from the knowledge of the structure of the compounds of the elements whose valency is to be determined, it is obvious that the structure of a substance must be inferred from the widest and most care ful study of all its properties the study of the relationships of allotropic substances is in fact inseparable from that of valency, and the con verse is equally true

In the case of 'unsaturated' carbon compounds, it has been customary of late years to represent the affinities not engaged by other elements as saturating each other thus, ethylene is formulated as H₂C CH₂, acetylene as HC CH Thomsen's determinations of the heat of combustion of ethylene and acetylene in comparison with those of saturated hydrocarbons, as well as the general behaviour of such unsaturated compounds, may, however, be held to favour the view that the carbon atoms are possessed of free affinities, as expressed by the formulæ H.O...

HC— Although the discussion of this question excited considerable attention a few years ago, it has latterly almost entirely fallen into

^{&#}x27; It appears to me that the term valency must at present be used in a perfectly general sense, and that we cannot restrict our attention to the consideration of gaseous compounds (* EQUIVALENCY) in the case of gase, the problems are for the most part of a very simple kr d, and rarely excite differences of opinion, liquids and solids, however, present problems of great complexity

oblivion, but as very many of the cases of anomalous isomerism, of which an explanation is required, occur among compounds of the ethylenic type, it is one of considerable importance. The possibility of the two forms of com-

bination pictured by the expressions # and

 H_2C- should also be taken into account, espe H_2C-

cially in the case of ethylenic derivatives

Among the more recondite problems of valency requiring mentice is that relating to the number of carbon atoms which form closed chains or ring. It is now regarded as well established that, in addition to the six atom ring of benzene, five atom rings also exist, indeed, their formation apparently takes place with peculiar readiness, the existence of both three-and four atom rings is now also generally held to be established, chiefly in consequence of the researches of W H Perkin, jun (cf C J Trans 1885 801, et seq) The hydrocarbon obtained by the action of sodium on trimethylene bromide, BrCH CH, CH, Br, is almost universally assumed to be the simplest compound of the land trimethylene Hard trimethylene has the simplest compound of

the kind, trimethylene $\frac{H_{C}C}{H_{C}C}$ CH₂, as shown by Freund, its discoverer, this hydrocarbon has the remarkable property of being reauly absorbed by a solution of hydrogen iodide, forming normal propyl iodide, although it is acted on with extreme slowness by bromine By the action of ethylenic bromide on the disodium derivative of ethylic malonate, Perkin has obtained an acid which he regards as a trimethylenedicarboxylic

acid $\frac{H_2C}{H_1C}$ >C(COOH)₂, and by employing tri methylenic bromide in place of ethylenic bromide, he has prepared what he regards as tetramethyl

enedicarboxylic acid (CH_2-CH_2) both acids $(CH_2-C(COOH)_1)$

closely resemble the hydrocarbon in their beha viour with bromine and halhydrides The casy resolution of closed carbon chains by halhydrides in this manner, however, is altogether without precedent in the case of five and six atom car bon rings, at all events, which, as a rule, cannot be split by means of halhydrides, but are fre quently resolvable by bromine, their behaviour is more nearly akin to that of five atom rings, such as those of furfuran and indole, which also resist the action of bromine, but are resolvable by treatment with agents which are commonly regarded as weaker than bromine (the formation of pyridine derivatives from pyrrole and of quinoline derivatives from indole, which appears to involve the resolution at some stage of the ope ration of the five atom rings, is contemplated in this statement) The alternative formula for trimethylene, if it be not a closed chain hydro carbon, is CH, CH, CH, which represents it as a compound in which two terminal carbon atoms are each possessed of a single free affinity, the possibility of the existence of such compounds has not yet been contemplated by chemists, ex cepting myself It is conceivable, I think, that such a compound would be attacked by bromine with difficulty, in consequence of the two un-

satisfied carbon atoms failing to assist each other in separating the constituent atoms of the bromine molecule and the impossibility of a 'conducting chain of molecules' being formed between the carbon atoms, as bromine is a dielectric, as solutions of the halhydrides are electrolytes of low resistance, such a conducting chain might, however, be formed in their case, and the requisite electrolysis of the halhydride molecule could thus occur According to Thomsen, trimethylene has a higher heat of combustion than propylene, CH, CH CH2, judging from the analogy afforded by benzenoid compounds, it is to be expected, however, that the closure of the chain involved in the formation of the three atom ring would be attended with a considerable loss of energy, and that propylene would, therefore, have the higher heat of combustion its behaviour with bromine certainly justifies this view The confirmation of Thomsen's statement thus becomes of extreme importance It is a noteworthy fact that ethylenic oxide, according to Thomsen, also has an exceptionally low heat of formation, and that this ob server has proposed to represent it as a dimethylene oxide of the formula CH2O CH2 Ethylenic oxide as represented by the conventional formula bears a similar relation to trimethylene that furfuran bears to pentamethylene, thus

Thomsen's formula for ethylenic oxide is mad missible, as it indicates a severance of the carbon atoms, if, however, the formula were written CH₂CH. O, it would correspond to that given above to trimethylene, Thomsen's observations that both ethylenic oxide and trimethylene have an exceptional heat of combustion may there fore be regarded as mutually confirmatory. It is also to be noticed that the compound formed from ethylenic bromide and a sulphide is not the corresponding sulphide, but the polymeride

CH₂—S—CH₂
hereof | | If an open chain formula
CH₂—S—CH₃

be assigned to trimethylene, Perkin's tri- and tetramethylene derivatives must also be represented by open chain formule. Perkin has fully discussed this question, and has pointed out the improbability attaching to such formule. The evidence does not appear to be sufficient, however, to permit of a final decision being arrived at with regard to so difficult a question.

Finally, it is necessary to refer to a problem closely akin to the two previously considered, viz that relating to the distribution of the spare affinities of the carbon atoms in closed chains, of those affinities, that is to say, which are not engaged in the formation of the ring, or in re taining the hydrogen atoms. This problem is chiefly of importance in discussing the structure of benzenoid hydrocarbons and their derivatives of the various formulæ proposed for benzene, that of Kekulé always has been, and still remains, the most popular, but it is open to the serious objection that it represents benzene as a compound containing three pairs of carbon atoms in the same condition as the pair in ethylene. Dewar's for-

mula is open to a similar objection 'The prism formula of Ladenburg and the diagonal formula of Claus cannot be objected to on this ground, but are open to criticis n in many other respects, and in the light of Von Baeyer's recent researches on the reduction products of terephthalic acid of A 245,103, 251,257) these formula are generally regarded as finally disposed of (cf Miller, C. S Trans 1887 208) A symbol proposed by the writer in February 1887 (cf P. M), and a year later also by Von Baeyer (A 245, 122), appears to be exempt from the deficiencies which characterise previous formulae, but it embodies somewhat unconventional conceptions, and therefore has not yet attracted attention The

84

symbol in question has been very happily

termed the centruc formula by Von Baeyer, he expressly states that this formula is to be under stood to indicate that 'die 6 Kohlenstoffvalenzen des Benzols sich sattigen, ohne dadurch drei Verkettungen der Kohlenstoffatome zu bewirken' (A 251, 285)—one valency of each atom is directed towards the centre of the ring, and these valencies mutually paralyse each other (A 245, My own words were 'Of the twenty four affinities of the six carbon atoms twelve are en gaged in the formation of the six carbon ring, while the remaining six react upon each other, acting towards a centre as it were, so that the affinity may be said to be uniformly and sym metrically distributed I do not consider that, apart from its connexion with the other carbon atoms owing to their association in the ring, any one carbon atom is directly connected with any other atom not contiguous to it in the each individual carbon exercises an influence upon each and every other carbon atom there is an excess of affinity beyond what is required to maintain the CoH, ring, but I do not consider that each carbon atom can be considered to have an affinity free '

The conclusion here arrived at with regard to benzene, that no direct connexion exists between any but the contiguous carbon atoms in the ring—that para carbon atoms are not and cannot become united—may be regarded as of universal application. Von Baeyer's experiments prove, moreover, that the dihydro tereph thalic acid in which an atom of hydrogen is associated with each of the para-carbon atoms to which the carboxyls are attached, unlike terephthalic acid, behaves as an unsaturated compound, forming a tetrabromide, and that it is to

be represented by the formula $H CO_2H$

this it follows that the type changes on conversion of the 'centric' compound into the di addition compound, and probably this is generally the case, for example, when quinol is converted into quinome. OH O

OH O Quinole.

It would also follow that in the case of benzenoid corpounds four of the six 'spare' affinities can not act 'centrically' To what extent this is true in the case of other rings remains to be ascer tained, from the remarkable similarity of thiophene and benzene, it would appear probable that the former is to be represented as analogous to HC — CH

benzene in structure, thus HC CH, whereas

the analogous compounds furfuran and pyrrole more nearly resemble the unsaturated compounds in their behaviour, but this is perhaps ascribable to the influence exercised by the oxygen or imidogen

The foregoing brief discussion will suffice to direct attention to the numerous problem i comprised in the philosophy of isomerism, and to show how far from final are the conclusions as to structure which we are at present able to arrive at

In a large and rapidly increasing number of instances, it is impossible to assign different rational formulæ to compounds undoubtedly different so long as the system employed takes into account merely the nature of the radicles and the manner in which they are associated as pictured by disposing them in a single plane If, while assuming the hydrogen atoms in a compound, such as methane-in other words the four valencies of the carbon atom-to be equal, it be supposed that the radicles intro duced in place of the hydrogen atoms occupy relatively different positions in the plane, a variety of isomeric derivatives would appear to be possible eg two of the form CRRR, R,, two of the form CRRR, R2, and three of the form CRR₁R₂R₃, R, R₁, R₂, R₃ being different radicles A special study of methane derivatives from this point of view has been made by Henry, but both his results and our general experience show that isomerides such as are here contem plated do not occur

By considering the arrangement of the atoms in space, conclusions have, however, been arrived at which are far more in harmony with experience. Such a step was first taken in 1874 by Van't Hoff (La Chimie dans l'Espace, Rot terdam, 1875), and independently and almost simultaneously by LeBel (Bl [2] 22, 337, cf ibid 23, 295). A German adaptation of Van't Hoff's pamphlet entitled, Die Lagerung der Atome im Raume, was published in 1877 by Hermann A full account of the subject is to be found in the previous edition of this dictionary and in Miller's 'Chemistry,' vol in

The fundamental hypothesis of the Van't Hoff system consists, as is well known, in supposing that the carbon atom occupies the centre of a tetrahedron and that its four affinities are directed towards the four solid angles. When four different radicles are associated with the carbon atom, but only in such a case, two isomerides are possible, represented by two irregular non-superposable tetrahedra bearing to each other the relation of an object to its reflected image, and, moreover, these isomerides should be of enantomorphous crystalline form, as

well as optically active and possessed of erual! and opposite rotatory powers, as the molecules are unsymmetrical, such tetrahedra exhibiting, in relation to an axis drawn parallel to the corresponding edges, a screw shaped grouping of the four summits, turning to the right in the one form and to the left in the other A carbon atom thus situated is termed asymmetric, and is represented in a formula by an italicised C The hypothesis serves therefore at once to ex plain both the existence of isomerides which cannot be represented by formulæ written in a single plane, and to account for the optical activity of certain substances Thus in the case of tartaric acid, which contains two asymmetric carbon atoms, but is composed of two equal groups, (COOH)(HO)HC CH(OH)(COOH), the hypothesis indicates the existence of two opti cally active isomerides of equal but opposite rotatory powers, and a third inactive isomeride in which the optical effect of the one asymmetric carbon atom is balanced and neutralised by the equal opposite effect of the other, it thus accounts for the existence of dextro-, lavo . and meso tartaric acids, racemic acid, the fourth modification, apparently, is to be regarded as a 'physical' allotrope formed by the conjunction of the two active isomerides it would seem that it does not exist in solution Van't Hoff has shown, in a recent much extended new edi tion of his pamphlet, that every prevision of the hypothesis with reference to the optical characters of isomerides has been fulfilled in the most complete manner possible by the in vestigations carried out in the interval since its enunciation by Le Bel and himself (cf Dix Années dans l'Histoire d'une Théorie, Botter dam, P M Bazendijk, 1887), this remarkable agreement of practice with theory has naturally led to the almost universal adoption of the hypothesis

The hypothesis also provides for a greater number of isomerides in the case of compounds of the ethylenic type than is indicated if the space relationship of the radicles be omitted from consideration, if a compound of the form R,R,C CR,R, be represented by two tetrahedra joined so as to have one edge in common, it will be found that only one such figure can be constructed, if either the four radicles are iden tical, or if only R, differs from R, or R, from R,, but if R, is different from R, and R, is also different from R., although R, and R., R, and R., are identical, two such figures may be constructed -this is more readily rendered obvious by the adoption of the simpler plan of writing the symbols of the radicles attached to the two doubly linked carbon atoms on either side of a line representing the plane of their conjunction

Thus the symbols $\frac{a}{a}\frac{b}{b}$ and $\frac{a}{b}\frac{b}{a}$ represent modifi-

cations in which in the one case the two similar radicles are situated symmetrically with reference to a plane at right angles to the axis of the system, and in the other are symmetrically situated with reference to the axis of the system, such modifications may therefore be termed, as Wishicenus has suggested, the plane and axially symmetric modifications. The isomerism of maleic and fumeric acids is regarded by Van's

Hoff as dependent on such a difference in struc-

Such a stereometric mode of formulation does not afford an increased number of expressions for acetylenic derivatives, the same is true of ben-enoid compounds if Kekulé's symbol be adopted (cf Marsh, P M Nov 1888, p 426) It may be noted, however, that the asymmetric carbon atom hypothesis is applicable to the explanation of the optical activity manifested by a variety of closed chain compounds, such as quercitol and quinic acid, which are derivatives of hexamethylene, and conine and its homologues, which are derivatives of piperdine

Although the Van't Hoff Le Bel hypothesis has been very generally accepted as affording a sufficient explanation of a very large number of cases of isomerism difficult to account for in accordance with the existing canons of belief, it is as yet by no means certain that it can be always so regarded, in many cases the difference between isomerides is so great that it is somewhat difficult to believe that it depends on so comparatively simple a difference in structure as the presence of one or more asymmetric carbon atoms would involve The two isomeric tartaric acids are the veritable image the one of the other, but this is rarely the case thus hydrobenzoin differs very considerably from isohydrobenzoin, as do also mannitol and dulcitol. and to a still greater extent the acids, sacchario and mucic, formed from these latter, in all these cases the isomerism is assumed to depend on mere geometrical differences In the case of mesotartaric acid, the intra-molecular neutralisation of one asymmetric carbon atom by the other already produces a marked effect, as evidenced by the difference in properties of this acid in comparison with either of the active modifications It may be, therefore, that in the case of mannitol and dulcitol, and the acids formed by their oxidation, the accumulated effect of the several asymmetric carbon atoms is much greater than in the case of tartaric acid, and hence the greater difference in properties between the iso-Very little alteration is involved in the formation of racemic acid, and, as above pointed out, this substance appears to be a mere physical' allotrope, hardly a polymeride, of its active constituents, in certain cases the formation of the 'racemic form' is attended with a considerable alteration in properties-in the case of leucine and of camphoric acid, for example, their racemic forms being much less soluble and of higher melting points than their optically active constituents In these cases there would seem to be a more intimate union than in the case of racemic acid, the marked difference between saccharic and mucic acid may be due to some such cause as this But the isomerism of the hydrobenzoins is more difficult to explain, assuming that they are both compounds of the formula (C,H,)(HO)HC CCH(OH)(C,H,) Including a racemic form, four modifications of such a compound appear possible, two of which should be optically active Neither compound is optically active, and, judging from Zincke a observations, it does not appear probable that, if the one be the meso or mactive modification corresponding to mesotartaric acid, the other is the racemic form. The assumption that the one, perhaps 86 ISOMERISM.

isohydrobenzoin, contains the two hydroxylgroups attached to the one carbon atom, thus C.H.,H.C C(OH), C.H., would satisfactorily account for its behaviour, but has hitherto been rejected as improbable owing to the general belief that compounds of such a character are exces sively unstable But it may be that the presence of the negative phenyl groups confers stability in such a case, much as in the case of chloral hy drate, and it is well to remember that in not a few instances of late years proof has been given of the incorrectness of views based on general considerations, as in the case of phthalic chlor ide, for example, and the hydroxamic acids

Still greater difficulties occur in accepting the conclusion that the Van't Hoff hypothesis affords an explanation of the isomerism of unsaturated compounds such as maleic and fumaric acids, which, according to this view, are respectively the plane symmetric and axially symmetric isomerides of the formula

HOOC CH HC COOH and нё соон HC COOH Fumaric acid. Maleic acid

It is well known how great are the differences between these two acids, both in physical pro perties and in general chemical behaviour, and that maleic acid alone yields a corresponding anhydride, fumaric acid being converted into the same anhydride when dehydrated Ostwald also has shown that the electrical conductivity of their solutions is such as to indicate that maleic acid is a weak acid akin to selenious and phos phorous acids, whereas fumaric acid is a wellmarked dibasic acid (J pr 32, 362) acid has also a considerably greater heat of combustion than fumaric acid (Thomsen, J pr 40, 202) Roser has suggested that, whereas fumaric acid is a normal di carboxylic acid, maleic acid is to be represented by the formula

HC CO

|| >0 HC C(OH)₂ This formula would afford a satisfactory ex planation of the great differences observed be tween the two acids, and it has been strongly advocated by Anschütz (A 254, 168) No valid argument has yet been advanced which would prevent its adoption

It may here be pointed out that no attention is paid in applying the Van't Hoff hypothesis to unsaturated compounds to the peculiarities which are manifest in such compounds, and which ap parently must be attributed to the presence of unsaturated carbon atoms, a 'double or ethylenic bond' is represented as the precise equivalent of two single bonds, and a 'treble or acetylenic bond' as the equivalent of three single bonds, which is certainly not in accordance with facts, and especially with Thomsen's observations on the heats of combustion of unsaturated compounds

Wislicenus has not only accepted the Van't Hoff Le Bel hypothesis in its entirety, but has in the most ingenious manner possible extended its application, and has endeavoured both to elucidate the structure of geometrically isomeric unsaturated compounds, and to explain the '150meric changes 'which such compounds frequently exhibit (Abhandlungen der math. phys. Classe

der könig Sächsischen Ges der Wissenschaften, Band xiv Leipzig, 1887).

In the case of maleic and fumaric acidassuming that these are stereometric isomeridesas pointed out originally by Van't Hoff, the for-HOOC CH

may without hesitation be mula HC COOH

assigned to the latter, as it is incapable of form ing an anhydride, whereas maleic acid, being easily convertible into the anhydride, is repre нс соон

sented by the formula in the case нс соон '

of crotonic and isocrotonic acids however, it is more difficult to find criteria on which to base a choice between the formulæ

HC CH, CH, CH and HC COOH HC COOH

and similarly in other cases Wislicenus con that if a compound of the form $C_1R_1R_2R_3R_4$, consisting of the two systems $R_1R_2C_3$, and $C_1R_3R_4$, be derivable from a cor responding acetylenic compound, its constitu tion can at once be inferred from the fact that when one pair of bonds between the carbon atoms in the acetylenic compound is severed, as the two atoms are still united by double bonds. no rotation of the systems can take place, consequently the added radicles both occupy posi tions on one side of the common axis of the Thus the tolane dichloride melting at systems 143°, obtained by chlorinating tolane, is neces sarily the plane symmetric modification

C.H.C C.H. CCI Ш C,H,C C,H, CCl

The isomeride of lower melting point (63°) must therefore be regarded as the axially symmetric

C.H. CCl compound In principle this CIC C,H,

method appears perfectly sound, but it is based on an assumption with reference to the manner in which the carbon atoms in ethylenic and acetyl enic compounds are united, which, as previously pointed out, is perhaps open to question, it also involves the conclusion that the radicles attached to the carbon atoms are incapable of changing their positions, which is also by no means a safe assumption, bearing in mind the extreme readi ness with which 'isomeric changes' occur

A method of more universal application, but involving much more complex considerations, is the following In saturated compounds in which the carbon atoms are united by single affinities. one carbon system must be capable of rotating about another, moreover, it is to be assumed that the atoms in a molecule—even those which are not directly connected—exercise an influence on each other, and will therefore tend to condi tion such rotation so that radicles which have the greatest affinity are brought into the closest proximity possible Thus, on converting ethyl ene into its chloride, in the first instance the change would take place in accordance with the following scheme

But, in consequence of the superior affinity of hydrogen for chlorine, such a system would be unstable, rotation would set in, and the more CHHCl

stable system

| would result.

To take another case, that of the conversion of tolane tetrachloride into dichloride by reduction, this compound may present three configurations, viz

CC,H,ClCl CC,H,ClCl CC,H,ClCl

It would probably chiefly consist, especially at low temperatures, of the second and third modifications, as the dissimilar radicles are most proximately situated in these, and as these two modifications would both farnish the axially symmetric dichloride on reduction, it is to be supposed that the chief product of reduction will be this dichloride, actually that melting at 63° is chiefly obtained (Blank, A 248, 1), and it is, therefore, to be supposed that this modification is avially symmetric—a conclusion which harmonises with that previously arrived To this it may be objected that our know ledge of the relative affinities of the radicles within a compound is purely hypothetical, and that it is by no means certain that dissimilar radicles would in all cases tend to influence and attract each other more than would similar ra-Thomsen's observations on the heats of combustion of chlorine compounds, in fact, would appear to favour an opposite conclusion more important argument is to be found in the fact that in cases in which the constitution may fairly be regarded as established, the relation is of the obverse order to that required if the con tention of Wishcenus be correct thus, the sym metric or para diderivative of benzene always has the highest melting point, the same appears to be true of the symmetric tri and tetra-deri vatives, and, in the case of naphthalene, the axially symmetric isomeride is always that of highest melting point (cf. C. S. Proc. 1888-93)

Another use which Wish cenus has made of the

Another use which Wishcenus has made of the argument here criticised may now be mentioned. It is a well known fact that maleic acid is very readily converted into fumario by the action of acids. Wishcenus supposes that when this con version is effected for example, by bromhydric acid, the double bond becomes severed, bromosuccinic acid being formed.

HC COOH HC COOH + HBr = HCH COOH HCBr COOH

but rotation setting in, the radicles are brought into their preferential positions, viz HOOC CHH

HC BrCOOH, and when, by the action of the water present, this modification becomes deprived of hydrogen bromide, fumaric acid naturally results. Although in the highest degree in agenious, this conception unfortunately does not appear to be in accordance with the facts, for, as Anschutz points out (2. 254, 168), the conversion takes place under conditions under which the succinic derivative is stable, and there is no reason therefore to suppose that such a compound is formed at any stage of the conversion of maleic into fumaric acid, if maleic acid be formulated in the manner advocated by An-

schutz, its conversion into fumaric acid by acids is easily understood

Victor Meyer's researches have led him to carry speculation even further On submitting benzil to the action of hydroxylamine, Meyer and Goldschmidt obtained an a dihydroxime which they found was converted into a more stable &isomeride by heating with alcohol to about 180° a careful investigation of these compounds was subsequently made by Meyer and Auwers, but they were unable to discover any substantial difference in their chemical behaviour, and they came to the conclusion that both must be regarded as compounds of one and the same formula C.H. C(NOH) C(NOH) C.H. As the existence of two such compounds was incompatible with the assumption that carbon atoms united by single affinities are free to rotate, Meyer and Riecke (B. 21, 946) have put forward an hypothesis as to the nature of the carbon atom itself which serves to account for two kinds of union by single affinities, one in which rotation is impossible, the other in which it can freely take Having regard, however, to the readiness with which 'isomeric change' takes place. and to the extremely imperfect state of our knowledge of the exact manner in which polyad ele ments are held in association, there cannot be any doubt that it is premature to conclude that the benzil dihydroximes are necessarily structurally identical, the study of chemical inter-changes is after all but an approximate and fallible mode of determining structure

Hantzsch and Werner (Ber 23, 11) have quite recently proposed to extend the Van't Hoff conception to the introgen atom itself. They suppose that in some nitrogen compounds the three affinities of the nitrogen atom are directed towards three of the solid angles of an irregular tetrahedron, and that the nitrogen atom itself is located at the fourth. In the case of compounds of the form CXY NZ, which are comparable with carbon compounds of the form CXY CHZ, it is conceivable that the Z radicle may alter its position in space relatively to the radicles X and Y and thus give rise to isomerides

Victor Meyer (B 23,567) has, however, pointed out that the views of Hantzsch and Werner are in many respects in conflict with the experimental evidence. This memor is a noteworthy contribution to the discussion of a number of the more obscure cases of isomerism. (The two papers here referred to have been published since this article was in type)

It is here the place to refer to the numerous discussions which have taken place during late years in cases in which one set of interactions of a compound appear to be in accordance with one formula, while another set favour a different but closely related formula, which have led, in fact, to the recognition of labile or pseudo-forms capable of passing spontaneously into stable forms For example, it has long been a question whether ethylic acetoacetate is to be represented as CH, CO CH, CO, Et or by the formula CH, C(OH) CH CO,Et A discussion of such cases has been given by Laar (B 18, 648, 19, 380), who proposes to term such isomerides But, as he practically himself tautomeric. admits, the use of such a term savours of tauto88 ISOMERISM

logy. V. Meyer subsequently brought forward a suggestion of Jacobson's to substitute desmotropic for tautomeric Hantzsch and Herrmann (B 20, 2801), while using the term tautomerism when speaking of compounds capable of passing from the one type into the other, proposed to limit the term desmotropic to each of the states As the phenomena in question are the outcome of mobility and not of fixity, the new term also appears to be particularly ill chosen, and bearing in mind the intention of Berzelius in introducing the term metameric (see p 81), it would appear that this old term is a peculiarly appropriate one to use in such cases Laar suggests that a compound which is capa ble of an 'alternative' behaviour actually has an alternating structure, the intra-molecular condition being such that the structure is of one kind at one moment and different at another But, as Hantzsch and Herrmann remark, it is scarcely necessary to make such an assumption Ethylic succinylosuccinate and its derivatives manifest the peculiarity in question in a high degree, acting sometimes as quinonic compounds and sometimes as quinols, s.e in modes such as correspond to the presence of one or other of the two forms CO CH(CO,Et) and C(OH) C(CO,Et) As a rule only one of the forms is stable, the other being developed in the course of the change, thus phloroglucol appears to be a true trahydroxylbenzene, 2 e a phenol, but frequently it affords derivatives of 'triketohexamethylene, which may with propriety be termed phloroglucone Thus

It is not improbable that in those cases in which the several forms can be obtained in a definite crystalline form, the necessary stability is conferred by union of the fundamental molecules amongst themselves. The formation of such molecular complexes is rendered probable by a large number of observations, one of the most striking is that recently brought forward by Perkin in the case of orthomethoxybenzalde hyde CH₂O C₂H₄ COH (C J Trans 1889 549), which is capable of existing in two solid modifications, one unstable melting at 3°, the other stable and melting at 35 5° A list of similar cases of what is sometimes termed physical isomerom is quoted by Perkin

Having thus briefly touched on the numerous problems which the study of the different kinds of allotropism presents, it appears desirable finally to re-direct attention to the terminology of the subject.

The term allotropic, as already pointed out, has a perfectly general meaning and is therefore applicable to the phenomena generally, and may be used in all cases in which the nature of the relationship is obscure

According to our modern conceptions, truly isomeric substances—substances composed of equal parts—are equi-molecular compounds containing identical radicles arranged in relatively

different modes, and on the principle of calling a spade a spade, bearing in mind that it was obviously the intention of Berzelius to limit the scope of the expression, the term isomeric should be used only with reference to such compounds The space relationship of the radicles being the determining cause of isomerism, although it is not always requisite in order that it may become apparent to express their relationship according to stereometric canons, it is scarcely necessary to make any principal distinction between cases, such, for example, as occur among benzene derivatives and between the tartaile acids, but if it be thought desirable to call attention in some way to the finer isomerism which obtains in cases such as the latter, the term erkorsomerism, from εἰκών, a likeness or image, may be suggested as not mappropriate

Typically different allotropes belonging to different classes of compounds might well be termed heteromeric, metameric being reserved for those heteromeric allotropes which change their type with exceptional facility in the course of chemical interchanges, but if the use of the term in this restricted sense be objected to, such allotropes might advantageously be spoken of as isodynamic Allotropes belong ing to the same class but consisting of different radicles-the butylic alcohols, for examplemight be to med isonomic It appears unnecessary to specially distinguish the physical iso merism manifest in the occurrence of several crystalline forms of different melting point. The phenomena of pleomorphism generally, as well as those involved in change of state from solid to liquid and gas, and the existence of allotropic forms both of the metallic and nonmetallic elements, are now being more and more generally attributed to changes in molecular complexity, and if this be the case, such allo tropes mostly partake of the nature of polymeric allotropes

ISOMORPHISM (loos, equal to, μορφή, form) In the year 1819 Mitscherlich (A Ch [2] 14 172) discovered that certain arsenates phosphates of analogous constitution crystallised in the same form, subsequent investigation (A Ch [2] 19, 350, 24, 264, 355) led to the general conclusion that substances of analogous chemical constitution possess the same or nearly the same crystalline forms, and will under suitable conditions crystallise together in all proportions to form homogeneous mixed crystals. such substances are termed isomorphous spite of numerous attempts to widen or otherwise modify it, this definition has lasted to the present time Owing, however, to recent researches, especially those of Groth, it will be best not to treat isomorphism as an isolated phenomenon, but as a part of that branch of physical chemistry which studies the relations between the chemical compos tion and crystal line form of bodies, and which from a knowledge of the constitution and chemical properties of a substance seeks to pred ct its system, form, and crystallographic constants. We are still very far indeed from doing anything approaching to this, for, although attempts have not been want ing -v Schrauf (Physikalische Mineralogie, 1868 bd 2, 166, Z K 9, 265) and Barlow (O N 53, 3, 16) - small success has so far attended them, and at present crystal form cannot be deduced from a knowledge of chemical constitution and properties alone, if, however, we find that in a given case certain atoms arranged in a certain definite way are accompanied by a certain definite form, we may argue that similar atoms similarly arranged will be accompanied by a similar form This hypothesis is found to be true, and its verification has resulted in the dis covery of relations between the forms of substances more or less chemically allied relations may be conveniently discussed under the three following heads

I The same chemical substance possesses two or more forms-Polymorphism

II Bodies more or less closely related chemically have more or less analogous forms-Morphotropy, including Isomorphism

III Bodies not chemically related possess the same form -Isogonism

Full references, especially for the early history of the subject, will be found in the article Isomorphie by Argruni, in Fehling's Handworterbuch der Chemie, 1878 vol 3, for more recent work Fock's Entetting in die Chemische Crystallographie, Leipzig 1888, may be consulted, while full lists of substances considered isomorphous have been given by Topsoc, Tiditrift for Physik of Chemi, 8, 5 193, 321, 9, 225 summarised by Arsruni above For the use of isomorphism in determining atomic weights r ATOMIC AND MOLECULAR WEIGHTM, vol. 1, p 335

POLYMORPHISM Haüy believed that every substance possessed its own characteristic form, and, in spite of numerous observations tending to establish the chemical identity of calcite and arragonite (v De Lisle, Klapproth, Thenard, and Stromeyer), refused to admit that the same substance could yield two distinct kinds of crys tals In the course of the work on the arsenates and phosphates which led him to announce that two different chemical compounds could possess the same or nearly the same crystalline form, Mitscherlich found that NaH2PO, H2O gave, ac cording to the conditions, two kinds of crystals, while his discovery in 1823 (A Ch [2] 24 264) that sulphur crystallised both in rhombic and oblique forms readily convertible the one into the other by change of temperature alone, esta blished conclusively that the same substance could exist in two different forms, to express these phenomena Mitscherlich proposed the term dimorphism, and in 1828 recognised the possibility of trimorphism. The existence of several modifications of the same substance may be generally expressed by the terms polymor phism or heteromorphism At the present time these terms are usually applied to compounds only, polymorphism, when exhibited by elements, being termed allotropy (q v, vol 1 p 128) The change of one dimorphous modification into another has been especially studied by Lehmann, and all known cases have been collected and dis cussed by him in his Molekularphysik, 2 vols Leipzig, 1888 (vol. 1 pp 119-219, vol 11 pp 898-415)

MORPHOTROPY From the time of Mitscherhch onwards the rap.d growth of organic chemistry provided a large number of new sub stances for crystallographic examination, and as the existence of many cases of isomorphism among inorganic substances had been esta blished, numerous attempts were made to introduce the same conception into organic chemistry

In general, however, these efforts were fruitless, and the researches merely resulted in the introduction of new terms and in several attempts at widening Mitscherlich's definition

Thus Laurent, who investigated the halogen substitution and addition products of naphthalene and salts of the fatty acids, concluded that identity of system is not necessary for isomorphism. Nicklés and De la Provostaye collected cases of analogous angles and introduced new terms, such as hemi isomorphism, isomeromorphism, and hemimorphism, to express those cases in which crystals of two substances had each a zone with nearly similar angles (v papers by these authors, C R 11, 15, 20, 23, 26, 27, 29) Pasteur again (C R 26, 535) found analogies between the tartrates, while other workers in the same direction were Rammelsberg, Marignac, Delafosse, Sella, and Hjortdahl (J pr 94, 286) Owing to the paucity of results, such researches lost favour till Groth, in 1871 (P 141, 131, B 3, 449), attacked the subject from a new point of view, and set himself to investigate the changes in crystal form which take place when one or more of the hydrogen atoms of an organic molecule, such as benzene, are substituted by other atoms or groups relations observed between the form of the parent substance and the form of the substituted body Groth terms morphotropic relations, while he attributes the actual change of form produced by substitution to the morphotropic force of the elementary atom or group Benzene, which crystallises in rhombic pyramids, was the first substance examined by Groth, he compared its form with the forms of as many as possible of its hydroxy-, nitro, amido, and haloid, substitution products, and his researches have led to the following general statement. The less the chemical character of the combination is changed by substitution the less is also the change of crystal form, which depends

1 On the specific morphotropic properties

of the substituting atom or group,

2 On the chemical nature and crystalline system of the body in which substitution occurs, 3 On the relative positions of the substituting

atoms or groups in the molecule

1 Morphotropic properties of atoms and groups

(a) The metals Potassium and ammonium, when substituted for H, only change one axis, thus -

rhombic 0 937 1 Picric acid 0 942 1 352 Potassium picrate

As a rule, all the alkalı metals produce the same

(b) Substitution of OH for H in benzene derivatives only alters the crystalline form slightly, and in rhombic substances the ratios of two of the axes remain unaltered, and only the third axis is materially affected

NO, and NH, behave much like OH

				a	ь	c
Benzene			rhombic	0 891	1	0 799
Resorcin			11	0 910	1	0 540
Nitrophenol	12	-	"	0 878	1	0 600?
Dinitropheno	l 1	24	**	0 933	1	0 758
Truntrophen				0 987	1	0-974

(c) Cl, Br, and I act more energetically, but less regularly, than NO₂. The angles of one zone, however, remain like those of the parent substance, while the system is generally altered to one of lower symmetry

Benzene rhombic 110 $1\overline{10} = 96^{\circ}$ 30' Dichlorobenzene oblique ,, , 98° 40' Tetrachlorobenzene ,, , 96° 17'

(d) The influence of the CH₃ group is extremely variable, depending very much on the nature of the substance into which it enters Among the substituted ammonias it is often without influence, thus, 2NH₄Cl PtCl₄, 2NH₄Cl PtCl₄, 2NH₄Cl PtCl₄, all crys

tallise in the cubic system

2 Influence of the nature of the When the parent sub parent substance stance belongs to the cubic system, substitution has either no influence on the form, or else causes change to a system of lower symmetry In other systems the axial ratios may alone alter, or the system itself may be changed, according to the morphotropic force of the substituting element or group If the hydrogen atoms of like functions are replaced singly the system fre quently at first changes to one of lower symmetry, but when the substitution is complete returns to the symmetry of the parent substance methyl substitution compounds of 2NH,Cl PtCl, illustrate this well

2NH₄Cl PtCl₄ Cubic 2NH₃(CH₃)Cl PtCl₄ Rhombohedral 2NH₂(CH₃)₂Cl PtCl₄ Rhombic 2N(CH₃)₃Cl PtCl₄ Cubic 2N(CH₃)₄Cl PtCl₄ Cubic

As an illustration of the influence of the chemical nature of the parent substance, we may quote the observation of Hintze that, contrary to the general rule, the substitution of the paraffinoid H in (C_bH_j)₅CH by (OH) or Br raises the symmetry, instead of lowering it

3 Influence of position—The relative position of the substituting atoms in the mole cule has a very great influence on the form of the crystal, but we are very far from being able to connect form and constitution

As a rule the crystals of isomerides exhibit very few analogies, and in many cases none at all In the benzene series, however, a few relations have been observed, though even here they are rare, and often more readily detected by a comparison of the isomerides with the parent sub stance than directly with each other. Thus a comparison of the angles given by Bodewig (P 158, 232) for the three dinitrobenzenes shows that certain analogies do exist, although the compounds do not crystallise in the same system, while meta $C_8H_4(NO_2)_2$ is related to benzene itself, as is shown in the following table.

The above examples suffice to show vary clearly that the great influence exercised by position renders the discovery of the morpho tropic properties of an element or group very difficult. Thus we have stated above that the entry of the nitro- group into benzene leaves the

system and axial ratio a b unaltered, while the c axis is more or less changed This statement for o C₀H₁(NO₂)OH, C₀H₂(NO₂)₃OH(1 2 4 6), we found held good for C₆H₃(NO₂),OH(1 2 4), and $m \, C_e H_1(NO_2)_2$ As soon, however, as we become acquainted with o and $p \, C_e H_1(NO_2)_2$ the generality of our statement disappears, and the exact morphotropic value of the NO, group remains still undetermined Although we are not in a position to deduce form from a knowledge of constitution alone, we may often from the chemical analogy of two substances, the form of one of which is known, draw conclusions as to the form of the other, or, vice versa, knowing the form of two substances, and the constitution of one of them, we may draw conclusions as to the constitution of the other This method has been chiefly employed in inorganic chemistry, but Friedlander (Z K 3 168) has made use of it in order to throw light on the constitution of the tri nitrobenzene got by nitrating $m C_6H_1(NO_2)_2$ The trinitrobenzene made in this way may be either of three theoretically possible ones It crystal lises, however, in the rhombic system, and has the axial ratios 0 954 1 0 733, and agrees ac cordingly with m C₆H₄(NO₂), On the other hand it shows little or no analogy to the forms of o or p C₆H₄(NO₂)₂, and it is therefore probable that this substance is symmetrical trinitrobenzene 135 A comparison of its form with that of acid $C_6H_2(NO_2)_8OH(1356)$, rhombic pierie 0 937 1 0 974, confirms this view

ISOMORPHOTROPY and ISOMORPHISM When the products obtained by replacing the hydrogen atoms of the parent substance by two closely allied atoms or groups are compared together they are often found to crystallise in identical or nearly identical forms, such products are isomorphous, while the substituting atoms or groups are said to possess the same morphotropic force, or to be isomorphotropic. Thus, K and NH4 are isomorphotropic, and replace the H of

acids to give isomorphous salts

The term morphotropy was first applied to cases in which an atom of H was substituted, but the conception may very conveniently be extended to include all cases of substitution whatever, thus, KBr may be regarded as derived from KCl by substituting Cl by Br, and since KCl and KBr both crystallise in the same system and possess very similar physical characters, they are isomorphous, while Cl and Br are isomor The greater the analogies between photropic the substituting atoms the greater is the corre spondence between the forms of their compounds, ie the more closely isomorphous are they, but because two elements are isomorphotropic when in combination with one set of atoms or groups it does not necessarily follow that they are always isomorphotropic, for the morphotropic force of any atom is largely conditioned by the compounds in which it finds itself Again, Kopp (P 53, 446) has pointed out that although it is often true that two isomorphous substances combine with a third to form two isomorphous compounds (Schröder), we cannot, as has been too frequently done, deduce the isomorphism of elements from the isomorphism of their compounds, there are few elements which cannot by such a mode of reasoning be made isomorphous Elements are only truly isomorphous when they

actually crystallise in the same forms, if they merely combine with another element or group to form isomorphous compounds they may be spoken of as isomorphotropic in that particular class of compounds As we have seen, the conception of morphotropy includes that of isomorphism Now, ever since the latter term was introduced, great difficulties have been felt in defining it. and in finding tests which might authoritatively decide in any given case whether two substances were isomorphous or not Mitscherlich's defini tion is vague, for we at once ask, What constitutes chemical analogy? And again, How widely may the angles of two substances differ and the substances stall be considered isomorphous? The truth seems to be that no hard and fast line can be drawn between those substances which are so closely related morphotropically as to be considered undoubtedly isomorphous, and those slightly less closely related whose isomor phism is doubtful, while we may pass by im perceptible stages from truly isomorphous bodies to others to which, although they still exhibit relations, this term is as evidently inapplicable Although it seems impossible in the present state of our knowledge to give a definition which shall distinctly mark off isomorphous bodies from those which are merely closely related morphotropically, this is not in practice attended with any very great inconvenience, for the difficulty is chiefly one of nomenclature, most cases of isomorphism are at once recognised as such, and it is only in comparatively few instances that we must hesitate

In doubtful cases much assistance may often be obtained by a comparison of the other properties of the two substances. Besides great similarity of form, agreement in several other physical properties has been thought necessary before two substances could be considered iso morphous, and we must now notice in detail the more important of these properties, pointing out the weight which has been attached to each as a test of isomorphism

Physical properties of isomorphous substances

(a) Geometrical properties. As the name itself implies, near equality of external form is the first and most essential condition for iso morphism Absolute geometrical isomorphism, however, does not exist except in the case of sub stances crystallising in the cubic system, in all other systems small differences of angle occur a fact first noticed by Wollaston These differences are seldom equally distributed, in rhombic oblique and triclinic crystals the anomalies are often confined to one zone, another zone per pendicular to the first having the same angles in both cases Here a difficulty meets us, for we ask, How great may these differences become and the substances still remain isomorphous? Unfortunately no definite answer to this question is possible, some authors have admitted much wider differences than others, while others still have gone so far as to admit that the boundaries of the systems may be overstepped It is perhaps best to restrict the term isomorphous to substances crystallising in the same system with nearly the same angles. It is to be noted that though all substances crystallising in the cubic system have exactly the same angles

they are not necessarily isomorphous, to be so they must be either both holohedral or must both possess the same kind of hemihedrism, and must also agree in other properties, such as cleavage and power of forming mixed crystals

(b) Cleavage Isomorphous bodies possess as a rule the same cleavages variations in the relative perfection of such cleavages are, how ever, possible This property is especially useful in assisting us to detect isomorphism in the cubic system

(c) Thermal conductivity Jannetaz (C R 75, 1501) has shown that certain isomorphous substances have axes of maximum and minimum conductivity of like direction and magnitude

(d) Coefficient of expansion The data are not sufficient for general conclusions to be drawn, and no simple relations have been detected at present

(e) Etched figures Since these stand in a close relation to crystalline form, Baumhauer has sought to use them as a test of isomorphism He finds that isomorphous substances give, as a rule, the same sort of etched figures, but that they often differ in orientation

(f) Optical properties These have been specially compared by Senarmont (A Ch [3] 33, 391), Topsoe, and Christiansen (A Ch [5] 1, 5) No general law has been established, but as a rule isomorphous bodies if uniaxial have the same sign of double refraction, and if biaxial have the plane of the optic axes similarly oriented, but biaxial crystals, oblique and triclinic ones especially, exhibit frequent exceptions. Optical properties are, moreover, very sensitive to changes of temperature, which often do not influence isomorphous substances to the same degree (Arzruni, Z K 1, 165)

(g) Specific volume

themical composition, SV, and crystalline form are of special importance, since several authors have considered near equality of SV an essential condition for isomorphism. The first of these was Kopp (A 36, 1, P 47, 133, 52 243, 262, 53, 446), his views may be briefly summarised as follows. (1) The condition for isomorphism is equality or near equality of SV. The answer to the question, how widely may the SV's differ and the substances remain isomorphous, is given by the empirical formula.

 $D = \frac{\iota - \iota_1}{\frac{1}{6}(\iota + \iota_1)}$ where v and ι_1 are the S V 's of the

two substances If D=0 the isomorphism is perfect, but if D is greater than 33 the substances are not isomorphous, thus the value of D for the two substances ZnCO₃ and CaCO₃, whose S V's are 28 2 and 36 8 respectively, is 264, they are, therefore, isomorphous (2) Kopp has also pointed out that the nearer are the axial ratios of a series of isomorphous bodies the nearer are their S V's This statement, though criticised by Schröder, appears to hold good, and has received the support of Tschermak (Sits W 45'[2] 603) and Schrauf (P 134, 417) The former expresses the law as follows 'The series of crystal dimensions and specific volumes is in each group of isomorphous bodies of analogous composition the same' As an illustration he gives the series of rhombohedral carbonates.

	a	đ	
ZnCO,	1	0 807	282?
MgCO.	1	0 812	279
(MgFe)CO.	1	0 814	29 2
FeCO,	1	0 819	30 2
MnCO,	1	0 822	31 9
CaCO	1	0 854	36 8

Schröder (P 50, 553, 95, 441, 562, 106, 226, 107, 113) at first held views much resembling those of Kopp, but in his later papers he comes to the conclusion that the statements made above are erroneous, and expresses himself thus 'The specific volumes of isomorphous compounds differ in general quite as much from one another as the specific volumes of corre sponding heteromorphous compounds' (Schroder uses the term heteromorphous as opposed to isomorphous, it is now often considered synonymous with polymorphous), and he believes that his results lead him to a new law, viz 'If two elements or groups, A and B, enter into combination with other elements or groups c, D, E, &c, to form the compounds A c and B C, A D and B D, A E and B F, &c , belonging to the same type and asomorphous by pairs, then the differences of the specific volumes of A c and B C, A D and B D, A E and B E, are always equal' If, however, the pairs of compounds are not isomorphous, or if the isomorphous pairs belong to different types, the differences are as a rule unequal Schröder terms bodies of equal SV isosteric, and the equality of the differences of analogous pairs parallelosterism Adopting this nomenclature, the above law may be shortly expressed thus 'Isomorphous analogous pairs of like type are also parallelosteric

Tschermak (lc) finds that, although Schröder's criticism of Kopp is unfounded, his own results support Schröder's law, which he enunciates thus 'Among isomorphous bodies a like difference of composition corresponds to a like difference of specific volume, 'thus the difference Br-Cl is about equal to 63

Apparent exceptions to Schröder's law are believed by Tschermak to be due to difference of constitution in the substances compared, and he illustrates this by the following table of difference for the change of composition K to Am

	s v		sv
KCl	37 9	KBr	44 3
A mCl	352	AmBr	422
	27		21
	SV		8 V
K ₂ PtCl ₄	134 5	K ₂ SO ₄	65 6
K ₂ PtCl ₅ Am ₂ PtCl ₅	150 5	Am_2SO_4	74 6
•	160		90

We see from this table that substances of the type M'_2PtCl_e cannot be directly compared with those of the type M'_2SO₄ or these again with M'Cl

Tschermak has, moreover, endeavoured to trace a connection between the varying differences shown by pairs of elements which occur

in compounds of similar constitution, and the crystal-system to which these compounds belong.

Cubic	8 V	Oblique S∇.
Am, PtCl,	150 5	Am ₂ Cu(SÕ ₄) ₂ 6aq 218
K ₂ PtCl ₄	134 5	K ₂ Cu(SO ₄) ₂ 6aq 205
	160	18
Am ₂ IrCl _e K ₂ IrCl _e	156 138 3	Am ₂ Mg(SO ₄), 6aq 209
		K ₂ Mg(SO ₄) ₂ 6aq 196
	17 7	13
Tetragonal		
Am ₂ CuCl ₄ 2aq	137	Am, Fe(SO4)2.6aq 212
K ₂ CuCl ₂ 2aq	133	K ₂ Fe SO ₄) ₂ -6aq 197
	4	15
Rhombic		
Am,SO,	746	Am.Zn(SO4), 6a4 211
K.SO.	65 6	K ₂ Zn(SO ₄), 6aq 201
- '	90	10
	00	10

Thus he finds that for the change of composition Am_2 to K_2 the difference of S V is greatest in the cubic system, less in the oblique, still less in the rhombic, and least in the tetragonal system

In connexion with SV we may note that at or about maximum and minimum points of the atomic olume curve (v Periodic Lin) occur ductile metals crystallising in the cubic system, eg Na, Mg, Al, K, Fe, Co, Ni, Cu, Pd, Ag, Pt, Ir, Au, Hg, Pb

Although isomorphism is usually accompanied by similar values for the SV's, we cannot from the near equality of SV alone deduce the isomorphism of two substances, neither can we at the present time attachmuch weight to Kopp's empirical formula as a test of isomorphism, in a general way, however, his results, in common with those of Tschermak, Schröder, and Schrauf appear to hold good, owing, however, to the great discrepancies which exist between the relative densities of many of the commonest substances as given by different observers, we must be cautious in accepting conclusions often resting on doubtful data

Special properties of isomorphous substances

- (a) Formation of layer crytals
- (b) Formation of mixed crystals
- (a) Layer crystals These are made by growing a crystal of one substance in a solution of another

Kopp (B 15, 1653) considers regular growth under these circumstances the best test of iso morphism

Thus a crystal of common alum when brought into a solution of chrome alum continues to increase regularly, again the sulphates of the type M"SO, 7aq where M" = Zn, Mg, Fe, Co, Ni, grow in solutions of one another

In those cases where the forms of the two substances are the same the new particles have exactly the same orie tation as those of the nucleus Klocke (Z K 2, 144) has, however, brought to light differences between the phenomena of growth in such cases, and in those where a crystal grows in its own solution Having produced etched figures on the faces of two potassium alum crystals, he grew one in its

own solution, the other in a solution of an monia iron alum, in the first case the etched figures were rapidly filled up from the bottom, in the second very much flattened octahedra of ammonia iron alum were developed at certain points on the crystal of common alum, and perfectly parallel to it, they then increased laterally, and covered up the etched figures, which remained unaltered till the new layer reached them

Although the power or forming overgrowths seems to be a mecessary consequence of isomorphism, the property is not confined to isomorphous substances alone, and from the perfect conformity of form and orientation exhibited by isomorphous substances, such as the alums, we may pass by imperceptible stages to cases of regular orientation among substances possessing but little chemical analogy and crystallising in differer. systems Thus rutile TiO₂, tetragonal, is often found developed on the basal plane of hæmatite Fe₂O₂, rhombohedral, in such a way that the c axis of the rutile lies in a plane of symmetry of the hæmatite

A specially interesting and much discussed case of overgrowth is that of calcite CaCO, rhom bohedral rr' = 74° 55' and Na \ O₂ rhombohedral rr' = 73° 27' When a rhombohedron of CaCO₄ is placed in a solution of NaNO, this substance is deposited on the former in small rhombo hedra, whose morphological axis and planes of symmetry are exactly parallel to those of the CaCO_s, these rhombohedra grow till they meet, a polysynthetic crystal being the result accordingly made a difference between growth in this case and the regular increase of alum crystals, in the light of Klocke's work, and taking into consideration the slight difference of the angles rr', such a distinction vanishes, and if the formation of overgrowths is a test of iso morphism, these two substances are certainly isomorphous, a view confirmed by the agree ment in their other physical characters, the dif ference in their chemical constitution leads us rather to regard them as an example of isogonism.

Closely connected with the formation of layer crystals are Thomson's researches on super saturated solutions (C J 1879 196), he has shown that supersaturated solutions of certain salts can readily be crystallised by the addition of crystals of isomorphous salts, while crystals of substances not possessing the same form, or fragments of amorphous bodies, such as glass, have no influence Thus a supersaturated solu tion of MgSO, 7aq is at once crystallised by ZnSO, 7aq, NiSO, 7aq, and also by CoSO, 7aq and FeSO, 7aq, whose action, however, is less rapid, on the other hand, Na₂SO₄ 10aq, NaCl, and glass, are quite mactive Common alum can be crystallised by iron and chrome alums, while other cubic substances, such as NaCl, FeS, and Fe₂O₄, are mactive

This appears to be an excellent test of isomorphism as far as it goes, but it unfortunately is of very limited application

Although at the present time the formation of layer-crystals cannot be considered a conclusive proof of isomorphism, the success or failure of attempts to obtain them may help us to determine whether two substances crystallising in the cubic system are isomorphous or not.

(A discussion of numerous cases of layer-crystallisation will be found in Lehmann's Molekularphysik, Bd 1 pp 393-407, v also Wackernagel, Kästners Archiv, 5, 293, and especially Kopp, B 12, 901)

(b) Mixed crystals To obtain mixed crystals rolutions of two substances are mixed, or in some cases the two substances are simply melted together, and then allowed to crystallise, we thus obtain perfectly homogeneous crystals, which do not, however, contain their components in any fixed ratio

As a rule only isomorphous substances yield mixed crystals, and their formation is usually considered the best criterion of isomorphism [Klein (C R 95, 781), Kopp (B 12, 868, 17, 105), but v also Brugelmann (B 17, 2359), and especially Lehmann (l c Bd 1 420, 456, 461)]

Numerous researches have been undertaken with a view to the elucidation of the constitution and mode of formation of mixed crystals, while other investigators have endeavoured to trace the connexion between their physical properties and those of their components

Growth of mixed crystals Mixed crystals are most readily formed when the two substances have nearly equal solubility, and in this case Rammelsberg (P 91, 321) has found that the ratio of the two salts in the mixed crystal is about the same as in the solution, mixed crystals of ZnSO, 7aq and MgSO, 7aq afford a case in point, if, however, as more usually happens, the solubilities differ, the first crystals always contain most of the less soluble salt, the last most of the more soluble, such salts are CuSO, 5aq and MnSO, 5aq Thomson (lc) has pointed out that in the case of the crystallisation of supersaturated solutions consisting of a mixture of two substances, the composition of the mixed crystal depends very much on the velocity of crystallisation, if this takes place suddenly the composition of the mixed crystal is much the same as that of the solution, if slowly the less soluble salt is deposited first

The physical properties of mixed crystals

(a) Geometrical properties Mixed crystals belong to the same system as their components, but exhibit simpler forms, cf calcite and dolomite, and v also Rammelsberg (lc) In some cases the angles of mixed crystals lie between those of their components, this usually holds good for the naturally occurring mixtures of the rhombohedral carbonates, thus

Chalybite FeCO₃ rr' = 72° 59' Pistomesite (FeMg)CO₃ = 72° 42' Magnesite MgCO₃ = 72° 32'

But even in this series exceptions are not wanting, and as a rule no simple relation can be detected between the angles of the mixed crystals and those of its components, thus Groth (P 133, 193) in the case of the permanganates and perchlorates found that the angles of the mixed crystals often lay outside those of their components.

In the crystal containing 1Mn 1/Cl the ratio b c lies inside the limits, and the other two outside, further increase in the quantity of Mn causes the form of the mixed crystal to approach nearer to that of KClO. Similar results have been obtained by Arzumi on the alkaline earths (B 5 1043), Meminar on baryto collectin (Min Met 1875 59), v Lang on Am₂SO₄ and K₂SO₄ (Sitz W 1858 31, 85), Arzumi and Baerwald on compounds of FeS₂ and FeAs₂ (Z K 7, 337), and lastly by Miers in his investigations of proustite and pyrargyrite (Min Mag 8, 37)

(b) Optical properties

(1) Index of refraction In the year 1878 Dufet (C R 86, 881), from an investigation of MgSO, 7aq, N1SO, 7aq, and ZnSO, 7aq, found that the connection between the chemical composition of isomorphous mixtures and their indices of refraction is one of simple proportion ality, so that expressing the results graphically by taking, along two axes at right angles, ordinates proportional to the observed values of μ, and abscissæ proportional to the percentage of one component in the mixture, the resulting curve is a straight line Fock (Z K 4, 583) has, however, taken exception to Dufet's work, and although he finds that the changes in the values of the ordinary and extraordinary ray are proportional to the changes in composition for mixed crystals of SrS2O6 4aq and PbS2O6 4aq, yet in mixtures of thallium and potassium alums, and again in mixtures of MgSO₄ 7aq and MgCrO, 7aq, he could find no such law, v also Fitz and Sansoni (Z K 6, 67) Fock's results have in their turn been questioned by Soret (Z K 11, 197) and Dufet (C R 99, 990) former finds that mixtures of thallium and potassium alum and also of ammonium and potassium alum satisfy the law, while the latter has shown that mixtures of MgCrO, 7aq and MgSO, 7aq are not sufficiently homogeneous for investigations of this kind

Dufet's law probably holds good, but further investigation is needed before it can be considered

esta blished

(11) Optic axis angle Wyrouboff (Bull Soc Min France, 2, 91, 170) has endeavoured to trace the connection between the angle of the optic axis and the chemical composition in the cases of mixtures of K₂SO₄ and Am₂SO₄, and of K₂CrO₄ and K₂SO₄. His results have been expressed graphically by Mallard (Bull Soc Min France, 3, 3), who finds that they give a continuous regular curve, not, however, a straight line if the optical properties of the components are non accordant, those of the mixed crystals will be different from either, v especially Senar mont (lc) on mixed crystals of KNaH₄Cl₄O₄ 4H₂O and (NH₄)NaH₄Cl₄O₄ 4H₂O

	Optic axis plane	1st mean line	2nd mean line
Potassium salt	010	a	c
Ammonium	100	c	h

Starting from the potassium salt and substituting with NH, we observe the following changes, first the obtuse angle diminishes and more quickly for red than for violet light, then at a certain point the axes for red light coincide, while the axes for violet light still lie in 010, the red axes then begin to diverge in 100, the violet

afterwards coincide and follow the red Wyrouboff ($\angle K$ 18, 648), on ammonium and thallium tartrates, gives the following example —

The mixture had always the cleavage and optic axis plane of the ammonium salt, and a crystal containing 88 7 p c of the thallium salt had $2H = 45^{\circ}30'$

(iii) Circular polarisation Bodlander (Z K 9, 309) investigated mixtures of lead and strontium thiosulphates, he found that the rotation varied directly with the composition

(iv) Angle of extinction Max Schuster has shown that the angle of extinction of certain oblique and triclinic mixed crystals, especially the felspars, varies directly with their chemical composition His results have been confirmed by Mallard (Z K 6, 612), who has trewed the subject mathematically

(v) Specific volume relations The specific volumes of mixed crystals appear to depend directly on the relative proportions of their compounds Thus Schroder states (P 95, 441) that

$$V(a\text{CaCO}_3 + b\text{FeCO}_3) = \frac{aV'(\text{CaCO}_7) + bV''(\text{FeCO}_3)}{a + b}$$

where V is the specific volume of the mixed crystal an 1 V', V'' are those of its components. These results have been confirmed by Tschermak (lc) thus

The specific volumes of artificial mixed crystals have been especially investigated by Retgers $(Z \ P \ C \ 3, 497)$ He has studied with great care the mixed crystals formed by $(a) \ K_2 SO_4$ and $Am_2 SO_4$ (b) potassium and thallium alums, he finds that the SG varies directly with the composition, and expressing his results graphically he obtains as his curve a straight line, a result similar to that obtained by Dufet for the values of μ

Formation of mixed crystals by iso dimorphous substances—Two substances, X and Y, are said to be isodimorphous if they each exist in two forms A and B, A' and B', of which A is isomorphous with A' and B with B'

On crystallising a solution containing two isodimorphous substances two series of mixed crystals are obtained, one set having the form A, the other the form B It often happens that the form A of one salt, X say, is stable under ordinary circumstances, while of the other salt, Y, the form B is stable, in the mixed ciys tals of the form A the substance X predominates, in mixed crystals of the form $B, \ Y$ is present in excess In such cases as these a continuous series of mixed crystals cannot always be obtained Crystallisation under these conditions has been especially studied by Rammelsberg (P 91, 321) Thus he finds that MgSO₄ 7aq is rhombic and FeSO, 7aq is oblique, from a solution containing both substances two sorts of mixed crystals are obtained, these do not, however, contain their constituents in all possible proportions, but a gap occurs, the oblique crystals always having more than 1 atom Fe to 2-3 Mg, while the rhombic crystals always contain more than 4 Mg to 1 Fe Another good example is afforded by BeSO, 4aq tetragonal and BeSeO, 4aq rhombic The mixed crystals are tetragonal when S Se > 7 33 1, and rhombic when S Se < 4 1 (Topsoé, Sitz W [2] 66, v also Schulze, A 125, 49, Wyrouboff, Bull Soc Min France, 2, 91)

Cases of crystallisation perfectly analogous to but differing from these have been studied by Rammelsberg (l c), thus copper sulphate usually crystallises in the triclinic system with 5aq, ferrous sulphate in the oblique system with 7aq When solutions of copper sulphate and ferrous sulphate are mixed and allowed to crystallise, two sorts of crystals are got, both of which contain Cu and Fe, as long as the proportion Cu Fe is > 20 1 the crystals possess 5aq and are triclinia, but when there is less Cu the crystals are oblique and contain 7aq

It is very commonly supposed, when two substances closely allied chemically crystallise in different forms but yield two kinds of mixed crystals, that these substances are isodimor phous, although more than one form of each may not be known, v Fock (Z K 6, 160), and note the adverse criticism of Wyrouboff (Bull Soc Min 5, 32)

The specific volumes of isodimorphous substances have been compared by Ri al (B 19, 589), while Retgers $(l\ c)$ has found that in those cases where isodimorphous substances form mixed crystals, each series obeys the law enunciated above, viz that the relative density varies directly with the composition

Constitution of mixed crystals— Since the beginning of the century two opposing views have been held as regards the constitution of these substances

(a) According to the first or physical theory, as we may call it, the most homogeneous mixed crystal really consists of a very intimate mixture of particles of each of the components. This view, held by Hauy, and maintained by Frankenhein n opposition to Berthollet, has recently received the support of Lehmann and Retgors, the latter says that a mixed crystal is a very intimate but purely mechanica mixture of its components, and finds strong confirmation of his view in the fact that the densities, indices of refraction, &c, of mixed crystals vary directly with their composition

(b) The supporters of the second or chemical theory man tain that molecules of each substance come together in the solution to form a complex 'liquid molecule,' while 'liquid molecules' of the same kind unite on crystallisation and form the mixed crystals. Berthollet held this view, which is perhaps more generally accepted than the other, at the present time its chief exponent is Fock, who believes that the formation of mixed crystals and double salts are phenomena of the same order.

Use of mixed crystals as a test of iso morphism—As we have seen, much weight has been attached to this property by Mit scherlich, Kopp, and others, but at the present time so many instances are known of the formation of mixed crystals by substances which can not be considered isomorphous that the test

has lost much of its value (v Lehmann, l c) Retgers (l c) has proposed that only those sub stances should be considered isomorphous, the physical properties of whose mixed crystals vary directly with the chemical composition

Isogonism -Speaking generally we find that if two substances are to be considered isomorphous they must satisfy the two following con ditions (1) they must agree very closely in form and possess similar physical properties, (ii) under suitable conditions they must be capable of forming layer and mixed crystals In Mitscherlich's definition we find, however, a third condition, viz analogy of chemical constitution, and the ques tion arises, How far may two substances which satisfy the two conditions above differ in chemical constitution and still be considered isomorphous? This question has received various answers, thus Scheibler (J pr 83, 273) has announced the isomorphism of most meta tungstates, although they do not all contain the same number of molecules of water of crystallisation, Marignac (C R 55, 888) considers the two following series of substances to be isomorphous -

> K,TiF, H,O CuTiF, 4H,O K,NbOF, H,O CuNbOF, 4H,O K,WO,F, H,O CuWO,F, 4H,O

And he also makes rhombohedral silicotungstic acid, and the acid silicotungstates of Ba and Ca isomorphous Some other similar examples are given by Baker (C. J. 1879, 760). Klein (C. R. 95, 781) believes that the following substances are isomorphous.—

9WO, B₂O, 2H₂O 22aq 9WO, B₂O, Na O 23aq 12WO, B₂O, 4H₂O 29aq (Marignae)

Klein following Marignac, amends Mitscherlich's definition thus Isomorphous substances have either an analogous chemical constitution or a very slightly different percentage composition, in the latter case they contain a group of common elements or elements of identical chemical function, this group making up by far the largest portion of the compound 'It seems however, hardly advisable to widen Mitscherlich's definition, indeed, it is perhaps better if possible to narrow it by defining more closely what is meant by the phrases analogous chemical composition and analogous crystalline form

Substances, such as the double fluorides described by Marignac, are not so much isomorphous as closely related morphotiopically, while from them we may pass through substances exhibiting less and less of chemical analogy to those which agree in form alone, and which may therefore be considered as examples of isogonism (v. Retgers, lc.) As an instance of this we may quote the remarkable analogy noticed by Hjort dahl (C. R. 88, 584) between the crystals of tindimethyl and diethyl chlorides and lead chloride, which all crystallise in the rhombic system, and possess the following axial iatios—

Tin dimethyl chloride 0 8346 1 0 9407
Tin diethyl chloride 0 8386 1 0 9432
Lead chloride 0 8408 1 0 9990

At present it seems that substances which exhibit relations in form and composition may most

conveniently be divided into the following more or less arbitrary groups, between whose limits no

absolute line can be drawn —

(1) Substances very closely related morphotropically, or isomorphous substances—Bodies belonging to this class possess great chemical analogy, crystallise in the same system with nearly the same forms and angles, exhibit a general agreement in the physical properties of their crystals, and often possess the same specific volume, they are, moreover, under suitable conditions capable of forming mixed and layer-crystals Such substances are the sulphates of the group M"SO, 7H,O (M"=Fe", Zn, Mg, Co, Ni) and the alums

(2) Substances closely related morphotropically—To this class belong Marignas's double fluorides, and the substances derived from hydrocarbons by substitution, from them we pass on the one hand to isomerides such as the three dinitro benzenes, which with a minimum difference of chemical constitution possess but little form analogy, and on the other hand to bodies differing but little in form, but showing less and less chemical analogy, till we

reach members of the next class

(3) Isogonous substances, differing greatly in chemical composition but nearly similar in form — To this class belong CaCO, and NaNO, and the substances described by Hjortdahl above, while all substances crystal lising in the cubic system are strictly isogonous (v Sohneke, Entwickelling einer Theorie der Krystallstruktur, Leipzig, 1879)

A H

ISOPRENE o Pentinenes
ISOPYRINE An alkaloid obtained by boiling
the mashed roots of Isopyrum thaluctroides with
water, filtering, evaporating to a syrup, ppg with
ammonia, and extracting with ether (Hartsen,
C C 1872, 523) White powder with bitter taste,
forming an amorphous hydrochloride

Pseudo-isopyrine After the roots have been boiled with water they still contain this alkaloid, which may be extracted with alcohol After removing the alcohol by evaporation ammonia is added to the aqueous residue, and the ensuing pp treated with ether, whence pseudo isopyrine separates in needles. It is ppd from its solution as hydrochloride by adding very dilute HClAq and ammonium chloride (difference from isopyrine)

ISURETIN v FORMAMIDOXIM

ITABROMOPYROTARTARIC ACID v Bromo

ITACHLOROPYROTARTARIC ACID & CHLORO-PYROTARTARIC ACIDS

ITACONIC AGID $C_3H_4O_4$ to $C_4H_4(CO_2H)_2$ or $CH_2(CO_2H)$ $CH_2(CO_2H)$ $CH_2(CO_2H)$ (?) Mol w 130 [161°] S G 1 6 (Schröder, B 13, 1072) S 5 at 10°, 8 at 20° S (88 pc alcohol) 25 at 15° (Baup) R_{∞} 44 25 (in a 4 18 pc aqueous solution) (Kanonnikoff, J pr [2] 81, 348) H C 476,580 (Louguinine, O R 106, 1291) Heat of solution 5,923 (Gal a Werner, Bl [2] 47,160) Heat of neutralisation 25,725 (G a W) Shown by Raoult's method to be isomeric and not polymeric with citraconic and messaconic ands (Paterno, B 21, 2156)

Formation—1 By the action of heat on entrie acid, aconitic acid being first formed (Baup, A. 19, 29, Crasso, A 34, 63)—2. By

heating itamalic acid $C_bH_aO_a$ (Swarts, Z 1867, 649)—3 By heating citric acid with water at 160° (Markownikoff a Purgold, Z 1867, 264)—4 By heating aconitic acid with water at 180° (Pebal, A 98, 94)—5 By heating citraconic anhydride with water under pressure (Fittig, A 188, 72)

Preparation —1 Coarsely-powdered catric acid (125 g) is anistilled from shallow retorts completely filled with it as quickly as the frothing will allow, the cily distillate is separated from the water as completely 21 possible and left to crystallise (Meilly, A 171, 153, cf Wilm, A 141,28) A temperature of 160°-175° is favour able to the formation of itaconic acid, at a very high temperature it is mostly converted into catraconic anhydride—2 Citraconic anhydride (2 vols) is heaten with water (5 vols) at 150° for 7 hours, and the produce poured into flat dishes and left to crystallise (Fittig, A 188, 72)

Properties — Trimetric octahedra (from water) Strongly and Sol ether When heated above its melting point it is resolved into citra conic anhydride and water Ammonium itaconate gives a brown pp with FeCl. soluble in excess of FeCl_s, but reppd on boiling, and redis

solved on cooling

Reactions —1 Combines with bromine, form ing ita-di-bromo pyrotartaric acid (Kekulé, A Suppl 1, 338, 2, 111, Cahours, A Ch [3] 67, 129) - 2 Chlorine forms ita di chloro pyrotar taric acid -3 Heated with aqueous HBr, HCl, and HI, combination takes place with produc tion of ita bromo-, ita chloro-, and ita iodo pyrotartaric acids Excess of HI produces pyrotar taric acid (Bl [2] 4, 374) —4 Sodium-amalgam reduces it to pyrotartanic acid (Kekulé) -5 HOCl gives chloro-itamalic acid C,H,ClO, -6 Anhy drous HCy at 145° apparently forms an addi tion-product, which, when distilled, gives citra conic acid (Barbaglia, B 7, 465) -7 Heated with aqueous K.SO, it forms a gummy salt, pos sibly sulphopyrotartaric acid C, H, SO, (Wieland, A 157,34)-8 The electrolysis of the potassium salt yields a mixture of gases, apparently containing propylene and acetylene, out not allylene CH₂ C CH₂ (Béhal, A Ch [6] 16, 366, cf Aar land, J pr [2] 6, 256) -9 Cold HNO, gives off no CO₂ (Franchimont, R T C 3, 422)

Constitution — The molecular weight is shown by Raoult's method to be the same as that of citraconic and of mesaconic acids According to Aarland potassium itaconate gives a different allylene on electrolysis from that derived from the potassium salts of citraconic and mesaconic acids, this would lead to the formula CH₂ C(CO₂H) CH₂ CO₂H Béhal, however, was unable to confirm Aarland's experiments According to Knops (A 248, 228) the molecular refraction of the itaconic ethers indicates one C C group Itaconic acid resembles mesaconic acid, but differs from citraconic acid in requiring heat to enable it to combine with HBr and with bromine Itaconic acid reacts with aniline, but not with dimethylaniline

acid (Petri)

 $Anhydride C_{2}H_{1}(C_{2}O_{3})$ [68°] (148°) at 30 mm Occurs among the products of the dis-tillation of citric acid Prepared by the action of AcCl on itaconic acid (Anschutz, B 13, 1539) or on silver itaconate suspended in ether (Markownikoff, B 13, 1844) Trimetric prisms a b c = 617 1 455 Sol chloroform Slowly dis Trimetric prisms, solves in water with formation of itaconic acid When distilled under atmospheric pressure it changes into the isomeric citraconic anhydride

Amide C,H,(CONH₂)₂, [192°] From Me₂A" and aqueous NH₂ (O Strecker, B 15, 1639) Small colourless crystals (from water)

hot water, m sol alcohol, insol ether Mono anilide C,H4(CO,H)(CONHPh) or

CO'H CH CH' CO (3) Itaconantlic acid [189°] Formed by heating itaconic acid (5 g) with water (50 g) and aniline (3 g) to boiling for half an hour, and depositing on cooling as crystals (Michael a Palmer, Am 9, 200, Gottlieb, A 77, 265) Formed also by allowing a solution of acid aniline itaconate to stand for several days in the cold Needles (from water) Insol dilute HClAq, sol dilute alkalis, and reppd unchanged by acids —BaA'₂ (at 170°) —CuA'₂ (at 160°) — AgA

Mono-anilide C₃H₄(CO₂H)(CONHPh) (?) [151 5°] From itaconic anhydride and aniline (Anschütz, B 20, 3215, 21, 958) Not identical

with the preceding

Anilide C,H4(CONHPh), [185°] Formed by heating aniline itaconate, or a mixture of ita come acid, with excess of aniline at 180° (Gottlieb, A 77, 282, O Strecker, B 15, 1639) thin plates, sol alcohol and ether, sl sol water A mixture of HNO, and H,SO, converts it into an amorphous penta nitro-derivative (Gottlieb, A. 85, 40)

Chloro-itaconic acid CaHaClO Formed by heating aconic acid C,H,O, with HCl (Swarts, J 1873, 584) Crystailine crusts, sl sol cold water Reconverted by boiling water into aconic acid

Bromo-itaconic acid C,H,BrO, [164°] Formed by the dry distillation of its di bromopyrotartario acid C.H.Br.O. (Swarts, Bull Acad roy Belgique [2] 83, No 1) Also by heating aconic acid with HBr Its anhydride is similarly formed from ita-di bromo-pyrotartaric anhydride (Petri) Crystals resembling itaconic acid (from Vol. III

water or by alkaline carbonates into HBr and aconic acid Reduced by tin or zinc to itaconic acid

ITAMALIC ACID v OXY-PYROTARIARIC ACID.

ITAPYRUVIC ACID C4H6O2 Obtained, to gether with water and CO₂, by distilling statartaric acid at 125°-170° (Wilm, A 141, 37) Viscid mass, v sol water and alcohol, volatile with steam —BaA', aq (at 100°) glassy amorphous mass —PbA', hygroscopic amorphous mass, sl sol water The silver salt is soluble, but very decomposable

ITATARTARIC ACID C.H.O. Dr-oxy-pyrotartaric acid Formed by gradually adding a solution of HOCl to one of sodium itaconate (2 p c solution) at 0° in the dark, and boiling the resulting solution of chloro oxy pyrotartaric acid The acid is ppd as lead salt, which is subse quently decomposed by H2S (Wilm, A 141, 28 Morawsky, J pr [2] 10, 00, 11, 200, also by warming ita di bromo pyrotartaric acid with Ag_2O (Kekulé, A Suppl 1, 346) Amorawarana witroons deliquescent mass V e sol water and alcohol, not volatile with steam Split up by dry distillation into CO₂ and itapyruvic acid. The alkaline salts prevent the ppn of ferric and cupric salts by alkalis - CaA" 1/2 aq crystalline mass, sl sol water -BaA" (at 100°) amorphous, v sol water, and ppd from aqueous solution by alcohol —PbA" aq tablets, v sl sol water —Ag₂A" bulky pp, sol water, but decomposed on boiling its solution

IVAIN C24H42O2 Occurs in Iva, the leaves and stem of Achillea moschata gathered before flowering (Von Planta, A 155, 150) The volatile oil is first removed by distillation, and the residue is dried and extracted with alcohol, the filtrate is ppd with lead acetate, freed from lead by H2S, and evaporated Dark yellow resinous mass, msol water, v sol alcohol The alcoholic solution has an extremely bitter taste

When my leaves, col-IVY Hedera Helix lected in December, are bruised, exhausted with water, and then treated with alcohol, the alcoholic extract contains a glucoside C₃₂H₃₄O₁₁ This may be obtained by evaporating the alcohol, extracting the residue with benzene, and then with acetone, which deposits the glucoside on cooling (Vernet, C R 92, 360) It forms mammillary groups of silky colourless needles with slightly sweet taste and neutral reaction. It melts at 233°, and at 22° its alcoholic solution has a leworotatory power of $[a]_p = -47.5^{\circ}$ It is insol water, chloroform, and petroleum, al sol acetone, benzene, and ether in the cold, but readily soluble in these liquids when hot. V sol boiling alcohol Sol cold alkalis The glucos ide has no action on Fehling's solution, but on boiling with dilute H2SO, a sugar is formed which crystallises by slow evaporation of its alcoholic solution in bulky transparent crystals with decided sweet taste, and reduces Fehling's solution, but is not fermented by yeast. The rota bry power of a cold solution of this sugar is $[a]_{D} = +98.6^{\circ}$ immediately after it preparation, but some hours afterwards it has been found to fall to [a]_D = 76 2 Besides the sugar, there is formed in the hydrolysis of the glucoside a water), v sl. sol cold water, resolved by boiling neutral body C. H.O. [2780-2800], which crystallises in slender prismatic needles, without | ening to a hyscintu-red solid, which forms a taste, m sol. alcohol, insol. alkalis, and dextro-

JABONINE C.H.14N2 16 CH≪N-CH>C CHMe NMe₂. Dr - methyl -

amido ethyl pyridine (235°-240°) Formed by distilling pilocarpine or pilocarpidine with baryta (Hardy a Calmels, Bl [2] 48, 231) The crude product is evaporated several times with HClAq and the base set free with KOH Colourless oil with feetid odour Its hydro-chloride forms confusedly crystalline masses The double salts B'HAuCl, B'AuCl, B'2PtCl, and B'2H2PtCl, are all amorphous

JABÓRANDI The native name for several drugs of a sudorific and salivating character, consisting of the leaves and twigs of various species of Pilocarpus and other trees growing in Brazil, Pernambuco, and Paraguay (Holmes, Ph. [3] 5, 581, 641, Schelenz, Ar Ph [3] 7, 414, Baillon, Ar Ph [3] 7, 327) Jaborandi leaves contain pilocarpine (Byasson, Ph [3] 5, 826, Hardy, Bl [2] 24, 497), which readily changes to jaborine (H Meyer a Harnack, A 204, 67) The latter acts like atropine, and is an antidote to pilocarpine Pilocarpine C₁₁H₁₆N₂O₂ gives with MeI a methylo iodide Pilocarpidine C₁₀H₁₄N₂O₂ is also present in jaborandi (Harnack, A 238, It is crystalline but extremely deliques-It is alkaline, and turns yellow in light cent V sol alcohol, m sol water, sl sol ether sulphate and hydrochloride are deliquescent, its nitrate forms crystals resembling KNO, platinum salt B', H, PtCl, is crystalline It readily changes when exposed to light into a base jabor tidine $C_{10}H_{12}N_{..}O_{.0}$, which has an amorphous platinum salt The jaborandine of Chastaing (C Rnum salt 94, 968) obtained from pilocarpine and HNO, is probably jaboridine (Harnack, A 238, 238) The jaborandine of Parodi (Revista farmaceutica, 1875, 3) from Piper reticulatum CieH12N2O3 may be the same

JABORIC ACID C₁₀H₂₂N₂O₃ te C₅H₄N CMe(OH) CO O NMe, CMe(C₅H₄N) CO₂H Formed, together with NMe, jaborine and pilocarpidine, by rapidly heating pilocarpine to 175°, and keeping it at that temperature for half an hour If the product be extracted with baryta water and the extract shaken with ether, the ether will contain jaborine, while pilocarpidine and jaboric acid remain in the aqueous solution In this solution, after removing barium by CO₂, AgNO3 forms a curdy pp of C10H24N3O3Ag2NO3, whence H2S removes the silver (Hardy a Cal mels, C R 102, 1251, Bl [2] 48, 225) ous mass, v sol. water Not removed fron its aqueous solition by ether With alkalis it forms gummy salts, sol water and alcohol, and not de composed by CO₂. Hot conc KOHAq or boil ng HClAq converts it into pilocarpidine and oxypyridyl propionic acid C₂H₄N CH₂ CH(OH) CO₂H

Salts - AgA' brown powder, ppd by adding alcohol to a solution of the acid to which a limited quantity of AgNO₃ has been added — AgA'AgNO₃ curdy pp — A₂PtC₁, viscous pp — A'₄(PtCl₄)₃ yellow powder — A'₄H₂PtCl₆ sticky A'₄(PtCl₄), yel pp —A'(AuCl₃).

JABORIDINE C10H12N2O3 Formed by fre quently evaporating pilocarpidine with acid (Harnack, A 238, 234) Syrup, sol water, m sol ether Acts physiologically like jaborine though weaker Its hydrochloride is syrupy, and v sol water -B', H2PtCl, (dried at 100°) [110°-120°] Amorphous

JABORINE C.H.,N.O. te NMe. CMe(C,H,N) CO O NMe. CO CO CMe(C,H,N) NMe. (?) Occurs in jaborandi, and in false jaborandi (the leaves of Piper sticulatum) Prepared as described under Jaboric acid Brittle resin Insol water, v sol ether, sol alcohol Dissolves in a solu tion of jaboric acid Dissolves in HClAq, and is reppd by KOH as a curdy pp which readily Boiling conc agglomerates under warm water KOHAq converts it into pilocarpidine Boiling HClAq does the same Poisonous, acting like atropine

Salts -The hydrochloride is amorph ous, and v e sol water and alcohol -B PtCl. dirty white gelatinous pp —B'PtCl, yellowish white pp —B'H₂PtCl_g -B'(AuCl_s)₂ (Hardy a Cal

mels, C R 102, 1251)

JALAP The roots and tubers of certain convolvulaceous plants which rield purgative Officinal jalap consists of the tubers of Convolvulus Schiedanus, which contains Con volvulin, a strongly purgative resinous glucoside Jalap wood or jalap stalk (Stipites Jalapæ), the root of C orizabensis, contains a different glu coside, Jalapin (Kayser, A 51, 100, cf Mayer, A 95, 161)

JALAPIN $C_{24}H_{36}O_{16}$ or $C_{68}H_{112}O_{32}$ [150°] Oc curs in the root stalk of Convolvulu. (or Ipomæa) orizabensis, and forms the principal portion (soluble in ether) of the jalap regin prepared therefrom (Johnston, P T 1840, 342, P M [3] 17, 183, Kayser, A 51, 101, Mayer, A 83, 122, 95, 129, Haule, Rep 48, 365, Planche, J Ph 13, 165, 24, 169, Weppen, N Br Arch 87, 153, Chevallier, J Ph 9,306Occurs also in the resin in scammony root from Convolvulus Scammonia (Johnston, P T 1840, 340, Keller, A 104, 63, 109, 209, Spirgatis, A 116, 289, Planche, J Ph 13, 165, 18, 183, Marquart, N Br Arch 7, 248, 10, 139)

Preparation—1 Jalap resin is dissolved in

a large quantity of alcohol, water is added until the liquid becomes slightly turbid, and the whole boiled with animal charcoal, filtered, ppd by lead acetate and a little ammonia, filtered, freed JECORIN 99

from lead by H₂S, the alcohol distilled off, and the residue kneaded in boiling water, and the jalapin finally extracted with ether (Mayer)— 2 Finely powdered jalap resin is mixed with sand and extracted with ether, which deposits the jalapin on evaporation (Stevenson, Ph [8] 10, 644)

Properties — Colourless amorphous resin Softens at 123°, and relts at 150° Tasteless V al sol. water, v e sol alcohol, ether, and chloroform, sol benzene, oil of turpentine, petroleum, and HOAc Cone H₂SO₄ dissolves it slowly in the cold, acquiring in a few minutes a maroon colour, bu. finally becoming black With K₂CrO₄, KMnO₄, KClO₅, or KNO₅ there is a brown colour and a smell of rancid butter, while MnO₄ gives a dark green col. ur (Stevenson)

MnO, gives a dark green col. ur (Stevenson)

Reactions - 1 Boiling dilute HCl splits it up
into sugar and jalapinol - 2 Boiling aqueous
alkalis convert it into jalapic acid - 3 Nitric

acid forms ipomic and oxalic acids

Jalapic acid C₃₄H₅₀O₁₈ or C₆₈H₁₁₈O₂₈ [120°] Formed by dissolving jalapin in aqueous alkalis (W Mayer, A 92, 125, 95, 129, Spirgatis, A 116, 289) Prepared by boiling jalapin with baryta-water until the solution is no longer ppd by acids, the baryta is then removed by H₂SO₄, the excess of sulphate by lead hydrate, and the excess of lead by H₂S Jalapic acid is then de posited on evaporating Translucer, amorphous, yellowish, brittle mass Softens below 100°, and melts about 120° Has no smell, but an irritating taste and strong acid reaction. V e sol water, v sol alcohol, m sol ether In neutral solutions it is ppd by lead subacetate, but not by any other metallic salt

Reactions —1 1 uming HCl splits it up into palapinol and glucose According to Spirgatis the products of hydrolysis of jalapic acid (and jalapin) derived from scammony are jalapinolic acid and glucose —2 Boiling dilute HCl forms (a) jalapic acid, so called (Mayer) —3 HNO, gives ipomic, oxalic, and isobutyric acids —4 KMnO, gives isobutyric, oxyisobutyric, and oxalic acids (Poleck a Samelson, C C 1884,

813)

Salts — Jalapio acid displaces CO₂ from aqueous Na₂CO₂.—Ba(C₂₄H₁₀O₁₅)₂ obtained on evaporating a solution of jalapic acid mixed with a slight excess of baryta-water after removing excess of baryta by CO₂ Amorphous — Ba₂(C₂₄H₃,O₁₆)₂ obtained by using baryta (2 pts), and jalapic acid, passing CO₂ through the boiling solution, filtering and evapo-

rating Amorphous mass [100°]

(a) - Jalapic acid, so called C28 H 50 O 15 Formed, in small quantity, in the hydrolysis of lalapic acid by HClAq or dilute H2SO, (Mayer) On cooling it separates with the jalapinol as a soft brown amorphous mass, which is then boiled with baryta water, and the resulting solution de posits barium je apinolate on cooling When the mother liquor is concentrated silky needles of the Ba salt of '(a) jalapic' acid are obtained salt is decomposed by a retic acid. White flexible needles, melting below water at 80° Feebly acid. in reaction Sl sol cold, m sol hot, water, v e sol alcohol and esuer solit it up into jalapinol and glucose HNO, and oxalic acid. Potashe sol alcohol and ether Boiling dilute acids gives apomic acid and oxalic acid. Potash-fusion forms palapinolic acid and oxalic acid.

from lead by H₂S, the alcohol distilled off, and | Ba(C₂₂H₄₀O₁₈)₂: White needles, sol. water and the residue kneeded in holling water, and the | alcohol

JALAPINOL C₂₂H₄₂O₇. [62°] Formed, together with sugar, by the hydrolysis of jalapin and of jalapine acid (W Mayer, A 95, 145) C₄₂H₁₁₂O₄₂+11H₄O = C₄₂H₄₂O₇+6C₄H₁₂O₄. Prepared by allowing a solution of jalapine acid (2 vols) mixed with fuming HClAq (1 vol.) to stand for a few days, washing the crystalline product with water, and recrystallising from alcohol, with use of animal charcoal, whence it separates in cauliflower like groups of crystals. Insol cold, v sl sol boiling water, v sol alcohol and ether Aqueous alkalis convert it into jalapinolic acid KMnO₄ forms isobutyric acid and (by further oxidation) oxyisobutyric acid (Poleck a Samelson, J 1884, 1447)

JALAPINOLIC ACID C₁₄H₁₄O₅ [64°] Formed by treating jalapinol with aqueous KOH, ammonia, or baryta Formed also by fusing jalapin or jalapin acid with KOH (Mayer, A 95, 145, Spirgatis, A 116, 306) According to Spirgatis it is also produced, together with sugar, by the action of mineral acids on jalapin and jalapic acid derived from scammony Poleck and Samelson (J 1884, 1447) by the action of alcoholic potash on jalapinol obtained, together with iso butyl alcohol, a jalapinolic acid C₁H₂₀O₄ White tufts of minute thin four sided prisms Insol water, v sol alcohol and ether Lighter than water Has an acid reaction Nitric acid oxi

dises it to ipomic acid and oxalic acid

Salts—(NH₄)HA'₂ cauliflower heads of minute needles—NaA' (dried at 100°) slender needles—BaA'₂ (dried at 120°) minute thin white needles, nearly insol cold, sl sol boiling, water, m sol boiling alcohol—CuA'₂ (dried at 100°) greenish blue pp formed on mixing hot aqueous solutions of sodium jalapinolate and CuSO₄ (Spirgatis)—Cu₄A'₂(OH)₂ (dried at 100°) Ppd by adding aqueous cupric acetate to a slightly alkaline solution of ammonium jalapinolate Amorphous dark bluish-green mass—PbA'₂ Ppd by adding lead acetate to an alcoholic solution of jalapinolic acid mixed with a little ammonia White amorphous mass—AgA' From aqueous AgNO₄ and alcoholic ammonium jalapinolate Flocculi

Ethyl ether EtA' [325°] From the acid (or from scammony) by saturation of the alcoholic solution with HCl, and ppg with water

Flat tables

JAMEOSIN C₁₀H₁₃NO₃ [77°] Occurs in the bark of jambosa root (the root of Myrtus jambosa?), from which it may be extracted with ether (Gerrard, Ph [3] 14, 717) White tasteless crystals, sol cold ether, alcohol, chloroform, and hot petroleum ether Insol cold, sol boiling, water Conc H₂SO₄ gives a bright green colour changing to reddish brown Is not a glucoside. Does not form salts with bases Has no medianal properties

JAPACONINE v Aconite alkaloids JAPACONITINE v Aconite alkaloids JAVANINE v Cinchona bases

JECORIN C₁₀₅H₁₈₃N₃SP₂Na₃O₄₆ (?) A substance obtained from liver (Drechsel, *J pr* [2] 33, 425) Occurs also in ox spleen, human brain, and horse's muscle (Baldi, *Ar Physiol* 1887, *Suppl* 100) Amorphous substance Hygroscopie, insoluble in dry ether, soluble in wet ether, v sl

100 JECORIN.

sol alcohol Swells up in water forming a sticky mass, which separates into a clear solution and app The latter dissolves in much water Not ppd by boiling, ppd by NaCl Prevents ppn of cupric salts by NaOH, forming a blue solution, and on boiling app of Cu₂O Boiling HCl dearning amongst other products The latter dissolves in much water Not composes it, forming amongst other products stearic acid

JERVIC ACID An acid occurring in white hellebore root (Veratrum album) (Weppen, Ar Ph. [3] 2, 101, 198), found by E Schmidt (Ar Ph [3] 24, 513) to be identical with chelidonic aoid

JERVINE C₂₀H₃,NO₃ (Wright a Luff), C₂₁H₄,N₂O₃ (Tobien) or C₃₀H₄₀N₂O₃ (Will) [237°] (W a L) An alkaloid occurring in the rhi-magnes of Veratrum album (Weppen, Ar Ph [3] 2, 101, 193, Simon, P 41, 569, Mitchell, Ph [3] 4, 796, Bullock, Ph [3] 6, 1009, Wright a Luff, C J 85, 407), and of V lobelranum (Tobien, Ph [3] 8, 808) and V viride (Bullock, Ph [3] 10,

Preparation - The extract obtained with al cohol containing tartaric acid is used several times to macerate fresh portions of the root, freed from alcohol by distillation, mixed with water, frac tionally ppd by NaOH and taken up by ether The base first ppd is pseudojervine, and is the least soluble in ether Other fractions contain jervine, rubijervine, and veratralbine (Wright a Luff)

Properties -Loosely coherent crystals (containing 1 aq or 2aq) (from alcohol) Almost insol water, sol alcohol, v sl sol ether (when pure), insol ligroin Cone H₂SO₄ forms a yellow solution changing through brown to greenishbrown Boiling alcoholic KOH has no action

Salts - The hydrochloride is crystalline, sl sol water, v sl sol HClAq (Will, A 35,116) According to Tobien it gives a rose colour when warmed with nitric acid. The nitrate and sulphate are sl sol water -B H2PtCl4 (Will) -B'HAuCl, -The acetate is sol water

Rubijervine C₂₈H₄₃NO₂ [236° cor] Anhydrous crystals (from alcohol) Dissolves in conc H₂SO₄, forming a yellow solution changing to brownish-red The sulphate is crystalline, v sol cold dilute H.SO, sl sol cold water The hydrochloride is crystalline and v sol water - B'HAuCl,

Pseudojervine C₂H₄₅NO, [209°] Crystals V sl. sol ether Reacts with conc H₂SO, in the same way as jervine Not affected by boiling al coholic KOH —B'HCl 2aq crystalline, v sl sol hot water, m sol dilute HClAq —The sulphate 18 sl sol cold, v sol hot, water -B'HAuCl,

Veratralbine C22 H43 NO Amorphous resinous base Conc H2SO, forms a yellow solution turning crimson and exhibiting green fluorescence Alcoholic potash does not saponify it Its salts are amorphous

HC C(OH) C CO CH JUGLONE C. H.O. 1.6

HC CH — C CO CH Oxy (a) naphthogumone Nucin. Regionin [154°] Formed by the oxidation of (a) hydrojugione which occurs in the green shell of the walnut (Vogel & Reischauer, C C 1858, 543, B 10, 1544, Phipson, C R 69, 1872, C N 52 89, Mylius, B 17, 2411) Formed also by allowing (1,4')-di-oxy-naphthalene to stand for 24

hours inixed with k2Cr2O, and dilute H2SO.

(Bernthsen a Semper, B 20, 984)

Preparation — Dry ripe walnut shells are The etherepeatedly extracted with cold ether real solution is shaken with a dilute solution of CrO₃ (10 pts_K₂Cr₂O₇ + 18 pts H₂SO₄ in 500 pts. of water) The ether is distilled off, and the residue, after removing tarry impurities by boiling with a little ether, in crystallised from a mixture of chloroform and ligroin The yield is 150 grms from 100 kilos (Bernt'isen a Semper, B 18, 204)

Properties — Thin glistening red prisms or needles Sublimable in small quantities Somewhat volatile with steam Ēasily soluble in chloroform and acetic acid, sparingly in ether, ligroin, and cold a cohol, almost insol water It stains the skin brown Dissolves in dilute NaOH with a fugitive purple colour, in H_aSO₄ with a blood red colour It is decomposed by hot water or hot acids By boiling with HNO₄ it is oxidised to a di nitro oxy phthalic acid. On heating with water or HCl it decomposes into insoluble amorphous bodies. Its alkaline solution is oxidised by the air to oxy juglone C10H.O4 With aqueous dimethylamine it gives dimethyl amidojuglone C10H3O3(NMe2), and with alcoholic aniline it gives phenyl amido juglone $C_{10}H_3O_3(NHPh)$ On fusion with KOH it yields m oxy benze c acid (Mylius, B 18, 463) Finely powdered juglone gradually added to an alkaline solution of hydrogen peroxide is oxidised to c oxy phthalic acid (B a S) Juglone and its oxim do not dye materials mordanted with metallic oxides (Kostanecki, B 22, 1347) Jug lone yields naphthalene when distilled with zinc dust Reducing agents yield (a) hydrojuglone

Salt -(C10H2O3)2Cu nearly insoluble mi-

croscopic violet prisms

Acetyl derivative C10H3O2(OAc) [155°], flat yellow tables or thin prisms, sublimes in long thin plates, volatile with steam, sparingly soluble in water and cold alcohol, easily in hot alcohol, ether, benzene, chlorofor n, and CS2, yields an intense green colouration with alcoholic KOH

Mono oxim C₁₀H₃(OH) $\left\{ egin{array}{l} O \\ NOH \end{array} \right.$ Glistening red needles or thin prisms, easılv soluble in alcohol and acetic acid, very slightly in water, dissolves with a blood red colour in H,SO, and in dilute NaOH (Bernthsen a Semper, B 18, 203)

Droxim C₁₀H₁(OH)(NOH), From juglone (1 mol) and hydroxylamine hydrochloride (2 mols) at 140° (Bernthsen a Semper, B 19, 168) Brownish yellow needles (from HOAc) Puffs off at 225° Sl sol. alcohol and acetic acid Alkalis dissolve it, forming an orange solution

Phenyl-amido juglone C₁₀H₂O₂(NHPh) [230°] Formed by heating an . lcoholic solution of juglone and amline (Mylius, B 18, 472) Red tables Sublimable V sl sol alcohol Dissolves in alkalis with a purple red colour

Di-methyl-amido-juglone O₁₀H₁O₂(NMe₂) [150°] Formed by dissolving juglone in dimethylamine solution (Mylius, B 18, 464) Brownish violet tables Soluble in bensene, chloroform, and CS, sparingly in alcohol, ether, and acetic soid, insoluble in water By SnCl, it is reduced to dimethylamido hydrojugione; On | soluble in benzene, sparingly in alcohol and heating with strong HCl it splits off dimethyl-

Oxyjuglone CioH.O. 2 6 CH C(OH) C CO C(OH)

. Di-oxy-naphthoquin-CH CH — Č CO ĆH one [c 220°] Formed by heating di methylamido juglone with Hell Formed also by oxidation of an alkaline solution of juglone by exposure to the air Prepared by oxidation of juglone with an alkaline solution of potassium ferricyanide, yield 50 pc of theory (Mylus, B 18, 466) Small yellow trimetric tables Spa ringly soluble in alcohol, ether, benzene, and

 CS_2 Salts $-A''Na_2$ easily soluble red needles -A"K, sparingly soluble red needles -A"Ag. ∆"Ci amorphous red pp

KAMALA A yellow dye, used in India, con tained in the seed capsules of Mallotus philhpensis, and occurring in commerce as a yellowish brown powder composed of minute resinous globules It contains Mallotoxin (q v) (A. G a.

W H Perkin, jun, B 19, 3109)

KAORI GUM The product of a coniferous tree (Dammara australis) growing in New Zes-When distilled with steam it yields a terpene C10H16, (157°-158°), S G 15 863 (Rennie, C J 39, 240, cf Thomson, A Ch [3] 9, 499; Mur, C J 27, 733) It is feebly laworotatory, and yields a small quantity of cymene when

treated with PCl,

KAWAIN A crystalline resin, occurring along with METHYSTICIN $(q \ v)$ in Kawa kawa, the root of Macropiper methysticum (Gobley, J Ph. [3] 37, 19, O'Rorke, C R 50, 598, Cuzent, C R 50, 436, 52, 206, Nölting a Kopp, Monst. 50, 436, 52, 206, Nölting a Kopp, M Scient [3] 4, 9, 20) It is not a glucoside oxidation it yields benzoic acid

KELLIN A glucoside in Ammi Visnaga (Mustapha, C R 89, 442) Small silky needles, v sl sol cold water, sol alcohol, v sol ether. Has a bitter taste Gives a white pp with Nessler's reagent Emetic and narcotic

KEPHIR v MILE

KERATIN v PROTEIDS, Appendix C KETATES (ethers of ketones) Bodies constructed on the type $\stackrel{X}{Y} > 0 \stackrel{O}{\stackrel{R'}{\circ}}$ (Morley a. Green, B 17, 8015) Bodies of the lorm X > C < SR' or X > C < SR'' may be calledthioketates

A name given by V Meyer and KETINE Treadwell (B 14, 1150, 15, 1059, 1055) to the product of the reduction of nitroso-acetone with tin and HCl Its di-carboxylic ether is formed 102 KETINE.

in like manner by reducing nitroso-aceto-acetic ether Ketine C.H.O. appears to be di-methyl-CH. N CMe CH N CMe

, and will be pyrazine or | CMe N CH ČMe N ČH

described as such (cf Oeconomides, B 19, 2524, Japp, C J 51, 98) Meyer (B 21, 19) proposes to use the name aldine instead of pyrazine CH N CH CH N CH

Other for the group CH N CH or CH N CH

alkyl-pyrazines are formed in like manner by the reduction of the nitroso-derivatives HONCHCOC_nH_{2n+1}, of ketones of the form CH₂COC_nH_{2n+1} As ketine di carboxylic acid does not form an anhydride it has probably the CO₂H C - N CMe

formula rather than CMeN CCO,H

CMe N C CO.H , whence the symmetrical formula CMe N C CO_2H

for ketine given above (Oeconomides)

KETIPIC ACID A name given to DI METHYL-DIKETONE DI-CARBOXYLIC ACID, as it might perhaps

be called di keto adipic acid

KETO This prefix is employed by some chemists to denote the displacement of H2 in the group CCH₂C by O Thus quinone might be called di keto benzene, while aceto acetic acid would be β keto-butyric acid. The prefix 'keto' does not indicate the introduction of a new or game group, whereas the corresponding prefix 'aldehydo-' indicates the introduction of the group CHO, and 'carboxy ' is used to denote the introduction of CO₂H In order to avoid the confusion likely to arise from this circumstance the term 'keto' is avoided in the headings of articles in this Dictionary substances which might have such names given them are described as ketones, quinones, or oxy compounds The prefix kero- has also been used as indicating sub stitution of hydrogen by the ketonic group CO CH₂, thus Erdmann (B 21, 635) terms CH₂ CO C₁₀H₆ OH keto naphthol In keto compounds the group CO CH may often be regarded with equal propriety as C(OH) C, and such compounds are named in accordance with the latter formula Thus phloroglucin may be described as tri-keto-benzene hexahydride or as tri-oxybenzene

DI-KETO-INDONAPHTHENE v INDONAPH THOQUINONE

KETO-LACTONIC ACID C,H,O, [1819] When a-acetyl-\$-ethyl-succinic ether is heated it partly breaks up into alcohol and ethyl keto lactonate, which, on saponification, gives potassie ketolactonate (S Young, C J 43, 175, A 216, 45) It is also formed, together with CO.H.CHEt CH.Ac, by boiling the other

(CO, lt.CHEt CHAc CO, Et) with dilute HCl, and may be extracted from the product by ether. The free acid crystallises from water, and is al. sol cold water, m sol hot water

Salts -BaA'22H2O -AgA'

Reaction -1 Heated with baryta the following reaction occurs 2C.H.O.+ 3BaO + H.O The $= 2BaCO_3 + Ba(C_7H_{11}O_3).$ new acid. C,H₁₂O₃, appears to be 'iquid, it forms a very soluble and unstable silver salt —2 Cold baryta produces an unstable dibasic acid, CaH, Oas by

assimilation of H₂O

Constitution — Ketolactonic ether is formed from CO,Et CHAc CHEt CO,Et by splitting off HOEt Inasmuch as CO, Et CMeAc CHEt CO, Et does not form in the same way the ether of a crystalline acid it is probable that the H which is here displaced by methyl goes to form alcohol in the formation of the ketolactoric ether. And since ketolactonic ether appears to be a lactone it should be

CO,Et C CHEt CO,

CH, Ö O-CO.H C CHEt CO the acid being CH, CO --

KETOLE Another name for Indoir (Jackson, B 14, 879)

The ketones, in their simplest KETONES form, contain a carbonyl group CO attached to two monad hydrocarbon radicles If the twa radicles are identical, as in acetone (dimethylketone) CH, CO CH, the compound is a simple ketone, if different, as in methyl ethyl ketone CH, CO CH, CH,, it is a mixed ketone

Just as the fatty acids of the series C, H, O, may be derived from the hypothetical carbonic acid CO(OH), by replacing one hydroxyl group by a monad hydrocarbon radicle, so the ketones may in turn be derived from the fatty acids by replacing the remaining hydroxyl group by a second radicle

HO CO OH Carbonic acid CH, CO OH Acetic acid

«OH, CO CH» Acetone

There is therefore a simple ketone derivable from each fatty acid by the introduction of a hydrocarbon radicle, identical with that which is attached to the carboxyl group of the acid, in place of its hydroxyl group

If one of the radicles in a ketone is hydrogen the resulting compound is an aldehyde

CH, CO H Aldehyde

CH,CO CH, Acetone

and owing to this similarity in constitution, the aldehydes and ketones have many reactions in common In the case of formic acid the radiole attached to carboxyl is hydrogen, and the ketone therefore coincides with the aldehyde

H CO OH

H CO H Formaldehyde.

From this point of view the ketones may be regarded as homologues of formaldehyde

Compounds containing two carbonyl groups are termed deketones, those containing three, triketones

Fatty ketones

Formation.—1 By the destructive distilla-

tion of the calcium salts, o., better still, of the barrum salts, of acids of the series C,H,,O,

(CH₂ CO O)₂Ca = CH₂ CO CH₂ + CaCO₂ If a mixture of the salts of two acids is

employed, a mixed ketone, containing the hydrocarbon radicles of both acids, is formed

 $\begin{array}{c} ({\rm CH_s~CO~O)_sCa} + ({\rm C_sH_s~CO~O)_sCa} \\ = 2{\rm CH_s~CO~C_sH_s} + 2{\rm CacO_s} \\ ({\rm Williamson},~C~J~1852,~^38) \end{array}$

If one of the salts is a formate, an aldehyde is formed, a hy rogen atom from the formate attaching itself to the carbonyl group

(CH, CO O), Ca + (H CO O), Ca = 2CH, CC H + 2CaCO,

(Piria, Cimento, 3, 126, A 100, 104, Limpricht, A 97, 508)

In the preparation of k tones by the de structive distillat on of salts it is advantageous, if the molecular weight of the ketone is high, to conduct the distillation under reduced pressure (Krafft, B 15, 1693)

2 By the destructive distillation of the cal cium compounds of primary alcohols (Destrem, A Ch [5] 27, 7) In this reaction the alcoholates are converted, with evolution of olefins and hydrogen, into salts of fatty acids

 $(\tilde{C}_1H_3O)_2Ca = 2C_2H_4 + \tilde{C}aO + H_2O$

 $(C_1H_2O_2)Ca + 2H_2O = (C_2H_2O_2)Ca + 4H_2$ and the calcium acetate is then decomposed by the heat, yielding acetone A por on of the acetate, however, reacts with the calcium oxide, evolving methane

3 By heating a mixture of the sodium com pound of an alcohol and the sodium salt of a fatty acid in a current of carbon monoxide, mixtures of higher ketones are formed, along with sodium salts of higher organic acids (Geuther, A 202, 288) The constitution of these ketones is not known with certainty, and the process in which they are formed is not understood

4 By the action of acyl chlorides on zinc alkyls (Freund, A 118, 1, cf Pawlow, A 188, 104) The acyl chloride is added to the zinc alkyl, at first gradually, afterwards more rapidly, cooling with ice during the operation The mixture is then decomposed with excess of water

 $CH_1 COCl + Zn(C_2H_3)_2$ = $CH_2 CCl(OZnC_2H_3) C_2H_3$,

 $2CH_{s}$ $CCl(OZnC_{s}H_{s})$ $C_{s}H_{s} + 2H_{s}O$ $= 2CH_{1} CO C_{2}H_{3} + 2C_{2}H_{4} + ZnCl_{2} + Zn(OH)_{2}$

If the mixture is allowed to stand too long be fore adding water, the additive compound formed in the first stage of the process reacts with a second mol of alkyl chloride, exchanging its halogen for alkyl and generating a compound which, on treatment with water, yields a ter tiary alcohol

5 By the oxidation of secondary alcohols $CH_3 CH(OH) CH_3 + O = CH_3 CO CH_3 + H_2O$

6 By the oxidation of secondary acids of the lactic series with potassium bichromate and dilute sulphuric acid Thus hydroxy-isobutyric acid yields acetone

 $(OH_2)_2C(OH)CO_2H + O = (OH_2)_2OO + OO_2 + H_2O$ 7 Certain ketonic acids part with carbon dioxide, forming ketones This decomposition takes place very readily in the case of the Thus when ethylic aceto-8-ketonic acids acetate is warmed with a caustic alkali it is

hydrolysed, and the liberated acid splits off carbon dioxide, thus

CH, CO CH, CO, H = CH, CO CH, + CO, 8 Alcohols containing a hydroxyl-group attached to a doubly-linked carbon-atom do not appear to be capable of existing in the free state, and change, at the moment of their formation, into either aldehydes or ketones, the former transformation occurring when the hydroxyl group is situated at the end of, the latter when it is within, the chain

 CH_2 $CH(OH) = CH_1$ CHOCH, C(OH) CH, = CH, CO CH, (Erlenmeyer, B 13, 809, 14, 320)

9 When secondary or secondary tertiary glycols are treated with dehydrating agents, such as phosphorus pentoxide or zinc chloride, they part with water, forming ketones bably an unsaturated alcohol is first produced, and this changes, at the moment of its forma tion, into a ketone (v preceding paragraph).

CH, CH(OH) CH(OH) CH₁-H₂O

= CH, CH C(OH) CH, = CH, CH, CO CH, Primary glycols, when thus treated, yield aldehydes Tertiary glycols (pinacones) are dehydrated even by boiling with dilute sulphuric acid forming ketones, the reaction being accompanied in this case by the migration of an alkyl group

> $(CH_2)_2C(OH)C(OH)(CH_2)_2-H_2O$ Pinacone

= (CH₂)₃C CO CH₆ Pinacolin

10 When the homologues of acetylene are passed into a solution of mercuric chloride heated to 90°-95° they take up the elements of water, yielding ketones (Kutscherow, B 17, 18) $CH_1 CCH_1 + H_2O = CH_1 COCH_2$

Acetylene itself yields aldehyde

11 Letones, especially acetone, are formed in the destructive distillation of wood, sugar, citric acid, and various other organic compounds

Properties and Reactions -The lower members of the ketone series are liquids, with a peculiar ethereal odour, boiling without decom-The higher homologues, beginning position

with CiaH co, are crystalline solids

The ketones are isomeric with the aldehydes containing the same number of atoms of carbon They closely resemble the aldehydes in many of their reactions, but are distinguished from them by not reducing ammoniacal silver solutions. Like the aldehydes, many of the ketones combine with the hydrogen sulphites of the alkalis to form crystalline double compounds The rule given by Grimm (A 157, 262) that only those ketones combine with hydrogen sodium sulphite which contain the group CH2.CO, holds very generally an exception is propone (di-ethyl ketone) CO(C₂H₃), which forms a double compound, although with difficulty These compounds are used in separating and purifying the ketones on treating the double compound with sodium carbonate the ketone is liberated. The ketones, like the aldehydes, unite with hydrocyanic acid to form nitriles of hydroxy-acids (CH₃)₂CO + HCN = (CH₃)₂C(OH) CN (Urech, A 164, 258, Tiemann a. Friedlande., B 14, 1971) and these nitriles react with ammonia, yielding nitriles of amido-acids (CH₂), C(OH) CN + NH, $=(CH_2)_*C(NH_2)CN+H_2O$ (T a. F.). — In 104 KETONES.

presence of caustic potash, acetone unites with chloroform to form acetone-chloroform (OH2),C(OH) CCl2, which when Leated with water to 180° yields hydroxy-isobutyric acid and hydrochloric acid (Willgerodt, B 14, 2451, 16, 1585) - Sodium amalgam, acting on aqueous solutions of the ketones, reduces them to secondary alcohols, acetone is converted into isopropyl alcohol $(CH_3)_2CO + H_2 = (CH_3)_2CH OH$ (Friedel, CR55, 53) At the same time, a second reaction occurs in which 2 mols of the ketone are united during the process of reduction, forming a tertiary glycol, or pinacone $2(CH_3)_2CO + H_2$ = $(CH_3)_2C(OH) C(OH)(CH_3)_2$ —The ketones are less susceptible of oxidation than the aldehydes, and, unlike the latter, can never yield by oxida tion an acid containing the same number of carbon atoms They are best oxidised by boil ing them with a mixture of potassium bichromate and dilute sulphuric acid Popoff (A 161, 300) has formulated the following rules regarding the products formed in the oxidation of the ketones rules to which, however, there are occasional exceptions The ketone is broken up at a point between the carbonyl group and one of the alkyl groups, the combined carbonyl being oxidised to carboxyl, and the separated alkyl being oxidised, if primary, to a fatty acid with the same number of atoms of carbon as the alkyl itself, and if secondary, to a ketone, which may in turn be further oxidised If a ketone con tains two dissimilar alkyls, the carbonyl group will remain attached to that carbon atom which has most hydrogen combined with it, unless in the case of a tertiary alkyl or a radicle of the benzene series, when the carbonyl group will remain in combination with the non hydro genated carbon atoms If the two dissimilar alkyls are both primary, or both secondary, or both tertiary, the carbonyl will remain attached to the alkyl of lower molecular weight following equations illustrate these rules

 $CH_{2} CO CH_{2} + 3O = CH_{2} CO_{2}H + H CO_{2}H$ $CH_{2} CO CH_{2} \cdot CH_{2} + 3O = CH_{2} CO_{2}H + CH_{2} CO_{2}H.$

> CH₂ CH₂ CH₂ CO CH(CH₂)₂ + 2O = CH₃ CH₂ CH₂ CO₂H + CO(CH₃)₂. CO C(CH₂) + 3O₂H CO H + (CH₃) C C(CH₃) C C C(CH₃) C C(CH₃) C C(CH₃) C C(CH₃) C C(CH₃) C C(CH₃)

 CH_{a} CO $C(CH_{a})_{a} + 3O = H CO_{a}H + (CH_{a})_{a}O CO_{a}H$ CH_{a} CO $C_{a}H_{b} + 8O = H CO_{a}H + C_{a}H_{b} CO_{a}H$

In several cases, however, a subordinate reaction, in which the ketone is oxidised in a way the reverse of that predicted by the rule, occurs simultaneously—Chlorine and bromine give substitution compounds—Phosphorus pentachloride replaces the oxygen of ketones by two chlorine atoms—Ammonia reacts less readily with ketones than with aldehydes With acetone it forms diacetonamine C₂H₁₂NO, and triacetonamine C₂H₁₂NO—With hydroxylamine in aque ous solution the ketones yield the ketoximes.

OH₂ CO CH₂ + NH₂ OH = OH₂ C(N OH) CH₃ + H₂O. Acetoxime

The ketoxime, are generally solid crystalline compounds, volatile without decomposition Concentrated hydrochloric soid decomposes them into hydroxylamine and ketone.—In like

manner phenylhydrasine reacts with the ketones, eliminating water and forming ketohydrazones: CH₂ CO.CH₂ + O.H., NH NH₂

= CH₃ C(N NHC₆H₅) CH₃ + H₂O
Acetonephenylhydrasone

The ketohydrazones of the fatty series are for the most part oily liquids, which may be distilled under reduced pressure. Acids decompose them into phenylhydrazine and ketones (E. Fischer, B. 16, 661)—Nitrous acid converts the ketones into isonitroso ketones. The reaction occurs more readily, however, with ethereal salts of n trous acid, thus when a mixture of amyl nitrite and acetone is warmed with hydrochloric acid isonitroso acetone is formed.

CH_a CO CH_a + C_bH , O NO

= CH, CO CH N OH + C,H, OH

Sodium ethoxide may be substituted for hydro chloric acid in the foregoing reaction, but in this case the sodium compound of the isonitroso ketone is formed and must afterwards be decomposed by acetic acid (Claisen, B 20, 252, and 656, Claisen a Manasse, B 20, 2194) The isonitroso ketones are also readily obtained by the action of nitrous acid on aceto acetic acid and its homologues

CH₃ CO CH₂ CO₂H + HNO₃ Aceto acetic acid

- CH₂ CO CH N OH + CO₂ + H₂O Isonitroso-acetone

(V Meyer a Zublin, B 11, 695, Ceresole, B 15, 1328)—Concentrated nitric acid converts the ketones into dinitro paraffins thus propione CH₂ CH₂.CO CH₂ CH₃ yields dinitroethane CH₂ CH(NO₂)₂ (Chancel, Bl 31, 504)—The ketones react with the mercaptans, eliminating water and yielding 'mercaptoles' (thioketates), ethyl thiodimethylketate is formed when gaseous hydrochloric acid is passed into a mixture of acetone and mercaptan

 $(CH_1)_2CO + 2C_2H_3$ $SH = (CH_2)_2C(SC_2H_3)_2 + H_2O$ (Baumann, B 18, 887) The mercaptoles are liquids, insoluble in water, not volatile without decomposition, stable towards alkalis and dilute acids - Under the influence of dehydrating agents, such as sulphuric acid, zinc chloride, hydrochloric acid, &c, the ketones readily undergo condensation, two or more molecules combining, with elimination of water, to form more Thus 2 mols of acetone complex compounds unite to form mesityl oxide (CH,),C CH CO CH,, and 3 mols to form either phorone (CH₃)₂C CH CO CH C(CH₃)₂ or mest ylene (1, 3, 5 trimethylbenzene) C₈H₁(CH₃)₃, according as 2 or 3 mols of water are eliminated in the

Bensene ketones Ketones of this class may either contain two benzene radicles directly attached to carbonyl, as in benzophenone (diphenyl ketone) C_aH_a CO C_aH_a, or the carbonyl group may unite a benzene redicle and a fatty radicle, as in acetophenone (phenyl niethyl-ketone) C_aH_a CO CH_a, or one or both of the benzene radicles may be attached to carbonyl by means of a fatty group, as in phenyl benzyl-ketone C_aH_a CO CH_a C_aC_aH_a, or di benzyl ketone C_aH_a CO CH_a C_aC_aH_a, or di benzyl ketone C_aH_a CO CH_a C_aC_aH_a.

C.H. CH. CO CH. O.H.

Preparation — Many of the methods already
described for the preparation of the fatty ketones
are also applicable in the case of the benzene

ketones Thus benzophenone may be obtained by the distillation of a benzoate

(C_sH_s CO O)₃ = (C_sH_s)₂CO + CaCO₂, and acetophenone by distilling a mixture of a benzoate and an acetate

(O₂H₂ CO O)₂Ca + (CH₂ CO O)₂Ca = 2C₂H₃ CO CH₂ + 2CaCO₃ Again, acetophenone may be obtained by the action of benzoyl chloride on zinc methyl, but if it is desired to introduce a benzene radicle in place of the haiogen of the acyl chloride the mercury compound of that radicle must be em ployed C_0H_a $COCl + H_a(C_0H_a)_2$ = $(C_0H_a)_2CO + H_g(C_0H_a)Cl$

The benzene retones are also formed, like the fatty ketones, by the oxidation of the correspond ing secondary alcohols

$$(C H_s)_2CH OH + O = (C_6H_s)_2CO + H_2O$$
, Diphenylcarbinol

and of secondary glycolic acids containing benzene radicles

$$(C_0H_0)_2C(OH)CO_2H + O$$

Bensilio acid $=(C.1)$

 $= (C_4H_1),CO + CO_4 + H_4O_4$

further, by splitting off carbon dioxide from ketonic acids of the benzene series

$$C_eH_s$$
 CO CH_z CO₂ $H = C_eH_s$ CO $CH_s + CO_2$
Benzoylacetic acid

By shaking phenylacetylene with sulphuric acid of 75 pc it takes up the elements of water, yielding acetophenone

 C_8H_3 \bar{C} $CH + H_2O = C_uH_a$ CO CH_a (Friedel a Balsohn, Bl [2] 35, 55)

The following modes of formation are pe culiar to benzene ketones -

1 By the action of an acyl chloride on a benzene hydrocarbon in presence of aluminium chloride CH, COCl + C,H, = CH, CO C,H, + HCl (Friedel a Crafts, A Ch [6] 1, 507) In this reaction the acid radicle always attaches itself to a benzene nucleus, and never to a fatty group In like manner ketones containing two benzene radicles directly united to carbonyl may be prepared by acting on a benzene hydrocarbon with carbonyl chloride in presence of aluminium

chloride $COCl_2 + 2C_6H_6 = CO(C_6H_3)_2 + 2HCl$ 2 The last mentioned class of ketones may also be obtained by heating a mixture of a benzene carboxylic acid and a benzene hydro

carbon with phosphorus pentoxide

 C_aH_a CC OH + C_aH_a = C_aH_a CO C_aH_a + H_aO 8 By the oxidation of hydrocarbons in which two benzene radicles are united by a methylene group

 C_aH_a CH_a $C_aH_a + O_a = C_aH_a$ CO $C_aH_a + H_aO$ Ketone-alcohols are obtained by polymerising benzene aldehydes with potassium cyanide

Ketone phenois are formed when acyl chlor ides of the benzene series act on phenols in presence of zinc

$$C_eH_a$$
. $COCl + C_oH_a$ $OH = C_eH_a$ COC_eH_a $OH + HCl$

p-Hydroxybensorbenone

The acid radicle enters the nucleus of the phenol in the para- position to the hydroxyl group

Properties and Reactions — The benzene ketones are liquids and solids, boiling without decomposition and having a pleasant aromatic odour

In most of their reactions they closely re semble the fatty ketones Popoff's rules (v supra) apply to the oxidation of the benzene the carbonyl group always remains ketones attached to a benzene nucleus to which it is directly united Like the fatty ketones, the benzene ketones react with hydroxylamine and with phenyl-hydrazine eliminating water and yielding hydroximes and hydrazones On reduction with sodium amalgam they form secondary alcohols, but heating with hydriodic acid, or distillation with zinc dust, reduces them to the corresponding hydrocarbons

$$(C_6H_3)_2CO + 2H_2 = (C_6H_5)_2CH_2 + H_2O$$

Diphenylmethane

By fusion with caustic alkalis they yield a salt of a benzene acid together with a hydrocarbon

 $C_eH_s CO C_eH_s + KOH = C_eH_s CO_2K + C_eH_e$ They are less subject than the fatty ketones to undergo condensation with elimination of water, and those which contain two benzene radicles directly attached to the carbonyl group do not exhibit this tendency at all

Only those benzene ketones combine with hydrogen sodium sulphite in which the carbonyl is attached to two fatty groups, one of which is methyl thus, benzyl methyl ketone C₆H₃CH₂CO CH, and methyl phenylethyl ketone C₆H₃CH₂CO CH, CO CH, form double compounds, acetophenone C₆H₃CO CH, does not Diketones The diketones contain two car-

bonyl groups attached to hydrocarbon radicles If the two carbonyl groups are directly united, the compound is an a diketone, if they are united by a carbon atom, it is a \$-diketone. if by a chain of two carbon atoms, a γ-ketone, and so on

Some of the diletones, such as benzil C_eH_s CO CO C_sH_s , have been known for a considerable time, but the majority are of recent discovery Their chief interest lies in the ease with which the two carbonyl groups may be made to condense with one or more molecules of some other substance to form closed chain compounds In this way glyoxalines, quinolines, pyrazoles, furfurans, pyrrholes, thiophens, and similar compounds have been prepared

These may be regarded as a-Diketones homologues of the dialdehyde glyoxal, CHO CHO They may be obtained by the action of chlorine, or, better, of nitric acid, on a ketone alcohols

(Laurent, A Ch. [2] 59, 402, Zinin, A 34, 188) By hydrolysing the isonitrosoketones by boiling them with dilute sulphuric acid

Von Pechmann, B. 21, 1411)

The benzenoid a diketones react with caustic potash to form secondary glycolic acids, the two 106 KETONES.

hydrocarbon radicles attaching themselves to the same carbon atom

$$\begin{array}{c} \mathbf{C_{e}H_{5}} \text{ CO CO } \mathbf{C_{e}H_{5}} + \mathbf{KOH} = (\mathbf{C_{e}H_{5}})_{2}\mathbf{C(OH)} \text{ CO}_{2}\mathbf{K} \\ \text{Potassium benzilate} \\ \text{(diphenylglyoolate)} \end{array}$$

(Liebig, A 25, 25, Zinin, A 31, 329) In like manner glyoxal yields glycolic acid. The fatty adiketones, however, condense to form quinones $(q \ v)$ —a-Diketones react with 2 mols of hydroxylamine to form dihydroximes. Benzil dihydroxime is remarkable as occurring in three isomeric modifications, all of the formula C_sH_5 C(N OH) C(N OH) C_sH_5 , an isomerism which is explained by Victor Meyer by means of tridimensional formulæ (Auwers a V Meyer, B 22, 705, cf also Hantzsch a Werner, B 23, 11) These three hydroximes, when heated, part with water, yielding in each case the same closed-chain compound—an anhydride

(Auwers a V Meyer, B 21, 810) —With odiamines the a-diketones yield quinoxalines (azines)

(Hinsberg, B 17, 322, cf Witt, B 19, 915) For an account of the behaviour of a diketones with aldehydes and ammonia v vol 1 p 465

The lowest member of this β-Drketones series which is a true diketone and not a dialdehyde is acetyl acetone CH, CO CH, CO CH, By the action of aluminium chloride on acetyl chloride a crystalline substance of the formula C₁₂H₁₄O₆Al₂Cl₈ is formed, which, on treatment with water, evolves carbon dioxide and yields acetyl acetone (Combes, C R 103, 814) general method for the preparation of β diketones consists in acting on a mixture of a fatty or a benzene fatty ketone and the ethyl salt of a carboxylic acid with sodium ethoxide latter substance produces condensation between the ethereal salt and the ketone with elimination of alcohol

In reality it is the sodium compound of benzoylacetone G_0H_0 CO CHNa CO G_0H_0 which is formed, and it is necessary to decompose this compound with earbon dioxide in order to obtain the free diketone (Claisen, B=20, 655) Di acyl derivatives of acetic acid are decomposed on boiling with water, eliminating water and generating B diketones

$$(C_6H_5 CO)_2CH CO_2H = (C_6H_5 CO)_2CH_2 + CC_2$$

Dibensoylacetic acid Dibenzoylmethane

(Baeyer a W H Perkin, jun, B 16, 2128, E. Fischer a Kuzel, B 16, 2239)

The methylene group in the β-diketones is attached to two electro negative carbonyl groups.

For this reason one atom of hydrogen in this group, like the hydrogen in the methylene group of aceto acetic ether or malonic ether, is replaceable by an alkali metal when presented to it in the form of an ethoxide. By treating the alkali compound thus obtained with the halogen compound of an alkyl or acid radicle, the radicle can be introduced in place of the alkali metal.

The \$\beta\$-diketones react with 1 mol of phenyl hydrazine eliminating 2 mols of water, and forming pyrazoles

(Knorr, B 20, 1104)—Antine reacts with β-diketones in two stages thus when benzoylacetone is heated with aniline at 150° the two substances first unite, parting with 1 mol of water C₄H₃ CO CH₂ CO CH₃ + C₄H₃ NH₂ = C₄H₃ CO CH₂C(N C₄H₃) CH₃ + H₂O, and when the compound thus obtained is heated with concentrated sulphuric acid, it parts with a second mol of water, forming a quinoline derivative

(C Beyer, B 20, 1770) This is a general method for the preparation of quinolines containing alkyls in the α γ positions

γ-Diketones—In these compounds the two carbonyl groups are united by an ethylene radicle The lowest member of the series, acetonyl acetone, was obtained by Paal (B 18, 58) by heating pyrotritaric acid with water at 150°-160°

= CH₂ CO CH₂ CO CH₂ + CO₂ Acetophenone acetone is obtained by heating acetophenone aceto acetic acid (prepared by acing with bromacetophenone on sodaceto acetic ether, and hydrolysing the ether thus formed)

KOSIN. 107

inde, the y-diketones are converted into fui turans It is supposed that in this reaction the liketone first forms a 'labile' modification con saining two hydroxyl groups, and that this then parts with water to form the furfuran

Phenylmethyl furfuran

(Paal, B 17, 2756) An unsaturated ketone someric with phenylmethylfurfuran is formed at the same time -Phosphorus pentasulphide converts y diketones into thiophens, whilst with ammonia they yield pyrroles, the reaction in both cases being supposed to be preceded by the above-mentioned transformation of the diketone into its 'labile' modification

C CH, + NH, C CH₃ + 2H₂O

Phenylmethylpyrrole

(Paal, B 18, 367)

An unsaturated y diketone, anhydracetophenonebenz' (aß dibenzoylstyrolene) is formed by the action of caustic potash on a mixture of benzil and acetophenone

Quinones If the two carbonyl groups of a diketone occur in a closed chain of six carbon atoms, the resulting compound belongs to the This group of diketones class of the quinones will be treated of separately (v Quinones).

Triketones A triketone in which the three carbonyl groups are directly united has been obtained in the following manner (von Pechmann, B. 22, 852). Dibenzoylbromomethane

C.H. CO CHBr CO C.H. (prepared by the action of bromine or dibenzoylmethane, v supra) is converted by treatment with potassium acetate the acetate of dıbenzoylcarbınol C_sH_s CO CH(OC₂H_sO) CO C_sH_s, which, when brominated, yields CaH, CO CBr(OC2H,O) CO CaH, When this compound is heated above its meltingpoint (101 5°) it breaks up into acetyl bromide and diphenyltriketone

C,H, CO CBr(OC2H,O) CO C,H,

= C₂H₃OBr + C₅H₅CO CO CO C₆H₅ Diphenyltriketone, like some other compounds in which a carbonyl-group is situated between two electro negative groups, unites with 1 mol of water to form a hydrate, this has probably the constitution C₆H₅ CO C(OH), CO C₆H₅

The formation of another triketone, tribenzoyl methane, in which the three carbonyl groups are attached to the same carbon atom, has already FBJ been referred to

DIKETO-PENTANE v METHYL ETHYL DIKE-

LABURNINE An alkaloid said to occur along with cytisine in laburnum seeds (Huse mann a Marmé, Z [2] 1, 161, 5, 677) crystalline groups of monoclinic prisms, v sol water, sl sol alcohol, nearly insol ether

LAC A substance surrounding the eggs of Coccus laccæ on the twigs of various trees in Bengal and Sumatra These twigs are called stick lac The lac is removed by melting and squeezing through canvas, when the hardened drops are known as seed lac After bleaching by chlorine or charcoal and making into sticks it is known as shell lac or shellac Lac is used for making sealing wax, varnishes, and a red dye called lac dye Lac contains 68 to 88 p c resin (about half of which is soluble in ether), a small quantity of wax and of a red dye, and a larger quantity of a substance insoluble in alcohol The wax [60°] contains ceryl and myricyl alcohols and their stearic, palmitic, and oleic ethers (Benedikt a Ulzer, M 9, 579) Shellac may be freed from wax by dissolving in boiling dilute Na₂CO₂, filtering, and ppg with HCl the boiling be continued too long, liquid shellac 18 produced Shellac freed from wax gives azelaic acid when oxidised by KMnO, (Benedikt a Ehrlich, M 9, 163)

Liquid shellac C₄₈H₇₂O₁₂ Formed by boiling shellac (1,000 g) with NaOH (300 g) and water (20,000g) for 2 hours When cold, sulphuric acid is added and the liquid shaken with ether (B a E) Thick liquid, insol water, v sol alcohol and ether Forms salts with Pb, Ag, Zn, Ba, and Ca — C46H70Mg2O18 amorphous, v sol water, ppd on heating, but redissolves on

Laccaic acid $O_{10}H_{12}O_{0}$ (?) Obtained from lac dye by treating with HClAq, filtering, boiling the residue with water, ppg the solution with lead acetate, and decomposing the pp with H₂S (R E Schmidt, B 20, 1285) Brownish red powder composed of minute tables (from alcohol ether), m sol alcohol, sl sol water, nearly insol ether, insol benzene Decomposes, without previous fusion, at about 180° Alkalis form a crimson solution which has an absorption spectrum like that of carminic acid Baryta gives a violet pp
FeSO₄ a black pp FeCl₂ a black colouration
only It reduces ammoniacal AgNO₂ bu. not
Fehling's solution Cone HNO₂ yields pieric
and oxalic acids Cone HClAq at 180° forms a
substance C₂ H₁₈O₁ Laccasic acid dyes like carminic acid, but its solution in H.SO, shows a different absorption spectrum —K,C,sH,O, (dried

at 100°) flocculent pp formed by adding also holic potash to an alcoholic solution c' the salt BaC_{1s}H_{1s}O_s brownish red pp formed by adding NH₂ and BaCl₂.

LACMOID

Preparation -1 A mixture of resorcinol (20 pts), sodium nitrite (1 pt), and water (1 pt) is slowly heated to 110°, at which temperature a vigorous reaction sets in, the melt is then kept at 115°-120° till it has become quite blue and the evolution of NH₂ has ceased (Traub a Hock, B 17, 2615) -2 By the action of H₂O₂ on am moniacal resorcin solution (Wurster, B 20, 2938) -8 By fusing resorcin (15 g) with KNO2 (18 g) (Benedikt a Julius, M 5, 534)

Properties —Glistening brown powder It is easily soluble in methyl, ethyl, and amyl al cohols, acetone, acetic acid, and phenol, less easily in ether and water, insoluble in benzene and petroleum spirit It dissolves in strong HCl or H₂SO₄ with a blue colour It decomposes below

200°

Lacmoid differs from litmin, the colouring matter of litmus, in being soluble in strong Litmin is insoluble in strong alcohol, though soluble in dilute (50 pc) spirit The solution of litmin in 50 pc alcohol is bleached after a time, while that of lacinoid retains its colour for months The absorption spectra of the two substances do not differ markedly (Hart

ley, R Dublin Soc 5, 159)

LACTAM The anhydride of an amido acid $R''(NH_2)(CO_2H)$ containing the group R'' < CO > NH

(Baever, B 15, 2102)

LACTAMIC ACID IS a AMIDO PROPIONIC ACID Di lactamic acid 18 a IMIDO DI PROPIONIC ACID LACTAMIDE v Amide of LACTIC ACID

LACTARIC ACID C₁₃H₃₀O_r Prepared by pressing the juice out of the mushroom (Lactarius piperatus) and extracting the residue with ether or boiling alcohol (Chuit, Bl [3] 2, 158) White leaflets (from alcohol), v sol hot alcohol, ether, CHCl₂, CS₂, and benzene, v sl sol cold alcohol and petroleum spirit, insol water

LACTIC ACID C₂H₂O, te CH₂CH(OH) CO₂H₃COxy propionic acid Ethyledene lactic acid Fermentation lactic acid Mol w 90 S G 29 1 2403 (Bruhl), 19 1 2485 (Mendeléeff, C R 50, 52) $\mu_{\rm S} = 1\,4469$ R_{$_{\rm C}$ 0 = 31 18}

Isomerides — Lactic acid is isomeric with hydracrylic acid, and appears to be chemically identical with sarcolactic acid (v infra)

In 1863 Wislicenus got from ethylene chlorhydrin and KCN, by saponifying the product, a lactic acid which formed a cr-stalline zinc salt ZnA', 2aq He called it ethylene lactic acid, thought it was identical with Liebig's sarco lactic acid (A 128, 4) Dossios (A 146, 168) said that sarcolactic acid gave, on oxidation, Wishcenus held (A 167, 346) malonie acid that his ethylene lactic acid was not hydracrylic acid, for by the action of HI he was unable to obtain \$ 10do propionic acid He said also that his ethylene sactic acid differed from sarcolactic, although it accompanied sarcolactic acid in extract of meat Erlenmeyer (A 191, 261) showed that Wislicenus's ethylene lactic acid from glycol chlorhydrin is hydracrylic acid, and could be converted by HI into \$ 10do propionic acid The acid accompanying sarcolactic acid 18, according to Siegfried (B 22, 2711) the acetyl

derivative of lactic acid

Occurrence -1 Discovered by Scheele in sour milk and first recognised as a peculiar acid by Berzelius -2 In opium (Smith, Ph [2] 7, 50, Buchanan, B 3, 182)

Formation -1 by the lactic fermentation of milk sugar, cane sugar, or glucose (v Fermentation, vol in p 543) -2 By the exidation of propylene glycol by the oxygen of the air in presence of platinum black (Wurtz, A 105, 206, 107, 192) —3 By boiling a chloro propionic acid with water and Ag₂O (Wurtz, A Ch [3] 59, 165, Buff, A 140, 156) In like manner from a bromo propionic acid (Friedel a Ma chuca, A 120, 286) -4 By the action of nitrous acid upon alanine (Strecker, A 75, 27, 42) -5 By the reduction of pyruvic acid by sodium amalgam (Wislicenus, A 126, 227) or with zinc in presence of dilute acetic acid (Debus, C J 16, 260) -6 From aldehyde by combination with HCy a d saponification of the resulting nitrile (Wishcenus, A. 128, 6, Simpson a Gautier, A. 146, 254) —7 By heating di chloroacetone with a large quantity of water at 200° (Linnemann a Zotta, A 159, 247) -8 By boiling glucose with aqueous NaOH (Hoppe Seyler, B 4, 346) —9 When glucose (20 g) is allowed to stand with potash (40 g) and water (200 c c) at 40° in a flask loosely plugged with cotton wool, it is converted within 24 hours into lactic soid (8g) and another soid, soluble in alcohol (Nencki a Sieber, J pr 183, 499) Lactic acid may possibly be thus formed in animals from sugar The decomposition occurs even in very dilute solutions, thus even 9 g of glucose and 9g of potash dissolved in 8 litres of water and kept at 85°-40° are converted in 10 days into potassium lactate Na₂CO₂ does not decompose

sugar at 40°, nor does NH_s, but NaOH_t NMe_tOH and neurine do convert it into lactic acid. Creatiline and guanidine produce no lactic acid. Milk sugar and maltose behave like glucose. Lactic acid is formed when glucose (dextrose) (1 pt), water (10 pts) and KOH (2 pts) are left, even in an atmosphere of hy drogen, for 48 hours at 35° No sugar is left (Nencki a Sieber, J pr [2] 26, 1, Kiliani, B 15, 701)—10 By heating cane sugar with baryta at 150° (Schutzenberger, Bl [2] 25, 289)—11 Among the products of the distillation of glycerin with KOH (Herter, B 11, 1167), and formed, together with formic and oxalic acids, by boiling glycerin with potash solution (Debus, A 109, 229)

The filtered solution of Preparation -1 sour whey evaporated nearly to dryness, in strong alcohol, is mixed with alcoholic tartaric acid, as long as any precipitate of tartrate of potassium, sodium, and calcium is formed, the liquid decanted after 24 hours, and evaporated. the residue dissolved in water, the solution digested with carbonate of lead, till lead dissolves in it, the filtrate evaporated, neutralised with carbonate of barium, again filtered, and diluted with water, the whole of the barium precipitated with sulphate of zinc, and the fil trate evaporated till lactate of zinc crystallises out (Berzelius, Lehrb Ausg 5, v 241) -2 Three kilos of cane sugar and 15 g of tartario acid (which serves to invert the cane sugar) are dissolved in 13 kilos of boiling water. 11 kilos of levigated chalk added after two days, together with 60 g of stinking cheese, suspended in 4 kilos of sour milk (decaying cheese favours the production of lactic acid and retards its conversion into butyric acid), the mixture set aside at a temperature between 30° and 35°, and well stirred every day till, in the course of six or eight days, it is converted into a stiff paste of lactate of calcium, this paste is boiled for an hour with 15 g of quicklime and 10 kilos of water, the solution strained through a cloth filter and evaporated to a syrup, the crystalline mass, which forms in four days, pressed, first by itself, then three or four times, after having been each time stirred up, with 14 of its weight of cold water, and the lactate of calcium thus purified is dissolved in twice its weight of boiling water. To the solution of every 32 pts of the calcium salt there is then added a mixture of 7 pts oil of vitriol and 7 pts water, the lactic acid, while still hot, is strained through linen to separate it from sulphate of lime, the filtrate obtained from 7 pts of oil of vitriol is boiled with 12 pts carbonate of zinc for a quarter of an hour (by longer boiling a very sparingly soluble basic salt is formed), the liquid is filtered boiling hot, the colourless crystalline grains of lactate of zinc, which separate on cooling, are freed from sulphuric acid by washing with cold water, and additional quantities of crystalline grains are obtained by evaporating the mother-liquor almost to the end Lastly, 1 pt of the zinc palt is dissolved in 7½ pts of boiling water, sulphuretted hydrogen passed through the solution as long as sulphide of kine is precipitated, and the filtrate boiled and evaporated on the water bath to a syrup, whereupon 8 pts. of the sine salt yield 5 pts. of syrupy lactic

acid (Bensch, A 61, 174) By this process, 100 pts of cane sugar yield 117 pts of lactate of calcium, which, if the sugar was white, is colourless, and does not require to be purified by pressure (cf Engelhardt a Maddrell, A 63, 83, 70, 241, Boutron a Fremy, J Ph 27, 341) 8 Lautemann (A 113, 242) recommends the following modification of Bensch's process of preparation -Retaining the proportions of sugar, tartaric acid, milk, and cheese indicated by the latter, he takes one third more water, uses 1,200 g oxide of zinc (commercial zinc white) instead of levigated chalk, and keeps the temperature as constantly as possible between 40° and 45° during the fermentation eight or ten days, the inside of the vessel is lined with white crystals of lactate of zinc, which can be obtained pure by one or two crystalli sations from boiling water The lactic acid prepared from the zinc salt generally contains mannite, which does not completely crystallise out from the concentrated and To separate this, the aqueous acid is shaken up with ether. and then the ethereal layer is pipetted off and evaporated it then leaves pure lactic acid -4 The following mixture is recommended by C O Harz (Vierteljahrsschrift pr Pharm 20, 501), 3 pts milk sugar, 36 pts ordinary water, 05 to 075 pt flour containing a large proportion of gluten, a little beer yeast, 6 pts of soda crystals, or 3 pts of sodium bicarbonate When the fermentation has once been set up by milk sugar, it may be continued by addition of cane sugar -5 By the action of NaOH or KOH on dextrose or levulose, the operation being per formed as follows -A solution of 500 grms of cane sugar in 250 cc of water and 10 cc dilute sulphuric acid (3 pts H2SO, to 4 pts H2O) is heated to 50° in a closed vessel for 3 hrs After cooling, 400 cc of aqueous NaOH (50 pc) is slowly added The mixture is then warmed to 60°-70° till it no longer reduces Fehling's solu tion, the calculated quantity of H2SO4 (same strength as b fore) is then added, and the Na, SO, made to crystallise out by cooling and The mass is extracted with 93 pc agitation spirit and filtered, the filtrate is divided into two portions, one half being neutralised with ZnCO3 filtered hot and the other half added On cool ing, the zinc lactate crystallises out in a nearly pure state, the yield is 200 grms (Kiliani, B 15, 699, cf Hoppe Seyler, B 4, 346)

Properties — Colourless syrup with very sour taste Hygroscopic Miscible with water and alcohol, sl sol, ether Does not solidify at -24°

Reactions—1 When gradually heated it gives off water at 130° leaving sold lactide. At 250° to 300° the products are CO, CO₂, alde hyde, and lactide—2 Dilute H₂SO₄ at 130° gives aldehyde and formic acid (Erlenmeyer, Z 1868, 343) CH₂ CH(OH) CO₂H = CH₂ CHO + HOO₂H. 3 When gently heated with cone H₂SO₄ it gives off CO freely (Pelouze, A Ch [3] 13, 257)—4 Boiling nitric acid forms oxalio acid—5 Dis tillation with NaCl, dilute H₂SO₄, and MnO₂ yields aldehyde and chloral (Stadeler, A 69, 382)—6 Pistillation with MnO₂ and dilute H₂SO₄ yields aldehyde and CO₂—7 Fuming H₂SO₄ gives methane disulphonic acid (Strecker, A. 118, 291)—8 Chromic acid sinches gives

acetic acid and CO₂ (Chapman a Smith, Z. 367, 477)—9 KMnO₄ gives pyruvic acid—10 PCl, acting on dry calcium lactate gives chloro-propionyl chloride CH₂ CHCl COCl whence water forms a chloro propionic acid 11 HIAq reduces it to propionic acid (Lautemann, A 113, 217) —12 A concentrated solu tion of potassium lactate submitted to electrolysis yields aldehyde and CO₂ (Kolbe, A 118, 244, Brester, Z 1666, 680)—13 Distillation with quicklime yields alcohol $C_3H_0O_3$ = $CO_2 + C_2H_0O$ (Hanriot, C R 101, 1156, Bl[2] 45, 80) —14 Heated at 170° in a stream of gaseous HBr, or at 100° in sealed tubes with conc HBrAq, it yields a bromo propionic acid (Kekulé, A 130, 11) -15 Bromine at 100° decomposes lactic acid (Beilstein, A 120, 227) Br acting on an ethereal solution of lactic acid forms tribromo pyruvic ether (Wichelhaus, A 143, 10, Klimenko, J R 8, 125) -16 The d y distillation of calcium lactate produces CO, ethylene, propylene (Gossin, Bl [2] 43, 49), acrylic acid, phenol (?) (Claus, A 136, 287), and other products—17 Distillation of calcium lactate with soda lime yields acetic, propionic, butyric, hexoic, and other fatty acids Heating calcium lactate with KOH at 280° yields formic, acetic, propionic, butyric, and oxalic acids (Hoppe Seyler, H 3, 352)—18 Among the products of the nutrefactive fermentation of calcium lactate are hydrogen, CO2, acetic, propionic, butyric, and n valeric acids and ethyl alcohol (Pasteur, Bl 1862, 52, Strecker, A 92, 80, Fitz, B 11, 1898, 12, 479, 13, 1309)—19
Heating with mamido benzoic acid forms CH, CH(OH) CO NH C₆H, CO₂H crystallising from water in small prisms [162°] (Pellizzari, A 232, 154), which at 240 forms an anhydride CH, CH

N C_oH₄ CO₂H [243°] The corre

sponding acetyl derivative

CH₃ CH(OAc) CO NH C₆H₄ CO₂H melts at 148° Estimation —The substance, acidified with H₂SO₄, is extracted with ether, the ethereal solution evaporated, the residue treated with water and the aqueous solution ppd with lead acetate and filtered The filtrate is then ppd with alcoholic NH₄, and the pp of Pb₂O₂2(C₅H₆O₂) washed with alcohol, dried, weighed, ignited, and weighed again (Palm. Fr 26, 33)

Salts -The crystalline lactates do not effloresce in the air, but give off water in vacuo They are not decomposed at 150° They are insoluble in ether and, for the most part, spar ingly soluble in cold water —Ammonium salt forms deliquescent prisms, and gives off NH, when exposed to air -NaA' (at 140°) amor phous, deliquescent mass, v sol water and alcohol, ppd by ether from its alcoholic solution —Na₂C₃H₄O₂ te CH₃ CH(ONa) CO₂Na ob tained by the action of sodium on the preceding at 130°. Hard, deliquescens brittle mass. De composed by cold water, with evolution of heat, into NaOH and NaC,H,O, Absorbs CO, from the air, forming 1,a,CO, and sodic lactate Basic sodium lactate appears to dissolve without decomposition in perfectly dry alcohol MeI it gives Nal and CH, CH(OMe) CO, Na (Wishcenus, A 125, 49)—Potassium salt crystallises with difficulty—BaA', 4aq (at 100°): large cauliflower-like bun lles of rectangular needles (Hans Meyer, B 19, 2454) Deliquescent, v sol dilute alcohol, insol absolute alcohol and ether — BaH₂A'₄ crystals, v sol water Not altered by exposure to air —CaA'₂5aq small white mammillated crystals (from water or alcohol) S 105 in the cold Extremely soluble in boiling water Sol hot, nearly insol cold, alcohol At 100° it becomes CaA', and at 280° it is converted into CaC_aH_aO_a (Wurtz a Friedel, A Ch [8] 63, 184)—CaH_aA', 3aq crystals resembling wavellite, sol absolute alcohol (Engel-hardt a Maddrell, A 63, 119) —CaK, A', octa nedra Deposits CaA' when dissolved in war.n water (Strecker, A 91, 352) -CaNa, A', 2aq granules (S) CaClA' aq prisms, v e sol water (E a M) -Ca₂(CHO)(C₂H₂O₂)Cl₂10aq from calcium chloride, formate, and lactate (Böttinger, A 188, 329) Long needles—SrA', 3.q very soluble—MgA', 3aq prisms, insol alcohol, less soluble than the corresponding sarcolactate S 36 in the cold, 167 at 100° -Al, A', triclinic octahedra (Hans Meyer, B 19, 2454)—AlNa, A', 5aq rectangular prisms and tables—FeA', 3aq small greenish crystals S 2 1 at 10°, 8 5 at 100° Insol alcohol—Ferric lactate is a brown amorphous deliquescent mass, v sol water -MnA', 3aq amethyst coloured monoclinic crystals, m sol cold, v sol hot, water — CoA'23aq peach blossom coloured needles, nearly insol cold, m sol boiling water, insol alcohol -NiA'23aq apple green needles - ZnA', 3aq shining crusts, or large crystals irregularly grouped S 107 at 8° (Buff A 140, 160), 18 at 10° (Wishcenus, A 126, 228), 19 at 15° (Strecker A 105, 316), 167 at 100° Almost insol alcohol, which partly con Almost insol alcohol, which partly con verts it into amorphous ZnA', aq, which again takes up 2aq when exposed to the air (Klimenko, J R 12, 98) —ZnA N,H_e—ZnA',N,H_e (Lut schak, B 5, 30) —ZnNa,A', 2aq —CdA', small needles Anhydrous when deposited from a boiling solution Insol alcohol S 10 in the cold, 12 5 at 100° —BiC₆H₁O₆ (Brüning, A 104, 194) — CuA'₂ 2aq dark blue monoclinic tables (Schabus J 1854, 40a) S 167 in the cold, 45 at 100° S (alcohol) 9 in the cold, 4 at Decomposed at 200° giving aldehyde, lactide, and CO₂ (Engelhardt, A 70, 249) — CuC,H₄O₃ v sl sol water —Hg₂A'₂ aq rosecoloured or crimson crystals, sl sol water, ob tained by mixing the boiling solutions of mercurous nitrate and sodium lactate (E a M)-Prisms of the mercurous salt Hg,A', are also formed by boiling aqueous lactic acid with HgO (Bruning) —SnC₂H₄O₂ crystalline powder, insol water — PbA'₂ gummy, v sol water —PbC₂H₄O₃ (Moldenhauer, A 131, 333) —Pb₂A'₂O₂ aq heavy granular pp, formed when lactic acid is mixed with lead acetate and alcoholic NH_a—UrOA' yellow crystal line crusts — AgA' aq silky needles S 5 in the cold V sol hot, nearly insol cold, alcohol

Nitroxyl derivative
CH₂ CH(ONO₂) CO₂H SG 135 Formed
by dissolving lactic acid in a mixture of cone
HNO₂ and H₃SO₄, and ppg with water (Henry,
B 3, 532) Thick oil Sl sol water v e sol
ether Decomposes in the cold into HCy and
example acid (Henry, B 12, 1837)

Acetyl derivative C, H,O, 1.e CH, CH(OAc) CO,H [167°] (Siegfried) Formed by heating ethyl lactate with Acol and saponifying the product by heating it with water at 150° for 3 hours (Perkin, Z 1861, 166, Wislicenus, A 125, 60) Formed also by boiling a solution of zinc acetate and sarcolactate or lactate (Siegfried, B 22, 2715) Occurs in extract of meat. Thin needles, v e sol water Inactive tile with steam Decomposed by long boiling with water into acetic and lactic acids Bases quickly effect this decomposition When first prepared it is soluble in alcohol, but on keeping it becomes insoluble in alcohol, does not then melt below 300°, and is saponified with great difficulty by alkalis HI produces no \$ 10dopropionic acid — BaA'24aq brittle gumlike mass, v sol water, sol alcohol —Copper salt amorphous deliquescent bluish green mass— ZnA'₂ gummy mass Its solutions become quickly acid, from conversion into acetic acid and zinc lactate

Benzoyl derivative C₁₀H₁₀O₄ te CH₂CH(OBz) CO₂H [112°] S 25 in the cold Obtained by heating lactic acid with benzoic acid at 180° (Strecker, A 80, 42, 91, 360) Formed also by the action of BzCl on calcium lactate (Wislicenus, A 183, 277) Tables or needles, m sol boiling water, v sol alcohol and ether Converted by boiling water into benzoic and lactic acids When recrystallised from water benzoyl lactic acid is always accompanied by an oily hydrate C₁₀H₁₀O₄ aq, which in dry air is slowly converted into the crystalline acids—BaA', 6aq thin six sided plates—AgA'

acids—BaA', 6aq thin six sided plates—AgA'
Amide C,H NO, ie CH, CH(OH) CONH,
[74°] Obtained by the action of gaseous or
alcoholic NH, on lactide (Wurtz a Friedel, A Ch
[3] 63, 108) Formed also by saturating ethyl
lactate with ammonia and allowing the liquid to
stand (Bruning, A 104, 197), and by heating
ammonium lactate in a slow current of dry NH,
at 130° (Engel, C R 98, 574) Small prisms, v
sol water and alcohol Does not combine with
acids or bases, but is decomposed by them on
boiling into NH, and lactic acid

Benzoyl derivative of the amide CH, CH(OB2) CONH, [124°] From benzoyl lactic ether and alcoholic NH, (Wislicenus, A 133, 257) White needles, may be sublimed, sl sol water, v sol alcohol Resolved by boiling KOH into lactic and benzoic acids and NH, Prolonged treatment with alcoholic NH, forms benzamide and lactamide

Isomeride of the amide C₄H,NO₂ Formed by heating ammonium lactate in a cur rent of dry NH₂ at 100° (Engel, C R 98, 574) Pale amber coloured syrup Decomposes at 200° In contact with water it immediately forms ammonium lactate

Ethylamide CH, CH(OH) CO NHEt [48°] (260°) From lactide and NH,Et Crystalline (Wurtz a Friedel, A Ch [3] 63, 110) Decomposed by alkalis into ethylamine and lactic acid

Antitée C. H. 1NO; te CH. CH (OH) CO NHPh [58°] Formed by heating lactic ether with aniline *t 150° (Leipen, M 9, 48) Colourless prisms, sl sol water, insol ligroin, v sol ether, chloroform, and alcohol. o-Tolusde C₁₀H₁₃NO₂. [72°] From o-toluidine and lactic ether Crystalline powder [72°] (from benzene) Insol ligroin (Laipen, M. 9, 50, 51)

p.Tolusds C, H, NO, ss CH, OH(OH) CO NHC, H, Me [102°] From toluidne and ethyl-lactate White needles [102°] From p-

sl sol water

Cyanamide CN NH(CO CH(OH) CH₃) Formed by dissolving lac-Lacto-cyanamide tide (20 g) in a strong alcoholic solution of potassic cyanide (16 g), passing in CO₂ to remove free alkalı and evaporating to crystallisation (Mertens, J pr 125, 33) It forms a silver

Methyl ether C,H,O, 16 CH, CH(OH) CO Me (145° 1 V) S G § 1 1180 (Schreiner, A 197, 1, B 12, 179) Colourless neutral liquid Combines with CaCl2. Is imme-

diately decomposed by water

Ethyl ether C₃H₁₀O₃ * e

CH₂CH(OH) CO₂Et

Ethyl lactate (154 5°

1 V) S G § 1 0546 Formed by distilling cal (154 5° cium lactate with KEtSO, (Strecker, A 81, 247 91, 355) Formed also by heating lactic acid (dried at 145°) with alcohol (F a W) and by passing alcohol vapour into lactic acid at 175° (Wishcenus, A 125, 58) Colourless liquid, immediately decomposed by water (Schreiner) Forms with CaCl, the compound CaCl, 4EtA Colourless liquid, crystallising in granules Chloral gives a liquid compound, whence phosphorus pentachloride forms liquid CCl₃ CHCl O CHMe CO₂Et S G ¹¹ 1 42 (Henry, Bull Acad Roy Belg [2] 37, No 5) Lactic ether is a weak hypnotic (Pellacani a Bertoni, C C 1887, 1149)

Acetyl derivative of the ethyl ether CH, CH(OAc) CO₂Et (177°) at 733 mm V D 5 70 (calc 554) SG 17 1046 From ethyl lactate and AcCl (Wishcenus, A 125, 58) Neu tral oil, gradually decomposed by water into alcohol and CH₂ CH(OAc) CO₂H Miscible with

alcohol and ether

Bensoyl derivative of the ethyl ether CH, CH(OBz) CO₂Et (288° cor) From ethyl lactate and BzCl at 100°, or from silver benzoyllactate and EtI (Wislicenus, A 133, 272) miscible with alcohol and ether Resolved by water at 150° into lactic acid and benzoic ether Alcoholic NH, gives CH, CH(OBz) CONH,

Nitroxylderivative of the ethylether CH₄ CH(ONO₂) CO₂Et (178°) S G 13 1 153 From ethyl lactate, HNO, and H2SO, (Henry,

B 3, 532)

Butyryl derivative of the ethyl ether CH, OH(O C4H,O) CO2Et (208°) SG 2 1 024 From a chloro-propionic ether and potassium butyrate (Wurtz, A 112, 235)

Isopropyl ether CH, CH(OH) CO.Pr

(167°) (Sılva, Bl [2] 17, 97)

Ethylidene ether CH, CH CO O Formed by heating lactic acid with

acetic aldehyde at 150° (Leipen, M 9, 46). Liquid, al sol water Quickly decomposed by hot water into its components

Tri-chloro-ethylidene ether

CH, CH<O O CH COI. [45°] (228°)Prepared by heating syrupy lactic acid with excess of chloral for a short time at 150°, and

distill ng the product with steam (Wallach, A. 193, 1) Colourless crystals, readily sol alcohol,

ether, and CS₂, insol water

Methyl derivative C₄H₂O₂ is

CH₄ CH(OMe) CO₂H

The Na salt is formed, together with the methyl ether, by treating CH, CH(ONa)CO,Na with MeI The free acid is a syrup, volatile with steam. It forms an amorphous silver salt O4H,AgO3, v sol water

Methyl ether of the methyl derivative C₁H₁₀O₃ ve CH₃ CH(OMe) CO₂Me (135°-138°) (Markownikoff a Krestownikoff, A 208, 343) From basic sodium lactate CH₃ CH(ONa) CO₄Na and MeI (Wislicenus, A 125, 53)

Ethylether of the methyl derivative C_eH₁₂O₃ re CH₂ OH(OMe) CO₂E (135 5° 1 V). SG § 9906 From a bromo propionic ether and NaOMe (Schreiner, A 197,1) Colourless liquid, nearly insol water

Ethyl derivative C, H,O, 1e

CH, CH(OEt) CO2H Ethyl lactre acid (195°-198°) Obtained by decomposing its ether CH, CH(OEt) CO.Et with caustic potash or lime Formed also, together with CH.I. and acrylic acid, by the action of NaOEt on iodoform (Butlerow, A 114, 206, 118, 325, BL 1861, 9) Liquid, partly decomposed by distillation Miscible with water, alcohol, and ether, but separated from its aqueous solution by CaCl, or Na₂SO₄ Decomposes carbonates Alkalis do not convert it into lactic acid and alcohol When heated with conc HIAq there is formed lactic acid and EtI

Salts - CaA', 2aq flat prisms, v sol water -AgA' bunches of slender silky needles (from hot water)

Ethyl ether of the ethyl derivative C,H,O, ie CH, CH(OEt) CO,Et (155° 1 V) (Schreiner, B 12, 179) SG 8 9498 VD 505 (calc 506) Formed by the action of NaOEt on a chloro propionic ether (Wurtz, A Ch [3] 59, 169) Formed also by treating lactic ether with sodium and EtI (Wurtz a Friedel, A Ch [3] 63, 103) Also from silver ethyl lactate and EtI Colourless liquid, nearly insol water, sol alchohol and ether convert it into alcohol and ethyl lactic acid

Amide of the ethyl derivative CH, CH(OEt) CONH, Lactamethane [68°] (219°) Formed by allowing CH, CH(OEt) CO,Et to stand a few days with aqueous NH, (Wurtz, A Ch [3] 59, 174) Broad plates, sol water, alcohol, and ether Decomposed by distillation

with potash into NH, and lactic acid

Phenyl derivative CH₂CH(OPh) CO₂H.
Phenoxy propionic acid [113°] Formed from
a chloro propionic acid (25 g), strong caustic
soda (to neutralisation), and sodic phenylate
(24 g) The liquid is evaporated till it becomes (24 g) thick, dissolved in water, and treated with HCl (L Saarbach, J pr 129, 152) Glassy needles (from water) Sl sol cold water, volatile with steam, v sol hot water, alcohol, and ether. Aqueous solutions give a yellow pp with FeCl, Its salts are soluble in water —NaA' Exhibite rotatory action while dissolving in water Deliquescent —KA'1 aq at 180° — CaA', 2aq —AgA'; sharp needles, blackened by light

Ethyl ether of the phenyl derivative Eth. (244°) SG 1860 Formed when an alcoholic solution of the acid is allowed to standMore rapidly by passing HCl into such a solu-

Amide of the phenyl derivative CH, CH(OPh) CONH, [130°] Formed from the ether by aqueous ammonia Crystallises V sol alcohol from hot water in long needles and ether Dissolves in hot HCl, on cooling crystals of the hydrochloride of the amide separate

Bromo-pheryl derivative

OH, CH(OC,H,Br) CO₂H Bromo phenoxy pro-prome acid [106°] Formed by the action of bromine water on a solu ion of phenylated lactio acid Crystallised from alcohol V sol. alcohol and ether, sl so water Boiling aqueous NaOH cannot turn out the bromine, 'tence Br is in the benzene nucleus (Saarbach, J pr [2] 21, 157) — NaA' Deliquescent needles

Thymyl derivative CaH.PrMe O CHMe CO2H Formed by heating thymol with a chloro propionic soid in presence of a 50 pc solution of KOH, acidifying with HCl, and adding ammonium carbonate (Scichi lone, G 12, 48) The acid from synthetical thymol crystallises in prisms [74°], v sol alco hol, ether, and chloroform The acid from natural thymol crystallises in needles [48°], and forms very soluble and amorphous Ba and Ag

p Benzyl-phenyl derivative C.H. CH.C.H. O CHMe CO.H [102°] From p benzyl phenol, KOH, and a-chloro propionic acid (Mazzara, G 12, 264)

Benzyl p-tolyl derivative C₄H, CH, C₄H, Me O CHMe CO₂H [1150] Small crys-Formed in like manner (Mazzara) tals, sl sol water, v sol alcohol and ether solutions give a yellow turbidity with ferric salts and crystalline pps with lead acetate and AgNO,

Allophanyl derivative

NH, CO NH CO O CHMe CO, H [190°] Formed by passing gaseous cyanic acid into an ethereal solution of lacticether and saponifying the result ing allophanyl lactic ether with conc HClAq at 100° (Traube, B 22, 1572) Minute colourless needles, m sol cold, v e sol boiling, alcohol or water When heated above 190° it splits up into lactic and cyanic acids -AgA' white powder, decomposed by boiling water -PbA',

orystalline pp

Ethyl ether of the allophanyl derivative Et!' [170°] Colourless needles, v sol hot alcohol and hot water, v sl sol ether Decomposed by alkalis into CO2, ammonia, alcohol, and lactic acid Ammonia yields

biuret

Isoamyl ether C,H,A' [131°]. Monobasic anhydride

C_cH₁₀O₃ ie CH₃ CH(OH) CO O CHMe CO₂H Dilactic acid Formed when aqueous lactic acid is left for several months over sulphuric acid in vacuo (Wislicenus, A 164, 181) quires 1 mol of KOH for each mol of C.H,O, to neutralise it, but the neutral solution gradu-

ally becomes acid from liberation of free lactic acid, potassium lactate being also formed By heating lactic acid at 140° this anhydride is formed together with lactide It may also be

Vor III

amorphous Mg and Casalts The ethyl ether CH, CH(OH) CO O CHMe CO2Et (c 235°) 8 G 2 1 134 is formed by the action of chloro-proplonic ether on potassium lactate (Wurtz a Friedel, A Ch [3] 63, 112) It is decomposed when heated with water into lactic acid and alcohol

Distributed by the Distributed by the Distributed C₁₀H₁₈O₃ are (CH₂CH(CO₂Et))₂O or CH₃CH(OEt) CO O CHMe CO₂Et (190° and CH₃CH(OEt)) CO O CHMe CO₂Et (190° and CH₃CH(OEt)) CO O CHMe CO₂Et (190° and CH₃CH(OEt)) vacuo) Formed by treating a-chloro propionio ether with CH₁ CH(ONa) CO₂Et at 115° (Britg gen, A 148, 224) Scarcely attacked by conc Scarcely attacked by conc KOHAq Alcoholic KOH gives lactic acid and ethyl lactic acid NH, in ether forms an oily amide C₈H₁₅NO₄, decomposed by KOH giving lactic and ethyl-lactic acids

Neutral anhydride C.H.O. s.c.

сн, сн<0 со осн сн, Lactide [124 59] (255°) V D 481 (calc 496) (Henry, B 7, 753) Formed by the dry distillation of lactic acid (Gay Lussac a Pelouze, A 7, 43, Pelouze, A 53, 116, Engelhardt, A 70, 243, Wurtz a Friedel, A Ch [3] 63, 101) Prepared by pass ing dry air through lactic acid at 150° (Wish cenus, A 167, 318) Monoclinic tables (from alcohol) May be sublimed V sl sol. hot water, but gradually converted thereby into lactic acid Bases quickly convert it into lactic acid Ammonia gives lactamide Ethylamine gives the ethylamide of lactic acid CH, CH(OEt) CO,Et forms a compound C₁₂H₂₂O, (270°) decomposed by potash into alcohol and lactic acid

Nitrile C.H.NO is CH, CH(OH) CN Aldehyde cyanhydrin (183°) Formed in the cold by allowing a mixture of aldehyde (1 mol.) and anhydrous HCy to stand for 9 days (Max well Simpson a Gautier, Bl [2] 8, 277) Liquid, not solidified at -21° Partially decomposed into its components by distillation Miscible with water, alcohol, and ether Aqueous KOH forms KCy and aldehyde (or aldehyde resin) Conc HClAq acts violently upon it, at 0° the products are lactic acid and NH,Cl

Sarcolactic acid C3H6O, 1 e

CH, CH(OH) CO H Paralactic acid (Heintz, P 75, 391) [a]_D = 35° Occurs in muscular tissue, thymus and thyroid gland, urine after much exercise, spleen, lymphatic glands, and in pig's bile (Liebig, A 62, 278, 326, Wishcenus, A 167, 302, Strecker, A 123, 354, Colasanti a. Moscatelli, H 12, 416, G 17, 548, 18, 548, Marceuse, B C 1887, 92, Nebelthau, Zent Brol 25, 123, Hirschler, H 11, 41, Gleiss, Pf 41, Sarcolactic acid is absent from living blood, but occurs in blood after death (Salomon, Virchow's Archw, 113, 356, of Berlinerblan, C C 1888, 757, Vissokovitch, C C 1888, 117) Sarcolactic acid may occur sometimes along with ordinary lactic acid as a product of fermentation (Maly, B 7, 1567) Its presence is then due to micrococcus acidi paralactici, which can convert glucose into sarcolactic acid (Nencki a Sieber, M 10, 532) Sardolactic acid is formed in the fermentation of inosite by cheese (Helger, A 160, 336) It is also formed by the action of nitrous acid on the formed from a-bromo propionic soid and potas-sum lactate (Brüggen, Z 1869, 388) It forms amido propionamide present in urine A dextrorotatory lactic acid is formed by the action of Pemcelleum glaucum on ordinary ammonium

lactate (Lewkovitch, B 16, 2720)

Preparation.—1 Chopped fiesh is exhausted with cold water, the extract mixed with baryta water, the albumen coagulated by boiling and removed by filtration, and the clear liquid concentrated by evaporation Sulphuric acid is added to the syrupy residue, and it is shaken with ether, which leaves sarcolactic acid when evaporated —2 Extract of meat (1 pt) is dissolved in warm water (4 pts) and ppd with 90 p.c. alcohol The filtrate is evaporated to a syrup, mixed with 4 pts of alcohol, filtered, evaporated, acidified by H₂SO₄ and extracted with ether (Klimenko, J. R. 12, 17, Bl [2] 84, 321)

Properties — Dextrorotatory syrup, forming levorotatory salts Resembles ordinary lactic acid in its reactions. In a dry atmosphere it changes in the cold to a levorotatory anhydride $[a]_D = c - 86^\circ$ At 140° it forms ordinary lactide, whence water produces ordinary inactive

lactic acid (Strecker, A 105, 313)

Reactions—1 Hot dilute sulphuric acid

splits it up into formic acid and aldehyde—2

Chromic acid maxture gives CO, and acetic

acıd

Salts —CaA'₂4aq (Engelhardt, A 65, 359) S 8 in the cold V sol boiling water and alcohol —CaA'₂5aq changes into CaA'₂5aq on recrystallisation —MgA'₂4aq More soluble in water and alcohol than ordinary magnesium lactate —NiA'₂3aq —ZnA'₂2aq Forms more distinct crystals than ordinary zinc lactate S (of ZnA'₂2aq) 57 at 145°, the solubility of ordinary zinc lactate being 17 (Wislicenus) S (98 pc alcohol) 104 —ZnA'₂3aq Ppd by adding alcohol to an aqueous solution of the zinc salt —AgA'₂aq flat needles

zinc salt —AgA' $\frac{1}{2}$ aq flat needles Ethyl ether EtA' [a]_D = -14 2° From the silver salt and EtI (Klimenko)

Chloro lactic acid v Chloro oxy-propionic

Chloride of lactic acid v Chloride of a-Chloro-propionic acid

LACTIDE v Neutral anhydride of Lactic

LACTIM A compound of the form C OH (Baeyer, B 15, 2093).

LACTIMIDE C.H.NO 1.6

CH_s CH CO_{NH} [275°] Produced together with ethylamine and CO₂ by heating alanine in dry HCl at 190° as long as water comes off (Preu, A 134, 872) The brown amorphous product is treated with lead hydroxide and H₂S and recrystallised from alcohol Colourless needles, may be sublimed V sol water and alcohol Has a bitter taste Its solution does not dissolve Ag₂O or give a pp with ZnCl₂ or AgNO₃

LACTO-ALBUMEN v Milk LACTO-ALBUMOSE v Milk

LACTO-EIONIC ACID $C_{12}H_2O_{12}$. Formed by treating a solution of milk sugar (1 pt) in water (7 pts) with bromine (1 pt) at ordinary temperatures for some days, the bromine is next removed by a stream of air and H_2S , the HBr is

removed with white lead followed by Ag₂O and the metals with H₂S, on treating the syrup so obtained with glacial acetic acid the lacto bionic acid is left. The product is purified by conversion into lead salt, with specially prepared basic lead acetate, and decomposition of the same with H₂S (Emil Fischer a Jacob Meyer, B 22, 362) Colourless syrup of strong acid reaction, v sol water, v sl sol alcohol, insol ether. Shows no tendency to crystallise. Does not reduce alkaline copper solutions even on boiling. On warming a short time with dilute mineral acids it splits up into galactose and gli come acid.

C₁H₂O₁₂ + H₂O = C₈H₁O₄ + C₆H₁O₇

LACTOCYANAMIDE v Lactic actic, p 112

LACTONES Anhydrides of oxy acids formed by elimination of water between the hydroxyl and carboxyl groups, both being in the same carbon chain The name is derived from lactide which, until its vapour density had been determined, was written CH₃ CH $\stackrel{\circ}{CO}$ Lactones are usually derived from γ - or from δ oxyacids The formula $R''R'C \stackrel{\circ}{CH_2} CH_2$ represents a γ lactone, while

R''R'C < CH₂·CH₂ > CH₂ is a 8 lactone (Fittig, A. 200, 21, 208, 67, 216, 52)

200, 21, 209, 67, 216, 52)

Formation—1 γ Oxy acids split up in the cold, and immediately on heating their aqueous solution into water and a γ-lactone—2 Formed by boiling their carboxylic acids with dilute H.SO₄ (Erdmann, A 228, 176)—3 From ethers of γ oxy acids on distillation, alcohol being split off, eg oxy iso caproic ether (Bredt), oxy valeric ether (Kissling)—4 From unsaturated acids (v A 227, 8, 26), eg

Properties —Volatile liquids, neutral to litnus Volatile with steam

Reactions -1 7 Lactones do not take up water to form an oxy acid by mere boiling the other hand most 8 lactones in presence of water, cold or hot, are partially converted into acid, and tend to assume equilibrium with 65 pc of lactone to 35 pc of acid (Fittig a Wolff, A 216, 187, Hantzsch, A 222, 28) — 2 All lactones are converted into salts of the corresponding oxy acids by boiling with aqueous solutions of alkalis, alkaline earths, and sometimes even with CaCO, (Fittig, A 208, 116). 3 All lactones form compounds with NH3, which easily split up into their components (Wolff, A 229, 278) These compounds are pro-bably acid amides—4 No lactone at present known reacts with hydroxylamine, but a few aromatic lactones readily react with phenyl-hydrazine (e.g. phthalide) Hence the fact of an oxygen compound reacting with phenyl hydrazme cannot be taken (as previously assumed) as a proof of its aldehydic or ketonic nature This can only be proved by its behaviour towards hydroxylamine (V Meyer a Münchmeyer, B 19, 1706) The compound formed with phthalide appears to be HO CH, C,H, CO N,H,Ph being formed by direct addition (Wisheams, B 20, 401)—5 Lactones (1 mol) appear to react with oxalic ether (1 mol.) in presence of NaOEt (1 mol) Phthalide gives C₁₂H₁₀O₃ [122°] and | valerolactone also gives a crystalline compound (Wishcenus, B 20, 2061)

Lactones are for the most part described in this Dictionary under the oxy acids of which

they are the anhydrides LACTONIC ACID v GALACTONIC ACID

Lactonic acids Acids which are at the same time lactones When warmed with alkalis they give rise by assimilation of water to acids of higher basicity

LACTONITRILE v Nitrile of Lactic acid

LACTO-PROTEIN v MILE

LACTOSE or Milk sugar v Sugar and Milk LACTOSIN O36H62O31 Occurs in the roots of all the caryophyllacese, being most conve niently obtained from Silene vulgaris (A. Meyer, B 17, 685) White amorphous powder (anhydr), $[a]_D = +168$, or small glistening crystals $(+H_2O), [a]_D = +2117$ It forms gummy solu tions with water, but is sparingly soluble in alcohol The aqueous solution of the crystal lised lactosin gives no pps with neutral or basic lead acetate, although a pp is produced by lead acetate and NH. Fehling's solution is not re duced on short boiling By boiling with dilute H₂SO₄ it is inverted into lactose and a new sugar

LACTUCARIUM A brownish "isoid sub stance obtained by evaporating juice which exudes from incisions in the leaves and stem of certain species of lettuce, especially Lactuca vwosa It has an odour resembling opium and acts as a narcotic According to Ludwig (Ar Ph [2] 7, 129) it contains (50 p c of) 'lactucone' C₁₀H₈₆O₂, a crystalline substance [150°-160°] soluble in boiling alcohol, 'lactucic acid,' lactucin, a wax, and oxalic acid According to Hesse (A 234, 243) lactucarium contains the acetyl

derivatives of (a) and (B) lactucerol

LACTUCERIN C₄₀H_{el}O₃ (L), or C₂₂H_{el}O₂ (K),
or C₁₂H_{e2}O₃ (H) Lactucone [210°] Obtained
by washing lactucarium with benzene and extracting the residue with boiling alcohol, the crystals obtained may be purified by shaking their ethereal solution with aqueous KOH, and ppg by the addition of alcohol and water (Lenoir, A 60, 83, Kassner, A 238, 220) Lactucerin so prepared forms minute white needles [200°], but after sublimation in CO₂ it melts at 210° On fusion with KOH it gives lactucel On fusion with KOH it gives lactucol C, H20, hydrogen, and acetic acid It is dextrorotatory According to Hesse, lactucerin consists of the mono-acetyl derivatives of (a) and (B) lactucerol From the milk juice of lactuca canadensis, by crystallising from hot alcohol Flowers (Ph [3] 10, 44) obtained a 'lactucern' [89°] crystallising in colourless needles

Lactucone C, H₂₄O(?) [296°] Microscopic Insoluble in water, difficultly soluble needles in alcohol Occurs in French lactucarium from Lactuca altissima, from which it is extracted with 90 pc alcohol Acetic anhydride does not act upon it even at 200° By distillation with P.S. it gave a hydrocarbon of the constitution $C_{14}H_{22}$, boiling between 247°-252° (Franchimont, B 12, 10)

Lactucol C, H, O [1629] Obtained by fusing lactucern with KOH (Kassner, A 238, 224) Needles Dextrorotatory, [a]₀ = 46° Acetyl derivative C₁₈H₁₈AcO [200°]

Like lactucel and lactucerin its solutions in ether, chloroform, and CS, are dextrorotatory, $[\alpha]_D = 68^\circ$

(a)-LACTUCEROL C, H 60 O, [166°-181°]. Obtained by exhausting lactucarium with ligroin and extracting the residue with alcohol crystals so obtained are saponified by alcoholic potash, and the product ppd with water pp is recrystallised from alcohol, from which (a) lactucerol separates first (Hesse, A 234, 245,

244, 268)

Properties — Crystallises from 90 p c alcohol in silky needles (containing 2aq) From chloroform or ether it separates in anhydrous crystals. Insol water and alkalıs It melts at 162°, but after purification by conversion into its di-acetyl derivative and saponification of the product its melting point is higher Conc H₂SO₄ colours its solution in chloroform red It absorbs Br with It is dextrorotatory, in a 2 3 evolution of HBr p c solution in chloroform $[a]_D = 76.2$ at 15° It may be distilled in a current of CO2

Acetyl derivative C36H59AcO [202°-207°] Occurs in lactucarium, and is formed by heating (a) lactucerol for a short time with Ac.O at 80° Small plates, m sol cold alcohol, v sol

ether Dextrorotatory

Di-acetyl derivative C,6H,58Ac2O [1980-200°] From (a) lactucerol and Ac2O by boiling for 2 hours Satiny plates In a 1 pc solution in chloroform $[\alpha]_D = 63.6$ at 15°

D: propionyl derivative
C₁₄H₁₅(C₅H₅O),O₂ [152] Minute needles (from alcohol), v e sol CHCl₂ and ether

Di-bensoyl derivative CacH,sBz2O2 [156°] White crystals, insol water, v sol ether and chloroform, sl sol alcohol Saponified by alcoholic potash

(β)-Lactucerol $C_{10}H_{50}O_2$ [α]_D = 38 at 15° in a 4 p c solution in chloroform Occurs as a mono acetyl derivative in lactucarium, and separated from its (a)-isomeride by crystallisation from alcohol Long silvery needles (from ether or chloroform) Separates from alcohol as a gelatinous mass (containing 2aq) More soluble in alcohol, and less dextrorotatory than its iso meride

[230°] Acetyl derivative C36H39Ac2O Plates (from alcohol) Less sol alcohol and

ligroin han its isomeride

LACTUCIC ACID Obtained from the juice of Lactuca canadensis after separating 'lactucerin,' adding water, ppg with lead acetate, decomposing the lead salt with H₂S and evaporating (Flowers, Ph [3] 10, 44) Brownish green amorphous substance, with acrid, bitter taste. Sol alcohol, insol petroleum spirit, ether, and chloroform Ludwig (J 1847, 824) and Walz (N Jahr Pharm 15, 118) obtained a substance (C40H38O19?) called lactucic acid by triturating lactucarium (1 pt) with dilute H₂SO, (1 pt), adding alcohol (5 pts of 84 pc), filtering, shaking the filtrate with slaked lime, decolourising with animal charcoal, evaporating, and crystallising the residue from boiling water yellow amorphous mass, gradually becoming crystalline Its solutions are colouled wine-red by alkalis, and reduce boiling Fehling's solution.

LACTUCIN C., H., O15 or C., H., O, or C., H., O5.
S 1 25 in the cold Occurs in the juice of common lettuce (Lactuca sativa) and of Lactuca

LACTUCIN 116

altissima (Aubergier, B J 24, 522, A 44, 299, Walz, A. 32, 85, N Jahr Pharn 15, 118, Ludwig a Kromayer, Ar Ph [2] 111, 1, Kromayer, Ar Ph [2] 105, 3, Buchner, Rep Pharm 43, 1, Flowers, Ph [3] 10, 44) Obtained by macerating the dried juice with hot water (1) pt) for four days, pressing the mass, boiling the residue with water, and ppg the filtrate with lead subacetate, removing excess of lead from the filtrate by H2S, and evaporating Pearly M sol alcohol and scales (from alcohol). HOAc, sl sol ether Conc HNO, turns it brown Its solutions are not ppd by ordinary reagents

LACTUCOPICRIN C44H84O21. An amorphous very bitter substance which remains in the mother-liquor in the preparation of lactucin (Kromayer, Die Bitterstoffe, 1861, Flowers, Ph [3] 10, 222) Sol water and alcohol, its solutions not being ppd by lead salts

LACTURAMIC ACID v URAMIDO PROPIONIO

LACTYL CHLORIDE is the chloride of

a-Chloro propionic acid CS NH CH CH. LACTYL-THIO-UREA NH CO

From this urea and a chloro propionic ether at 100° (Freytag, J pr [2] 20, 380) LACTYL-UREA C4H4N O2 1 c. Crystalline.

NH CH CH. Methyl hydantoin [140°] NH CO

(H), [145°] (Urech, B 6, 1113) Formed by treating aldehyde ammonia with crude KCy and hydrochloric acid CH₃CH(OH)NH₂ + HCN + HCNO $= NH_2 + C_4H_6N_2O_2$ (Heintz, A 169, 120) Formed also by heating uramido propionic acid Prisms, or cauliflower-like tufts (containing aq), v sol water and alcohol, nearly insol ether May be sublimed Tastes bitter Neutral in reaction May be Boiling baryta water converts it into uramidopropionic acid Heating with barium hydrate at 100°-140° gives alanine Pure HNO, gives a quantitative yield of a nitro derivative, but no gas is evolved (Franchimont, R T C 6, 217) — AgC₄H₂N₂O₃, formed by treating lactyl ures with moist Ag₂O Insol water, sol NH₂Aq Ppd as a white powder by adding HNO, to its ammoniacal solution

LÆVULAN $C_6H_{10}O_5$ [250°] $[\alpha]_D = -221°$ Occurs in an impure condition in the residues obtained from desugarising molasses by Steffen's process (Lippmann, B 14, 1509) White amorphous powder Sol hot water, the solution gelatinises on cooling Bylong boiling it becomes much more soluble and loses its power of gela tinising Insol alcohol It does not reduce Fehling's solution but produces a blue pp By HNO₂ it is oxidised to mucic acid H₂SO₄ at 120° converts it into levulose LEVULIN C₁₂H₂₀O₁₀ (dried at 110°) Dilute

stance resembling dextrin, contained in the juice of the tubers of the Jerusalem artichoke (Hehanthus tuberosus) and of Dahlia variabilie, and ın oak bark (Ville a Joulie, Bl. [2] 7, 262, Popp, A 156, 1814 Dieck a Tollens, A 198, 228, BC 1879, 275, Etti, B 14, 1826, Lefranc, J Ph [5] 2, 216, Reidemeister, J. Th 1881, 68) Frepared by ppg the juice of artichokes with lead acetate, filtering, removing excess of lead by

H.S., neutralising with MgCO, filtering and evaporating The residue is extracted with alcohol, until it is optically mactive It is then extracted with absolute alcohol, which leaves inulin undissolved, and ppd with ether

Properties - Amorphous deliquescent mass, optically mactive, but becomes levorotatory on boiling with dilute HCl, being split up into levulose and glucose V sol water and dilute alcohol, al sol absolute alcohol, insol ether Has an insipid taste Turns brown at 140° forming caramel Not ppd by lead subacetate Peduces Fehling's solution after long boiling Dilute HNO, gives oxalic acid and saccharic Alkalıs do not turn ıt brown acid hydrolysed by yeast and then undergoes alcoholic fermentation Lævulin prevents the ppn of ferric and cupric salts by alkalis AgNO, gives a white pp blackened on heating —K₂C H₁₈O₁₉ ppd by adding alcoholic KOH to its alcoholic solution — Ba₂C₁₂H₁₆O₁₀ aq amorphous - Pb₂C₁₂H₁₆O₁₀ aq amorphous, ppd by adding an alcoholic solution of lead subacetate to an alcoholic solution of lævulin

LEVULINIC ACID v B ACETYL PROPIONIC ACID

LEVULOSE v SUGAR.

LANTHANUM La At w 138 2 Mol w. unknown SG 6163 Melts between MP of Sb (450°) and that of Ag (950°) (Hillebrand a Norton, P 156, 466) S H 04485 (H a N, P 158, 71) S V S 22 4 Chief lines in emission spectrum 5183, 4921, 4920 in the green, 4824, 4655, 4558 in the blue, 4522, 4330, 4268 in the indigo, 4238, 4196, 4086, 4077 in the violet (Thalén) In 1803 Klaproth separated a new earth from a Swedish mineral, the earth was examined by Hisinger and Berzelius and called by them certa (from the planet Ceres then recently discovered) In 1839 Mosander showed that ceria contained two oxides (P 46, the name ceria was retained for one, and the other was given the name lanthana (λανθάνειν = to be concealed) In 1841 Mo sander discovered that lanthana was a mixture of two oxides (v P 60, 297), one of these he called lanthana and the other didymia (δίδυμος = twofold)

Occurrence -As silicate, with silicates of Ce and Di, in cerite, gadolinite, orthite, &c (Ram melsberg, P 107, 631) Lanthante, from Bethlehem in Pennsylvania, US, is a car bonate of La and D1 (Lawrence Smith, Am S [2] 18, 378) La containing mine als occur in small quantities in a few localities

Preparation -The mixed oxides of Ce, La, and Di are separated from cerite by treatment with H2SO4, &c, as described under Cerium (vol 1 p 723), the oxides are dissolved in HNO, Aq, the solution is evaporated to dryness the residue is heated to full redness until pale yellow, and then treated with boiling dilute HNO, Aq in which nitrates of La and Di dissolve while basic Ce nitrate remains insoluble There are various ways of separating La from D₁ in the nitric acid solution. The hydrated oxides may be obtained by ppn with NH₃Aq, the pp is dissolved in H₂SO₄Aq, and the mixed sulphates are obtained by crystallisation, the sulphates are dried and powdered, 1 part is dissolved in small successive portions in 6 parts

water at 2°-8°, the solution is then heated to 6. 40° when La₂(SO₄)₃ separates nearly free from D1₂(SO₄). The La₂(SO₄), may be purified by re solution in ice cold water and heating to 40°, the operations being repeated until the sulphate as perfectly white and shows no Di lines in the spectrum Or the solution of La₂(SO₄), may be ppd by oxalic acid, the pp strongly heated, dissolved in HNO,Aq, and fractionally ppd by NH, Aq, the ppn must be effected from very dilute solutions by means of very dilute NH, Aq, the first third of the pp contains most of the Di oxide, ppn is continued so long as the pp shows Di lines in the spectrum. This method gives good results when comparatively much La 18 present (Mosander, lc, Bunsen a Jegel, P155, 877), but it is slow and laborious Marignac (J pr 48, 406) adds excess of HNO, Aq to the solution of the nitrates of La and Di, heats, and adds oxalic acid, the pp dissolves, when crys tallisation begins the solution is allowed to cool, and is then poured off from the pp which is rich in Di oxalate, these operations are repeated, a very acid solution of La salt is finally obtained from which NH3Aq ppts La2O3xH2O method is recommended when much Di is present with little La.

The method of Von Welsbach (Sitz W 92 [2nd part], 317) was found very go i by Robin son (priv comm) A large quantity of the mixed nitiates of Ce and La obtained from cerite after separating basic Ce nitrate (v vol 1 p 723) is mixed with the necessary quantity of NH₄NO₄, about 10th part cone HNO Aq is added, and the liquid is evaporated until small crystals appear on the surface, a little water is then added, and crystallisation is allowed to proceed for about 24 hours, the crystals are drained and washed with a little HNO, Aq which is added to the mother liquor, the mother liquor is evaporated and crystallised, the liquor from this is again evaporated, and so on until 68 fractions are obtained The first fraction contains almost all the La By fractionating the middle fraction, placing the first fractional pp in the former first fraction, and repeating this process a few times, pure La(NO₃), is obtained For other methods of separating La salts from salts of Ce and Di v Hermann, J pr 82, 385, Erk, Z [2] 7, 100, Cleve, Bl [2] 21, 196, 246

La₂Cl₆ is obtained by dissolving the pp of La₂O₂xH₂O (obtained as described above) in HClAq, adding NH₄Cl, evaporating to dryness, and heating strongly in a covered crucible By reducing La₂Cl₆ by heating with K and washing out KCl in alcohol, metallic La is obtained Hillebrand a Norton obtained approximately pure La by electrolysing La₂Cl₆ covered with a fused mixture of KCl and NaCl, using a thick iron with a sengative electrode and a battery of 4 Bunsen's cells (P 156, 466, of Bunsen, P 155, 633)

Properties and Reactions—White metal, fairly malleable and duotile, rather harder than Ce Oxidises rapidly in dry air, but burns only at temperature considerably higher than that at which Ce burns Decomposes cold water slowly, hot water rapidly Easily dissolved by acids, including cold cone HNO₃, which cearcely acts on Ce

The atomic weight of La has been deter-

mined (1) by converting the oxide into the sulphate and tice versa (Rammelsberg, P 55, 65, Margnac, A Ch [3] 27, 228, [4] 30, 67, Holzmann, J pr 75, 348, Czudnowicz, J pr 80, 33, Hermann, J pr 82, 395, Zschiesche, J pr 104, 174, Erk, Z [2] 7, 106, Cleve, Bl [2] 31, 196, Brauner, C J 41, 75, Crookes, Pr 38, 414, (2) by analysing La iodate (Holzmann, J pr 75, 349), (3) by estimating Cl in La chloride (Hermann, J pr 82, 395), (4) by converting La carbonate into oxide (Hermann, lc), (5) by determining S H of La (Hillebrand a Norton, P 158, 71), (6) by considering the chemical relations of La with other elements in the light of the periodic law

The at w of La was taken for many years as c 922, the oxide was formulated LaO and the chloride LaCl₂ Mendelejeff (v C N 41, 49) proposed to multiply the usually accepted at w by 2, and to regard the oxide as LaO, by doing this he placed La in Group IV along with Ce As the properties of La salts were not much known when Mendelejeff's memoir was published, he did not strongly press the arguments in favour of the position assigned by him to La Fuller investigation showed that the usually accepted at w of La should be increased by one half, that the oxide should be regarded as similar to the oxides of the earth metals (M2O2), and that La should be placed in Group III along with Al, Ga, Sc, &c (v EARTHS, METALS OF THE, vol 11 p 424)

La is distinctly metallic in its chemical relations, it forms the oxide La₂O₃ and there are indications of the existence of a higher oxide, the chloride is La₂Cl₅ or LaCl₃ La forms several

salts of the form LaX₃,
$$X = NO_3$$
, $\frac{SO_4}{2}$, $\frac{PO_4}{3}$

dc, a few double salts and one or two basic salts are known. The investigation of the La compounds shows that this metal is to be placed with the metals of the earths (Group III), it is more closely related to the even series members of the group (Sc, Y, and Yb) than to the odd series members (Al, Ga, In, Tl). The strongly basic character of La, O, marks the connection of La with the alkaline earths and alkali metals. The examination of La compounds is yet far from complete (cf Metals, Rare)

Detection and Estimation—Most of the La salts are colourless, the soluble salts have an astringent, sweetish taste, solutions of La salts do not show any absorption-bands. Alkalis, NH,HS, and KCN, form gelatinous pps insoluble in excess of pptant. Alkali carbonates ppt La.(CO₂)₃, BaCO, forms a pp without warming, H,C₂O₄ forms a white pp at first curdy, then crystalline, more soluble in acids than the oxalates of Ce and Di, Na₂S₂O₃ does not produce any pp. La salts do not colour beads of borax or microcosmic salt.

La may be estimated as La₂O₃ or La₂(SO₄)₃. La O₃ is obtained (1) by ppg with NH₄Aq, washing as rapidly as possible with water containing NH₃ (to prevent formation of La₂CO₂ and partial solution of La), solution in HNO₃Aq, re ppn by NH₃Aq, washing with NH₃Aq, and strongly heating, (2) by ppg La₂(C₃O₄), by addition of H₂C₂O₄ and standing, washing, and heating to white heat La₂(SO₂)₂ is obtained by ppg with

NH.Aq, as above, dissolving in warm dilute H.SO,Aq, evaporating to dryness at 100°, and gradually heating to redness

Lanthanum, arsenate of Lag(HAsO4)3, and arsenite of, La₂(HAsO₂), v Smith, A 191, 331

Lanthanum, borate of (? 2La2O2 B2O3), ob tained, along with crystals of La₂O₂, by dissolving La₂O₃ in molten borax (Nordenskjöld, J pr 85, 481)

Lanthanum, bromide of La, Br, 14H,O, or LaBr. 7H2O. Colourless crystals, e sol water or alcohol, obtained by dissolving La2O, xH2O m HBrAq and evaporating (Cleve, Bl [2] 39, 151, 43, 56) By the action of Br in vapour on La₂O₃, the oxybromide LaOBr is obtained (Frerichs a Smith, A 191, 331) Double salts are described by Cleve (lc) La₂Br₆ 2AuBr, 18H₂O, La₂Br₆ 3ZnI₂ 27H₂O, also by F a S (*lc*), La₂Br₆ 3N₁Br₂, 18H₂O, and La₂Br₆ 3Z₁Br₂, 39H₂O

Lanthanum, carbide of A carbide of La 18 said to be produced by heating the oxalate or formate in absence of air, it is described as similar to, but more easily acted on by acids than, Ce carbide (Delafontaine, C N 11, 253)

Lanthanum, chloride of La,Cl, or LaCl, A

white crystalline mass, e sol water or alcohol Obtained by adding NH₄Cl to a solution of La₂O₃ xH₂O in HClAq, evaporating to dryness, and heating in a closed crucible until all NH₂Cl is volatilised (Hermann, J pr 82, 406, Hille brand a Norton, P 158, 71) Mosander (P M 23, 241) says that LaCl, can be obtained by evaporating La₂O₃ xH₂O in HClAq to dryness,

and heating the residue in a stream of HCl gas By slowly evaporating La₂O₃ xH₂O in HClAq, large colourless triclinic crystals of LaCl, 7H,O are obtained Double salts are described by Smith (A 191, 331), and Cleve (Bl [2] 21, 196, 39, 151) — M 9HgCl, 24H,O, M 2PtCl, 26H,O,

M 8AuCl₂ 21H₂O, M 2AuCl₂ 20H₂O (M = La₂Cl₆) Oxychlorides are obtained by heating the hydrated chloride in air, and by the action of Cl on La2O3 (v Lanthanum, Oxychlorides of)

Lanthanum, chromate of Lag(CrO,), 8H2O,

. Smith, A 191, 355

Lanthanum, cyanide of LaCy, v. vol 11

p. 841

Lanthanum, fluoride of La2F6 H2O A gela tinous pp by adding HFAq to solution of La acetate (Cleve, Bl [2] 39, 151, 43, 56) From solution of La sulphate, Smith obtained a pp of

La₂F₃3HF (A 191, 331) According to Marignao, H₂SiF₅ ppts La₂F₆ from La salts (J pr 48, 406) Lanthanum, hydroxide of La₂O₅H₆, or LaO₄H₅, may also be regarded as hydrated conde La₂O₅3H₅O A white gelatinous pp by adding KOHAq or NaOHAq to solution of a La salt (NH,Aq ppts basic compounds) produced by action of warm water on La2O2 La2O.H. is a strongly basic hydroxide, it turns red litmus blue, decomposes NH, ClAq on warm ing with evolution of NH_2 , absorbs CO_2 from the air, reacts with acids to form salts

$$LaX_s(X = NO_{sp} \frac{SO_s}{2}, \frac{PO_s}{2}, &c)$$
 Thomsen gives

the heat of neutralisation with H280,Aq and HClAq as $[La^2O^4H^4, 3H^4SO^4Aq] = 82,820$; $[La^2O^4H^4, 6HClAq] = 74,970$ (Th. 1, 375).

Lanthanum, haloid compounds of. LaF. LaCl, and LaBr, have been isolated, the formulæ may be written La,F, &c, as none of these compounds has been gasified. All form hydrates, and all combine with haloid compounds of Au and some other heavy metals to form double salts Oxychlorides and oxybromides, LaOX, are known

Lanthanum, 10dide of LaI, has not been isolated, but the double salt 2I al, 3ZnI, 27H,O is described by Frenchs a Smith (A 191, 355)

Lanthanum, oxides of Only one oxide, La2Os, is known with ce 'ainty, there are indi cations of the existence of an oxide containing more O

LANTHANUM SESQUIOXIDE, La2O. by strongly heating La₂O₃ xH₂O, or the oxalate, or any La salt the acid of which is volatilisable Forms a white, amorphous, infusible powder, S G 6 48-6 53 (Cleve, lc, Nilson a Pettersson, B 13, 1464) S H 0749 (N a P, lc, v also Pr 31, 46) Diamagnetic (N a P, lc) Combines with water to form La₂O₃ 3H₂O (v Lanthanum, HYDROXIDE OF) Easily sol in acids Nordenskjöld (J pr 85, 431) obtained La₂O₂ in lustrous rhombic crystals, a b c = 5658 1 6863, S G 5 296, by dissolving the amorphous oxide in borax in a porcelain oven, the crystals did not directly combine with water, but were easily sol in acids The great infusibility of La2O3, and its power of emitting white light when strongly heated, render it useful as a light giver, Von Welsbach has patented an arrangement whereby La₂O₂ is heated in the flame of a Bunsen lamp and emits a clear white light (English Patent, 15,286, July 1886).

LANTHANUM PEROXIDE According to Mosander (P M 23, 241) a peroxide of La is ppd by adding BaO, to a neutral La salt, on drying it loses O Hermann (J pr 82, 397) says that a peroxide is obtained by heating oxalate, nitrate, or carbonate of La in the air, it dissolves in HClAq with evolution of Cl, heated in H it yields La_2O_3 Zschiesche (J pr 104,74) was unable to confirm Hermann's observations Cleve (Bl [2] 43, 56) by ppg La salts by alkalı and H₂O₂Aq obtained an oxide to which he assigned the com position La,O.

Lanthanum, oxybromide of LaOBr Obtained by the action of Br vapour on heated La₂O₂ (Frerichs a Smith, A 191, 331)

Lanthanum, oxychlorides of LaOCl and La₂O₂Cl₂ (=3La₂O₃La₂Cl₂) The former is a greyish mass, unchanged by water, obtained by heating La₂O₂ in Cl to 200° (Frerichs a Smith, A 191, 331, Cleve, Bl [2] 89, 151, 43, 56) The latter is obtained by heating LaCl, 7H₂O and washing the residue with water (Hermann, J pr. 82, 385)

Lanthanum, salts of. La forms one series of salts, LaX, where $X = NO_2$, $\frac{S \cap_4}{2}$, $\frac{PO_4}{3}$, &c Most

of the La salts are colourless, those which are soluble have a sweetish astringent taste. The salts of volatilisable acids yield La₂O₂ when strongly heated La₂8SO₄ combines with the alkalı sulphates, but the products are not alums A good many double La salts are known, a few basic salts have been isolated. The following are the chief La salts . arsenate, arsenute, borate, bromate, carbonate. chlorate, chromate, hypochlorate, vodate, molybdate, nutrate, perchlorate, percodate, phosphates, phosphate, selenate, selenite, silicate, sulphates, sulphates, throsulphate, tungstate, v Carbonates, Nitrates, Sulphates, &c

Lanthanum, sulphide of Ia₂S₃ Red-yellow, microscopic crystals, obtained by the action of 8 parts Na polysulphide with 1 part La₂O₃, and washing with water (Beringer, A 42, 134) Mosander obtained a greyish powder by heating La₂O₃ in CO₂ laden with CS₂ (P 60, 297), and by a similar reaction F with a Smith (A 191, 355) obtained La₂S₃ as a brownish grey powder, soluble in acid—with evolution of H₂S, decomposed by water to LaO₃H₃ and H₂S Didier (C R 100, 1461) obtained a similar body by heating La₂O₃ in H₃S gas M M P M

LAN.HOPINE $C_{73}H_{23}NO_4$ [c 200°] A base homologous with papaverine, occurring in opium (Hesse, A 153, 57, Suppl 8, 271, C C

1870, 168)

Preparation — The aqueous extract of opium is ppd by Na CO₃, the pp dissolved in ether, the ethereal solution shaken with dilute HOAc, and the acid solution poured into aqueous NaOH After 24 hours the ppd thebaïne and papaverine are filtered off, the filtrate neutralised with HCl, ppd by NH₃, and shaken with chlor orm The chloroform takes up codeïne, lanthopine, and meconidine, and is then shaken with dilute HOAc, and the solution exactly neutralised by NaOH, when lanthopine is ppd

Properties — White powder composed of minute prisms (from CHCl₃) Insol water, nearly insol alcohol, v sl sol ether and benzene, m sol chloroform When ppd from solutions by KOH or lime it dissolves in excess of the pre cipitant NH₂ gives a pp insol excess It does not give a blue colour with FeCl₂ Conc HNO₃ gives an orange red colour H₂SO₄ gives no colour in the cold, but a brownish yellow colour at 150°

Salts —The sulphate forms extremely thin needles—B'HCl6aq extremely thin needles, appearing like a jelly when in mass, v sol boil ing water —B'₂H₂PtCl₈2aq lemon yellowcrystal line powder, insol water, alcohol, and HClAq

LANUGINIC ACID C 416 pc, H 73 pc, N 163 pc, S 34 pc, O 314 pc An acid produced by the action of boiling baryta water upon wool (Champion, C R 72, 330, Knecht a Appleyard, B 22, 1120) The excess of baryta is removed by CO₂, the acid ppd by lead acetate, and the pp decomposed by H₂S Yellowish porous mass, v sol hot water, sl sol alcohol, insol ether Its aqueous solution ppts colouring matters as lakes It also ppts tannin and most metallic exides from their acetates It reacts like a proteid with Millon's reagent and with phosphotungstic and

LAPACHIC ACID C₁₅H₁₄O₃ i.e C₁₆H₄O₂(OH)CH CHPr Oxy-amenyl naphtho-

quinone Targuic acid [138°]

Occurrence —A yellow colouring matter present in the 'lapacho' wood of a genus of the Bignoniaces, several species of which are indigenous to the Argentine Republic and other parts of South America (Siewert, Report of Argentine Republic, cap 15, Philadelphia). Oc-

curs also in Greenheart from Surinam (Stein, J pr 99, 3), and in Bethabarra wood (Greene a. Hooker, Am 11, 267)

Preparation—The wood (10 kilos), in the form of saw dust, is boiled with a moderately-concentrated solution of sodium carbonate (500 grms crystallised salt in 80 litres water), the extraction is repeated several times. The solution is of a blood red colour, and the addition of hydrochloric acid precipitates the crude acid together with a red brown resin, from which it is best purified by frequent solution and recrystallisations from benzene (Paternó, G 9, 505, 12, 337, Arnaudon, C R 46, 1152) Yield 5 p.c. of pure material

Properties — Monoclinic prisms, abc = 72061 6492, n = 97 9 (Panebianco, G 10, 80), v sol boiling alcohol, benzene, and ether It dissolves readily in solutions of the alkalis and alkaline earths, forming red solutions containing salts of the acid It decomposes carbonates on boiling

Reactions —1 Completely oxidised by chromic acid —2 Alkaline KMnO₄ gives oxalic acid — 3 Boiling nitric acid (S G 138) yields phthalic acid —4 Distillation with sinc-dust yields isobutylene, naphthalene, and possibly a homologue of naphthalene —5 Boiling with HIAq and phosphorus forms amyl naphthalene (305°) and a little di (B)-naphthyl, both being perhaps derived from an intermediate naphthyl amylene 6 Cold cone HNO₄ (S G 149) or H₂SO₄ gives lapachone —7 Zinc-dust and potash reduce it to an unstable crystalline hydride, re-oxidised by air to lapachic acid

Salts—NaA'5aq scarlet radio-crystalline mass S (of NaA') 15 1 at 24° Sol alcohol—
KA'S 33 3 at 24°—NH₄A'aq large brick red crystals—CaA'₂ aq amorphous red pp S 224 at 24°—BaA'₂ 7aq long slender needles (from boiling water) S 23 at 26°—SrA'₂ aq—PbA'₂ amorphous red pp, insol water—AgA' scarlet powder—Aniline salt C₆H₁NH₂A' [122°], orange prisms (from alcohol)—o-Toluidine salt C₆H₁MeNH₂A' [135°], yellow laminæ—p-Toluidine salt [130°], orange yellow laminæ

Acetyl derivative C₁₈H₁₃AcO₂ [83°]. Formed, together with a compound C₁₉H₁₈O₂ (?), by heating lapachic acid with NaOAc and Ac₂O (Paternò) Sulphur yellow prisms, insol water, sol alcohol, ether, and benzene Readily converted by potash into lapachic acid Br in HOAc converts it into bromo lapachone HNO₂ (S G 148) at 0° forms a nitro-compound C₁₈H₁₂(NO₂)AcO₃[170°], crystallising in reddish plates The compound C₁₉H₁₈O₅ forms small white acicular prisms [132°], v sl sol cold alcohol and ether Boiling alcoholic KOH does not saponify it, but converts it into a compound C₂₆H₂₈O₅, which crystallises (from alcohol) in orange needles [141°] Br does not convert the compound C₁₈H₁₉O₅ into bromo lapachone

Bromo-lapachone C, H, BrO, 26

C₁₀H₄O₂ CHBr O CHPr (?) [140°] Formed by warming lapachic acid with Br in HOAc (Paterno, G 12, 353) Orange lamines, v sol

warming lapachic sold with Br in HOAd (Paterno, G 12, 353) Orange lamine, v sol Lot alcohol, sol HOAc, and benzene, sl sol, ether, insol cold aqueous alkalis. HNOs oxidises it to phthalic acid. Lapachone C, H,O, se

C₁₀H₄O₂<CH₂>CHPr(?) [156°] 'Formed by the action of H2SO, or cold cone HNO, (SG 149) on lapachic acid (Paternò, G 12, 837, Hooker a Greene, B 22, 1723) Silky orange red needles (from alcohol), insol water, v sol hot alcohol and benzene HNO, oxidises it to phthalic acid Distillation over red hot zinc dust gives naphthalene and isobutylene Ac.O has no action Boiling with NaOAc and Ac.O forms a compound C26H26O5, crystallising in brown tables with blue reflex, nearly insol Ac₂O NaHSO₃ forms a white crystalline compound Combines readily with hydroxylamine and with NH, Its molecular weight, found by Raoult's method, agrees with the formula $C_{1a}H_{14}O_3$ Lapachone is converted by heating with alkalis into $C_{10}H_1O_2(OH)$ $CH_2CH(OH)$ Pr, which separates from cold alcohol or HOAc in large crystals [125°], v sol most solvents, readily converted into lapachone by dilute HCl, and forming the salts BaA"aq and Ag,A"aq, both crystallising in red needles

LARCH FUNGUS This fungus extracted with 95 pc alcohol yields a mixture of at least

four different resins (Masing, Ar Ph [3] 6, 111)
(a) C₄₁H₇₇O₈ [125°] S (95 p c alcohol) 3
at 14° Insol chloroform

(β) C₆H₁₀O [90°] S (95 pc alcohol) 7 Sol chloroform

 (γ) $C_{16}H_{30}O_5$ Agaricic acid. [272°] Needles, v sl sol boiling alcohol, insol chloro-

form (Jahns, Ar Ph 221, 269)

(8) A portion easily soluble in alcohol, and partly ppd by water, leaving in solution a resin [C 619 pc, H 81 pc, O 300 pc] S 17, S (alcohol) 17 The resmous mixture is altered by boiling with milk of lime, the pp then thrown down by HCl being separated by chloroform into two substances C_{so}H_{es}O₄, insol chloroform, S (alcohol) 6, and C₃₅H₅₂O₆, sol chloroform, S (alcohol) 2 1

LARDACEIN v PROTEIDS

LARD OIL A nearly colourless fatty oil, obtained by pressing hog's lard SG 20 9122.

un 1 4686 (Long, Am 10, 392)

LARICIC ACID C₁₀H₁₀O₅ [153°] S 1 14at 60° Obtained from the small branches of larch trees (Pinus larix) from 20 to 30 years old (Stenhouse, Pr 11, 405) The bark is exhausted with water at 80°, and the extract evaporated and distilled The distillate is evaporated at 80° and the resulting crystals purified by sublimation monoclinic crystals resembling benzoic acid, usually in twins Sublimes at 93° Volatile with steam Has a bitter astringent taste and powerful odour Reddens litmus slightly sol boiling water and 'alcohol, insol ether tric acid oxidises it to oxalic acid. Its aqueous solution is ppd by baryta water, but not by lead or silver salts Ferric chloride gives a purplered colour The K salt forms flat reddish brown crystals, decomposed by CO2

LARREA RESIN Occurs on branches of Larrea mexicana (Stillmann, B 13, 756) 617 pc of it dissolves in alcohol, 263 in aqueous potash, and 14 p c. consists of a colouring matter

soluble in water

LASERPITIN O₂₄H₂₆O₇ (Feldmann, A 135, 836; Bl. 1866, 1. 457) or O₁₂H₂₆O₄ (Kulz, Ar Ph

[8] 21, 161) [114°] (F); [118°] (K) A bitter principle contained in the root of Laserpitum latifolium Extracted by 80 p c alcohol (F) or by light petroleum (K) Prisms Insol water. sol benzene, chloroform, ether, and CS₂ May be sublimed Its alcoholic solution is ppd by water, but not by alcoholic lead acetate (F) Insol dilute acids and alkalis Conc H.SO. and cone HClAq form deep red solutions (K).
When heated with cone alcoholic KOH it is resolved into angelic acid and laserin C14H22O4 (F) or $C_{20}H_{30}O_{5}$ (K), a crystalline resin, insolcids, sol ether, alcohol chloroform, and HOAc Potash fusion gives methyl crotonic acid and laserin (K)

Laserpitin forms an acetate C15H22O4HOAc crystallising from acetic acid in silky needles (K)

Acetyl derivative C₁₈H₂₁AcO₄ [113°] From laserpiin, Ac₂O, and dry NaOAc (K) Colourless needles, insol water, sol HOAc, alcohol, ether, and CHCl,

Bromo derivative C_{so}H_{so}Br_sO_s [90°] Formed by the action of Br on a solution of laserpitin in CHCl, (K) Needles, sol alcohol, ether, CHCl₃, and HOAc

Di-nitro- derivative C15H20(NO2)2O4 aq [115°] From laserpitin and HNO, (K) Amorphous mass, insol water, sol alcohol, ether, CHCl_s, and HOAc

LAUDANINE C₂₀H₂₅NO₃ (Hesse, A 153, 57, 176, 201, Suppl 8, 272) [165°] S G 1 256 (Schröder, B 13, 1075) S (ether) 155 at 18° $[\alpha]_1 = -135$ in a 2 p c chloroform solution at 22 50

Preparation -An aqueous extract of opium is ppd by lime or Na, CO, the filtrate is shaken with ether, the ethereal solution is shaken with dilute acetic acid, the acetic acid solution is neutralised exactly with NH, the ppd lanthopine is removed by filtration, the filtrate is ppd by excess of ammonia, and the pp crystal lised from ether Laudanine separates first from the ethereal solution, and afterwards codamine. The laudanine is dissolved in acetic acid solution, and the solution mixed with excess of NaOH, which ppts cryptopine The alkaline filtrate is ppd by ammonium chloride, and the pp dissolved in aqueous HOAc, on adding KI laudanine hydro iodide is ppd, and this is de composed by ammonia and the free base crystallised from ammonia

Properties -Stellate groups of small sixsided prisms (from alcohol) Cannot be sublimed Tasteless Lævorotatory In the crystaline state it is v sol benzene, CHCl₃, and boiling alcohol, sl sol cold alcohol, v sl sol ether In the amorphous state it is much more Its salts have a bitter taste their solutions caustic potash and ammonia ppt the base in white amorphous flocks, which soon become crystalline, and dissolve in excess of the precipitant Chloroform extracts the base from the ammoniacal but not from the potash solution Cone H₂SO₄ (containing ferric salt) gives an intense rose red solution, which at 150° changes to dark violet Cone HNO₂ gives an orange-red solution FeCl, gives an emeraldgreen colour The base is poisonous, its hydrochloride acting physiologically like strychnine. Salts —B'₂H₂SO₄4aq concentric groups of

needles, v e sol water, almost insol dilste H₂SO₄—B'HCl 6aq prisms, v sol water and alcohol, v sl sol NaClAq Inactive to light—B'HBr 2aq nodules S 3 5 at 20°—B'HI aq orystalline powder S 2 at 15°, v sol boiling water, insol KIAq—B'₂H₂PtCl₂2aq yellow amorphous pp, v sol boiling water—B'H₂C₂O₄ 6aq concentro groups of delicate needles [110°] S 2 2 % 10°—B'C₄H₄O₄ 8aq [100°] S 4 9 at 15°

LAUDANOSINE $C_{21}H_{22}NO_4$ [89°] S (ether) 5 2 at 16° [a]₁ = 105 in a 2 pc alcoholic solution at 22 5° a = 56 in a 2 pc chlord-

form solution at 22 5°

Preparation - Obtained from opium by ppg the aqueous extract with Na2CO3, dissolving the pp in ether, shaking the ethereal solution with dilute HOAc, and pouring the acid solution into aqueous NaOH The pp contains a large number of bases, and is warmed with alcohol and dilute HOAc, and partially evaporated at 50° Papaverine and narcotine are then ppd, and thebaine and tartrate is ppd by adding tartaric acid to the filtrate. The filtrate is exactly neutralised with NH3, and NaHCO3 added After a week the pp is collected and extracted with benzene Cryptopine and protopine separate first from the benzene, and when the filtrate is shaken with NaHCO, laudanosina separates (Hesse, A Suppl 8, 321) It is purified by dis solving in acetic acid, ppg with KI, decom posing the resulting salt with NH, and re crystallising from benzene

Properties—Needles More soluble in ether than thebaine and cryptopine, extremely sol alcohol and chloroform, v sol boiling benzene and ligroin, insol water and alkalis Conc H₂SO₄ (containing ferric salt) gives a brownish red solution, which at 150° becomes green, and inally dark greenish violet FeCl, gives no colour Tastes slightly bitter, its salts have an extremely bitter taste Its alcoholic solution exhibits a strong alkaline reaction Dextro rotatory Its hydrochloride is also dextrorota tory, [a]₁ = 108 in a 2 p c solution at 22 5°

Salts —B'HI laq small prisms, v sl sol cold water, v sol alcohol —B',H PtCl_e 3aq yel low amorphous pp, insol cold water —

B'H2C2O, 3aq prisms, v e sol water

LAUREL OILS The essential oil from the leaves of the common cherry laurel (Cerasus laurocerasus) consists of benzoic aldehyde, HCy, a volatile oil (possibly benzyl alcohol) convertible by oxidation into benzoic acid, and minute quantities of an odorous resin (Filden, Ph. [3] 5, 761, cf. Leger, Ph. [3] 3, 971). The essential oil from the fruits of Laurus nobilis contains a laworotatory terpene C₁₀H₁₆ (164°), S. G. 18 908, a laworotatory sesquiterpene C₁₅H₂₁ (250°), S. G. 18 925, and lauric acid C₁₂H₂₁O, (Blas, A 134, 1, Gladstong, C. J. 17, 1). The essential oil from the leaves of the Californian laurel (Oreodaphne californica) contains terpineol (168°) and umbellol C₂H₁₂O (216°) (Stillmann, B 13, 629).

Laurel-nut oil is a fatty oil, S G 932, derived from Calophyllum inophyllum growing in the East (Hooper, Ph [3] 19, 525)

LAURENE v DI METHYL-ETHYL-BENZENE
LAURIC ACID C₁₂H₂₄O₂ Dodecore acid
Mol. w. 200 [48 6°] (Heintz) (225°) at 100 mm.

(Krafft, B 13, 1415) S G 28 888 (Görgey). H C 1759720 (Louguinne, A Ch [6] 11, 222) Occurs as glyceryl ether in the berries of the bay tree (Laurus nobilis) (Marsson, A Ch 41, 35, Blas, A 134, 1), in the fat of pichurim beans (Sthamer, A 53, 393), in the volatile oil of these beans (Muller, J pr 58, 469), in small quantity in spermaceti (Heintz, A 92, 394), in croton oil (Schlippe, A 105, 14), in the fruit of Cylico daphne sebifera (Gorkom, Tydschrift af neerl Indie, 81, 410), in the so called Dika bread, the fruit of Mangufera gabonensis (Oudemans, J pr. 81, 356), in the age of the Mexicans, a fat obtained from Coccus Axia (Hoppe, J pr 80, 102), and in cocoa nut oil (Görgey, A 66, 303)

According to Schering (A 96, 236) it is among the products of the distillation of cetyl alcohol with potash-lime, but Heintz (A 97, 271) denies this A dodecoic acid (35°], isomeric with lauric acid, may be obtained by treating the amide of myristic acid with Br and NaOH, and converting the resulting dodecylamine into the nitrile and thence into the amide [97°] of dodecoic acid, and boiling the amide with conc

HClAq (Lutz, B 19, 1433)

Preparation—Lauric acid may be obtained from fats containing it by saponification followed by fractional precipitation of the acids by barium acetate (Huntz, A 92, 294, P 92, 429, 583, J pr 66, 1) It may also be obtained from the fat of bay berries by saponifying, distilling the solid fatty acids under reduced pressure, and rectifying in vacuo (Krafft, B 12, 1665)

Properties — Silky needles united in tufts (from alcohol) or scaly crystalline mass (after fusion) Its alcoholic solution has a slight acid reaction It is slightly volatile with steam In sol water, v sol alcohol and ether. Gives di ennyl ketone (C₁₁H₂₅)₂CO when its calcium salt is distilled

Salts—KA' Amorphous S (alcohol) 45 at 15°, 38 at 78° (Oudemans, C C 1863, 737)—KHA'₂ Crystalline S (alcohol) 15 at 15°; 400 at 78°—NaA' White powder S (alcohol) 25 at 15°, 145 at 78°—NaHA'₂. S (alcohol) 2 at 15°—NH₄HA'₂. S (alcohol) 6 at 15°—BaA'₂ crystalline spangles (from alcohol) S 07 at 100°, 0054 at 15° (Oudemans), 009 at 17°, 50 at 100° (Gorgey) S (alcohol) 0187 at 15 , 1009 at 78° (O), 07 in the cold, 5 at 78° (G)—CaA'₂ aq S 0039 at 15°, 0547 at 100° S (alcohol) 0719 at 15°, 220 at 78° (O)—SrA'₂ aq S 0272 at 15°, 220 at 78° (O)—SrA'₂ aq S 0272 at 15°, 036 at 100° S (alcohol) 90 at 15°, 36 at 78°—MgA'₂ 3aq S 023 at 15°—PbA'₂ [110°—120°] (Hentz) S 0011 at 100° S (alcohol) 0047 at 15°, 235 at 100°—CoA'₂ aq—NiA'₂ aq—NiA'₂ 3aq—CuA'₂ S 0023 at 15°, 0029 at 100°—AgA' white powder, consisting of minute slender needles S 0001 at 15°, 0405 at 100°. S (alcohol) 0323 at 15°, 0824 at 78°

Ethyl ether EtA' [-10°] (269°) at 750 mm (Delffs, A 92, 278) SG 20 86 (Gorgey) V L 84 (calc 79) From the acid, alcohol, and HCl

Glyceryl ether C,H,(C,H,D,), (Schiff, B 7, 781) Trilaurn Laurostearn [45°] H. C. 5707420 (Louguinine, A Ch [6] 11, 222). Obtained from bay berries by extracting with alcohol Silky needles, sl sol cold alcohol, v sol ether

Phenyl ether A'C₆H₅ [24½], (210° at 15 mm), pearly plates p-Tolyl-ether A'C₇H, [28°], (220° at

p-Tolyl-ether A'C,H, [28°], (220° a 15 mm) (Krafit a Burger, B 17, 1378)

Amide C₁₁H₂₃ CO NH₂ [102°] (Krafft a Stauffer, B 15, 1729) From the chloride and NH.

Chloride C₁₁H₂₃ CO Cl [-17°] (142½° at 15 mm) Colourless liquid (Krafft, B 17, 1878)

Nutrile $C_{11}H_{23}CN$ [4°] (198° at 100 mm) SG $\frac{1}{4}$ = 835, $\frac{1}{4}$ = 827, $\frac{199}{4}$ = 767 Formed by distilling lauramide with P₂O₈ (Krafft a Stauffer, B 15, 1729) Colourless liquid of peculiar odour

LAURIC ALDEHYDE C₁₁H₂₂CHO [45°] (143° at 22 mm) Prepared by the dry distillation of a mixture of calcium laurate and formiate (Krafft, B 18, 1414) White crystal-

line odourless solid

LAURIN C22H30O3 Bay berry camphor substance discovered by Bonastre (J Ph 10, 32) in the berries of the bay tree, and further ex amined by Marsson (A 41, 329) and Delffs (A 88. 854) It is prepared by boiling the skinned and pounded berries with alcohol of 85 to 90 pc, filtering at the boiling heat, and leaving the liquid to itself for several days Lauro stearin is then first deposited, and on filtering again and leaving the liquid to evaporate, laurin is deposited in crystals contaminated with a viscid oil, from which they may be freed by pressure between paper and recrystallisation Dimetric crystals, destitute of taste and smell, insol water, v sol alcohol, even in the cold, sol ether The solutions are neutral to test papers Laurin does not dissolve in alkalis Laurin can not be distilled without decomposition Its alcoholic solution is not precipitated by acetate of lead or nitrate of silver

LAUROCERÁSIN A name given by Lehmann (N R P 23, 440) to amygdalin when extracted from the leaves of the cherry laurel (Cerasus laurocerasus) or the bark of the berry-bearing alder (Rhamnus Frangula), v Amyg

LAURONE $C_{23}H_{46}O$ is $(C_{11}H_{23})_2CO$ Distribution [69°] S.G. $\frac{70}{4} = 802$, $\frac{100}{4} = 788$ Formed by distilling barium laurate with lime Shining plates (from alcohol) On reduction it gives tricosane (Overbeck, P. 86, 591, A. 84, 289, Krafft, B. 15, 1712)

LAURONOLIC ACID C. H., O. 2 & C. H., CO. H. Formed by distilling camphanic acid, or by heating its barium salt with water at 200°, campholactone is formed at the same time

(Woringer, A 227, 7)

Properties —Oil Sol water and ether Volatile with steam In presence of HCl some of it changes into the isomeric campholactone When distilled with water, a great part changes to the campholactone

Salts—CaA'₂3aq Forms dendritic crystals on the surface of an evaporating solution— AgA'

LAUROSTRARIN v Glyceryl ether of LAURIG

LAUROXYLIC ACID v. DI METHYL BENZOIC ACID.

·LÀUTH'S VIOLET & AMIDO IMIDO IMIDO DI PHENYL SULPHIDE

IAVENDER OIL A volatile oil obtained by distilling the flowers of Lavendula officinalis with steam S G ½ 875 It contains a lavorotatory terpene C₁₀H₁₀ (162°) which forms a crystalline hydrochloride and various oxygenated bodies which yield camphor on further oxidation (Dumas, A Ch 13, 375, Lallemand, A 114, 198, Barth, Z 1867, 509, Bruylants, J Ph [4] 30, 39) English oil of lavender submitted to fractional distillation yields 30 p c of the torpene (176°-186°), and 30 p c of oxygenated products (200°-207°) (Shenstone, Ph [2] 13, 207) LEAD Pb At w 206 4 Mc¹ w not known

LEAD Pb At w 2064 Mc' w not known with certainty, but probably same as at w (v. p 124) [330°-335°] (Brigel, B 6, 191, Pictet, P M [5] 7, 446), [326°] (Riemsdyk, C N 20, 32, Person, J 1849) (Between 14-0° and 1600°) (Carnelley a Williams, C J 35, 565) S G 11 335 at 0° (Quincke, P 97, 396), 11 37 at 0° (Reich, J pr 78, 328), 11 345 to 11 358 at 4°, 11 352 to 11 366 at 23° (Schweitzer, Am Ch 7, 174) S G molten 10 37-10 65 (Roberts a Wrightson, A Ch [5] 30, 181) For other values for S G v Clarke's Table of Spec Gravities [1888], pp 5-6 S H -78° to 11° 03065 (Reg nault, A Ch [3] 26, 286), S H 19° to 48° 0315 (Kopp, Tr '865 71), S H molten 340° to 450° 0402 (Person, A Ch [3] 24, 129) C E 0° to 100° 00002799 (Matthessen, Pr 15, 220) T C (Ag = 100) 85 (Wiedemann a Franz, P M [4] 7, 33) Heat of fusion 5858 (Rudbeig, P 19, 125), 5369 (Person, A Ch [3] 24, 129) E C (Hg at 0° = 1) 48 at 0°, 3 363 at 100° (Lorenz, W 13, 422, 582) Crystallises in regular octahedra For emission spectrum of lead v Werther, J pr 88, 180, Cornu, C R 73, 332, L de Boisbaudran, C R 77, 1152, Hartley a Adency, Tr 1884 63

Occurrence — Lead occurs native in small quantities (eg v Chapman, P M [4] 31, 176, Kokscharow, J M 1875 873, Igelstrom, J M 1889 (i) 32) Galena (PbS) is very widely distributed, the other most important ores of lead are cerusite (carbonate), anglesite (sulphate), pyromorphite (phosphate), and mimetesite (arsenate) Small quantities of oxychloride, chromate, molybdate, tungstate, vanadate, &c, of Pb also occur Lead has been known and used from very early times

Formation—1 PbS is roasted in a reverbe ratory furnace until a portion is oxidised partly to PbO and partly to PbSO₄, the doors are then closed, and the PbS, PbO, and PbSO₂ react to produce SO₂ and Pb, PbS+2PbO=3Pb+SO₂, PbS+PbSO₄=2Pb+2SO₂-2 PbS is roasted in a reverberatory furnace, the temperature being gradually increased until a considerable quantity of PbSO₄ and a little PbO are produced, the doors are then closed, and the temperature is raised until the mass softens but does not melt When the PbS and PbSO₄ react to produce Pb and SO₂ the residue is again roasted, whereby more PbSO₄ is formed, and on raising the temperature with closed doors the PbSO₄ and PbSO₄ relatively to PbS becomes so great that the chief product of their reaction is PbO (PbS+3PbSO₄=4PbO+4SO₂), coal and wood are then thrown into the furnace, and heating is

LEAD 128

continued, when the PbO is reduced to Pb(PbO+C=Pb+CO), at the same time some of the PbSO, is partly reduced to PbS, which, reacting with the remaining PbSO, produces Pb and SO₂ (2PbSO₄+2C=PbSO₄+PbS+2CO₂)—3 PbS is melted with scrap Fe, PbS+Fe=FeS+Pb—4 PbCO₂ is strongly heated with C, PbCO₃+2C=Pb+3CQ—5 PbO is reduced by heating in H or CO, or, with C, KCN, or Na—6 Zinc is suspended in an acidulated solution of a Pb salt, when Pb is ppd on the zinc—7 PbCl₂ is mixed with Na₂CO₂, and heated with KCN or C

Preparation -1 By melting Pb prepared by one of the foregoing methods, exposing the molten mass to a gentle current of air, blowing water vapour through the mass, and running off the metal from beneath the film of oxides of Cu. Sb, Fe, &c, nearly pure Pb is obtained -2 Pb oxalate is strongly heated in a carbon crucible, or is mixed with powdered C and heated -3 Stas prepared pure lead by the following pro cess (Chem Proport 324) Commercial Pb acet ate was dissolved in water, and digested at 40° to 50° in a leaden vessel with sheets of Pb until all Cu and Ag were ppd, the filtered liquid was run into almost boiling water, strongly acidulated with H₂SO₄, the ppd PbSO₄ was very thoroughly washed, and then suspended in a solution of NH, sesquicarbonate and NH, until transformed into PbCO, the PbCO, was thoroughly washed, a part of it was decomposed to PbO by heating in a Pt dish, and the rest was almost, but not quite, entirely dissolved in dilute HNO, Aq, the solution of Pb(NO,) was heated to boiling, and the PbO was added little by little, the last traces of he were thus ppd as oxide, the boiling liquid was filtered and poured into solution of NH, sesquicarbonate In this way pure PbCO. The PbCO, was dried, and added was obtained little by little to pure molten KCN contained in an unglazed porcelain crucible placed within a larger crucible, the space between being filled with powdered Al₂O₃ previously heated and mixed with 5 pc meited and powdered borax The Pb thus obtained was again placed in pure molten KCN, and kept there until the upper surface of the Pb appeared convex and lustrous like pure Hg, after partial cooling the Pb was run off into a mould of polished steel If a trace of PbO or PbS is present in the molten Pb the surface does not become convex

Properties -Almost white, lustrous metal Ordinary lead is blue grey, it contains traces of Ag, Cu, Sb, and sometimes Fe and Mn malleable and ductile, but the properties are greatly affected by small quantities of impurities, notably by PbO, which is somewhat soluble in molten Pb Tenacity very low Somewhat so-Leaves a mark on paper Lead 1s so soft that it can be cut by a knife or scratched by the nail, traces of foreign metals, or of As or S, increase the hardness of Pb By slowly cooling molten Pb, piercing a hole in the crust by an iron rod, and pouring off the still molten portion, the metal is obtained in regular octahedra often ag gregated together similarly to crystals of NH,Cl (Marx, S 57, 193, Stolba, D P J. 164, 371) Crystals of Pb are also obtained by hanging a rod of zine in a slightly acidulated solution of a Pb salt, or by passing an electric current through

such a solution Pb vaporises at high tempera tures (1400° 1600°), the vapour is very poisonous. The lustrous surface of Pb quickly tarnishes in ordinary air from formation of a film of oxide (probably Pb₂O) Very finely divided Pb is quickly changed to the suboxide Pb.O. such finely divided Pb may be obtained by covering a Zn plate with a little PbSO, made into a paste with water, laying another Zn plate on the top, and placing the whole in NaClAq for 9 or 10 days (v Bolley, Ph C 1850 59) Pb is readily changed to PbO on the surface by melting in air Pb is not changed in dry air, nor when kept under pure water from which all air has been removed, in contact with water and the atmosphere it becomes gradually covered with a white deposit of 2PbCO3, PbO2H2, and small quantities of a soluble Pb salt are also formed (v Reactions, No 2) Pb is soluble in HNO₃Aq, and is slowly changed to PbCl₂ by the action of HClAq in the air, hot conc H2SO, forms PbSO, Pb is oxidised by heating with KNO, or KHSO. Combines with the halogens, also with S, Se, P, and

As, forms alloys with many metals

The atomic weight of Pb has been determined
(1) by finding V D of PbCl₂ (Roscoe, Pr 27, 426),
and analyses of this compound (Marignac, Ar Sc
1, 59, 209, Dumas, A Ch [3] 55, 196), (2) by
syntheses of Pb(NO₃)₂ and PbSO₄ (Stas, Rech
101, Chem Proport 329), (3) by converting
Pb, PbO, and PbS into PbSO₄, and by analysing
PbCO₃ (Berzelius, P 8, 15, G A 37, 259, 265,
Turner, A 13, 17), (4) by determining S H of

Pb (Regnault, A Ch [3] 26, 286)

Lead is metallic in its chemical behaviour The oxide PbO is strongly basic, it is slightly soluble in water, and the solution turns red lit mus blue and absorbs CO₂ from the air, it de composes hot solutions of NH, salts with evolu tion of NH2, and it reacts with acids to form salts PbX_2 (X = NO_{3} , ${}^{1}_{2}SO_4$, &c), $PbCO_3$ is isomorphous with the carbonates of the alkaline earths, on the other hand, PbO dissolves in fairly conc KOHAq, probably forming a salt PbO,K, and compounds of PbO with CaO and Ag,O are PbO₂ reacts with strong bases, eg KOH, to form unstable salts, eg K.PbO₃, on the other hand, treatment of Pb₂O₄ with conc H,PO,Aq or H,CO,Aq produces solutions which react as if they contained salts of PbO2. The greater number of the lead salts correspond with the oxide PbO, Pb(CH₃)₄, however, is stable as a gas

Lead is placed in Series II of Group IV , the other odd series members of this group are Si, Ge, and Sn Pb more nearly resembles Sn than any other member of Group IV, it is more distinctly metallic than the other elements of the group, the other elements of this group form several compounds MX^t₄, whereas most of the Pb compounds belong to the form MXI. Pb forms many basic and several double salts (cf CARBON GROUP OF ELEMENTS, vol 1 p 684, also Tin group of elements, in vol 1v) In its physical properties Pb resembles Tl, one series of Tl salts, however, is similar to those of the alkalı metals, and the other senes resembles those of the earth metals (v EARTHS, METALS OF The atom of Pb is divalent THE, vol 11 p 424) in the gaseous molecule PbCl2, and tetravalent in the gaseous molecule Pb(CH₂)4.

124 LEAD.

Ramsay (C J 55, 521) has determined the lowering of vapour pressure of Hg produced by dissolving Pb in Hg, the results obtained make it probable that the molecular weight of lead is the same as the atomic weight, this result assumes the accuracy of Van't Hoff's law, that equal volumes of dlute solutions contain equal numbers of molecules of the dissolved substances, and it also regards the molecular weight of liquid Hg as the same as the atomic weight

Reactions —1 Unchanged in dry air, super ticially oxidised (probably to Pb,O) in moist air, oxidised to PbO by heating in air or oxygen -2 Water quite free from air has no action on Pb at ordinary temperatures (Stalman, D P J 180, 366, Bottger, J 1866 232, but v Muller, J pr [2] 36, 317) Water and arr together dis-J pr [2] 36, 317) solve a little Pb, and at the same time a deposit of 2PbCO₃ Pb(OH)₂ is formed Water charged with CO2 under a pressure of a few atmo spheres dissolves considerable quantities of Pb (perhaps in the form of an acid carbonate) The presence of small quantities of nitrates, espe cially NH, NO₃, of soluble alkaline chlorides, and of some other salts, eg (NH₄)₂SO₄, increases the solvent action of water on Pb, the amount of Pb in solution is greater after a few days' action than after many days' exposure to the air In these reactions the soluble salt of Pb is probably slowly acted on by the CO2 of the air with formation and ppn of insoluble 2PbCO, Pb(OH), The presence of alkaline carbonates or of a little Ca silicate in water almost wholly stops the solvent action on Pb, probably the insoluble hydrocarbonate is formed as quickly as Pb is dissolved The action of water on lead has been examined by Graham, Miller a Hofmann, Noad (C J 4, 20), Yorke (P M [3] 5, 82), Dumas (C R 77, 1054), Berthelot (C R 77, 1063), Pattison Muir (C N 25, 294, 33, 102, 125, 145, 34, 223, 234, 35, 82, 110, C J 31, 660), Muller (J pr [2] 36, 317), Carnelley a Frew (S C I)7, 15, 78), and others Granulated lead slowly decomposes boiling water, evolving H (Stolba, J pr 94, 113) -3 Lead is dissolved by several acids, slowly by hot cone HClAq in contact with air, also slowly by conc H SO, (Calvert a Johnson, C J 16, 66), rapidly by HNO, Aq For account of gaseous products of neaction with HNO, Aq v Ackworth a Armstrong, C J 82, 54.

Technical applications of lead—Lead is largely used for vessels and apparatus in which different chemical processes are conducted, e.g. for sulphuric acid chambers, water pipes are usually made of lead. Alloys of lead with tin form solder and pewter, an alloy with As is used for making shot, an alloy with Sb is used as type-metal, and emery wheels and grinding tools used by lapidaries are made of an alloy of Pb and Sb, alloys of Pb with Sn and Bi have low melting-points. Lead oxide, chromate, accetate, and carbonate are all largely used in manufactures.

Detection and Estimation—HClAq ppts white PbCl₂ from solutions of Pb salts, sl sol cold water, fairly sol hot water, nearly insol dilute HClAq Dilute H₂SO₄, or a soluble sulphate, ppts white PbSO₄ almost insol dilute H₂SO₄Aq, quite insol alcohol. K₂CrO₄Aq ppts

yellow PbCrO,, insol water KIAq ppts yellow PbL, sol boiling water, but reppd in yellow crystalline spangles on cooling H₂S ppts brownish black PbS, insol dilute acids, alkalis, or alkaline sulphides, presence of much HCl prevents ppn from rather dilute solutions of salts of lead, in presence of a little HCl pp is sometimes red or vellow red, and consists of xPbS yPbCl₂ (v Lead sulphochloride of) The H₂S test is said to detect 1 pt of lead in 100,000 pts of water, the H₂SO, test 1 pt in 20,000, and the K₂CrO, test 1 pt in 70,000 Pb may be estimated as Pb₂O, by ppn with dilute H₂SO₄Aq adding about 2 vols of alcohol, washing with alcohol, drying and callining

Supposed clotropic form of lead When lead is deposited on the negative electrode by passing a current through a neutral or acid solution of a lead salt, and the current is con tinued for some hours, the lead becomes the colour of copper (Wohler, A Suppl 2, 135) After washing the red leaflets thus obtained with water and alcohol, they retain their colour on exposure to the air, and are not acted on by dilute HClAq or cold dilute HNO,Aq, or alkalis, but are readily dissolved by hot HNO3Aq, heated in H they melt above 200° and become ordinary lead Wöhler regarded the red substance either as an alloti pic form of lead, or as a hydride of lead, Stolba (J pr 94, 113) suggested that the red colour was due to a film of oxide on the surface of the lead (v also Schutzenberger, C R86, 1265)

Lead, alloys of Lead alloys with many metals, the alloys are produced by fusing together the constituent metals, some of them are definite compounds, in these cases either of the constituents is generally soluble in the compound

Alloys with bismuth, and with bismuth and other metals. Pb and Bimay be alloyed in all proportions, mall-ability is diminished by adding more than an equal weight of Bi By fusing together 70 pc. Pb, 15 pc. Bi, and 15 pc. Sb an alloy is obtained which expands on cooling. An amalgam of Pb (4 pts.) Bi (2 pts.), and Hg (1 pt.) may be melted by rubbing pieces of it together. Alloys of Pb with Bi and Sn are known as fusible alloy, the MP varies from c. 90° to c. 170°, all these alloys are said to solidify at 98° (For MP and solidification points of these alloys v. Dallo, C. C. 1865. 831, for expansion and S. H. v. Spring, A. Ch. [5]. 7, 178, also Wiedemann, W. 3, 237, for thermal conductivity v. Wiedemann a. Fianz, P. 89,514, 108, 399, cf. also vol. 1. p. 511)

Britannia metal is composed of equal parts of brass, Sn, Sb, and Bi, Queen's metal of 1 pt Pb, 1 pt Bi, 1 pt Sb, and 9 pts Sn Alloys of Pb with Bi, Sn, and Ag are very fusible, melting as low as 45°, the alloy often used for tinning the inside of glass globes, tubes, &c is made by fusing together 1 pt Pb, 1 pt Sn, 2 pts Bi, and adding 10 pts Ag

Alloys with copper v vol ii p 254

Alloys with mercury Pb easily amalgamates with Hg, by rubbing together Pb filings with Hg or by adding Hg to molten Pb An amalgam containing 33 pc Pb is liquid, an amalgam of equal parts Pb and Hg can be crystallised Contraction occurs during the amalgamation

Alloys with potassium and solium Prepared either by directly heating the metals together or by fusing PbO with an alkaline flux, eg with cream of tartar When distilled with EtI, MeI, &c, compounds of Pb with Et, Me, &c are obtained

These metals may be Alloys with tin alloyed in all proportions, the SG of the alloy is always a little less than that calculated from the SG of the constituents There are no indications of the formation of definite com pounds (v Laurie, C J 55, 677) These alloys are very easily ignited and burnt The two com monest alloys of Pb and Sn are solder and pewter Fine solder contains 1 pt Pb and 2 pts Sn, common solder, equal pts Pb and Sn, coarse The M P varies solder, 2 pts Pb and 1 pt Sn from c 340° for 1 pt Pb and 2 pts Sn, to 370° for equ l parts Pb and Sn, and 440° for 2 pts Pb and 1 pt Sn, by increasing the relative quantity of Pb the MP rises until the alloy of 25 pts Pb to 1 pt Sn melts at c 560°, by increasing the relative quantity of Sn, above 2 pts to 1 of Pb, the MP also slightly rises until the alloy of 6 pts Sn to 1 pt Pb melts at c Pewter is an alloy of c 80 pts Pb with According to Rudberg (P 18, 20 pts Sn 240) when Pb and Sn are melted together and allowed to cool, the thermometer always shows a stationary point at 187°, he thinks that a compound PbSn₃ is always formed, that this alloy has a fixed solidification point lower than that of Pb (326°) or Sn (228°), and that the heat produced by the solidification of this alloy acting on the excess of Pb or Sn causes fluctuations in the final solidification point of the whole mixture (v also Pohl, WAB 1850 402, Riche, CR55, 143, Wertheim, P Erganzbd, 2, 75, Matthicssen, P 130, 62) It seems that the amount of Pb in pewter vessels for domestic use should not exceed 18 p c, else Pb may be dissolved out by the action of dilute acids, e g vinegar

Alloys with tin and copper metal is an alloy of 43 pc Pb, 80 pc Cu, 101 pc Sn, and 5 6 pc Zn A little Pb is sometimes added to Cu and Sn in making bronze

Alloys with palladium A crystalline, greyish white, brittle alloy is obtained by fusing granulated Pb with rather more than its own weight of Pd foil, and removing excess of Pb by the action of acetic acid and CO, The alloy has the composition PdsPb, SG 11 225 (Bauer, B 3, 691, 4, 419)

Alloys with platinum Analloy having the composition PtPb is formed by fusing 3 pts Pb with 1 pt Pt, and exposing the product to the prolonged action of Co., action of the prolonged action of the state of the to the prolonged action of CO₂, O, and acetic Steel-Bauer (lc) also describes an alloy PtPb2

Alloys with zine Pb and Zn alloyin all proportions, all the Zn is removed by heating Alloying Pb with Zn increases if the Pb Alloys of Pb, Zn, and very strongly the hardness of the Pb Sn solidify at 168°, when the ratio is 2Pb Zn 9Sn the alloy solidifies at 168° only, but other alloys show also two higher points

Lead also alloys with chromium and man

Lead, antimonate of, v vol 1 p 286

Lead, antimonides of Pb and Sb may be melted together in all proportions, the alloys are crystalline, most of them are formed with expansion Ordinary type metal consists of 83 pts Pb and 17 pts Sb (v Riche, C R 55, 143, Matthiessen, P 110, 28, Calvert a Johnson, P M [4] 18, 354, H v d Planitz, B 7, 1664, Rollmann, P 84, 277)

Lead, arsenates of, v vol 1 p 308 Lead, arsenates of Pb melted with As takes up c 16 pc of the latter, the alloys are brittle and very fusible, some, but not all, of the As is expelled by heating Shot metal is an alloy of Pb

with not more than 3 p c As

Lead, arsenites of, v vol 1 p 306

Lead, borates of, v vol 1 p 530 Lead, borofluoride of $Pb(BF_4)_2[=PbF_2 2BF_4]$ Prismatic crystals, obtained by dissolving PbO in excess of HBF, Aq and evaporating to a syrup Crystallises with difficulty, partially decomposed by water or alcohol (Berzelius, P 2, 113, cf.

Lead, bromide of PbBr₂ Mol w not certain, but from analogy of PbCl is probably 365 9(= PbBr) Melts at c 499° (Carnelley, C J 33, 278), boils at c 861° (Carnelley a Williams, C J 33, 283) SG ppd PbBr₂ 6 572 at 19 2° (Clarke's Table of Specific Gravities [1888] 32) $\dot{H} F [Pb,Br'] = 64,450$, [Pb,Br',Aq] = 54,410 (Th. 3, 337) Obtained by digesting PbO or PbCO. with HBrAq, or by ppg the solution of a Pb salt by HBrAq or a soluble bromide Obtained in well formed, colourless, rhombic needles by slowly evaporating a solution of Pb in alcohol containing Br (Hjortdahl, Z K 3, 302) containing Br (Hjoitdahl, Z K 3, 302) Sl sol. cold, more sol hot, water, more sol acids From the solution in hot cone HBrAq (72 pe HBr), Ditte says that white lustrous needles, PbBr₂ 3H₂O, crystallise (C R 92, 718), and that the compound 5PbBr 2HBr 10H2O is obtained by passing HBr into the solution of PbBr, in HBrAq After melting, PbBr₂ solidines to a yellow, horn like mass Heated in air, a yellow yellow, horn like mass mass remains containing the orybromide Pb OBr₂ (= PbBr...PbO), the same oxybromide is obtained by digesting PbBr with Pb(C H,O2).Aq A compound of PbBr, with PbCl, has been ob tained, also compounds of PbBr, with PbI2, and with Pb(CNS), (1 Lead, bromochloride of, Lead, woodbromides of, and Lead, bromosul-André (A Ch [6] 3, 104) phocyanides of) describes several double compounds of PbBr. with NH,Br

Lead, brom iodides of, v Lead, iodobrom rdes of

Lead, bromosulphocyanides of

PbBr, Pb(CNS), brownish crystals, by digesting the constituents together, and then crystallising from boiling water By acidifying with HBrAq, the salt 8PbBr Pb(CNS)2 is produced (Grisson a Thorp, Am 10, 229)

Lead, chlorides of Only one chloride of lead, PbCl., has been isolated, but there is strong proof of the existence of the tetrachloride, PbCl4, in solutions of PbO2 in HClAq

LEAD CHLORIDE, PbCl2. (Lead dichloride

Plumbous chloride Horn-lead) Mól w 277 14 8 G 5 805 at 15° (Stolba, J pr 97, 503), 5 88 (Brugelmann, B 17, 2359) V D 187 1 at c 1080° (mean of 4) (Roscoe, Pr 27, 426) Melts at 498°, and boils between 861° and 954° (Carnelley, C J 33, 278, and C a Williams, C J 35, 564) Crystallises in rhombic system, a b c = 5948 1 5949 (Schabus, W A B 1850 456) H F [Pb,Cl²] = 82,770, [Pb,Cl²,Aq] = 75,970 (Th 3, 337)

Occurrence —As cotumite, found in the crater of Vesuvius after the eruption of 1822,

mixed with NaCl and CuSO.

Formation —1 By heating Pb in a stream of Cl, combination occurs slowly —2 By dissolving Pb in hot HClAq in contact with air, PbCl, separates on cooling —3 By adding solution of a chloride, eg NaClAq, to a cone solution of a Pb salt —4 By dissolving PbS in hot HClAq and crystallising

Preparation —PbO or PbCO, is boiled with dilute HClAq, and HClAq is added little by little until all is dissolved, the liquid is allowed to cool, and the PbCl, which separates is repeatedly

crystallised from boiling water

Properties — Large, white, rhombic crystals (v supra), which melt at 498° and boil between 861° and 954° (v supra) VD atc 1080° agrees with the formula PbCl₂ Sl. sol cold water, S = 95 at 165°, solution contains 9414 pc PbCl₂ (Bell, C N 16, 09), addition of 1 pc HCl. diminishes S to 347, and with 14 pc HCl is present S increases, S in HClAq S G 1162 = 29 (Bell, C c) According to Field (C J [2] 11, 575) PbCl₂ is less soluble in NaClAq containing 5 pc NaCl than in water (S = 23), but the values of S for water and cone NaClAq are about the same The considerably greater solubility of PbCl₂ in cone than in dilute HClAq is supposed by Ditte to be due to the formation of a compound of PbCl₂ and HCl which is decomposed by water (C R 92, 718) Ditte gives the following table —

HCl in 100 pts H _s O	PbCl _a dissolved in 1000 pts of the liquid in col 1				
0 56 10 18 21 9 81 5 46	at 0° 8 2 8 1 2 2 4 4 7 11 9 29 8	20° 11 8 3 1 4 4 8 6 2 14 1 30 (at 17°)	40° 17 46 32 72 104 19	55° 21 65 55 98 129 24	80° 31 12 4 12 19 8 23 8 38

PbCl₂ is readily dissolved by boiling water, but almost all crystallises out on cooling Insol alcohol 94 pc, somewhat sol in more dilute Fairly sol Nac,H₂O₂Aq, Na,S₂O₃Aq, and some other salt solutions After melting and cooling, PbCl₂ appears as a horn-like mass (hence the uame horn-lead formerly used)

Reactions—1 Heated in the air until white fumes cease to come off, a light yellow onythionide Pb₂OCl₂ (=PbCl₂PbO) is formed (v. Lead, oxychlorides of)—2 Recently ppd PbCl₂ when digested with cold neutral lead acetate produces an oxychloride 2Pb₂OCl₂H₂O (Brandes, A. 10, 273)—3. The oxychloride

Pb₂OCl₂·H₂O is obtained by partially ppg PbCl₂Aq by time water —4 By adding caustic potash to PbCl₂ suspended in water, the oxy chloride PbCl₂ 2PbO is said to be formed (Ditte, C R 94, 1180) —5 According to Berzelius, the product of the action of ammonia on PbCl₂ is PbCl₂ 3PbO 4H₂O —6 Heated in carbon mon oxide, COCl₂ and Pb are produced —7 Heated, not too strongly, in phosphoretted hydrogen, HCl, P, and Pb are formed —8 Oxidised by alkaline hypochlorites to PbCl₂—9 Long continued passage of Cl into PbCl₃ suspended in water most probably produces PbCl₄, PbO₂ being simultaneously ppd (v bisher, C J 35, 284)

water most probably produces PbCl, PbO, being simultaneously ppd (v I isher, C J 35, 284)

Combinations—1 PbCl₂ absorbs ammonia gas, forming 2PbCl₂ 3NH₂ according to H Rose All the NH, is readily given off on warming -2 Combines with lead monoxide, when the two are heated together, to form oxychlorides $x \operatorname{PbCl}_2 y \operatorname{PbO}$ (v Lead, oxychlorides of)— 4 With lead carbonate forms PbCl₂ PbCO₃, ob the teat the two salts, or by the action of CO_2 on $PbCl_2$ under pressure (Miller, C J [2] 8, 37) -5 With lead acetate to form $PbCl_2$ pbCl₂ with $Pb(C_2H_3O_2)_2$, obtained by mixing freshly ppd $PbCl_2$ with $Pb(C_2H_3O_2)_2$ and enough glacial acetic acid to form a viscid mass, which soon solutions and removing excess of each by soon solidifies, and removing excess of acid by pressure (Carius, A 127, 87)—6 With lead phosphate, forms PbCl₂ Pb₃(PO₄)₂ H₂O and PbCl₂ 2Pb₃(PO₄)₂, or according to Gerhardt (A Ch [3] 22, 505) PbCl₂ Pb₂H (PO₄) The former is produced by pouring boiling PbCl,Aq into excess of boiling Na₂HPO₄Aq, the latter by pouring the Na phosphate into the PbCl₂ solution (Heintz, P 73, 122) Pyromorphite PbCl₂3Pb₃(PO₄)₂ occurs native -7 Combines with lead bromide to form PbCl₂ PbBr, with lead volude to form PbCl₂ PbL₂, with lead fluoride to form PbCl₂ PbF₂, and with lead sulphocyanide to form PbCl₂ PbC(NS)₂ (v Lead bromochloride, Lead volobromides, Lead volobromides, Lead chlorofluoride, and Lead chlorosulpho cyanide) -8 Probably combines with chlorine to form PbCl₄, when Cl 18 passed into PbCl₂ dissolved in considerable excess of HClAq, or when Cl is passed into PbCl,Aq mixed with CaCl₂ (v Lead tetrachloride) — 9 André (A Ch [6] 3, 104) describes various double compounds of PbCl2 with NH4Cl

LEAD TETRACHLORIDE (Plumbuc chloride)
No other chloride of lead except PbCl₂ has been
solated, but there is considerable evidence in
favour of the existence in HCl solution of tetra

chloride PbCl

If a considerable quantity of HClAq is added to PbCl₂, and Cl is passed in, the PbCl₂ dis solves to a reddish brown liquid, on warming Cl is evolved, addition of water causes ppn of PbO.

A mixture of PbCl₂Aq with CaCl₂Aq absorbs much Cl and forms a deep yel'ow liquid, which may be preserved unchanged in a closed vessel, but is decomposed in an open vessel giving PbCl₂ and Cl, a few dr-ps of this liquid added to a large quantity of water gives a pp of PbCl₂ and PbO₂, alkalis and alkaline carbonates ppt PbO₂, MnCl₂Aq ppts MnO₂ and PbCl₂, Fe, Cu, Zn, gold leaf, and finely divided Pt, are soluble in the liquid with separation of PbCl₂, it rapidly oxidises many organic bodies, PbCl₂ being ppd.

(Sobrero a Salmi, A Ch [8] 29, 165, Nucklès,

A Oh [4] 10, 323)

PbO₂ dissolves in cold fairly cone HClAq From this yellow solution, alkalis, alkaline carbonates, oxides and carbonates of Ba, Mg, Zn, &c , and alkaline borates and acetates, ppt PbO, The solution smells of Cl, and is decomposed by heat with evolution of Cl and ppn of PbCl2 If the HClAq is saturate. with PbO₂ the addition of water ppts PbO₂ Fisher (C J 35, 282) determined the ratio of Pb ppd from this solu tion by water as PbO₂ to Cl given off by decomposing the solution with ppn of PbCl₂ The ratio was almost exactly Pb 2Cl, now this is the ratio required on the hypothesis that the decomposition by water proceeds as shown in equation (1), and the decomposition to PbCl2 and Cl proceeds as shown in equation (2)-

(1)
$$PbCl_4 + 2H_2O = PbO_2 + 4HCl$$

(2) $PbCl_4 = PbCl_2 + Cl_2$

Fisher proved that the whole of the Pb in solution is thrown down by water as PbO₂ A yellow liquid with properties the same as those of the liquid just described is obtained by treating Pb.O. with a considerable quantity of HClAq

(Fisher, lc)

By the method described above, Sobrero a Salmi (lc) obtained a double salt PbCl, 9NaCl, and Nickles (lc) obtained PbCl₄ 16C₆Cl₂ Lva poration in vacuo, over conc KOHAq, of a solu tion of PbO2 in HClAq produces crystals of PbCl2 containing some PbCl, according to Bendant a Daguin (Ann M [5] 4, 239, v also Nikolukine, J R 1885 207, abstract in C J 50, 123)

Lead, iodide of PbI₂ Mol w not certainly known, but from analogy of PbCl2 probably 459 46 (= PbI₂) S.G 6 12, 5 6247 molten at 383° (Rodwell, T 1882 1144) Melts c 383°. and boils between 861° and 954° (Carnelley, C J 33, 277, C a Williams, C J 37, 126) For ex pansion of PbI₂ v Rodwell, Pr 32, 23 HF [Pb,I'] = 39,800 (Th 3,337)

Preparation --Solution of Pb(NO₂)₂ is added to solution of FeI, the pp is washed with cold water and dried KI or CaI, may be used instead of FeI₂. If Pb(C₂H₃O₂)₂Aq is added to KIAq oxylodides are formed when excess of Pb salt is added, and soluble double rodides are formed if excess of KI is present, to prevent both results the solution of Pb(C₂H₁O₂)₂ should be

acidified either with HNO, or $C_2H_1O_2$ Properties and Reactions — Golden yellow crystals, hexagonal, ac=1 1 3018 (Nordenskjöld) Melts when heated to a brown red liquid. and solidifies to a yellow mass Heated in the arr I is evolved, and oxylodides (q v) are formed Decom S cold water 03, boiling water 515 Zn or Fe boiled with PbI2 under posed by Cl water forms ZnI₂ or FeI₂, and ppts Pb Na₂S₂O₃ in excess forms Pb sulphite and NaI (Michaelis a Koethe, B 6, 999) NH, Aq added to boiling PbI,Aq ppts 3PbO PbI, 2H,O Dry PbL 1s unchanged by light, when moist and exposed to direct sunshine, in contact with the air, it is slowly changed to PbCO₂ and PbO₂ with separa tion of I, this change is hastened by all substances which absorb I (Schmid, P 127, 493) PbI, is somewhat soluble in conc solution of alkalı iodides, but is ppd on dilution

Combinations -1 Absorbs ammonia, form ing a white compound PbI, 2NH, -2 With lead monoxide forms various oxylodides xPbI2yPbO (v Lead, oxyrodides of) -3 By dissolving PbI2 in warm todhydric acid solution, and allowing to cool, white lustrous needles of PbL 2HI = H2PbL separate This compound may be called sodo plumbhydric acid or sodo plumbic acid, it is decomposed by water, gives off HI in vacuo, according to Berthelot, the crystals contain 10H₂O (C R 91, 1024)—4 PbI₂ combines with potassium iodide to form various double salts, one of which, PbI, 2KI, seems best regarded as the K salt of H.PbI. Yellow, lustrous leaflets of PbI, KI are obtained by dis solving the constituent salts in the ratio PbI₂ KI in boiling water, and allowing to cool, by dis solving this salt in warm KIAq and cooling, the salt PbI, 4KI is said to be obtained in white needles (Boullay, A Ch [2] 34, 366) Remsen (Am 11, No 5) asserts that the process de scribed by Boullay does not result in production of PbI, 4KI, and that the salt formed with most case when PbI, and KI react under different conditions is PbI2 KI H2O (cf Ditte, C R 92) 1 1841) -5 By mixing a boiling solution of KI

and NH₄Cl with Pb(C₂H₂O₂)₂Aq, taking care that | Pb₂O is prepared by heating PbC₂O₄ in a retort no permanent pp was formed, and cooling, Völkel obtained clear yellow lustrous needles of PbI₂ 2NH₄Cl (P 62, 252), decomposed by water with separation of PbI₂ By saturating hot NH4ClAq with PbI2, cooling, pouring off from PbI₂ 2PbCl₂ which separates, and evaporating, Poggiale (C R 20, 1180) obtained PbI₂ 4NH,Cl 2H₂O, decomposed by water with separation of PbI₂—6 PbI₂ combines with silver codide For properties of the PbI₂ AgI produced v Rodwell (Pr 32, 540), Bellati a Romanese (Pr 34, 104) -7 Compounds with lead bromide are formed by crystallising PbI₂ from HBrAq (v. Lead, vodobromides of)—8 Compounds with lead chloride, PbI₂ PbCl₂(=PbICl) and PbI₂ 2PbCl₂, are known (v. Lead, vodochlorides of)—9 By boiling PbCO₃ repeatedly with PbI₂Aq, Poggiale (C R 20, 1184) obtained PbI₂PbCO₃ — 10 PbI₂Pb(C₂H₃O₂)₂ was obtained by Carius (A 127, 87) similarly to the PbCl₂ compound (v Lead chloride, Combinations No 5)

Lead, 10dobromides of By crystallising PbI2Aq from HBrAq, Grisson a Thorp obtained the compounds (1) PbBr₂ PbI₂, (2) 3PbBr₂ PbI₂,

(3) 6PbBr₂ PbI₂ (Am 10, 229)

Lead, iodocarbonate of, v Lead, vodide of,

Combinations No 9

Lead, iodochlorides of The compound PbClI (= PbCl₂.PbI₂) is obtained, in sulphur yellow prisms, by cooling a solution of PbI2 in boiling HClAq (Labouré, J Ph [3] 4, 328) According to Engelhardt the compound contains more PbI2 than required by the above formula (J pr 67, 293) By saturating hot NH, ClAq with PbI₂, and allowing to cool, Poggiale obtained yellow needles of PbI₂ 2PbCl₂ (C R 20,

Lead, 10dosulphocyanide of, PbI₂ 3Pb(CNS)₂, formed with some difficulty by digesting the constituents and crystallising from hot water

(Grisson a Thorp, Am 10, 229)

Lead, oxides and hydroxides (or hydrated oxides) of Five oxides of lead have been isolated, viz, Pb₂O, PbO, Pb₂O₃, Pb₃O₄, and PbO₂, one or more oxides intermediate between Pb₂O₄ and PbO₂ perhaps exist Two hydrates of PbO, viz 2PbO H,O and 3PbO H,O are known, the hydrates Pb₂O₃ 3H₂O and PbO, H₂O have also been isolated. The most stable oxide is PbO, Pb₂O is easily oxidised to PbO by heating in air, and Pb2O3, Pb3O4, and PbO2 are reduced to PbO when strongly heated PbO reacts with acids as a basic oxide, forming salts PbX2, X=NO₅, Cl, \$SO₄, \$PO₄, &c, it decomposes NH₄ salts, evolving NH₃, and combines with CO₂ to form PbCO, PbO also reacts with strongly basic oxides as an acidic oxide forming unstable plumbites, e g K2PbO2 PbO reacts as an acidic peroxide, with KOH and NaOH it forms fairly stable plumbates, Mr₂PbO₃, with most acids it forms salts of PbO, but it appears capable of dissolving without reduction in glacial acetic and phosphoric acids The reactions of Pb2O2 and Pb.O. indicate that these oxides are compounds of the form xPbO yPbO₂ As none of the oxides of Pb has been gasified the molecular weight of none is known with certainty

LEAD SUBOXIDE, Pb2O The grey pellic's which forms on the surface of lead exposed to the air consists of Pb₂O, according to Berzelius

to near 300° as long as any gas is given off, 2PbC₂O₄ = Pb₂O + CO + 8CO₂, the residue is allowed to cool in the retort (Dulong, S 17, 229, Pelouze, J pr 25, 486) Pb₂O is a black powder, S G 9772 (Playfair a Joule, C S Mem 8, 83), heated in air it burns to PbO, heated out of contact with air, PbO and Pb are produced Moist Pb2O rapidly absorbs O from the air, forming white PbO x11,O Dilute acids resolve Pb₂O into PbO, which dissolves, and Pb, saturated Pb2NO₃Aq produces a similar resolution, but Pb₂O is wholly soluble in dilute Pb2NO₃Aq This oxide was at one time supposed to be a mixture of PbO and Pb, but this is disproved by the facts that when the oxide is rubbed with Hg either dry or under water, no Pb is removed, and that PbO is not removed from it by boiling with Pb acetate solution

LEAD PROTOXIDE PbO (Plumbous oxide Litharge Massicot) Mol w unknown, oxide has not been gasified SG 9 277 at 17 50 (Herapath, P M 64, 321), 925 (Playfar a Joule, C S Mem 3, 84), 917 to 988 (Ditte, C R 94, 1310), 874 to 929 (Geuther, A 219, 60) HF [Pb,O] = 50,300, heats of neutralisa $[PbO, 2HClAq] = 56,830, [PbO, HNO^3Aq]$ = 24,250 to form basic nitrate (Th 3, 337) Crystallises in rhombic forms $a \ b \ c = 666 \ 1 \ 971$ (Nordenskjold, P 114, 619, v also Mitscherlich, P 49, 403, J pr 19, 451, Graulch, W A B 28, 282, Marx, J pr 3, 217) PbO is dimorphous according to Ditte (C R 94, 1310)

Occurrence -As lead ochre, in small quan tities in Mexico, Baden, Virginia, and a few other localities

Formation -1 By heating Pb to low red ness in presence of air, if the temperature is kept below the melting point of the PbO, the oxide is obtained as a yellowish powder, known com mercially as massicot, if the PbO is melted during the preparation, the oxide solidines to a scaly reddish solid known as htharge -2 By heating Pb with KNO, -3 By strongly heating red lead in air -4 By strongly reating white lead on an iron plate -5 By adding boiling Pb acetate solution to boiling KOHAq, pp 18 crystalline (Winkelblech, A 21, 21, J pr 10, 227) -6 By slowly pouring Pb acetate solu tion into CaOAq at 80° until a crystalline crust appears, then adding a little more, and allowing to cool (Brendecke, R P 55, 318) -7 By add ing PbSO,, made into a paste with water, to boiling NaOHAq (Wichmann, C C 1860 334) For modifications of these processes v Payen, J pr 13, 485, Behrens, B J 24, 134 8 Ac cording to Yorke (P M [3] 5, 82), crystals of PbO are produced by placing Pb in a vessel of water exposed to the air The reaction of steam with Pb at white heat produces PbO

Preparation -1 Basic Pb nitrate is heated in a Pt crucible until comp etely decomposed (the neutral salt melts before decomposition is Berzelius recommends the following complete) procedure Equal we shts of PbO and Pb2NO, are kept in boiling water until the PbO is wholly transformed into basic nitrate, the basic salt is dissolved in boiling water, the solution is filtered hot and allowed to cool, the basic nitrate which separates is subjected to the action of the boiling solution as long as any solid separates on cooling.

A small quantity of the basic nitrate is made into a paste with water, the inside of a Pt crucible is covered with this paste, and the crucible is dried, the rest of the salt is strongly pressed while moist, then dried, and broken into smaller pieces, which are placed in the crucible, which is then heated until the decomposition is completed PbO formed from the pieces of basic nitrate in the middle of the crucible is pure, the outer layers of PbO contain a little Pt —2 PbO is prepared in crystalline form by dissolving PbO, prepared as in 1, in hot KOHAq or NaOHAq and allowing to cool The colour and S G of the crystals vary with the conditions (C R 94, 1310) obtained a greenish crystalline mass (8 G 9 1699) by heating KOHAq c 13 p c with PbO xH₂O, using 25 p c KOHAq he obtained sulphur yellow lustrous crystals (8 G 9 2089), brownish needles (8 G 9 8835) were obtained by using 30 pc KOHAq and allowing to cool, KOHAq 185 pc, saturated with PbOxHO when hot, gave deep green, almost black, crystals on cooling (SG 95605), satu rated KOHAq boiled with PbO xH2O gave deep rose coloured crystals of PbO (SG 9 4223), differing in form from the usual crystals, and becoming yellow when strongly heated (cf Mit scherlich, J pr 19, 451, Calvert, B J 24, 135, Becquerel, A Ch [2] 51, 105)

Properties -PbO is a yellow to reddish yellow erystalline solid, the colour and SG of the oxide when well crystallised seem to vary with the conditions of formation, v Preparation, Melts between 585° and 630° to a clear No 2 dark red liquid According to Leblanc (B J26. 193) molten PbO absorbs O, which it gives off on solidifying PbO is sl sol water, 1 part dissolves in c 7000 water, the solubility is affected by the state of aggregation of the PbO (cf Bineau, C C 1855 877), if the solution is exposed to the air CO, is absorbed, and the Pb ppd as basic carbonate, the PbO is also removed by filtration through paper (Yorke, P M [3] 5, 82) Heated to between 300° and 450° in air, PbO is oxidised to Pb₅O₄, but at higher temperatures Pb₂O₄ is deoxidised to PbO PbO is soluble in warm cone kOHAq or NaOHAq Geuther (A 219, 56) says that two varieties of PbO exist, one yellow and the other red, the yellow crystallises in rhombic, the red

Reactions -1 Heated in air Pb,O, is formed at c 300°-450°, at a somewhat higher tempera ture PbO is re formed -2 Heated in hydrogen, or carbon monoxide, reduction to Pb occurs at a little above 100°, PbO is also reduced to Pb by heating with C, Na, or KCN—3 Reacts with most acids to form salts PbX2, X = NO3, Cl, 3SO4, &c , absorbs CO, from the air forming PbCO, 4 Decomposes alkali salts with separation of the alkali -5 Dissolves in warm fairly conc potash or soda solution, probably with formation of plumbites $K_2(Na_2)PbO_2$ —6 Dissolves in mol ten potash forming K_2PbQ_2 which, on long con tinued heating in air, is oxidised to K_2PbO_3 (Carnegie, C N 60, 113) (v PLUMBATES under LEAD PEROXIDE, p 132) -7 Dissolves also by boiling with milk of lime on evaporating in ab-sence of air a compound separates in needles, probably CaPbO, -8 Molten PbO dissolves

in hexagonal, forms

Vor. III

silicates readily dissolve CaO, Al₂O₂, &c -9 Heated in chlorine, bromine, or rodine vapour, the compound PbCl₂, Pb₇Br₁₁O₂, or Pb₈I₄O₆, is formed, heated with Cl and air, Br and air, or I and air, the product is PbsCl16O, PbsBr,O2, or $Pb_{\bullet}I_{2}O_{\bullet}$ (Cross a Sigiura, C J 33,405) —10 By boiling excess of PbO with cone calcium chloride solution, filtering, and washing with alcohol the pp that forms on cooling, André (C R 104, 359) obtained 2PbO CaO CaCl₂ 4H₂O, by using strontium chloride he obtained 2PbO SrCl 5H2O 11 PbO does not react with phosphorus trichloride at 160°, but when heated together over a flame, PbO and PCl, react violently forming PbCl₂, Pb(H₂PO₃)₂, and P (Michaelis, J pr [2] 4, 449) —12 Dissolves in magnesium chloride so lution, on filtering and evaporating, the oxy chloride 3PbO PbCl, H,O separates (Voigt, Chem Zertung, 13, 695)

HYDRATES OF LEAD MONOXIDE -1 3PbO H,O, obtained by adding c 400 grams KOH to 1000 cc water containing freshly ppd PbO in suspension (Ditte, C R 94, 1310), also by adding basic Pb acetate solution to NH, Aq at 20°-25°, and digesting the pp under the liquid for some time (Payen, A Ch [4] 8, 302, Behrens, B J 24, 134) This hydrate forms lustrous octahe dral crystals, S G 7 592 at 0° (Ditte, C R 94, 1310), loses some H₂O at 130°, and is entirely dehydrated at 145°, e sol caustic alkali solu tions —2 2PbO H.O By ppg Pb(C₂H₂O₂)₂Aq by KOHAq or NaOHAq, and digesting with ex cess of pptant, if Pb(NO₃) is used some basic nitrate is always formed (Schaffner, A 51, 175) The hydrates of PbO readily absorb CO2 from the air, they also combine with NH, to form PbO H2O 2NH, and 8PbO 2NH, H2O (Calvert, C R 23, 480)

Plumbites Although PbO is a markedly basic oxide, it nevertheless dissolves in alkali solutions to form unstable salts of the form MinPbO2, these salts, plumbites, have not been much investigated, according to Carnegie (C N 60, 113) K plumbite is formed by dissolving PbO in molten KOH, and on long continued heating in air it is oxidised to plumbate K, PbO, The Ag salt is produced by adding NaOHAq to a mixture of a Pb and a Ag salt, Wöhler gives the formula Ag₂O 2PbO Krutwig (B 15, 1264) ob tained a yellow salt, Ag₂PbO₂ 2H₂O, by adding AgNO, Aq to alkaline Pb(NO,), Aq, and washing with hot KOHAq and then with hot water, the salt soon became black in the air

LEAD SI SQUIOXIDE Pb2O3 (Plumbo plumbic oxide) Mol w unknown, as oxide has not been A reddish yellow powder resembling gasined PbO, Debray describes Pb O, as greenish-brown (C. R. 86, 513) Debray (lc) prepares this oxide by heating PbO₂ to 350°, or by heating PbO or better PbCO₃ to the same temperature in a stream of air or O, Carnelley a Walker (C J 53, 85) say that PbO. is changed to Pb2O, at 280°-200°, and that Pb.O. gives off O at c 370° According to Jacquelain (J pr 53, 153) Pb.O. may be obtained by pouring a solution of red lead, Pb,O, in glacial acetic acid into very dilute NH.Aq, separating the pp quickly washing it with hot water containing a very little acetic acid, and drying at 100° Winkelblech (A 21, 21) obtained this oxide by pouring NaOHAq into silica, easily forming glass like silicates, these Pb(C₂H₃O₂),Aq until the pp dissolved, and then adding cold NaClOAq, taking care to avoid excess which would produce PbO₂ Debray asserts that this method yields only a mixture of PbO and PbO₂ Pb₂O₃ is not decomposed by heat until c 360°, but a little above this temperature it gives off O₄ leaving Pb₂O₄, heated to c 530°, PbO is produced (Carnelleya Walker, C J 53, 85) Pb₂O₂ is resolved by acids into PbO₂ and a salt of PbO, Winkelblech's statement that Pb₂O₃ is dissolved unchanged by HClAq, from which solution it may be ppd again by alkalis, is defined by Hausmann (A 91, 235) Pb₂O₃ is reduced to PbO by $H_2O_2O_4Aq$ or H CO₂HAq

HYDRATE OF LEAD SPSQUIONIDE Pb.O. 3H,O Obtained by adding PbO to cone K.PbO.Aq, as a red curdy pp (Seidel, J pr [2] 20, 200) The solution of K.PbO. so than ed by dissolving pure PbO. in molten KOH with a very little water, and then dissolving the fused mass in a small

quantity of water

RED OXIDE OF LEAD Pb,Q (Diplumboplumbic carde Red lead Minium) Mol w unknown, as oxide has not been gasified S G 9 096 at 15° (Herapath, P M 64, 321)

Occurrence — Minium is found mixed with other lead ores in Yorkshire, Anglesey, Virginia,

the Eifel, &c

Formation—By heating PbO in air to low redness (not above 450°) for some time, and cooling slowly—2 By adding PbO in KOHAq to K₂PbO₃Aq, washing the pp with hot water, and heating it—3 Finely divided ppd Pb exposed to air in presence of water and a little NH₃Aq is slowly changed to Pb₂O₄ mixed with Pb carbonate (Schonbein, J pr 74, 323)

Preparation—1 A mixture of 1 pt KClO₃,

4 pts PbO (prepared by heating PbCO₃), and 8 pts KNO₃ is heated, the mass melts, and PbO₂ is formed and on continued heating is changed to Pb₂O₄, the fused mass is treated with water and the residue is boiled with dilute KOHAq, to dissolve unchanged PbO, washed and dried (Levol, J pr 22, 38) -2 5 to 6 pts Pb(NO₃)₂ are dissolved in water, and KOH is added until the pp which forms is dissolved, to this liquid is added 1 pt PbO2 and the whole is boiled for some time, unchanged PbO2 is decomposed by digesting with H₂C₂O₄Aq, and the PbC₂O₄ formed is dis solved in KOHAq, the residue is washed and dried (Levol, lc) —3 Commercial red lead usually contains some PbO, this may be re moved by digestion with dilute acetic acid, or better with lead acetate solution Lowe (D P J 271, 472) recommends to digest 1 pt commercial red lead with 10-15 pts of a 10 pc solution of Pb(NO₃)₂, for some time at a gentle heat, then to boil, and finally wash well

Properties—A scarlet crystalline granular powder, when heated it becomes brighter red and then violet, at c 500°-530° decomposition to PbO and O occurs S G according to different observers varies from 8 94 to 91 (v Clarke's Specific Gravity Tables [2nded], p 47) Insol water, reacts with dilute acids to form salts of PbO, and PbO, which remains undissolved with cone H₂SO₄, or HClAq, gives salts of PbO and O or Cl Dissolves completely in glacial acetic acid forming a liquid which acts as an energetic oxidiser (v Reactions, No 6) Ph₂O₄ is readily reduced to PbO, e g by SO₂Aq or HNO₂Aq

Reactions -1 Heated to c 500°-530°, gives

PbO and O -2 Reduced to PbO by easily oxidised bodies, e.g. SO,Aq, HNO,Aq, solution of sugar -8 With stannous chloride gives PbCl2 and SnCl, -4 Dissolves in considerable quantity of cone cold hydrochloric acid to form u yellow liquid from which alkalis, alkaline carbonates, borates, and acetates, and oxides and carbonates of Ba, Mg, Zn, &c ppt PbO2, on heating, the solution decomposes to PbCl2 and Cl, this solution almost certainly contains PbCl, on warming Cl is evolved and PbCl, ppd (Fisher, C J 35, 282, v Lead tetrachloride, Dilute HClAy forms PbCl2, H2O, p 126) and PbO₂. Warm HClAq in excess evolves Cl and ppts PbCl₂—5 Dilute sulphuric, nitric, or acetic acid, and other dilute acids ppt PbO, and form sulphate, &c of PbO Hot cone H2SO4 forms PbSO₄ and O -6 Pb₃O₄ dissolves in glacial acetic acid, this solution is strongly oxidising, eg it converts SO_2Aq to SO_3Aq , As_2O_3Aq to As_2O_5Aq , PbS to $PbSO_4$, Pb, Hg, and Cu to oxides, separates I from KI (Schönbein, J pr 74 315), when dropped into dilute NH,Aq a pp of Pb₂O, is produced (Jacquelain, J pr 53, 153, v Lead sesquioxide, p 129) According to Jacquelain (loc cit) a solution of Pb₂O₁ in glacial acetic acid at 40° gives crystals of PbO₂(C₄H₂O₃), [O=8, C=6] [old notation], these crystals may be kept under acetic acid but give PbO₂ and H₄C₂O₂ on warming, or with water Schonbein (J pr 74, 315) says that conc acetic acid dissolves about 9 p c of Pb₃O₄ when shaken for 15 mins with excess of the finely powdered oxide, the solution is easily decomposed by heat or dilution, but is stable at c -18°, by careful addition of H₂SO₄, PbSO₄ is ppd and an acetate corresponding to PbO2 remains in solution, this solution deposits PbO2, slowly at ordinary temperatures, quickly when heated, addition of KOHAq does not ppt Pb₃O₄, but a mixture of PbO and PbO₂—7 Pb₃O₄ dissolves in conc phosphoric acid, the solution reacts similarly to that of Pb.O. in acetic acid By using a mixture of phosphoric and sulphurio acids, a solution is obtained containing only the phosphate corresponding to PbO, and free from PbO (Jacquelain, J pr 53, 152, v Lead per oxide, p 131) -8 Conc solutions of arsenic and tartaric acids dissolve Pb,O4, the solutions re semble those in acetic and phosphoric acids, but are more easily decomposed

Composition and constitution of red lead -When PbO is heated in air, O is slowly and con tinuously absorbed, when c 176° pc O has been absorbed the product is red, but absorption of O continues, and some specimens of red lead contain 2 67 pc O in excess of that contained in the PbO (Jacquelain, J pr 53, 151) An absorption by PbO of 179 pc O corresponds with the formation of Pb,O,, the formation of Pb,O requires 2 39 p c Older analyses of red lead led to the supposition that it was Pb2O8 (Dumas, B J 13, 113) Careful syntheses and analyses have, however, shown that a definite red coloured oxide exists having the composition Pb,O. At the same time the analyses of commercial red leads made by Mulder (J pr 50, 438) and Jacquelain (J pr 53, 151) show that the percentage of O above that required to form PbO varies from 116 to 267 Several samples of red lead agreed in composition with the formula Pb.O.

others approached Pb₂O₇ (c) Löwe, D'P J 271, 472) It is still doubtful whether a series of oxides exists of the form xPbO yPbO, x varying from 1 to 3 or 4 and y from 1 to 2 or 3, or whether only two such oxides are 'definite bodies, viz $PbO PbO_2 (= Pb_2O_2)$ and $2PbO PbO_2(=Pb_3O_4)$

Red lead, Pb₂O₄, may be regarded either as 2PbO PbO₂ or as PbO Pb₂O₃, the reaction of Pb,O, with acids, the synthesis of Pb,O, by the action of PbO in KOHAq on K₂PbO₃ (= K₂O PbO₂), and the fact that PbO2 is acidic towards some

oxides, point to the constitution 2PbO PbO₂ rather than PbO Pb₂O₃

LEAD PEROXIDE PbO₂ (Brown oxide of lead Pucc oxide of lead Lead dioxide) Mol w unknown, as oxide has not been gasified SG 8 902 at 16 5° (Herapath, P M 64, 321), 8 756 to 8 897 (Playfair a Joule, C S Mem 3, 84), 9 045 (Wernicke, P 141, 109)

Occurrence -As plattnerite, at Leadhills, in

hexagonal prisms

Formation -1 By boiling a Pb salt with a filtered solution of bleaching powder -2 By di gesting red lead with dilute HNO, Aq, and wash ing the residue -3 By mixing solutions of Pb acetate (4 pts) with soda crystals (3½ pts), and passing Cl into the mixture 2½ pts PbO₂ are obtained, PbCl, is not formed (Wehler, J pr 90, 383, cf Geuther, A 96, 382) -4 Вy heating PbO with KClO, to less than red heat and washing the mass with water -5 By boiling PbO rH O with K, FeCy, Aq in pre sence of KOH (2K₃FeCy₆Aq + 2KOHAq + PbO = $2K_1FeCy_6Aq + PbO_2 + H_2O$, Overbeck, Ar Ph[2] 85, 5) -6 By fusing PbO with KOH for some time (Becquerel, A Ch 51, 504) Carnegie (C N 60, 113) obtained PbO, H2O by long con tinued fusion of PbO in KOH, solution in water, and careful neutrali-ation by dilute H2SO4Aq (v. Hydrates of lead peroxide, mfra — 7 By oxidising PbO by an alkaline solution of KMnO₄ (Reynoso, C. R. 32, 646)—8 By electrolysing strongly alkaline solutions of Pb salts, the hydrate PbO, H O (q v) is deposited on the positive electrode (Becquerel, A Ch [3] 8, 405) By slowly electrolysing a solution of 1 pt Pb(NO₃), in 8 pts water, Wernicke obtained PbO, (P 141, 109) -9 PbO, is obtained, mixed with PbO, by shaking basic Pb acetate with H₂O₂Aq (Schonbein, J pr 75, 85)

Preparation -1 Very finely powdered Pb acetate is boiled with a filtered solution of bleaching powder, the liquid being poured off, and fresh solution added from time to time until no Pb is found in solution, the residue is washed with very dilute HNO, Aq, and then with hot water, and dried at a low temperature (Böttger, J pr 73, 493) -2 Fehrmann (B 15, 1882) recom mends to add a filtered solution of bleaching powder to conc PbCl2Aq at 50° to 60°, until a few drops of the supernatant liquid cease to show a brown colour when filtered, and to wash the

pp out of contact with air

Properties -A dark puce brown powder black according to Fehrmann (B 15, 1882) The native compound forms metal like, lustrous, iron-black, hexagonal crystals, S G, 9°392 to 9 448 (Breithaupt, J pr 10, 508) When heated, PbO₂ gives Pb₂O₄ and O, and at a higher temperature it is resolved into PbO and O Readily

parts with O to oxidisable bodies, eg rubbed with P or S vivid combustion occurs, sugar and gallic acid &c are ignited by trituration with PbO₂. Acids generally react with PbO₂ to form salts of PbO, cold conc HClAq seems to produce PbCl, and solutions of Pb3O4 in glacial acetic and phosphoric acids probably contain salts corresponding with PbO2 (v Re actions, No 9) PbO2 reacts with strongly basic oxides as an acidic oxide to form plumbates M¹₂PbO₂ (v infra, Plumbates) On account of its readiness to part with O, PbO, is largely used for forming a surface on which to strike 'safety' matches

Reactions -1 Heated, easily goes to Pb.O and O, and at a higher temperature to PbO and O-2 Readily gives up $\frac{1}{2}$ of its O to easily oxi dised bodies, either at the ordinary temperature or by slightly heating, eg when PbO2 is rubbed with an equal weight of H2C2O4, H2O, CO2, and PbCO₃ are formed, PbO₂ rubbed with ½ pt sugar or $\frac{1}{6}$ pt tartaric acid oxidises these rapidly, causing ignition, P is oxidised and ignited when rubbed with PbO2 (v Böttger, A 34, 94) -3 Sulphur dioxide is rapidly absorbed by PbO. with rise of temperature and production of SO. 4 Potassium wdide is decomposed with libera tion of I -5 PbO, reacts with a dilute solution of potassium ferrocyanide to form K, FeCy, pro vided the KOH produced in the reaction is neutralised by CO., with conc potassium ferricyanide solution in presence of KOH, K.FeCy, 18 formed —6 By digesting PbO₂ with ammonia solution, PbO, H₂O, and NH₄NO₃ are produced 7 Not acted on by cold nitric or sulphuric acid. with hot conc H2SO, gives PbSO, and O -8 Cold cone hydrochloric acid in excess dissolves PbO2, producing a yellow liquid which evolves Cl on heating and gives a pp of PbCl2, alkalis, alkaline carbonates, and alkaline earth oxides and carbonates ppt PbO2 from this solution, the solution almost certainly contains PbCl₄ (v Lead tetrachloride, p 126) Hot HClAq evolves Cl and forms PbCl₂—9 A basic acetate derived from PbO2 is said by Jacquelain (J pr 53, 152) to be obtained by dissolving redlead in glacial acetic acid at 40° and cooling. J gives the formula $PbO_2(C_4H_3O_3)_3$ [O=8, C=6][old notation] to the crystals which form These crystals are unchanged in acetic acid, on drying between paper, or on adding water, they are resolved into PbO, and acetic acid Similar salts derived from PbO, are obtained by dissolving red lead in very conc phosphoric and arsenic acids, but the salts are very unstable (J lc, cf Red oxide of lead, Reactions, No 6, p 130) — 10 Heated with phosphorus truchloride, PbCl₂, POCl_s, and Pb(H PO_s)₂ are formed (Michaelis, J pr [2] 4, 449) -11 Heated in chlorine, bromine, and vodine, the compounds Pb.ClO, Pb.Br.1O, and Pb.1LO, respectively, are obtained, heated in chlorine and air, bromine and air, and wodine and air, the products are Pb₁₂Cl₂₁O₄, Pb₁Br₃O, and Pb₁₁I₄O₁₀ respectively (Cross a. Sigiura, C J 33, 405) -12 PbO₂ reacts with alkalis to form compounds in which PbO, forms the negative radicle, eg the salt K2PbO. may be obtained from a solution in conc hot **EOHAq** (v infra, Plumbates)

HYDRATES OF LEAD PEROXIDE (1) PbO₂.H₂O This hydrate is formed as a brown pp, by dis

solving PbO in molten KOH, heating in air for a considerable time, dissolving the K_* PbO $_*$ produced in cold water, and exactly neutralising by dilute H_* SO $_*$ Aq (Carnegie, C N 60, 113) It is also probably obtained, at the positive electrode, by the electrolysis of strongly alkaline solutions of Pb salts (Becquerel, A Ch [3] 8, 405) By electrolysing an alkaline solution of Pb Na tartrate, Wernicke (P 141, 109) obtained a lustrous blue-black film, which had the composition PbO $_2$ H_* O, SG 6 267 (2) According to Carnelley a Walker (C J 53, 85), ppd PbO $_2$ after drying in the air for 10 days has very nearly the composition 3PbO $_2$ H_* O, at 230° this hydrate is changed to PbO $_2$

Plumbites -PbO2 reacts with acids as a basic peroxide forming salts corresponding with PbO, in some cases unstable salts derived from PbO₂ appear to be produced (v supra, Lead PbO₂ also reperoxide, Reactions 8 and 9) acts with alkalis as an acidic oxide to form salts M.PbO, known as plumbites Fremy (C R 15, 1109) obtained colourless crystals of K.PbO, 3H,O by dissolving PbO, in boiling very conc KOHAq, adding a little water, and placing over H₂SO, Seidel (J pr [2] 20, 200) obtained the salt by adding PbO₂ to molten KOH con taining a little water, dissolving the fused mass in water, and evaporating over H2SO, in vacuo The crystals form quadratic octahedra, a c =112216, they are decomposed by water with separation of PbO₂ A corresponding Na salt is known Solutions of these salts are said to yield pps of plumbites when added to solutions of various metallic salts K2PbO, is also pro duced by dissolving PbO in molten KOH and heating in air (Becquerel, A Ch 51, 504, Car negie, C N 60, 113) Crum obtained a plumbite of Ca by digesting Pb(NO₃)₂ with CaO and bleaching powder (A 55, 213) For Kassner (Ar Ph 232, 375 [1894]) For Plumbates v

Lead, oxybromides of Several oxybromides of Pb are known The compound PbO PbBr₂ is formed by heating PbBr₂ in air so long as white fumes are evolved, also by digesting PbBr₂ with solution of Pb acetate By heating PbO in Br vapour, Cross a Siguira obtained Pb₂Br₁₁O, and by heating the same oxide in a mixture of Br and air they obtained Pb₂Br₁O₂ (C J 33, 405), from PbO₂ they obtained Pb₂Br₁₁O₂ by

heating in Br

Lead, oxychlorides of PbCl₂ and PbO very readily combine when heated together to form oxychlorides from which HNO₂Aq dissolves out PbO

PbCl₂ PbO occurs native as matlockite, S G 7 21 (Greg, P M [4] 2, 120, Rammelsberg, P 75, 141), formed by heating PbCl₂ in air until fumes are no longer evolved, also by digesting freshly ppd PbCl₂ with cold Pb acetate solution (the oxychloride thus formed is (PbCl₂ PbO)₂ H₂O according to Brandes, A 10, 273), also (with H₂O) by partial ppn of PbCl₂Aq by CaOAq, thus prepared it is used as a pigment (Pattinson's white lead)

PbCl₂ 2PbO occurs native as mendipite, in yellow white trimetric prisms, SG 7 to 71, formed, according to Ditte (C R 94, 1180), by gradually adding KOHAq to PbCl₂ suspended in water, or by adding KClAq to PbO xH₂O

PbCl, 3PbO. the hydrate with 4H₂O is

formed by adding NH₄Aq to PbCl₂Aq (Berzelius); also by mixing NaCl with PbO, making into a paste with water, and allowing to stand, the product of this reaction, when washed and heated, gives a yellow powder, known as Turner's yellow, which is probably PbCl₂ 3PbO. The hydrate PbCl₂ 3PbO H₂O was obtained by Voigt (Chem Zertung, 13, 6°5) by dissolving PbO in MgCl₂Aq, filtering, and evaporating

PbCl₂ 7PbO a lustrous, golden-yellow, crystalline mass, obtained by melting together 1 pt pure NH₄Cl and 10 pts pure PbO, pouring off from a little Pb (formed by the reducing action of NH₄, set free by the PbO acting on NH₄Cl), and allowing to cool, known as Cassel yellow

By heating PbO in a mixture of Cl and air, Cross a Sigiura obtained Pb₈Cl₁₈O (C J 33, 405), by heating PbO₂ in Cl the product was Pb₈Cl₁₀O, and by heating PbO in a mixture of Cl and air the compound Pb₈Cl₁₀O, was obtained

the compound Pb₁₂Cl₂₁O₄ was obtained
According to André (A Ch [6] 3, 104)
PbCl₂ PbO, PbCl₂ 2PbO, and PbCl₂ 3PbO are ob-

tained by ppg PbCl₂ by KOHAq

Lead, oxycyanide of, v vol 11 p 341

Lead, oxylodides of Several oxylodides of lead are known PbI, PbO H₂O is formed by adding KIAq to excess of Pb acetate solution and digesting the pp in the liquid, it is a yellowish-white powder, insol water (Biandes, A 10, 269, cf Ditte, C R 92, 145) Other oxylodides, described by Kuhn (Ph C 1847 593) and Denot (J Ph 20,1) are PbI, 2PbO H₂O, PbI, 3PbO 2H₁O, and PbI, 5PbO Cross a Sigura (C J 33, 405) describe the oxylodides PbI, 1, O₁₀, Pb₂ 1₂O₄, Pb₁₁1, O₇, and Pb₉ 1₄O₈, obtained by heating PbO₂, and PbO, in I and air, and in I only

Lead, phosphide of No phosphide of Pb has been isolated with certainty Pelletier (A Ch [2] 13, 114) said that Pb takes up c 15 p c P when P is thrown on to melted Pb, or when Pb filings are strongly heated with glacial phosphoric acid, or PbCl₂ with P, but the experiments of Cloud (in Percy's laboratory) make it doubtful whether Pb and P combine According to H Rose (P 24, 326) a brown pp, consisting of a phosphide of Pb, is obtained by passing PH, into Pb acetate solution

Lead, salts of Compounds formed by repla cing the H of acids by Pb Pb forms one series of well marked salts, PbX₂, where X = Cl, NO₃, ¹/₂SO₄, ¹/₂CO₃, ¹/₂PO₄, ¹/₃AsO₄, &c PbCl₄ very probably exists in a solution of PbO₂, or Pb₃O₄, in cold cone HClAq, and $PbO(C_2H_3O_2)_2$ is said to have been isolated, these two salts belong to the series PbX, corresponding with the oxide PbO₂ Very many basic salts of Pb are known, and a considerable number of double salts The formulæ of the Pb salts are determined from analyses, comparison with the salts and com pounds of Sn, Ge, and Si, and from the vapour densities of PbCl₂ and PbMe, The following are the chief salts of lead (v CARBONATES, NI TRATES, SULPHATES, &c.) Antimonate, arsenate and ste, borate, bromate, carbonates, chlorate and ite, chromates, dithionate, hypophosphite, iodate, molybdate, nitrates and ites, pentathio nate, perchlorate, periodates, phosphates and -ite, sulphates and -ite, selenate and ite, selecates, throsulphate, trithronate, tungstates, uranate, vanadates

Lead, selenide of, PbSe Occurs native as clausthalite in the Hartz, &c, the Pb being sometimes partly replaced by Co, Cu, Hg, Ag, &c, SG 7 to 88 (H. Rose, P 2, 416, 3, 281, Stromeyer, P 2, 403, Kersten, P 46, 265) PbSe is produced by heating the constituents in the ratio Pb Se, it forms a porous, grey, soft mass (Berzelius), melted under borax small regular crystals are obtained, S G 8154 (Little, A 112, 212) Heated in air Se is vaporised, then a little PbSe, and a residue of basic selenite of Pb is left, cold HNO, Aq dissolves Pb, leav ing Se

Lead, selenocyanide of, Pb(SeCy),, v vol

ar p 348

Lead, silicofluoride of, Pb(BF₄). Long prismatic crystals, by dissolving PbO in HBF, Aq and evaporating to a syrup, partially decomposed by water or alcohol (Berzelius, P 2, 113)

Lead, sulphides of Besides PbS, which is a well marked compound, two subsulphides, Pb,S and Pb,S, probably exist, there are also indications of the formation of a persulphide

LEAD SULPHIDE (Lead monosulphide Plumb

ous sulphide) PbS

Occurrence - Native as galena, crystallised in monometric octahedra, and cubic and rhombic dodecahedra, SG 725 to 77 (v Neumann, P

Preparation -1 By mixing S with molten Pb -2 By heating PbO with excess of S 3 By the action of H,S or an alkaline sulphide on Pb salts -4 By passing CS over Pb heated a little above redness, crystals of PbS are formed (Pb thiocarbonate seems to be also produced) (Gautier a Hallopeau, C R 103, 111) —5 Well formed crystals of PbS are obtained by passing HS into a solution of c 3 grams Pb(NO₃), in 250 cc 10 pc HNO, Aq atc 15, if only c 1 pc HNO_s is present the pp is amorphous (Muck, Z [2] 4,211) -6 Crystalline PbS is produced by the action of PbO on thio urea (Reynolds, C J 45, Addition of HS to a Pb salt in pres ence of HClAq sometimes produces a red pp of 3PbS PbCl₂, on waiming and passing in more H S, PbS is formed -7 Winssinger (Bl [2] 49, 452) obtained an aqueous solution of colloidal PbS by ppg by HS a very dilute solution of a Pb salt, and dialysing, the solution was reddish brown

Properties -Lead grey crystalline solid, as prepared by fusion of Pb and S, SG 7505 (Karsten, £ 65, 394) A brown black powder, as prepared by ppn by H₂S SG 6924 at 4° (Playfair a Joule, C J 1, 137), 677 (Schneider, J pr [2] 2, 91) Melts at full red heat out of contact with air, and is said to sublime unchanged Insol in dilute acids, caustic alkalis, and alkaline sulphide solutions

Reactions —1 Heated in air evolves SO, and forms Pb and P' SO, and some PbO (Descotils, A Ch [2]55,441) —2 Heated with lead monoxide forms Pb and SO2, Pb and SO2 are also pro duced by heating with ead sulphate, if little PbS is heated with much PbSO, the chief pro ducts are PbO and SO, (v LFAD, Formation, Nos 1 and 2, p 122) -3 Melted with scrap eron FeS and Pb are formed -4 Heated in steam gives H2S, and at first PbO and afterwards Pb -5 Heated with alkaline carbonates half the Pb of

the PbS is separated -6 Boiled with dilute nitric acid Pb(NO₃)₂, S, and NO are produced. fuming nitric acid forms PbSO, and S, and sometimes Pb(NO₃)₂ - 7 Conc hydrochloric acid forms PbCl₂ and H₂S -8 Aqua regia forms PbCl, and PbSO, -9 Slowly reacts with chloring to form PbCl₂ and S₂Cl₂-10 By long fusion with potash and nitre Pb, O, is produced (Carnegie, C \bar{N} 60, 113) —11 Heated with lead, subsul phides $(q \ v)$ Pb S and Pb S are formed

Combinations - With lead chloride to form

the sulphochloride (q v) 3PbS PbCl

LEAD SUBSULPHIDES Ph.S and Ph.S Said to be formed by heating together PbS and Pb in the proper proportions (v Bredberg, P 17, 274) Pb2S is also formed, according to Berthier (A Ch 2] 22, 240), by heating PbSO, in a crucible lined with charcoal

LEAD PERSULPHIDE Addition of K pentasulphide to solution of a Pb salt gives a bloodred pp which is quickly changed, even in the liquid in which it is produced, into PbS and S Berzelius gives the formula PbS, to the per-

sulphide

Lead, sulphochloride of 3PbS PbCl₂ Obtained as a red pp by passing a little H₂S into a dilute Pb solution acidified by HCl, Renisch (J pr 13, 130) obtained the compound by passing H.S into a solution of 1 part Pb acetate in 200 parts water to which 20 parts HClAq, S G 1 168, were added Also produced as a yellowish red solid by digesting freshly ppd PbS with PbCl Aq Decomposed by H2S with formation of PbS Boiling water partly dissolves out PbCl,

Lead, sulphocyanide of Pb(SCy), v vol 11. p 350 Combines with PbBr, and PbCl₂, v. Lead bromosulphocyanide, and Lead chlorosulphocyanide, pp 125, 127

Lead, thiocarbonate of PbCS, by adding solution of an alkali thiocarbonate to a Pb salt (cf Thiocarbonates, vol 1 p 703)

M M P M

LEAD, WHITE White lead is a hydrocarbonate of Pb varying in composition, v vol 1. p 699

LEAD ORGANIC DERIVATIVES

Lead trimethyl salts Chloride PbMe,Cl Formed by the action of boiling aqueous HCl on PbMe, (Cahours A Ch [3] 62, 257, A 122, 48) Long needles resembling PbCl May be sub-May be sublimed M sol boiling water and alcohol verted into PbCl, by long boiling with HClAq

Bromide PbMe,Br More soluble than the

chloude

Iodide PbMe. I Obtained by adding iodine to PbMe, till the odour becomes permanent White mass, crystallising from water in long colourless needles which may be sublimed SI sol water, v sol alcohol On distillation with solid kOH it yields PbMe,OH, a strong basic oil smelling like oil of mustard solidifying in prisms

Lead tetra-methyl, PbMe, (110°) (B) V D 9 52 (calc 9 25) S G ° 2 034 From MeI and an alloy of lead (5 pts) and sodium (1 pt), or, better, from PbCl2 and ZnMe2 (Cahours) Colour less liquid, having a camphor like odour, insol water, sol alcohol and ether (Cahours) Accordng to Butlerow it smells like strawberries or mould It does not unite directly with chlorine or rodine, but is decomposed thereby, eg. PbMe4 + I2 = PbMe2I + MeI Acids convert it into

CH, and a salt of PbMe.

Di-plumbic hexa ethide, Pb_Et, Lead tra-ethyl SG 21471 Formed by adding sodium (1 pt) to molten lead (3 pts) and mixing the cooled and powdered alloy with EtI in flasks provided with inverted condensers When the first violent action has ceased the product is freed from EtI by distilling at 100°, and the residue extracted with ether (Klippel, J pr 81, 287, cf Löwig, J pr 60, 304, A 88, 318),
Properties — Yellowish mobile oil, insol

water, v sol alcohol and ether Decomposed on distillation By exposure to light, or by prolonged boiling with water, it decomposes with separation of metallic lead When exposed to the air in ethereal solution it absorbs O and CO2 with formation of (PbEt₃)₂O and (PbEt₃)₂CO₃ It

combines with iodine forming PbEt,I

Lead triethyl salts Chloride PbEt,Cl Obtained by adding BaCl, to a solution of (PbEt,),SO, in alcohol, or by treating (PbEt,),O, (PbEt_s)₂CO₃, or PbEt₄ with HCl Beautiful long needles, giving off a pungent odour when heated, presently decomposing with separation of PbCl2 and metallic lead —PbEt₃HgCl₃ white nacreous scales (from hot alcohol) — (PbEt₃Cl)₂PtCl₄ copper-red crystals, sl sol water, m sol alcohol and ether

Bromide PbEt, Br Long needles (from ether)

Iodide PbEt₃I From Pb₂Et₆ and 10dine, or from (PbEt₃)₂SO₄ and KI Sol ether and very unstable, the ethereal solution quickly depositing PbI₂

Cyanide PbEt,Cy From PbEt,Cl and KCy in alcoholic solution at 100° Prisms (from

Hydroxide PbEt_s(OH) From the chloride by treatment with moist Ag₂O or by distillation with KOH Needles, sl sol water, v sol alco hol and ether Has strong alkaline reaction and caustic taste Saponifies fats, ppts ferric, cupric, and argentic oxides from their salts Ppts alumina and zinc oxide, the pp dissolving in excess of the precipitant Expels NH, from its salts
Absorbs atmospheric CO₂ Fumes with HCl
When heated it gives off white vapours which powerfully excite sneezing

Carbonate (PbEt₃)2ČO2 Small hard crys tals, nearly insol water, sl sol alcohol and

ether Has a burning taste

Nitrate PbEt, NO, unctuous crystalline mass, decomposed by heat with slight detona-tion V sol alcohol and ether — (PbEt_s)₂SO₄ from the oxide and H₂SO. White crystalline pp, nearly insol water, alcohol, and ether, v White crystalline sol alcohol mixed with H2SO, or HCl, from which solution it separates in octahedra

Phosphate (PbEt₃)₃PO₄ stellate groups of crystals, v sol water, alcohol, and ether Sulphocyanide PbEt₃SCy crystals, sol

water, alcohol, and ether

PbEt,CHO2, formate PET, C, H, O, but yrate PbEt, C, H, O, oxalate (PbEt, D, C, Oxalate (PbEt, D, C, Oxalate (PbEt, D, C, Oxalate at 100°), and henzoate are crystalline

Lead tetrethide, PbEt, Mol w 328 (c 200°), (152° at 190 mm) (B) SG 162° at 190 mm) (C) SG 164° at 190 mm (C) SG 164° at 190 mm) (C) SG 166° at 190° at 190

Preparation -PbCl2 is added to ZnEt2 as long as reaction occurs The PbEt, is distilled

with steam $2ZnEt_2 + 2PbCl_2 = 2ZnCl_2 + 2PbEt_2$ and then $2PbEt_2 - Pb + PbEt_4$ (Buckton, P_M [4] 18, 212, 17, 282, A 109, 218, 112, 220, Frankland a Lawrance, C J 35, 244)

Properties -Oil, not decomposed by water or by gaseous NH_3 , CO_3 , CO_3 , CO_4 , NO_5 , O_5 , or H_2S Partially decomposes at 200°

Reactions -1 Gaseous SO, reacts forming diethyl sulphone and lead ethyl sulphinate PbEt₄+3SO₂=Et₅SO₂+(EtSO₁)Pb — 2 Iodine forms PbEt₅I and EtI — 3 Cone HCl forms PbEt_sCl and ethane

heas-isc_mylide, $Pb_2(C_5H_{11})_6$ D1-plumbic Prepared like the corresponding Pb, Et, using isoamyl iodide (Klippel) Oil, with irritating vapour Detonates with HNO,

Lead tri-isoamyl salts Chloride

Pb(C₅H₁₁)₂Cl from the oxide and HCl White needles

Iodide Pb(C,H11)2I from Pb₂(C₃H₁₁), in

ether by adding lodine [100°] Needles, insol water —Pb(C₃H₁₁)₃HgI₃ golden lamine, insol water, sl sol alcohol and ether —Hydroxide Pb(C_tH₁₁)_sOH, viscid mass, insol water, sol alcohol and ether Feebly alkaline, ppts ferric, but not cupric and silver salts

Lead tetra-phenyl Pb(C₆H₅), [225'] SG 20 1 530 Prepared by boiling 500 g of an 8 p c alloy of sod um and lead with 500 g of bromo benzene and 20 cc of acetic ether for sixty hours (Polis, B 20, 716, 3331 Small needles or dimetric prisms, ac=1 381 Decomposes at 270° V sl sol alcohol, ether, and HOAc, m sol benzene, CHCl₃ and CS₂ Heated with HClAq at 230° it yields PbCl₂, benzene, and chloro benzene

Lead diphenyl salts Chloride PbPh,Cl, Formed by passing chlorine into a solution of lead tetra phenyl in CS2, or by ppg PbPh2(NO3)2 with KCl White powder, insol alcohol and ether, v sl sol benzene

Bromide PbPh2Br2 From lead di phenyl White powder, which decom nitrate and KBr

poses before fusion

Indide Pb(C₆H₅)₂I₂ [c 103°] Formed by adding iodine to a solution of lead tetraphenyl in chloroform (Polis) Golden plates, sol chloro-

form, benzene, and alcohol

Nitrate Pb(C₆H₅)₂(NO₃)₂ 2aq Obtained by gradually adding lead tetra phenyl to boiling HNO. (SG 14) Small lustrous plates (from water) V sol hot water and alcohol Detonates when heated Boiling its aqueous solution produces a pp of the basic salt $Pb(C_6H_5)_2(NO_4)(OH)$ as a white powder which detonates when heated

Oxide Pb(C₆H₅)₂O Obtained by boiling the nitrate with aqueous NaOH (Polis, B 20) 3332) White powder, insol alcohol, ether, and

Oxy cyanide Pb(C_eH₅)₂Cy(OH) From the nitrate in aqueous solution and KCy powder, insol water, alcohol, and ether

Sulphocyanide Pb(C,H,)2(SCy)2 Formed by adding ammonium sulphocyanide to an aqueous solution of the acetate White powder, insol water and ordinary solvents

Phosphate (PbPh₂), (PO₄). Formed by adding sedium phosphate to an aqueous solu Formed by tion of the nitrate White pp, insol. usual solvents

Oxy-carbonate (PbPh2OH)2CO2. Ppd. as

a white insoluble powder by adding Na₂CO₂ to | 100° (Schunck) S (80 p.c alcohol) 7 at 15° solutions of salts of lead diphenyl

Chromate Pb(C₄H₃)₂CrO₄ From the nitrate and K₂Cr₂O₇ Yellow pp, insol water Sulphide Pb(C₄H₃)₂S From the acetate and H₂S Yellow prisms, 81 sol aloohol, v Decomposes between 80° and sol benzene 90°

Formate Pb(C6H3)2(OHO2)2 aq From lead tetra phenyl and concentrated formic acid Melts above 200°, with decomposi-Needles tion

Acetate $Pb(C_0HJ_2(C_2H_3O_2)_2$ 2aq lead tetra phenyl and glacial HOAc (Polis, B Prisms, v sol. water containing Melts at 193° when anhydrous acetic acid

Lead tetra-p-tolyl Pb(C,H,)4 [240°] 20 1433 Prepared by heating a mixture of 8 p c sodium lead alloy (300 g), p bromo toluene (120 g), toluene (40 g), and acetic ether (4 c c)for thirty hours in an oil bath Repeated crystallisation of the product from benzene and alcohol yields lead tetra tolyl and di-p tolyl (A Polis, B 21, 3424) Small needles Decomposes at 254° More sol benzene, CS₂ and CHCl₃ than lead tetra phenyl When heated with HCl at 200° it gives PbCl₂ and chloro toluene cone HNO causes decomposition with blackening, but on adding lead tetra tolyl to boiling nitric acid (SG 14) the products are lead di tolyl nitrate Pb(C,H,) (NO₃)₂ and nitro toluene Lead di-p-tolyl salts

Chloride Pb(C,H,) Cl₂. Formed by passing Cl into a solution of lead tetra tolyl in CS White powder, insol alcohol and ether, sl sol CHCl_s, benzene, and CS₂ Decomposed when Converted into the corresponding heated nitrate by AgNO_s in alcoholic solution

From Pb(C,H,), in Bromide Pb(CH,),Br2

CS₂ and bromine Resembles the chloride

Iodide Pb(CH).I. From Pb(CH), and
iodine, both dissolved in CS₂. Yellow powder,
more sol chloroform and CS₂ than the chloride or bromide

Nitrate Pb(C,H)2(NO3)2 28q Nitrate Pb(C,H)₂(NO₃)₂ 2aq Prepared as above White powder composed of very slender needles, sol water, containing HNO, sl sol alcohol Detonates when heated

Oxy nitrate Pb(C,H,)2(OH)(NO3) Formed by heating the nitrate with water, or by adding ammonia to a solution of the nitrate in dilute HNO, White amorphous powder

Chromate Pb(C,H),CrO, Insol yellow powder, ppd, by adding K2Cr2O, to a solution of

the acetate

Sulphide Pb(C,H)2S Formed by passing H.S into a solution of the acetate Transparent yellow plates (from alcohol benzene), sl sol alcohol and ether, v sol benzene, CS_2 and $CHCl_3$ Begins to turn brown at 90° and melts cHCl, at 98° It is decomposed by light

Formate Pb(C,H) (CHO₂) Formed from (C.H.), and formic acid Beautiful white Pb(O,H,), and formic acid Beautiful white needles, which at 233° blacken and decom

pose Acetate Pb(C,H,),(C,H,O2), 2aq [188 50] Formed by adding Pb(O,H,), to boiling HOAc Small white needles, more sol dilute HOAc than the corresponding phenyl compound

LECANORIC ACID C, H, O,. (a)-Orsellio acid Diorsellic acid. [158° cor] 8 04 at

(Schunck), S, (ether) 4 at 20° (Hesse), 125 at 15° (Schunck) Discovered by Schunck in 1842 and extracted from several lichens of the genera Lecanora, Variolaria, and Roccella (Schunck, 4 41, 157, 54, 261, 61, 72, Rochleder a Heldt, A 48, 1, Stenhouse, A 68, 61, 70, 218, Strecker, A 68, 108, Laurent a Gerhardt, A Ch [3] 24, 315, Robiquet, A Ch 42, 236, Hesse, A 139, 22) Obtained by exhausting the lichens with ether, dissolving the greenish white crys talline residue left on evaporation in milk of lime, ppg the filtrate with H₂SO₄, washing the pp with water, and recrystallising it from hot alcohol (Hesse) Stellate needles (containing Almost insol cold water Decomposed by heat with evolution of CO, A solution of barium lecanorate is not decomposed by CO. FeCl, colours its alcoholic solution dark purple red An ammoniacal solution of lecanoric acid forms white pps with lead subacetate and with AgNO, but the silver salt is quickly reduced, An alcoholic solution gives no pp with alcoholic solutions of lead acetate, HgCl₂, or AgNO₃, but with cupric acetate it gives an apple green pp When a solution of lecanoric acid is boiled it gives orsellic acid $C_{16}H_{14}O_7 + HO = 2C_8H_8O_4$ A solution of barium lecanorate yields, on boiling, first barium orsellate, and finally orcin C, H,O, and BaCO₃ An alcoholic solution yields, on boiling, orsellic ether An ammoniacal solution acquires, on exposure to air, a splendid purple colour, through formation of orcein Bleaching powder gives a red tint, quickly changing to brown

Salt - BaA" small stellate needles

Di-bromo-lecanoric acid C₁₆H₁₂Br₂O₂ [179°] From lecanoric acid and Br in ether (Hesse) White crystals (from alcohol), insol water FeCl, colours its alcoholic solution violet Gives off CO, on fusion

Tetra-bromo lecanorio acid C16H10Br4Ore [157°] From lecanoric acid and excess of Br in ether Pale yellow prisms (from alcohol), v sol alcohol, ether, and alkalis FeCl, colours its alcoholic solution purple Boiling barytawater decomposes it

LECITHIN C44H82O,PN (Von Lippmann, B 20, 3201), C44H90O,PNaq (Diaconoff) Protagon Occurs in the eggs and milt or soft roe of the carp and herring, the yolk of poultry eggs, the brain of man, sheep, and domestic fowl, bile of pigs, men, and oxen, retina of oxen, blood, yeast, milk, butter, radicles of sprouting lupin seeds, maize, peas, wheat, beet root, &c (Gobley, J Ph [3] 9, 1, 83, 161, 11, 409, 12, 5, 17, 401, 18, 107, 19, 406, 21, 241, 30, 241, 33, 161; Strecker, A 123, 356, Z [2] 4, 437, Kodweiss, A 59, 261, Diaconoff, Z [2] 4, 154, Liebreich, A 134, 29, Cahn, H 5, 215, Hoppe Seyler, H 2, 427, 3, 378, J 1866, 698, 744, Hermann, Z 1866, 250, Schmidt Mulheim, J Th 1883, 166, Schulze a Barbieri, J pr [2] 27, 358, H 13, 355, Heckel a Schlagdenhauffen, C R 103.

388, Copeman a Winston, J. Physiol. 10, 213, Preparation—1 Yolk of egg is extracted with alcohol ether, and an alcoholic solution of platinic chloride is added. A conspound of le orthin and platinic chloride is ppd, and this is agitated with Ag₂O, the filtrate freed from silver by HaS and evaporated (Strecker) -2 Brain is 186 LECITHIN.

exhausted with ether, and the residue extracted with absolute alcohol at 40°. The alcoholic extract is corled at 0° and filtered, and the pp of lecithin and cerebrin collected, washed with alcohol, and treated with ether. The ethereal solution of lecithin is evaporated (Diaconoff)—3. Beet root is extracted with ether alcohol, the ether evaporated and the residue dissolved in alcohol and ppd by platinic chloride. The pp is decomposed by H.S. (Lippmann)

Properties — Hygroscopic wax-like substance, which swells up in water and is v sol alcohol, ether, chloroform, and oils Boiling with baryta water produces glycero-phosphoric acid, neurine, and a fatty acid (stearic, oleic, or palmitic) According to Diaconoff lecithin from brain may be separated by dissolving in alcohol and cooling to —10°, into a stearo lecithin which separates and an oleo lecithin which remains in solution According to Strecker the decomposition by baryta may be represented thus —

 $C_{2n+8}H_{4n+18}O_{9}NP + 3H_{2}O = 2C_{n}H_{2n}O_{2} + C_{3}H_{9}PO_{4} + C_{5}H_{15}NO_{2}$ or

 $\begin{array}{c} C_{2a+8}H_{4n+14}O_0NP+3H_2O=\\ 2C_nH_{2n-2}O_2+C_3H_9PO_6+C_3H_{15}NO_2\;,\\ \textbf{thus stearo lecithin would be }C_{44}H_{90}O_9NP\;, while oleo lecithin would be $C_{44}H_{80}O_9NP$ and might be written$

(C₁₈H₃₈O₂)₂C₃H₅O PO(OH) O C₂H₄ N(CH₃), OH The particular lecithin examined by Strecker appeared, however, to be C42H84O9NP or to con tain one oleyl and one palmityl radicle in place of the two oleyls in the above formula the neurine is not present as a base appears from the observation that lecithin is hardly at tacked by dilute (10 p c) sulphuric acid (Gilson, H 12, 585) The neurine salt of distearyl glycero phosphoric acid appears therefore not to be a true lecithin (v GLYCERIN) According to Lippmann the base obtained by boiling beet root lecithin with baryta is sometimes neurine and sometimes betaine The presence of lecithin enables a solution of glucose to absorb oxygen from the air in the same way as an alkaline solution of that sugar (Nencki a Sieber, J pr [2] 26, 17)

Salts—The hydrochloride is a waxy mass—(C₄₂H₅₃O₅PN)₂PtCl₅ yellow flocculent pp v sol ether, chloroform, and benzene, but ppd from these solutions by alcohol (Strecker)—CdCl₂ gives a pp in a solution of lecithin in ether-alcohol

LEDITANNIC ACID C₁₈H₂₀O₈ Occurs in the leaves of the marsh wild rosemary (*Ledum palustre*) (Willigk, A 74, 363, Rochleder a Schwartz, A 74, 366, Z 1866, 382, Thal, J 1883, 1401) Prepared by ppg the alcoholic decoction of the leaves with water, and the filtrate with lead acetate The pp is dissolved in dilute HOAc, filtered, heated to boiling, and ppd with lead subacetate The pp is suspended in water and decomposed by H₂S, and the filtrate evaporated in a current of CÔ₂ Reddish powder, v sol water and alcohol FeCl₂ colours its aqueous solution dark green Lead acetate and SnCl₄ give yellow pps Boiling dilute H₂SO₄ forms ledixanthin but no sugar

Ledizanthin C,H_sO_s is a reddish-yellow powder, w. sol alkalis. Its alcoholic solution

gives & reddish-brown pp with lead acetate On

dry distillation it yields pyrocatechin

LEDUM OIL An oil obtained by steam distillation from the leaves of ledum palustre cording to Willigk (Sats W 9, 302) it consists of a terpene and of an oxygenated oil C₈₀H₁₂₈O₈ Grassmann (Rep Pharm 38, 53) obtained a volatile oil (1 pt) and ledum camphor (2 pts) Fronde (J pr 82, 181) found the oil to be acid and to contain a tergene (160°) and an oxygenated oil (241°) According to Trapp (Russ Zeit Pharm 1874, 289) the oil when recently prepared is yellowish, viscid, lighter than water, and possesses a pungent odour, when exposed to air the greater part solidifies to a crystalline mass soluble in alsohol The solution of this solidified oil (ledum camphor) in H.SO, is turned violet by HNO, Ivanoff (Russ Zeit Pharm 1876, 577) found ledum oil to consist of a white crystalline mass saturated with oil By repeated crystallisation from alcohol white prisms of C₅H₈O₂ were obtained These were insol water, v sol alcohol, ether, chloroform, and benzene, melted at 101°, boiled at 174°, and were dextroro-tatory in alcoholic solution According to Hjelt a Collan (B 15, 2500) ledum camphor melts at 101°, and has a vapour density 12 33 correspond ing with the formula C₂₅H₄₄O₂ (calc 13 02), and sublimes in long white needles Rizza (J R 19, 319) gives the following properties for ledum camphor, $C_{15}H_{26}O$ [101°], (292° 1 V), VD 8 10, and states that Ac_2O at 150° converts it into a sesquiterpene C₁,H₂₄ (264°), S G º 935

LEGUMIN © PROTEIDS

LEKENE C_xH_y ([9°] S G = 939 Forms the chief constituent of ozokerit or mineral wax, from which it is isolated by distilling the wax m vacuo, dissolving the distillate in benzene, and precipitating with absolute alcohol (Beilstein a Wiegand, B 16, 1547) White glistening crystals S (96 p c alcohol at 16°) = 0105, S (benzene at 15°) = 8, sparingly sol in most other cold solvents, e sol hot benzene and chloroform, insol acetone It decomposes on distillation under ordinary pressure, but can be distilled m

vacuo It is very stable towards oxidising agents
LEMON OIL Obtained by pressure from the peel of the fruit of citrus medica Contains a terpene C₁₀H₁₆ (166°) (Blanchet a Sell, A 6, 281, Soubeiran a Capitaine, A 34, 317) or (175°) (Regnault, J 1863, 70, A 52, 171) SG 85 at 15°-22° The terpene is dextrorotatory, $[a]_D$ = 109° (Kanonnikoff, Bn 3, 299) According to Wallach (A 227, 290) oil of lemen contains pinene and hesperidene (cf Deville, A 71, 348, In examining the es-Oppenheim, B 5, 628) sential oil obtained by steam distillation from lemon peel, Tilden (Ph [3] 9, 654) found the S G to be 852 at 20°, and the rotation + 59° in a column 100 mm long In this oil he found tere benthene $C_{10}H_{16}$, citrene $C_{10}H_{16}$ (constituting 70 p c of the whole), cymene (6 p c), a dextrorotatory body C10 H18O resembling terpineol (over 200°), a compound ether C₁₀H₁₇AcO decomposed by heat into HOAc and $C_{10}H_{10}$, and $C_{11}H_{11}O_{2}$ [116°] Tilden a Dick, C J 57, 32) The citrene (176°) forms a terpene hydrate when treated with HNO. Cone H₂SO₄ converts it into an inactive hydrocarbon (176°) Bouchardat a Lafont (C R 101. 383) find in essence of lemon a terpene C10H16 (178°) with a rotatory power + 105° which yields LEPIDEN.

137

a solid inactive hydrochloride Flavitzky (BI [2] 35, 171) found in a commercial sample of lemon oil ([a]_p = +60°) a levorotatory terpene (165°), S G 42 857, [a]_p = -29 8° which formed a levorotatory hydrochloride [a]_p = -25 9°, but this was possibly an adulterant. The oil from the peel of citrus bigamalia contains a terpene (178°) S G 42 852 which is strongly dextrorotatory, and forms a crystalline hydrochloride C.H.2HCI (De Luca. J. 1857, 481)

C₁₆H₁₆2HCl (De Luca, J 1857, 481) LEPARGYLIC ACID v AZELAIC ACID

LEPIDEN AND ITS DERIVATIVES Most of these complex comp unds were first described by Zinin' It is only recently that light has been thrown on their constitution

Lepiden
$$C_{28}H_{29}O$$
 = $C_{e}H_{s}C-CC_{e}H_{s}$
 $C_{e}H_{s}CCC_{e}H_{s}$

(Tetraphenylfurfuran) (Zinin, Z 1867, 313, Japp a Klingemann, B 21, 2934 n, cf Dorn, A 153, 358) Formed, along with benzil and oily matters, when benzoin is heated with 13 times its weight of cone hydrochloric acid (saturated at 8°) for 7-8 hours at 130° The product is washed with ether, which removes the oil and benzil, after which it is recrystal lised from boiling glacial acetic acid (Zinin) Also formed when bidesyl (hydro oxylepiden), or isobidesyl, is heated with cone hydrochloric acid for 2-3 hours at 130°-140° (Magnanini a Angeli, B 22, 855)

—Lamine [175°] Volatilises at 220° Insol water, sol 170 pts of boiling alcohol, 52 pts of ether at 17°, 28 pts of boiling glacial acetic acid, 8 pts of cold benzene Boiling alcoholic potash is without action on it Nitric acid or chromic acid oxidises it to 'acicular oxylepiden' C₂₈H₂₀O₂ Chlorine has the same action, but bromine converts it into dibromlepiden With phosphorus pentachloride it yields dichlor lepiden

Chlorlepiden C₂,H₁₉ClO By treating an alcoholic solution of dichlorlepiden with sodium amalgam for 24 hours (Dorn, A 153, 355)—Large needles [143°-146°], insol ether, sl sol alcohol, v sol benzene

Dichlorlepiden C₂₈H₁₈Cl₂O Cannot be obtained by passing chlorine into a boiling solution of lepiden, as under these circumstances 'acicular oxylepiden' is formed (Zinin, J R 7, 833) By heating together equal weights of lepiden and phosphorus pentachloride (Zinin, J R 5, 22)—Needles [169°], sol 20 pts boiling

glacial acetic acid, 66 pts boiling alcohol (95 p c), v sci ether

A dichlorlepiden described by Dorn (A 153, 355), and stated by him to melt at 156°, is probably identical with the foregoing

bably identical with the foregoing Isodichlorlepiden $C_{18}H_{19}Cl_2O$ Formed, to gether with hydrodichloroxylepiden, by boiling an acetic acid solution of 'acicular dichloroxylepiden' [202°] (Zinin, J R 7, 331), or of 'sparingly soluble dichloroxylepiden,' with zinculat (Zinin, J R 7, 194)—Needles [166°], sol 174 pts boiling alcohol (95 p c), 12 5 pts boiling glacial acetic acid, sol ether Oxidation converts it back into 'acicular dichloroxylepiden'

Pentachlorlepiden C₂₈H₁₆Cl₂O By heating oxylepiden with excess of a mixture of phosphorus pentachloride and oxychloride for half an hour at 200° (Dorn, A 153, 355)—Indistinct crystals [186°], v sl sol alcohol, ether, and glacial acetic acid, v sol benzene

Hexachlorlepiden $C_{2n}H_1Cl_0O$ By heating dichloroxylepiden with the foregoing mixture for 1 hour at 200° (Dorn) — Yellow amorphous substance [80°-90°], v sol alcohol, ether, and benzene

Octoblorlepiden C₂₈H₁₂Cl₂O By heating dichloroxylepiden with the foregoing mixture for 7 hours at 210° (Dorn) — Orange yellow amorphous substance [97°], v sol alcohol, ether, and benzene

Dibromlepiden C₂₄H₁₈Br₂O Prepared by heating a solution of lepiden in acetic acid with bromine (Zinin, Z 1867, 315) Formed, along with hydrodibromoxylepiden, when 'acicular dibromoxylepiden' is treated with zine and acetic acid (Zinin, J R 7, 330)—Laminæ (from acetic acid) [190°] (Zinin), [185°] (Berlin), sol 480 pts alcohol (94 pc), 44 pts boiling, and 6b pts cold, acetic acid, 50 pts ether Oxylepiden C₂₆H₂₀O₂ Zinin has prepared

Oxylepiden C₂₈H₂₀O₂ Zinin has prepared three isomeric oxylepidens, which he distinguishes as 'acicular oxylepiden,' 'tabular oxylepiden,' and 'octahedral oxylepiden'

lepiden, and 'octahedral oxylepiden'

1 'Acicular oxylepiden' (dibenzoylstilbene)
C.H. C=C C.H.

(Magnanini & Angeli, B 22, C.H. CO CO C.H.

854, cf Japp a Klingemann, C S Pr 1889,
136) By oxidising lepiden with nitric acid
(Zinin, Z 1867, 314) By treating thionessal C₂H₀S (Berlin, A 153, 131) or tolallyl sulphide C₃H₀S₂ (Doin, A 153, 352) with hydrochloric acid and potassium chlorate By digesting benzoïn with dilute sulphuric acid (Limpricht a Schwanert, B 4, 337) In order to prepare it, 1 pt of lepiden is suspended in 10 pts of boiling glacial acetic acid, and a mixture of 1 pt of acetic acid with 3 pts of nitric acid (S G 15) is added (Zinin, lc) -Yellow needles [220°], insol water, almost insol ether, sol 200 pts of boiling alcohol (94 pc) and 22 pts boiling glacial acetic acid, v sol benzene When heated to 340° it is converted into 'tabular oxylepiden' along with a little 'octahedral oxylepiden' Chromic anhydride in acetic acid solution oxidises it to dioxylepiden C ₈H₂₀O₅. Zinc and acetic acid reduce it to lepiden. Heating with hydriodic acid has the same effect (Dorn), also distillation with zinc dust (Berlin) to mation of lepiden by reduction, the oxylepiden is probably first converted into hydro oxylepiden, which then parts with water, yielding lepiden

¹ Zinin's work appeared for the most part in the Journal of the Russian Chemical Society. The author of the present article is indebted, for his secount of this portion of the subject, to Belistein's Handbuch der organ techen Chemic.

188 LEPIDEN

(v supra). Sodium amalgam, acting on the acetic acid solution, reduces it to hydro oxylepiden $C_{23}H_{22}O_2$ (Zinin) When heated with benzoin it is reduced to lepiden, whilst the benzoin yields benzil (Limpricht a Schwanert, B 4,388) Alcoholic ammonia at 200° converts it into a mixture of two imides of the formula $C_{23}H_{21}NO$ —one derived from 'acicular,' the other from 'abiliar,' oxylepiden—whilst with methylamine it yields a methylimide $C_{23}H_{23}NO$ [161°] (Klingemann a Laycock, private communication) Heating with phosphorus pentachloride converts it into dichlorlepiden

2 'Tabular oxylepiden' (tetraphenylcroto-(C₆H₅)₂ C-C C₆H₅ (Japp a Klingemann, CO C C₆H₅

O S Pr 1889, 137) By heating acicular oxylepiden' to 340° and recrystallising the product, first from ether and afterwards from alcohol Tabu lar crystals are deposited first, then microscopic octahedra of the third modification (Zinin, J R Tabular crystals [136°], insol water, sol **5**, 16) 145 pts boiling alcohol (95 pc), and in its own weight of boiling glacial acetic acid Dissolves readily in hot alcoholic potash solution (distinction from 'octahedral oxylepiden'), forming a salt of oxylepidenic acid $C_{28}H_{22}O_{3}$ (infra) Zinc and acetic acid are without action on it, but sodium and boiling amyl alcohol reduce it to tetra phenylbutyrolactone C28H22O2 Alcoholic am monia at 200° converts it into an imide C₂₈H₂₁NO, with alcoholic methylamine at 150° it yields the methylamide of oxylepidenic acid C28H21O2(NHCH.) When heated with phosphorus pentachloride at 200° it forms chloroxylepiden C₂₈H₁₉ClO₂

3 'Octahedral oxylepiden' Only 2 pc of this compound is formed when 'acicular oxylepiden' is heated to 340° Most readily ob tained by boiling 'acicular oxylepiden' with an alcoholic solution of caustic potash or caustic Four parts of 'acicular oxylepiden' are boiled for 12-15 hours with 60 parts of alcohol (95 p c) and 3 parts of caustic soda, employing a reflux condenser The product is washed successively with alcohol, water, and ether, and is finally recrystallised from boiling acetic acid (Zinin, J R 7, 186, J 1875, 409) —Yellowish, microscopic octahedra [232°] Sol 76 parts boiling glacial acetic acid, almost insol alcohol When heated to incipient boiling it is totally converted into 'tabular oxylepiden' Boiling the acetic acid solution with zinc reduces it to hydro oxylepiden, part of which loses water, yielding lepiden A solution of chromic anhydride in acetic acid oxidises it to isodioxylepiden C28H20O3 Alcoholic potash is without action on it

As regards the constitution of 'octahedral oxylepiden,' it is probable that this compound is a stereometric isomeride of 'acicular oxylepiden,' the latter representing the maleoid, the former the fumaroid form of dibenzoyl stilbene

C₂H₃ CO C C₄H₃
C₄H₃ CO C C₄H₃

(*Actoular oxylepiden' [232°]
(*Maleold dibensoylstilbene)
(*Fumaroid dibensoylstilbene)

(Japp a Klingemann, C S Pr 1889, 188) Both yield on reduction the same hydro oxylepiden (bidesyl)

C,H, CO CH C,H,

C,H, CO CH C,H,

which may be converted by dehydration into lepiden

The three oxylepidens yield by destructive distillation the same so called *usolepiden* C_2 , $H_{20}O$ (*unfra*)

'tabular oxylepiden $C_{2n}H_{10}ClO_2$. By heating 'tabular oxylepiden' with a mixture of phosphorus pentachloride (1 part) and phosphorus trichloride ($\frac{1}{5}$ part) at $180^{\circ}-200^{\circ}$ (Zinin, J R 5, 21—Crystals [185°], sol 22 8 parts boiling glacial acetic acid

Dichloroxylepiden $C_{28}H_{18}Cl_2O_2$ 'Acicular dichloroxylepiden' is obtained by hea ing lepiden with four times its weight of phosphorus pentachloride and treating the product with water (Zinin, J R 5, 23) By the oxidation of dichlor-lepiden [169°] (Zinin, J R 7, 332, J 1876, 426) — Needles [202°], sol 146 parts cold, 13 7 parts boiling acetic acid, 90 parts boiling ether When boiled with zine and acetic acid it yields a mixture of hydrodichloroxylepiden and isodichlor-lepiden [166°]

When 'he foregoing 'acicular dichloroxylepiden' is heated to near its boiling point it is converted into a mixture of two new isomeric dichloroxylepidens, which may be separated by the difference in their solubility in ether 'Readily soluble dichloroxylepiden,' which forms the chief product, is very soluble in alcohol, ether, and acetic acid, and is deposited from these solutions as a soft resin Alcoholic caustic potash converts it into a salt of dichloroxylepidenic acid C23H22Cl2O3 The other isomeride, 'sparingly soluble dichloroxylepiden,' is best prepared by boiling 4 parts of 'acicular di-chloroxylepiden' with three parts of caustic soda and 40 parts of alcohol for from 20 to 24 hours It forms a granular powder consisting of microscopic prisms [230°], almost insol alco-hol and ether, sol 36 parts boiling glacial acetic acid Boiling with acetic acid and zinc converts it into isodichlorlepiden [166°] (Zinin, J R 7, 191)

These three compounds, as their mode of formation and reactions denote, are to be regarded as dichlor substitution products of 'accoular,' 'tabular,' and 'octahedral' oxylepiden respectively

A fourth dichloroxylepiden has been obtained by Dorn (A 153, 353) by treating dichlorthionessal $C_{22}H_{16}Cl_{12}S$ with hydrochloric acid and potassium chlorate —Small needles [178°], readily sol alcohol, benzene, and glacial acetic acid Not attacked by alcoholic potash at 150° Zinc and acetic acid convert it into a dichlorlepiden and acetic acid convert it into a dichlorlepiden (156°) (v supra), whilst with hydrodic acid at 100° it yields dichlorlepiden, lepiden, and oxylepiden (?)

Dibromoxylepiden $C_{22}H_{12}Br_2O_2$. Three dibromoxylepidens, concesponding with the first three of the foregoing dichloroxylepidens, have also been described by Zinin (J. R. 7, 329, J. 1876, 425) In their modes of preparation, properties, and reactions, they resemble the chloring compounds 'Acicular dibromoxylepiden' is obtained either by brominating 'acicular oxylepi-

den' or by oxidising dibromlepiden in acetic acid | solution with nitric soid Needles [222°], sol 40 parts boiling acetic acid Heated above its melting point it yields two isomeric dibromoxylepidens-'readily soluble dibromoxylepiden,' which is resinous, v sol alcohol, ether, and acetic acid, and is converted by alcoholic caustic potash into a salt of dibromoxylepidenic acid C₂₈H₂₈Br₂O₄, and 'sparingly soluble dibromoxy-lepiden' This latter is more easily obtained by boiling the acicular modification with a quantity of alcoholic potash insufficient to dissolve it Crystallises from alcohol in lemon yellow rhombic tables [239°], almost insol ether, sol 66 parts boiling acetic acid and 1,000 parts boiling alcohol (95 pc) Heated above its melting point it is converted into 'readily soluble dibromoxy-lepiden (Zinin, J R 7, 329, J 1876, 425)

Both'sacicular' and 'sparingly soluble' dibromoxylepiden, when reduced with zinc and acetic acid, yield the same hydrodibromoxylepiden (dibrombidesyl), part of which undergoes dehydration, forming dibromlepiden [190°]

Hydro oxylepiden (Bidesyl) C.H. CH-CH C.H. (Magnanini a $C_{20}H_{22}O_2 =$

C_eH, CO CO C_eH, Angeli, B 22, 853) Formed, along with lepiden, by the action of zinc and acetic acid on octa hedral oxylepiden,' or of sodium amalgam on 'acicular oxylepiden'. The product of the reac tion is ppd with water and treated with ether, which dissolves only the lepiden (Zinin, J R 7, 188, J 1875, 409) By the action of desyl bromide, C.H. CHBr CO C.H., on sodium deoxy benzoin, or of iodine on sodium deoxybenzoin

C₆H₅ CHNa C'H' CH - CH C'H' C.H. CO CH, CO COCH, (Knovenagel, B 21, 1358) -Long flat needles (from acetic acid), [251°] (Zinin), [254°-255°] (Knovenagel, also Magnaninia Angeli) Almost insol cold alcohol and ether, sol 112 pts boiling acetic acid, sol hot benzene Heated with hydrochloric acid at 130°-140° it parts with water, yielding lepiden (Magnanini a Angeli, B 22,

Tetraphenylbutyrolactone

aphenylbutyrolactone
$$(C_{e}H_{s})_{c}C-CH C_{e}H_{s}$$

$$C_{2e}H_{2d}O_{s} = \begin{array}{c|c} (C_{e}H_{s})_{c}C-CH C_{e}H_{s} \\ COCH C_{e}H_{s} \end{array}$$

By treating & solution of 'tabular oxylepidene' (tetraphenylcrotolactone) in boiling amyl alcohol with sodium (Klingemann a Laycock, private communication) — Microscopic, white [221°], sol boiling, sl sol cold, alcohol

Hydrodichloroxylepiden C. H. Cl.O. Formed, along with dichlorlepiden, when sparingly soluble dichloroxylepiden is boiled for a long time with zinc and acetic acid, or, more readily, by boiling an alcoholic solution of 'acicular dichloroxylepiden ' with sodium amalgam, keeping the liquid acid with acetic soid (Zinin, J R 7, 195, J 1875, 413) —Flat needles (from acetic acid) [261°], insol alcohol and ether, sol 205 pts boiling acetic soid

Hydrodibromoxylepiden C,H,Br,O, the action of zine and acetic acid on 'acicular' or 'sparingly soluble' dibromoxylepiden (Zinin,

J~R~7,330 , J~1876,425) — Slender needles, v sl sol alcohol and ether, sol 172 pts boiling acetic acid

Dioxylepiden C₂₈H₂₀O₈ By warming 25 pts of 'acicular oxylepiden,' suspended in 20 pts of acetic acid, with a solution of 12-15 pts of chromic anhydride dissolved in 150 pts of acetic acid (Zinin, Z 1871, 483)—Rhombic tables [157°], sol 24 pts boiling alcohol (95°) Re ducing agents are without action on it By further action of chromic anhydride it yields benzil and benzoic acid Alcoholic potash hydro-

lyses it into deoxybenzoin and benzoic acid $C_{2n}H_{2n}O_1+2KHO=C_1H_{1n}O+2C_0H_1CO_2K$ Isodioxylepiden $C_{2n}H_{2n}O_3$ By boiling 'octa hedral oxylepiden' with a solution of chromic anhydride in acetic acid (Zinin, J R 7, 190, J 1875, 410) —Laminæ [164°], sol 10 pts boiling alcohol, less sol ether, sol 4 pts boiling acetic acid Boiling alcoholic potash is without action on it (distinction from foregoing isomeride)

Oxylepidenimide C28H21NO By heating 'acicular oxylepiden' with alcoholic ammonia for 5 hours at 200°, it yields a mixture of oxylepidenimide and the isomeric tetraphenyl pyrrholone. The oxylepidenimide is separated by means of its greater solubility in alcohol (Klingemann a Laycock, private communication) —Yellow prisms (from benzene) [180°-182°] Heated to 310° it changes into tetraphenylpyrrholone (v infra)

Oxylepiden methylimide C, H, O(N CH, By heating 'acicular oxylepiden' with an alcoholic solution of methylamine for 2 hours at 200° (K. a L)—Small pale yellow plates [161°] from alcohol, well shaped crystals from carbon bi-V sol benzene, readily sol carbon sulphide bisulphide, moderately sol boiling alcohol

Oxylepidenic acid (Benzoyl triphenyl pro (C,H,),C——CH C,H, pionic acid) C24H2O2= COOH CO C.H.

(Japp a Klingemann, C S Pr 1889, 138) The potassium salt is formed when 'tabular oxylepiden' is dissolved in hot alcoholic potash (Zinin, J R 5, 18)—The acid crystallises in laminæ, v sol ether, sol 35 pts boiling alcohol (95 pc), insol water Melts at 196°, breaking up into 'tabular oxylepiden' and water

The so called usoxylepidenic acid described by Zinin (J 1877, 397) is identical with the foregoing (Japp a Klingemann, C S Pr 1889,

Tetraphenylpyrrholone

with the isomeric oxylepidenimide, when acicular oxylepiden is heated with alcoholic ammonia at 200° By heating oxylepidenimide to 810° As sole product when 'tabular oxylepiden' 18 Reated with alcoholic ammonia at 200° (Klingemann a. Laycock) -Small pale yellow plates [208°], sparingly sol alcohol.

140 LEPIDEN

when 'tabular oxylepiden' is heated with an alcoholic solution of methylamine at 150° $C_{28}H_{29}O_2 + NH_2CH_3 = C_{28}H_{28}NO_2$ (Klingemann a Laycock) — Yellowish lamins [267°] from acetic acid, short needles from alcohol Sl sol boiling alcohol, more sol boiling acetic acid Decomposed by distillation in vacuo into methyleteraphenylpyrrholone (prismatic crystals [158°] from benzene) and water

CO C C₆H₃
N CH₃

formed appears to be isomeric, not identical, with oxylepiden-methylimide (K a L)

Dichloroxylepidenic acid $C_{28}H_{20}Cl_2O_3$ By dissolving 'readily soluble dichloroxylepiden' in boiling alcoholic potash (Zinin, JR, 7, 191, J 1875, 411)—Rhombic laminæ [182°], from acetic acid Sol 16 pts boiling acetic acid Heated to 200° it parts with 1 mol water, and is reconverted into 'readily soluble dichloroxylepiden'

Dibromoxylepidenic acid C₂₈H₂₆Br₄O₃ By dissolving 'readily soluble dibromoxylepiden' in boiling alcoholic potash (Zinin, J R 7, 330, J 1876, 425)—Six sided laminæ from acetic acid

J 1876, 425) — Six sided lamins from acetic acid So called isolepiden and its derivatives— Under the name of isolepiden, Zinin (J R 5, 20) has described a compound which he obtained by the destructive distillation of oxylepiden, and which he regarded as isomeric with lepiden Japp a Klingemann have, however, shown (C S Pr 1889, 139) that this compound has the formula $C_{p_1}H_{p_2}O_p_1$, instead of $C_{p_2}H_{p_2}O_p_2$, and that it is formed from oxylepiden with elimina ton of carbonic oxide according to the equation

 $C_{2}H_{20}O_{2}=C_{27}H_{20}O+CO$ The name 'isolepiden' is consequently inappropriate, but will be retained here, as the constitution of the compound is unknown, and a systematic name cannot be given The formulæ of the various hydro 'isolepidens' and oxy 'isolepidens' described by Zinin must also be written with 27 instead of with 28 atoms of carbon, although these compounds have not yet

been re investigated

Isolepiden $\hat{C}_{21}H_{20}O$ (Japp a Klingemann, lc) By the destructive distillation of oxylepiden (Zinin, J R 5, 20, cf preceding paragraph) The three oxylepidens all yield this compound on distillation, but in reality it is only 'tabular oxylepiden' which yields it, as the other two oxylepidens are previously transformed into 'tabular oxylepiden' at the temperature of the reaction The distillate is washed with ether and then recrystallised, first from alcoholic potash, afterwards from alcohol The ether extracts a little 'tabular oxylepiden,' which is carried over undecomposed (Japp a Klingemann, C. S Pr 1889, 139)—Isolepiden forms yellow tabular crystals [150°] Decomposes on redistillation Sol 18 pts boiling alcohol (95 pc), and in 2 pts boiling acetic acid (Zinin, J 1877,

394) Not attacked by alcoholic potash. It is reduced by zinc dust and acetic acid to dihydro isolepiden C_2 , $H_{22}O$, and by sodium amalgam to tetrahydro isolepiden $C_{21}H_{24}O$ Oxidising agents convert it into oxy isolepiden, and ultimately into a mixture of benzophenone and benzil

Dihydro-isolepiden $C_{2}, H_{22}O$ By reducing a solution of isolepiden in from 5 to 6 pts of acetic acid with zinc dust The product is poured into water, and the pp is washed with ether and recrystallised from alcohol (Zinin, J 1877, 394)—Small rectangular prisms [182°] Sol 12 5 pts boiling alcehol (95 p c), v sl solather

Tetrahydro isolepiden $C_{27}H_{24}O$ By the action of sodium amalgam on a boiling alcoholic solution of isolepiden (Zimin) Separates from ether as a soft resinous mass which noon becomes crystalline [132°] Readily so alcohol and acetic acid, less sol ether dride oxidises it in acetic acid solution, even in the cold, to dihydro isolepiden

Oxysolepiden C, H $_{0}$ O $_{1}$ Three pts of isolepiden are dissolved in 40 pts of acetic acid, and oxidised with a solution of 3 pts of chromic anhydride in 30 pts of acetic acid (Zinin J 1877, 395) —Short slender needles [161°] Sol 40 pts boiling, and 600 pts cold alcohol, and in 4 pts boiling acetic acid Boiling alcoholic potash is without action on it Zinc and acetic acid reduce it to dihydro isolepiden Excess of chromic acid oxidises it, in acetic acid solution, to benzophenone as chief product, together with benzil and benzoic acid

Oxy isolepiden, like oxylepiden, may be converted into isomeric compounds. Thus, when it is boiled with a quantity of alcohol or alcoholic potash insufficient to dissolve it, it is transformed into cunciform oxy isolepiden [162°] When this is heated above its melting point, or when ordinary oxy isolepiden is distilled, twollar oxy-isolepiden, a third isomeride, is formed Rhombic tables [152 5°] from acetic acid. Sol 13 5 pts boiling acetic acid, 80 pts boiling alcohol.

LEUCINDIGO v INDIGO

 (A Ch [2] 18, 119) found it among the products of the action of H₂SO₄ on animal substances Mulder (J pr 16, 290) showed the two substances thus obtained were identical

Occurrence -In old cheese (Proust), in fresh calf's liver (Liebig, Chem Briefe, ed 3, 453), in diseased but not in healthy human liver (Frenchs a. Stadeler, J 1854, 675, 1856, 702, 1858, 550), in the tissue of the lungs (Cloetta, A 92, 289), in the thymoid and thyroid glands, and in the pancreas (Gorup-Besanez, A 98, 7, Radziejewsky, Z 1866, 416), in the brain of oxen (W Muller, A 103, 131), in the pancreas of oxen (Scherer, J 1859, 610), in the liver and urine in cases of typhus, smallpox, leucæmia, and poisoning by phosphorus (Salkowsky, J Th 1880, 457, Valentiner, J 1854, 675, Sotnitschewsky, H 3, 391), in the stomachs and intestines if the pupe of butterflies (Schwarzenbach, J 1857, 538), in Agaricus muscarius (Lud wig, J 1862, 516), in the juice of vetches ger minated in the dark (Gorup Besanez, B 7, 146, cf Cossa, G 5, 314), in chenopodium album in young pumpkin plants (Schulze a Barbieri, B 11, 1233), and in beet root molasses (Lippmann, B 17, 2837)

Formation —1 In the putrefaction of proteids and gelatin $(B_{CP}, A 69, 20)$ and by boiling these substances with dilute $H SO_4$, or by fusing them with potash (Hinterberger, Sitz W 9, 450, A 71, 75, Zollikofer, A 82, 174, Gossmann, A 91, 130, Leyer a Koller, A 83, 332, Schloss beiger, Z 1860, 424, Erlenmeyer a Schoffer, Z 1869, 315, Hochstetter, J pr 29, 36, Ritt hausen a Kreusler, J pr [2] 3, 307) —2 In the pancreatic digestion of gelatin (Nencki, B 7, 1593, Jeanneret, J pr [2] 15, 353) —3 By acting on a bromo hexoic acid with ammonia (Hufner, J pr [2] 1, 6, Z [2] 4, 391, 616)

Preparation -Horn shavings (2 lbs) are boiled with H₂SO₄ (5 lbs) and water (13 lbs) for 24 hours with inverted condenser The product is mixed with lime, filtered, and evaporated to a smaller bulk (12 lbs) Oxalic acid is then added to acid reaction, and the liquid filtered and eva porated till a crystalline film forms on the sur Leucine mixed with tyrosine is deposited in groups of yellowish laminæ On recrystalli sation from water tyrosine is deposited first, and the mother liquor is then decolourised by animal charcoal and evaporated The leucine is recrystallised from alcohol (Schwanert, A 102, 221, cf Hinterberger, A 71, 72 Waage, A 118, 295) Leucine maj be detected and isolated by means of its sparingly soluble copper salt (C, H, NO,), Cu, although the precipitation of this salt is hin dered by free acids and by some organic bodies (Hoffmeister, Sitz W 75, 469)

Properties—Soft nacreous scales (from alsohol) resembling cholesterin. It may be sublimed (Mulder) Decomposed on fusion, giving amylamine, CO₂, and NH. Lavorotatory (Lewkovitch, B 17, 1439, cf Mauthner, H 7, 223) SI sol water and alcohol, insol ether. Its solubility in water is increased by the presence of acetic acid or an alkaline acetate. When heated with baryta water at 160° it becomes inactive. The inactive leucine is changed to an active variety, lavorotatory when dissolved in aqueous HCl, by the action of Penicillium glaucum (Schuize a. Bosshard, B 18, 388).

Reactions -1 An alkaline solution exposed to the action of ozone yields CO₂, butyric acid, and NH₂ (Gorup-Besanez, A 125, 210)—2 Chlorine passed into water in which leucine is suspended forms CO2 and valeronitrile, as well as chloro valeronitrile (Schwanert) Chlorine passed into an alkaline solution of leucine forms oxy-hexoic acid —3 Nitrous acid converts it into a oxy hexoic (leucic) acid —4 Distillation with MnO2 and dilute H2SO4 yields CO2 and valeronitrile -5 Distillation with water and PbO. yields butyric aldehyde and NH, (Liebig, A 70, 313) —6 Aqueous KMnO, yields NH, oxalio acid, and valeric acid (Neubauer, 4, 106, 59) — Potash fusion gives NH, hydrogen, and potassium valerate (Liebig, A 57, 127) — 8 When heated with fuming HIAq at 140° it gives hexoic acid and ammonia (Hufner) -9 With KOH (2 mols) and MeI (3 mols) it forms potassium di methyl amido-hexoate methylo iodide C₅H₁₀(NMe₂I)CO₂K, which, when heated with moist Ag_2O_1 , yields methylamine, a salt $C_6H_9O_2K_1$ and potassium leuconate C₆H₁₁O₅K (Körner a. Menozzi, G 13, 353) -10 Leucine gives off more nitrogen when its solution is decomposed by NaBrO in presence of NH₃, than when the

NH, is absent (E Schulze, J pr [2] 31, 236)

Benzoyl derivative $C_sH_{12}BzNO_2$ is $C_sH_{16}(NHBz)$ CO.H From leuone and BzCl at 100° (Destrem, Bl [2] 30, 481) Granules, sol alcohol and ether In the preparation of leucine anhydride there is also formed the anhydride $(C_sH_{16}(NHBz)CO)_sO$, which is an amorphous body [85°] insol water and ether, ve sol al cohol Decomposed by boiling water into benzoic acid and the anhydride of leucine

 $\begin{array}{cccc} Phthaloxyl \ derivative \\ C_3H_{10}(CO_2H) \ NHCO \ C_4H_cO \ H & [132^o] \end{array} \ \ From \\ leucine, \ alcoholic KOH, and phthalyl chloride \\ (Reese, B 21, 277) - K_2A'' \ \ concentric \ groups \\ of \ small \ slender \ needles \end{array}$

Anhydrade (C₃H₁₂NO)₂O When the product of the action of BzCl on leucine at 100° is treated with alcohol leucine anhydride remains undissolved, while its di benzoyl derivative (v supra) passes into solution (Destrem, C R 86, 484) Leucine anhydride is a white amorphous body, insol alcohol, but becoming gelatinous when boiled therewith It is not easily converted into leucine by boiling water

LEUCINDIN SULPHONIC ACID v Indin LEUCINIMIDE C. H., NO Obtained in small quantity, together with leucine and tyrosine, by boiling proteids with dilute H. SO. (Limpricht a Hesse, A 116, 201, Erlenmeyer, A 119, 17, Thudichum, C J 23, 409) Formed also when proteids are treated with bromine water (Hlasiwatz a Hebermann, A 159, 328), and, together with benzoyl-leucine, by heating leucine with HOBz at 200° (Destrem, Bl [2] 30, 481). Mi-

nute white trimetric needles; insol cold, al sol boiling water, sol alcohol, m sol ether May be sublimed Not affected by boiling aqueous

acids or alkalis

Iso-leucinimide C.H.11NO Formed by heating a-amido isohexoic acid in a current of HCl at 225° (Köhler, A 184, 869) Minute white needles (from alcohol), may be sublimed Insol water, sol alcohol Not affected by boiling KOHAq or by acids

LEUCO-BROMO-QUINONE PHENOLIMIDE

BROMO-DI OXY DI PHENYL-AMINE

LEUCOGALLOL C18HeCl12O 2aq [104°] Formed by passing chlorine into a cold mixture of pyrogaliol (10 g) and glacial acetic acid (20 g), then adding cone HClAq (5 c c), and continuing the passage of chlorine The pp is washed with benzene, dissolved in ether, and ppd with benzene (Stenhouse a. Groves, C J 28, 1, 704) Crystalline crusts composed of small needles Gives off HCl and water on fusion, and forms tri chloro pyrogallol and a body resembling quinone (Webster, C. J. Proc. 3, 130). V sol water and alcohol, m sol ether, insol CS₂ and ligroin, sl sol boiling benzene. Leucogallol is converted by zinc dust and dilute H₂SO₄ to tri-chloro pyrogallol C₆Cl₅(OH)₅ (Hantzsch a Schniter, B 20, 2033) It reacts with hydroxylamine and with phenyl hydrazine Its constitution may possibly be

COC(OH), C(OH) OC(OH) C(OH) CCI, C(OH) C(OH) CO 001-001-----001 O(OH),OCI OCI,OCI -- OCI

LEUCOLINE C.H., N This base, occurring in coal tar, has been shown by Hofmann (A 47, 76, 53, 427), Hoogeweiff a van Dorp $(R \ T \ C \ 1, \ 1, \ 107)$, and others to be identical with quinoline

LEUCOLINIC ACID C.H.NO. [162°] tained from coal tar quinoline (leucoline) (10 g) by dissolving as neutral sulphate and treating with KMnO, (25 g) in boiling water, adding the latter solution slowly Cold solution of KMnO. (40 g) gives only pyridine carboxylic acids
(J Dewar, Pr 26, 65, 30, 168)

Properties — Needles Often syrupy It

then becomes crystalline by boiling with water for some days Sl sol cold water, sol alcohol The lead salt is insoluble The silver salt forms

slender needles

Reactions -1 Theorystalline acid forms with glycerine a substance resembling indole -2 A solution of the potassium salt at 200° gives aniline -3 Potash fusion gives salicylic acid, CO₂, NH₃, and hydrogen —4 When heated with soda-lime to a low red heat it forms aniline, NH,, and a small quantity of methyl-pyridine

LEUCOMATNES Bases occurring in living animals (Gautier, Bl [2] 48, 16, cf J Ph [5] 18, 354, 401, Bl [2] 48, 158) Λεύκωμα white of egg Obtained by extracting fresh beef (30 kilos) with tepid water (60 kilos) to which 25 g oxalic acid and 1 cc oxygenated water is added per litre At the end of 24 hours the whole is heated to boiling, filtered, and evaporated at 50° in vacuo The residue is extracted with 99 p c alcohol, filtered, evaporated m vacuo, redissolved in alcohol, filtered, and the alcoholic solution ppd with ether The precapitate may be separated by a series of crystalli

sations from ether, alcohol, and water, and by precipitation with HgCl, into the six following bases

Xantho-creatinine CaH10N4O Small sulphuryellow micaceous lamine, with greasy surface Slightly bitter in taste Gives off an odour like acetamide when heated Smells in the cold like a dissecting room When strongly heated it gives off an odour of loast beef, and carbonises, with evolution of NH, and methylamine. Neutral to litmus Its hydrochloride and platinochloride are crystallisable and soluble solution like creatinine is ppd by ZnCl2, this pp crystallises from hot water on cooling in groups of needles AgNO, gives a flocculent pp. crystallising from hot water in needles Mercurio chloride gives a yellowish-white pp, sol alco hol It is not ppd by iodine in KIAq Sodium phosphomolybdate gives a pp after a time Treatment with HgO forms a substance melting at 174°

Chruso creatinine C.H.N.O Crystals (from water) Feebly alkaline Its hydrochloride crystallises in needles, is soluble and not deli quescent The aurochloride is slightly soluble and forms crystalline grains The platinochloride is soluble Chrusocreatinine gives no pp with zinc acetate or mercuric nitrate, but it ppts alumina from alum ZnCl, gives a ciystalline powder HgCl, gives a pp I in KIAq gives a pp Sodium phosphomolybdate gives

an abundant yellow pp

Amphicreatine C,H,,N,O, Feeble base, forming bright yellow crystals Its hydro chloride is crystalline and non deliquescent. Its platinochloride is soluble and forms lozengeshaped tables It ppts sodium phosphomolyb date, but not HgCl2

Flesh coloured Pseudocreatine C.H.N.O powder composed of minute crystalline grains Forms a very soluble hydrochloride, resembling that of hypoxanthine, crystallising in whet stone like shapes Its aqueous solution is ppd by HgCl. AgNO, gives a gelatinous pp Ppd by ammoniacal but not by neutral lead acetate When evaporated with HNO, like xanthine it leaves a residue which is turned orange red by

A base C11H24N10Os crystallising in colourless rectangular tables, with crystalline hydrochloride and platinochloride

A base C₁₂H₂₅N₁₁O₅ resembling both the preceding and xanthocreatinine

LEUCONIC ACID
$$C_5(OH)_{10}$$
 or C_5O_5 5aq 16
 $(HO)_2C < C(OH)_2 C(OH)_2$ or $OC < COCO$ $COCO$ $COCO$

croconic acid Deca oxy pentamethylene pared by adding finely powdered pure croconic acid (1 pt) to cooled HNO, of S G 1 36 (6-8 pts); the mixture solidifies to a magma of colourless needles, which are washed with ether alcohol and finally with ether (Nietzki a Benkiser, B 19, 301, of Will, A 118, 117, Lerch, A 124, 20) Gum like mass V e sol water, sl sol alcohol, insol ether Sweet taste It is readily reduced to croconic acid By dissolving in alkalis it is entirely altered Treated with tri amido benzene it forms a violet colouring matter, turned brown by alkalis (Witt, C J 49, 402)—KC₂H₂O₂: amorphous, sl sol water —Ba_s(C₅H₅O₆), doc-culent pp —Pb₅(C₅H₅O₆), pp —Ag₃C₅H₅O₆ (W) Penta oxim C₅(NOH), Yellow orystalline

solid Formed by the action of hydroxylamine apon croconic or leuconic acid. Decomposes auddenly at 172° — C.H., N.O.K.. very explosive The penta oxim may be reduced by C(NH.) C(NH.)

SnCl, to CH(NH2) ·C(NH₂, Ċ(NH₂)

forms crystalline salts

Tetra acetyl derivative of the pentaoxem C_s(NOH)(NOAc), aq (from benzene) From the penta oxim and Ac₂O at 45° (Nietzki a Rosemann, B 22, 916) Plates (from Ac₂O) or needles containing chloroform (from chloro-form) Sl sol hot benzene Decomposed at 100°

Tetre-oxim C,H,N,O, i e

C(NOH) C(NOH) When potassium croco-·C(NOH) Ċ(NOH)

nate (30 g) is gradually added to a cooled mixture of $HNO_x(45 g)$ of SG 1 39 and water (40 g), and the product is diluted with water (500 c c) and heated with hydroxylamine hydrochloride (180 g) for some hours at 45° and finally at 100° there is formed a pp of mixed oxims This is dissolved in aqueous Na, CO, and CO, is passed in, whereupon the penta oxim is ppd while the tetra oxim can be ppd from the filtrate by HCl Yellow pp Explodes at 160° sodium derivative is v sol water, but is ppd on adding alcohol or NaCl, apparently in the form of Na₂C₃H₂N₄O₅ Carbonyl-di-toluquinoxaline C₁₈H₁₂N₄O 1.6

 C,H_{\bullet} Leuconic-acid-C N

[above 300°] di tolylene-o diamide Formed by adding a salt of tolylene-o diamine to a cold aqueous solution of leuconic acid Golden yellow needles V sol warm chloroform, sl sol hot alcohol and acetic acid, insol water

Phenyl hydraside (CH,N2),C, CN2HPh Red needles (from acetic acid), v sol chloro form, sl sol alcohol Weak base The hydrochloride forms a dark-green pp (Nietzki a Ben kiser, B 19, 776)

LEUCOTIN v COTO BARK

LEUCOTURIC ACID C.H.N.O. Oxalantın Formed when a solution of alloxanic acid is rapidly boiled down to a syrup, cold water is then added which leaves the leucoturic acid un dissolved (Schlieper, A 56, 1) Formed also by reducing parabanic acid with zinc and HClAq in the cold (Limpricht, A 111, 134) White crystalline powder, insol cold, m sol hot, water Decomposes alkaline carbonates on boiling De composed by heating with KOH, giving off NH, and forming oxaluric acid Its ammoniacal solution is ppd by AgNO₃, and on boiling reduc sion takes place Boiling conc HNO, does not attack it

LEVONIC ACID C₁₄H₁₂O₄ 3aq An acid said by Wiederhold (C C 1884, 971) to be obtained by boiling levulose with baryta water Yellowish brown powder, v sol alcohol and water composed by heat.

LICARENE C₁₆H₁₆ (168°-172°) S G 18 835 An inactive terpene obtained by the action of ZnCl, or P,O, on the essential oil of Licars Kanah (Morin, A Ch [5] 25, 427) Cone HClAq forms C₁₀H₁₀2HCl, a colourless liquid, S G 12 1 069, mactive to light, and decomposed on distillation into licarene and hydrochloric acid The essential oil C₁₀H₁₈O might be looked upon as licarene hydrate and exhibits the following properties — (198°) at 755 mm S G 12 568. [a]_D = -19 at 15° It is sol alcohol, ether, and glycerın

LICHENINE C.H,O, Occurs in Iceland

Preparation - Cetraria islandica or other similar lichen is heated for several hours with a 2 p c solution of K₂CO₄ The aqueous solution 18 ppd by alcohol (Honig a Schubert, M 8, 460, cf Knop a Schnedermann, A 55, 164, Maschke, J pr 61, 7, Davidson, N Ed P J 28, 260, Errera, Bn 1, 882, Bauer, J pr [2] 34, 49, Klason, B 19, 2541)

Properties -Gelatinous pp, v sl sol cold Boiling water forms an opalescent solution, reppd on cooling or on adding alcohol Gives no blue colour with I and H₂SO₄ Dissolves in HCl, from which solution it is ppd in snowwhite flocks by alcohol Weak hot acids convert it after some time into a dextro rotatory sugar [a]1 - +55° Glucose is also formed Two carbo hydrates, resembling soluble starch in their properties, are present in the aqueous solution

LICHENO-STEARIC ACID C14H24O4 120°] An acid occurring in Iceland moss (Schnedermann a Knop, A 55, 149), and pro bably also in the fly agaric or toadstool (Bolley, A 86, 50) Obtained by boiling Iceland moss for 15 minutes with dilute alcohol and some K CO₂, filtering, adding HClAq and 4 volumes of water The pp is boiled with alcohol of 45 p c. whence a mixture of licheno stearic and cetraric acids separates on cooling The licheno stearic acid is extracted from the mass by petroleum and recrystallised from alcohol Mass of radiating needles which soon change to delicate pearly lamine Has a rancid taste Insol water, v sol. alcohol, ether, and oils Is not attacked by AcCl On oxidation it yields CO2 and decoic acid (Hilger a Buchner, B 23, 401) The ammonium salt forms a jelly containing extremely slender needles -BaA', grevish white pp which cakes together in boiling water -PbA' flocculent pp fusing under water -AgA'

LIEBERMANN'S REACTION A blue or green colour obtained by warming phenol-with H₂SO₄ containing nitrous acid It may be used as a test for phenol or for nitrous acid Various derivatives of phenol may be used instead of phenol, while nitroso and oximido compounds usually react like nitrous acid

LIGHT For an account of the applications of optical methods of inquiry to chemical problems, v Physical methods, section Optical

LIGNIFICATION v LIGNONE

LIGNO-CERIC ACID C2, H46O or C22H4, CO H [81°] Occurs in the paraffin obtained from beech wood tar (Hell, B 13, 1709) Occurs also in the product of the saponification of earth-nut oil, (Kreiling, B 21, 880) Colourless felted needles or plates (from alcohol)

LIGNONE (Lignin, Lignose Lignification) Lignification, or the process of wood formation, is one of the principal of the modifications of the cell-wall, by which it and the tissues con taining it are differentiated for fulfilling their several functions The history of a lignified cell, or rather of the substance of the cell wall, is usually stated to consist of (1) the elaboration of the primary cell wall from materials in protoplasm, and formed at its limiting film as an envelope of pure cellulose, (2) the induration of this cell-wall, is lignification, by the infiltration of substances, which when deposited are known as 'lignin,' or more vaguely as 'incrustive' substance Lignification is recognised by the morphological changes with which it is associated, as well as by the very characteristic reactions of the product (Goodale, Phys Botany, These products, although presenting a wide range of differences, corresponding with variations in structural and other characteristics of the tissues which they compose, fall naturally, and as regards their chief constituent, into a homogeneous chemical group, designated by the term lignocellulose, of which the typical features are represented in the substance of the jute fibre (vol i p 719)

It is the purpose of this article to give a brief account of more recent researches into the constitution of this typical lignocellulose, and to show the bearings of the results arrived at upon the chemistry of the woods, the most numerous and important section of the group The advantages of the jute fibre over the latter as a subject of study are that it is a simple tissue, whereas the woods are complex aggregates, that as an isolated fibred it is much more easy of penetration by reagents, and that as a product of only a few months' growth it has not undergone such secondary changes in composition as necessarily take place in the substance of a perennial stem or true wood Such characteristics mark out the jute fibre substance as a natural basis for the general solution of the chemical problem of lignification

Evidence has already been given (vol 1 loc cit) for regarding this product as chemi cally homogeneous, which view is further developed in the investigations referred to (C J 1889 199) In all reactions in which hydroxyl groups only are brought into play—hydrolysis and etherification-it behaves as an integral compound (lignocellulose), of which the formula C₁₂H₁₈O₂ is an approximate empirical expression. The limit of 'nitration' is the tetranitrate, indicating a number of OH groups in the original less by two than in the molecule of cellulose, similarly represented, to as C12H20O10 The product is of a bright gold colour, with a silky lustre In further contradistinction to

cellulose, the OH groups of the lignocellulose react with acetic anhydride at its boiling point Its reaction with chlorine has been studied quantitatively, 1 grm of the purified fibre substance takes up 54-55 c c Cl (calc at 0° and 760 mm), or approximately 16 pc by weight the quantity of Cl as HCl formed being equal to that entering the molecule The chlorinated product $n(C_{19}H_1,Cl_4C_9)$, a simple substitution-derivative of the non-ellulose constituent (which we may regard as $n(C_{19}H_{21}Cl_4O_9))$, contains mairogallol in combination with a body not yet com pletely studied, but yielding furfural on hydro lysis In addition to the molecular groupings thus indicated, the presence of methyl groups is proved by the formation of methyl chloride on heating this con pound, and of acetic acid on de structive distillation of the fibre substance, as also by dissolving it in sulphuric acid, dil iting and distilling These results afford a general view of the constitution of the 'lignin' substance, as it has been termed hitherto We may regard it as con taining closed C, chains, further characterised by the presence of ketone or quinone oxygen, and united to the furfural yielding body, which is probably related to 'wood gum' ('Holzgummı')
Tollens has, in fact, isolated xylose from the jute fibre (B 22, 1046), though in very small quantity, and we would note here the increase in the proportion of the parent substance, woodgum, with the more advanced lignification of perennial stems, as additional evidence for this view It is difficult to localise the methyl groups. but they would appear to be independent of the above, and may be regarded as existing in an acetic residue in combination For a substance of marked ketonic and aldehydic characteristics, the terms lignin and lignose are obviously un suited, and should give place, according to pre sent views, to lignone, by which, therefore, we shall designate the non cellulose component of the lignocelluloses generally

The lignone of plant cells generally in the earlier stage of growth, ie lignification, appears to be not merely similar to but identical with that of jute Proof of this has been afforded by the particular investigation of such widely dif sering structures as the stony concretions of pears -- Erdmann's glycodrupose---the fibrovas cular bundles of Musa Paradisiaca (Monocot), and the bast fibres of the Sida species (C J 1882, 108, 1883, 19, 1889, 212)

But very few of the woods have been particularly investigated in regard to the constitution of the wood substance, and for the most part only in regard to the products of hydrolysis (v vol 1 p 719) Thus Erdmann concluded from his study of coniferous wood that its chief constituent-'glycolignose'-is a chemical individual $C_{30}H_{46}O_{21}$, a species of glucoside resolved by treatment with boiling acids into 'lignose' C18H26O11 and a fermentat'e sugar (glucose). The presence of closed C₆ chains in the 'lig nose' molecule was evidenced by its yielding protocatechuic acid on fusion with alkaline hy-

A more direct conversion of the lignone into definitely - A more circut conversion of the lignone into definitely aromatic products is that which takes place spontaneously when masses of jute are exposed to moisture and heat. From specimens of fibre 'rotted under such conditions Cross and Bevan obtained an astringent substance C_mH_mO_{1m} which yielded phloroglucol and protocatechulo acid on fusion with potash (C S J 1882, 93)

LIGNONE. 145

drates It was also concluded that the wood of the widely different poplar species was similar if not identical in composition (A Suppl 5,

228)

The later researches of F Bente (D P J 217, 235), although modifying these views, chiefly in the variation in the results of hydrolysis, nevertheless in the main confirm them The general conformity of the woods to the types above described as representative is shown

(1) In the close similarity of their character istic reactions Of these we may mention (a) the colouration produced with solutions of the aro matic amines (golden yellow), and of solutions of the phenols in hydrochloric acid, most cha racteristic of which is the reaction with phloro glucol (crimson), (b) the powerfully reducing action of the wood substance upon the oxides of copper, selver, gold, and mercury-showing the presence of aldehydic groups, (c) the reactions with the halogens yielding, in the case of chlorine, substitution products of definite quinone chloride characteristics, attended by complete resolu tion into lignone (chloride) and cellulose with bromine and iodine less definite compounds, but constant under constant conditions, (d) with nitric and sulphuric acids yellow-coloured ex plosive nitrates, (e) with acetic anhydride at its boiling point and with benzoyl chloride in pre sence of alkalis, the corresponding ethereal deri vatives, (f) with solutions of the caustic alkalis at 160° - 190° , with bisulphites (of the alkaline earths) at 150°-170° and with sulphurous acid (7 p c solution) at 90°-105°, attended by complete resolution into lignone (soluble derivatives) and celillose (insoluble)

(2) In their empirical composition, which shows a remarkable uniformity throughout the group. This is illustrated in the appended table of results of analyses and determinations of calorific equivalents (Gottlieb, J. pr. 2] 28, 385)—

Wood	Åsh	\itro gen	Car bon	Hy dro- gen	Calorific equivalents per 1 gram
Oak Ash Hornbeam Beech Birch Fir Pine	 0 37 0 57 0 50 0 57 0 29 0 28 0 37		50 16 49 18 48 99 49 06 48 88 50 36 50 31	6 17 6 20 6 11 6 06 5 92	4620 4711 4728 4777 4771 5035 5085

An investigation by N Schuppe of the chemical composition of a number of woody tissues (Pharm J [8] 14, 52) led to the following conclusions (a) that the woods are uniform in their characteristics, being composed of cellulose and 'lignin' in somewhat variable proportions, (b) the cellulose when isolated (Schultze's process) having the composition $C_tH_{10}O_3$, and (c) 'lignin,' being represented by the empirical formula $C_{10}H_{10}O_3$, which is closely similar to that obtained for the 'lignone' of jute Further, G W Hawes has examined the woods of typical acrogens, e.g. lycopodium, equisetum, and aspidium, and finds that they do not differ essentially in composition from exogenous woods (Am S [8] 7, 585)

Vor III.

(3) In the products of their destructive distillation, which, when carried out under uniform conditions, gives results which are very similar for the several woods A very elaborate series of such distillations was carried out by M Senff (B 18, 60), the results being given in percentages of the wood under (1) total distillate, (2) tar, (3) crude vinegar, (4) anhydrous acid (acetic), (5) charcoal, (6) gases The following numbers represent the limits of the percentages observed (1) 40-50, (2) 3-8, (4) 2-6, (5) 20-30, (6) 17-35 The woods of all the more important species, e.g. Quercus, Populus, Betula, Fagus, and Pinus, were included in the research, and shown by the results to resemble one another very closely in composition The products may be more particularly classified as regards the light which they throw upon the molecular grouping of the parent substance into (a) members of the fatty series alcohols, ketones, aldehydes, and acids generally of low molecular weights, (b) furfural and its homologues, (c) a group of aromatic bodies, constituting 'creosote,' which may be described as a mixture of guaiacol and creosol, containing besides, methyl creosol and the dimethyl ethers of pyrogallol and its homologues in varying pro portions (Schorlemmer, 'History of Creosote,' S C I 4, 152) These divisions, it will be noted, correspond with the ascertained grouping of the complicated lignone molecule (supra), of which they afford additional confirmation It is obvious that the process of destructive distillation must be attended with complications arising from secondary reactions, but the temperatures in the case of wood are sufficiently low to reduce these to a minimum thus the yields of furfural are at a maximum when the temperature does not exceed 200° (Heill, B 10, 936), and the acetic acid is increased considerably beyond the per centages given by Senff (supra), viz from 2-6 to 5-10, by raising the temperature very gradually through 150°-300° (W Rudnew, D P J 264, 88 & 128), no doubt at the expense of the methylation of the aromatic derivatives This subject. however, except in regard to the outlines which we have sketched, belongs rather to the general theory of destructive distillation

The fundamental tissue of the woods we regard, therefore, in all cases as a lignocellulose, of which the lignone portion, while possessing the typical characteristics common to the group, is no doubt variously differentiated with the specialised characteristics of families, and indeed species and individuals

In addition to the fundamental tissue the woods contain other constituents, which from their nature are seen to be more or less adventitious. They are, in fact, generally removable by the action of solvents (in the case of resins, gum resins, balands, &c.), or by simple hydrolysis. In this group we may mention such definitely aromatic derivatives as confern and vanillin (M. Singer, M. 3, 395), the tinctorial constituents of the dye woods, also the very characteristic and important constituent of most exogenous woods known as 'wood-gum' (Holzgummi), first described by Thomsen (J. pr. [2] 19, 146), who found quantities varying from 8 p. c. to, 20 p. c. of the woods examined. This body yields on hydrolysis the C, sugar, xylose (Tollens, Uniters a. d. Agr. Chem. Lab. Gtittmen. An-

Ť.

146 LIGNONE

nalen, 254, 325), which by further resolution yields furfural Whether the wood gum is a product of resolution of the lignone molecule has not yet been disclosed, but it would appear to be probable A similar remark applies to the aromatic derivatives above mentioned

In conclusion we must briefly notice a recent contribution to the subject of the 'constitution of lignin' (Lange, Ztschr Physiol Chem 14,217) This consists in a study of the soluble products of resolution of certain woods-beech, oak, and fir-by heating with strong solutions of the alka line hydrates at 185° In addition to formic and acetic acids, traces of higher fatty acids, oxalic acid and small quantities of pyrocatechol and protocatechuic acids, there were obtained certain amorphous bodies of brown colour, which the author terms lignic acids These were resolved by treatment with alcohol into (a) soluble, (b) insoluble in this menstruum. The empirical composition of these derivatives is subjoined

Lignic Beech C 613 H 54 C 590 H 54 acids River C 609 H 54 Fir C 615 H 50 C 604 H 50 The yield of these bodies is from 12 15 pc of the weight of the wood The insoluble residues from the original alkaline digestion are described as 'celluloses,' but the description is doubtful These results have an empirical value, but throw little light on the constitution of the wood sub-

(a)

stance They afford additional evidence, how ever, of the general similarity of woods of various origin

Digested with alkalis at higher temperatures (200°-250°) than those employed in the researches detailed above, the lignocelluloses are resolved for the most part into oxalic and carbonic acids. With potassium hydrate—which appears to give the maximum yield—the following proportions of oxalic acid have been obtained, the yield being calculated on the dry woods pine, 94 7 pc, poplar, 93 2 pc, oak, 83 4 pc (W Thorn, D P J 10, 24). It is evident that the oxalic acid is derived from both lignone and cellulose, which are therefore probably similarly constituted as regards the arrangement of the C atoms.

The action of the alkalis, however, at the point at which they resolve the lignocellulose is too severe to afford any trustworthy evidence, from the study of the products, as to the constitution of the original substance. The problem can only be solved by first studying those reactions which yield definite substitution or ethe real derivatives, these are chiefly chlorination, conversion into nitrates, acetates, and benzoates, and the reaction with bisulphites (solutions) at high temperatures.

In this article we do not attempt a special description of the woods or their constituents, our endeavour is rather to generalise what is known concerning the wood substance proper, that which resists mechanical solvents alto gether, and hydrolytic agents up to a certain degree of intensity

CFC

LIGRO'N The mixture of homologues of methane obtained by collecting the portion of petroleum that boils below 100°

LIGULIN A crimson colouring matter in with ZnCl₂ it yields a terpene, v Licarene By ripe privet berries (Nicklés, J Ph [3] 85, 328), prolonged treatment with saturated HClAq and

LIME Oxide of calcium, CaO, v vol 1 p

LIME, CHLORIDE OF A name sometimes given to bleaching powder, v BLEACHING FOWDER, vol n p 17

LIME LEAF JIL The fiagrant oil obtained by distilling the leaves of Citrus Limetta with steam contains a citrene (c 176°), 1 active to light, and with refractive index for red rays 14611 at 30°, terpinol, methyl ennyl ketone, and a colophene (F Watts, C J 49, 316)

climes, OTTO OF Obtained by rasping and squeezing from the unripe peel of the fruit of Citrus limetta Contains a terpene (176°) and a soft resin, not volatile at 250° On standing the resin deposits C_{2i}H₂₅O₅ [102°] (Wright a Piesse, C J 32, 548)

LIMETTIC ACID C₁₁H₈O₆ Obtained by the action of H₂SO₄ and K₂Cr₂O₇ on the oil of lime (from Catrus Limetta) and on oil of rosemary (Vohl, N Ber Arch 74, 16) White crystalline body, may be sublimed Has no taste or smell Sl sol water, v sol alcohol—Ag,A" powder, sl sol water, blackening on exposure to light

LIMETTIN C₄H₁₄O₈ [122°] A neutral body occurring in oil of limes (Tilden, C J Proc 6, 30) Tufts of pale yellow needles (from alcohol) Not acted upon by AcCl or by phenyl hydrazine Bromine forms colourless scales of C₁₆H₁₁Br₂O₈ Boiling cone NaOHAq forms NaOAc and crystalline C₁₄H₁₁(OH)O₄

LIMONENE A terpene occurring in oil of lemon and in many other essential oils, v

LIMONIN C₂₁H_{2e}O, [275°] (Paterno a Oglialoro, G 9, 64), [245°] (Hoffmann A, Ph. [3] 14, 839) A bitter substance contained in the pips of oranges and lemons (Bernays, Buchner's Rep. [3] 21, 306, A 40, 317, Schmidt, A 51, 338) The pips are exhausted with boil nig water, alcohol is added, and the mixture is boiled with inverted condenser. After filtering, and distilling off the alcohol, linionin is left, together with a fatty substance which may be removed by CS₂ 1500 g of pips yield 80 g of limonin (P a G) Laminæ, sl sol water, ether, and NH₃Aq, v sol alcohol, HOAc, KOHAq, and baryta water. The barium salt is not de composed by CO₂ Cone H₂SO₄ forms a red liquid, from which the limonin is ppd by water.

LINALOES OIL The essence of linaloes, obtained from the wood of Licari kanali, the white cedar of Caylone, is a slightly coloured liquid with an odour like rose and lemon After distillation over CaCl₂ it consists of C₁₀H₁₆O (198°) S G ¹² 868 [a]_D = -19 at 15° It is sol alcohol, ether, and glycerin When distilled with ZnCl₂ it yields a terpene, v Licarene By prolonged treatment with saturated HClAg and

LITHIUM 147

exposure to light it yields CieHie2HOi, an optically inactive liquid with a camphor like odour, and S G 12 1069 When distilled with lime it yields licarene C₁₀H₁₆, (c. 170°), S G

18 835 (Morin, C R 92, 998, 94, 733)

LININ C 629pc H 47pc Acrystallisable substance obtained by digesting Linum catharticum with milk of lime, filtering, ppg with HCl, and extracting with ether (Pagenstecher, A 40, 322, C Schröder, N Kep Pharm 10, 11) Silky crystals, v sl sol water, v e sol alcohol and ether, m sol chloroform and HOAc The alcoholic solution is intensely bitter

LINOLEIC ACID C₁₈H₂₂O₂. Linolic acid S G ¹⁴ 92 Occurs as glyceryl ether in linseed oil, hemp oil, poppy oil, olive oil, nut oil, cotton seed oil, earth nut oil, almond oil, oil of sesame, palm oil, cacao butter, and probably in most fixed vegrtable oils (Pelouze a Boudet, A Ch [2] 59, 43, Laurent, A Ch [2] 65, 150, 298, Liebig, A 33, 113, Sacc, A 51, 214, Schuler, A 101, 252, Oudemans, J 1858, 304, Hazura a Grussner, M 9, 944, 10, 242, Benedikt a Hazura, M 10, 353) It does not occur in animal oils, so that when the acids obtained by saponifying animal oils are oxidised by KMnO4 no sativic acid will be formed, but di oxy stearic acid will be among the products, this being derived from oleic acid (B a H)

Preparation -Crude linseed oil or hemp oil is evaporated with aqueous NaOH, the sodium soap is decomposed by H SO,, and the crude acid dissolved in alcohol, neutralised with NH, and ppd by BaCl₂ The barrum salt is dissolved in ether, HCl is added, the ether decanted from ppd BaCl, evaporated, and the liberated acid dried in vacuo over H SO, (Schuler, Bauer a Hazura, M 7, 216) The acid so obtained is a mixture of oleic, linoleic, linolenic, and iso linolenic acid (Hazura) By treatment with bromine at 0° and reduction of the product C18H20Br4O2 with zinc and HCl pure linoleic acid

Properties -Faintly-yellow limpid oil Does not solidify at -18° Insol water, v sol ether, m sol alcohol When distilled under 90 mm pressure one third passes over at 290°, and the distillate contains sebacic acid C₁₀H₁₈O₅ [130°] and an oily mixture (Hazuia a Grussner, M 9,

206, of Norton a Richardson, B 20, 2735)
Reactions —1 Potash fusion gives myristic, acetic, and formic acids, with traces of azelaic acid -2 KMnO, hydrogen peroxide, and MnO, with H SO, exidise it to azelaic acid -3 KMnO, in presence of KOHAq converts it into sativic acid, some azelaic acid also being formed alkaline KMnO, oxidises crude linoleic acid from linseed oil (100 g) into sativic acid $C_{18}H_{32}(OH)_4O_2$ [173°] (6 5 g), linusic acid $C_{18}H_{20}(OH)_8O_2$ [204°] (4 5 g), isolinusic acid [175°] (15 8 g), and di oxy stearic acid $C_{18}H_{34}(OH)_2O_2$ [137°] (1 2 g) (Hazura, M 9, 180 of Dieff a Reformatsky, B 20, 1211) It appears therefore that crude linoleic acid consists of linoleic acid C₁₀H₁₀O₂ (which gives sativic acid or oxidation), linolenic acid C₁₈H₁₀O₂ (which gives linusic acid), isolino lenic acid (which gives isolinusic), and oleic acid (which gives di oxy stearic acid) The formation of sativic acid in this manner may be made use of as a test for linoleïc acid —4 Bromine at ordinary temperatures forms with crude linoleic

acid solid $\mathbf{Q}_{10}\mathbf{H}_{20}\mathbf{Br}_{0}\mathbf{O}_{2}$ [177°] Bromine at 0° forms a tetrabromide $\mathbf{C}_{10}\mathbf{H}_{22}\mathbf{Br}_{10}\mathbf{O}_{2}$ [115°] (Hazura, M 8, 147, Hazura a Friedrich, M 8, 155, 265) Of these two compounds the former is formed from linolenic, the latter from linoleic acid Pure linoleic acid gives only C₁₈H₃₂Br₄O₂ [115°] — 5 Fuming HIAq and amorphous phosphorus converts it into stearic acid (Peters, M 7, 552)

Salts -The salts are not crystalline With the exception of the salts of the alkalis they are insol water They are sol ether With the ex-

ception of the Pb, Mn, Na, and NH, salts they are insol alcohol—BaA'₂(Peters)

Linolenic acid C₁₈H₁₀O₂ Obtained by treat ing the compound $C_{18}H_{30}Br_{6}O_{2}$ [177°] (v supra) dissolved in alcohol with zinc and HCl (Hazura, M 8, 267) Yields on oxidation by alkaline KMnO, no solid acid except linusic (hexa oxystearic) acid [201°] Bromine forms only Linolenic acid 'dries C₁₈H₃₀Br₆O₂ [177°] rapidly when exposed to air, through oxidation Its salts behave in like manner The more glyceryl linolenate there is in an oil the more rapidly does it dry Glyceryl linolenate and isolinolenate also possess drying properties, but glyceryl oleate does not The product produced by exposing the acids to air is an anhydride, insol ether, but furnishing soluble acids when heated with alkalis

Isolinolenic acid $C_{18}H_{30}O_2$ An acid assumed to exist in crude linoleic acid on account of the formation of isolinusic acid on its oxidation When crude linoleic acid is oxidised by KMnO. in alkaline solution, and the product ppd by H SO, there is obtained a mixture of fatty acids whence cold ether extracts dr oxy stearic acid. sativic acid remaining undissolved The filtrate from the ppd acids is neutralised with NaOH, evaporated, again ppd with H2SO4, the pp extracted with ether, and the residue crystallised from alcohol and then from water, whereby it may be separated into linusic and isolinusic acids

LINSEED OIL The oil expressed from the seeds of flax (Linum usitatissimum) Like other drying oils when exposed to the air it dries up to a transparent resinous mass Lin seed oil is composed of the glyceryl ethers of oleic, linoleic, linolenic, and isolinolenic acids v LINOLEIC ACID Linseed oil dissolves some oxide of lead when heated therewith, being decolourised and rendered more easily drying (boiled

LINUSIC ACID v HENA ONY STEARIC ACID Isolinusic acid v Hela oxy stearic acid

LIQUIDAMBAR A balsam obtained from a large tree, Liquidambar styracifolia, growing in Florida and Mexico It resembles balsam of Peru, containing cinnamyl cinnamate, styrene, and cinnamic acid (Harrison, Ar Ph [3] 6,541, Maisch, Ar. Ph [3] 6, 545)

LIQUIDS, diffusion, dispersion, osmose, refraction, transpiration, of, v Physical

LITHIUM L. At w 701 Mol w probably 701 (v p 149) [180°] (Bunsen, J 8, 324) S G 578 to 589 (Bunsen, Ic) S H 27° to 100° = 9408 (Regnault, A Ch [3]63, .1) E C at 20°, (Hg at 0° -1) 10 69 (Matthiessen P M [4] 12, 199, 13, 81) Characteristic lines in emission spectrum are Lia in the red 6705 2, and a

148 T.ITHIUM.

weaker line in the orange 6102, and a weak line in the blue 4602 7 (Thalén, 1868, v also L de Boisbaudran, Spectres Lumineux, p 55, Schönn, W 10, 143, Liveing a Dewar, T 1883 187) S V S 11 9

Occurrence - Salts of L1 are very widely distributed, but occur only in small quantities Several phosphates of Fe and Al contain Li phosphate, especially triphyline, which contains c 7 p c Li₂O, many silicates of Al and Fe con tain small quantities of Li silicate, especially lepidolite, which sometimes contains from 3 to 5 pc LiO Tourmalines, borates, &c, often sontain traces of lithia Very many mineral springs contain lithia, according to Kirchoff a Bunsen lithia is present in almost all mineral waters (P 113, 357) Truchot found lithia in the soil of Limargue in the Auvergne, nearly all the plants growing on this soil take up lithia (C R 78, 1022) Dieulafait has found traces of Li in sea water from all parts of the globe, in the water of marshes, in mineral springs, in primary rocks, in gypsum of different formations (A Ch [5] 17, 377) Lithia is found in many plants, and in all sorts of tobacco, but not in raw sugar, cocoa, coffee, or tea (Focke, Der Natur forscher, 1872 307, Grandeau, A Ch [3] 67, 216) Lithia has also been found in the milk and blood of cows (Bunsen & Kirchoff), in different parts of the human organism (Bence Jones, P M [4] 29, 394), and in normal urine (Schiaparelli a Peroni, G 10, 390)

While investigating various silicates in 1817, Arfvedson (S 22, 93, 34, 214) found a new alka line base with a molecular weight smaller than that of soda or potash. Berzelius gave the name lithia to the new base ($\lambda i \theta \epsilon i \sigma s$) supposing that, unlike soda and potash, it was to be found only in minerals. The new alkali was decomposed by electrolysis in 1818 by Davy, also in 1820 by Brandes (S 8, 120), but the metal was first prepared approximately pure and in considerable quantity by Bunsen and Matthiessen in 1855 by

electrolysing fused LiCl (A 94, 107)

Preparation —The metal is obtained by electrolysing molten LiCl Bunsen a Matthiessen (A 94, 107) passed the current from 4-6 Bunsen cells through LiCl kept molten in a thick walled porcelain crucible, using a cylindrical rod of retort graphite as positive electrode, and an iron wire the thickness of an ordinary knitting needle as negative electrode The metal separated on the iron wire in small pellets, which were quickly removed by an iron spoon and placed under petroleum. Some of the metal was always oxi-dised, occasionally with ignition. To obviate this, Hiller (Neues Handwörterbuch der Chemie, 8, 534) passed the negative electrode (iron wire) through the stem of a tobacco pipe, which he connected with an apparatus supplying pure dry H, he allowed H to pass through the pipe until air was completely expelled, then plunged the bowl open end downwards, with the end of the wire inside, into the molten LiCl, stopped the H, and sent the current through the LiCl, when sufficient Li had collected inside the bowl, the pipe was broken and the metal collected under petroleum To prevent any action between the Li and the silica in the pipe, the inside of the bowl is covered with a thin layer of graphite, this is done by mixing powdered graphite with

dilute LiClAq so as to form a thick paste, spreading this inside the bowl, and drying first in air and then at a moderate red heat. It is advantageous to mix the LiCl before fusion with some NH,Cl

There are many methods for preparing LiCl from Li containing minerals, the methods vary according to the composition of the mineral dealt with, all seek to prepare a solution containing only the alkalis, from which Li may be separated by taking advantage of the comparatively small solubility in water of Li CO, LiCl is obtained by dissolving Li,CO, in HClAq, evaporating, and drying the crystals which separate Lepidolite is the usual starting point, different specimens contain from less than 1 to c 5 p c Li₂O The mineral is very anely powdered and triturated with water, the finest powder is dried and heated to redness with twice its weight of 'me, the cold mass, in which the SiO2 is combined with lime, is treated with HClAq, CaO is ppd from the solution by H2SO, Aq and evaporation, the filtrate is evaporated to dryness, and the solid is heated until H2SO, is all removed, the residue is dissolved in water, the solution is digested with CaCO₃, to remove Al₂O₃, and Ca is removed by ppn with (NH₄)₂CO₄, the filtrate is evaporated to dryness, and the residue is strongly heated, the Li-SO, thus obtained is dissolved in water, and the liquid is ppd by Ba acetate after filtration the Li acetate is strongly heated and so transformed into Li CO, (Arfvedson, S 22, 93, 34, 214)

The method recommended by v Hauer (J pr 68, 310) consists in strongly heating for 2 hours a mixture of equal parts of very finely powdered lepidolite and gypsum, lixiviating the mass with water, filtering, evaporating until CaSO, and K2SO, crystallise out, adding to the mother-liquor a mixture of NH₂Aq, NH₂HSAq, and (NH₂)₂C₂O₃Aq, whereby all bases are ppd except the alkalis, after filtering, Li₂CO₃ is ppd from

the warm solution by (NH₄) CO₁

The process adopted in Schering's manufactory at Berlin is described by Filsinger (D P J219, 183, 222, 321, 385) Finely ground and sifted lepidolite is mixed with conc H.SO, in a warm brick trough to the consistence of a thin paste, which is heated with slight stirring till it forms into lumps, the lumps are calcined in a reverberatory furnace, and, while warm, are lixi viated with water, the liquid is mixed with enough K2SO4 to convert all Al2O3 into alum, which separates on boiling, the esidual Al,O, being removed by milk of lime, the salts in the filtrate are converted into chlorides by ppn with BaCl2Aq, and the liquid is evaporated to dryness, digestion with absolute alcohol dissolves the chlorides of Li and Ca, after distilling off al cohol, Ca is ppd by (NH₄),C₂O₄Aq, the liquid is filtered, and a little NH₄HSAq is added to ppt any Fe, &c, still present, the filtrate is boiled to remove NH, HS and evaporated to dryness in a silver dish, pure LiCl is thus obtained LiCl may be conver ed into Li₂CO₃ by dissolving in water, adding NH₂Aq and (NH₄)₂CO₂, and washing the pp with alcohol of 60 p c

Schrötter's method is said to be one of the best (J pr 93, 275) Lepidolite is melted, at full red heat, with frequent stirring, the molten mass is ladled out by an iron spoon into water,

LITHIUM 149

when cold the solid is powdered and triturated with water, HClAq S G 12 is added little by little to the pasty mass, care must be taken that sufficient water is present to prevent the whole mass from solidifying, after standing for 24 hours, with frequent stirring, the semi liquid substance is heated nearly to boiling, and a little more HClAq S G 1 2 is added, the total quantity of HCl used should be c 2 parts to 1 part lepidolite, after a few hours most of the SiO. has separated, a little of the filtered liquid should be so acid that no permanent pp is formed on addition o a few drops of Na₂CO₃Aq, a little HNO, Aq is now added to completely oxi dise FeCl, to FeCl, the liquid is filtered from ppd SiO₂ (which separates as a powder), and Fe₂O₃, Al₂O₃, CaO, MgO, &c, are ppd by careful addition of Na CO, Aq to the boiling liquid The alkaline filtrate is nearly free from all salts ex cept chlorides of the alkalis, it is evaporated until the small quantities of MgCO₂, MnCO₃, &c, still present separate out, and Li,CO, 18 ppd from the filtrate by addition of Na₂CO, and

Commercial Li2CO, generally contains small quantities of salts of Mg, Ca, K, Na, &c, it may be purified by one of the foregoing methods For the other methods of preparing Li₂CO, from lepidolite, &c v Hugo Muller, J r 58, 148, Fuchs, J pr 5, 319, Troost, A Ch [3] 51, 103, Mallet, A 101, 389, Lunglmayr, D P J 171, 293, Allen, J pr 87, 480, Reichardt, D P J 172, 447, L Smith, A 159, 82, Stolba, D P J 198, 225, L de Boisbaudran, Bl [2] 17, 551 detailed criticism of various methods will be found in D P J 219, 183, 222, 271 385

Properties -A silver white metal, very soft, but harder than k or Na, when freshly cut, the surface appears vellowish, when melted and at once pressed between gla-s plates it forms a silver like mirror Li makes a grey streak on paper It may be drawn into wire, but shows very little tenacity Li is the lightest known solid, SG c 59, it swims on rock oil at 186° Is not acted on by dry O at its MP, heated in air to c 200° it burns with a very brilliant white flame May be vapourised in Hat full red heat Li decomposes cold water without itself melting, it combines rapidly with Cl. Br, I, S, O, it burns when heated in dry CO. Li reacts with most acids to form salts, conc HNO, Aq oxidises it with great rapidity, the metal usually melts, and is sometimes ignited In dissolves in liquid NH,, and on evaporation of the NH, it is left unchanged (Seeley, C N 23,

The atomic weight of Li has been deter mined (1) By converting LiCl into AgCl (Arfved son, S 22, 93, Mallet, Am S [2] 22, 349, Troost, A Ch [3] 51, 108, Stas, Nouv R 268), (2) by determining O in Li₂O (Berzelius, P 17, 379), (3) by ppg Li₂SO, by BaCl, (Berzelius, P 17, 379, Heimann, P 15, 482, Hagen, P 48, 361, Diehl, A 121, 97), (4) by determining CO, in Li₂CO₃ (Hermann, P 15, 480, Troost, A Ch [3] 51 108, Diehl, A 121, 93), (5) by converting Li₂CO₂ into Li₂SO₄ (Troost, A Ch [3] 51, 108), (6) by converting LiCl into LiNO₄ (Stas, Nouv R 274); (7) by determining SH of Li (Regnault, A Oh [3] 63, 11)

Ramsay (C J 55, 521) has endeavoured to

determine the mol w of Li by measuring the lowering of vapour pressure of Hg produced by dissolving Li in Hg the results make it pro-bable that the mol w of Li is the same as the This result is based on the assumption that Van't Hoff's law holds good, viz, that equal volumes of dilute solutions contain equal num bers of molecules of the dissolved substances, it also presupposes that the molecular weight of liquid Hg is the same as the atomic weight

As the VD of no L1 compound has yet been determined, the valency of the atom Li in gaseous molecules is not certainly known, but from the close analogy between Li and the other alkali metals there can be little doubt that the atom of

Li is monovalent in gaseous molecules

In is a strongly positive metal, it belongs to the group of alkalı metals, none of which shows any tendency to enter into the negative radicle of salts Li shows closer resemblances to the alkaline earths than are exhibited by any other metal of the alkalis, LiOH, Li₂CO₂, and Li₂PO₄ are much less soluble in water than the corre sponding compounds of Na, K, Rb, and Cs, Li does not form an alum The position and analogies of Li are discussed in the article ALKALIS,

METALS OF THE, vol 1 p 114

Reactions and Combinations -1 Li decomposes cold water rapidly without itself melting Thomsen (Th 3, 227) gives the thermal data [Li, H O,Aq] = 48,970 (to form LiOHAq+H) — Very rapidly oxidised by conc nitric acid-3 Slowly acted on by conc sulphuric acid, rapidly dissolved by dilute H2SO,Aq, also by dilute hydrochloric acid (Matthiessen, A 94, 10) Burns when heated in dry carbon dioxide or sulphuretted hydrogen -5 At temperatures lower than its melting point Li acts on silica, alkaline silicates, iron, gold, silier, and platinum - 6 Combines readily with sulphur, phosphorus, and the halogens

Detection - La compounds give a red colour to a non luminous flame Examination by the spectroscope will detect 000009 mgrms Li present as LiCl (Bunsen) To detect Li in silicates, the powdered mineral is treated with HFAq, the liquid is poured off, and the residue is evaporated with addition of a little H2SO4, the residue is extracted with absolute alcohol, and the liquid is evaporated to dryness, the residue is again treated with absolute alcohol, and this solution is again evaporated, and the residue $(\frac{1}{30} \text{ mgm} \text{ is sufficient})$ is examined in the spectroscope, if the mineral is non-siliceous, the treatment with HFAq may be omitted Li is estimated in the form of Li.SO.

Lithium, antimonate of LiSbO, By adding LiCl to KSbO, Aq (cf Antimonates, vol p 285)

Lithium, borate of LigB4O,, and hydrates with 5H2O, 6H2O, and 10H2O, by adding Li2CO2 to boric soid solution (Arfvedson, A Ch [2] 10, 82, Filsinger, Ar Pn [3] 8, 198, cf Borates, vol 1 p 529)

Lithium, borofluoride of By double decomposition between Ba(BF,),Aq and Tu,SO,Aq and evaporation at 40°, large deliquescent prisms are outsined, al sol water, these crystals are probably LiBF, but they have not been accurately examined (Berzelius)

150 LITHIUM

Lithium, bromide of LiBr H F [Li,Br,Aq] = 91,810 (Th 3, 227), [LiBr,Aq] = 11,850 (Bodisko, J R 1889 [1] 7) S G 3 102 at 17° (Clarke, Am S [3] 13, 293) A white crystalline, very deliquescent, mass tolving Li₂CO₂ in HBrAq and evaporating (Troost, A Ch [3] 51, 103), or by ppg excess of CaBr,Aq by K₂CO₃, after 24 hours adding enough Li₂CO₃ to ppt all the Ca, filtering, and evaporating (Klein, A 128, 239) S 143 at 0°, 196 at 34°, 222 at 59°, 244 at 82°, 270 at 103° (Kremers, P 103, 65)

Lithium, chloride of LiCl S G 2 074 at 3 9° (Schroder, P 106, 226), 1 998 at 0°, 1 515 at M P (Quincke, A 138, 141), S G fused 1 575 (Wernicke, P 138, 141) H F [Li,Cl] = 93,810, [Li,Cl,Aq] = 102,250 (Th 3, 227) S H 282

(Regnault)

Preparation—1 By dissolving Li₂CO₃ in HClAq and evaporating—2 By decomposing Li₂SO₄Aq by BaCl₂Aq, filtering from BaSO₄, and

evaporating

Properties — Crystallises from aqueous solution in regular octahedra, very deliquescent, more so than CaCl₂, tastes like NaCl, melts at dark red heat to a clear liquid, which gives off some Cl and becomes alkaline when heated for a long time in the air, the same change occurs to a slight extent when LiClAq is evaporated E sol alcohol, also in a mixture of ether and alcohol in which KCl and NaCl are nearly insoluble Volatilised at white heat S 63 7 at 0°, 80 7 at 20°, 104 2 at 65°, 115 at 80°, 129 at 96°, 139 at 140°, 145 at 160° Gerlach (Fr 8, 279) gives the following —

SG LiClAq	Pc LiCl		Pc LiCl
1 006	1	1 148	25
1 030	5	1 182	30
1 058	10	1 219	35
1 086	15	1 256	40
1 117	20		

BP of saturated L₁ClAq = 171° (Kremers, **P** 103, 65)

Reactions—1 Heated in air for some time is partially decomposed with evolution of Cl, residue is alkaline (Schulze, J pr [2] 21, 407) Evaporation of LiClAq is accompanied by slight decomposition—2 Completely decomposed by heating in steam, with evolution of HCl, decomposition is rapid in presence of silica, but is prevented by admixture of NH₄Cl (Kunheim, J 1861–140)

Combinations -1 With water to form two hydrates (1) LiCl 2H₂O, obtained as quadratic crystals by evaporating LiClAq under 10° Dried between paper, the crystals become opaque and powdery, when warmed, melts in water of crystallisation, then solidifies, and then the dry LiCl melts again at red heat, (2) by evaporating a solution of LiCl in aqueous alcohol, Rammelsberg obtained the monohydrate LiCl H₂O (P 66, 79) -2 With alcohol to form LiCl 2C2H6O, and with methylic alcohol to form 2LaCl 3CH,O, obtained by evaporating solut on of LaCl in the respective alcohols (Simon, J pr [2] 20, 371) - 3 With platinic chloride, to form Li_PtCl_s 6H₂O, orange-red salt, sol in water, alcohol, and ether-alcohol

Lithium, chromate and dichromate of, v. vol n pp 155, 157

Lithium, fluoride of LiF Small crystalline tablets, by dissolving excess of Li₂O₃ in HFAq, filtering, and evaporating Slightly sol in water, melts at red heat (Berzelius, A 1, 17) SG 2295 at 215° (Clarke, Am S [3] 13, 292) By solution of LiF in HFAq and evaporation, crystals of LiF HF are obtained, when heated LiF and HF are formed Fluckinger (A 87, 261) describes the louble salt 2LiF,SbF, LiF combines with SiF₄ to form the silvcofluoride Li₂SiF₈ (v Lithium, silicopluoride of, p 151)

ov, p 151)
Lithium, haloid compounds of Lithium combines directly with the halogens, the haloid compounds, LiX, are generally prepared by dis solving Li,CO, in 'he respective acids and eva porating As the V D of none of the compounds has been determined, their molecular weights are not known with certainty, but from the close similarities between compounds of Li, K Na, and Cs there can be little doubt that the formula LiX (X=F, Cl, Br, I) expresses the composition of the molecules of the haloid compounds of Li

Lithium, hydrosulphide of ?LiSH Obtained by reducing Li SO, by C, and passing H₂S into a solution of the product Only known in solution (Berzelius, P 6, 439) Thomsen gives HF [Lil, S, H, Aq] = 66,120 (Th 3, 227) Lithium, hydroxide of LiOH Obtained by

Lithium, hydroxide of LiOH Obtained by boiling Li₂CO₃ with CaOAq in a silver dish (Pt cannot be used as it is acted on by LiOH), hil tering, evaporating, and heating to 100° , better by ppg Li₂SO₄Aq by an equivalent quantity of BaOAq, filtering, evaporating, and heating to 100° Also obtained by dissolving Li₂O $(q \ v)$ in H₂O and evaporating Thomsen $(Th \ 3, 227)$ gives H F [Li₁, O, H, Aq] = 117,440, and heats of neutralisation [2LiOHAq, H²SO⁴Aq] = 31,290, [2LiOHAq, H²Cl²Aq] = 27,700 Beke toff $(Bl \ 41,\ 312)$ gives [Li²O, Aq] = 13,000 (to form LiOHAq)

A white crystalline mass which melts when heated, without decomposition, sol in water, but less so than KOH or NaOH, insol in ether alcohol Gmelin obtained small crystals of LiOH by evaporating a solution iniacuo, ac cording to Muretow (B 5, 331) the crystals are a hydrate of lithium hydroxide, LiOH HO (cf Dittmar, S C I 7, 730)

Lithium, iodide of LiI Obtained by saturations.

rating HIAq, containing a little H,PO, with Li2CO2, warming the ppd Li2PO4 with BaI2 and a trace of H2SO4, filtering, adding enough L12CO3 to decompose excess of BaI2 present, filtering again, evaporating, crystallising, and drying by pressure between filter paper (Liebig, A 121, 222) Luebig (lc) also recommends to neutralise half of an HI solution containing a little H,PO, by BaO or CaO, to add the other half of the acid, neutralise by Li₂CO₃, filter from Ba or Ca phos phate and evaporate The crystals are gene rally yellowish from a little separated I, this is removed by quickly pressing between filter paper Lil forms small, colourless, deliquescent crystals SG 3 485 at 23° (Clarke, Am S [3] 18, 293) HF [L1, I, Aq] - 76,100 (Th 8, 227) S 151 at 0°, 164 at 19°, 179 at 40°, 200 at 59°, 263 at 75°, 435 at 80°, 476 at 99°, 588 at 120° (Kremers, P 103, 65) By evaporating a solu tion of Li₂CO₂ in HIAq over H₂SO₄, Ram

melsberg obtained the hydrate Lil 3H,O

Lithium, oxide of Li,O Obtained by burn ing small quantities of Li, in a small iron vessel, in dry O at 200°, cooling in O, and heating in the air to decompose Li peroxide (Troost, A Ch [3] 51, 103) Also prepared by heating Li₂CO₃ with C in a Pt crucible, and by heating Lino, to redness in a Ag dish, best mixed with Cu turnings (H Muller, J pre 58, 148)

A white crystalline solid, S G 2 102 at 15° (Brauner a Watts, P M [5] 11, 60) Not de composed by heating with C or Fe Does not act on Pt at high temperatures, corrosion of the Pt vessel in the preparation of Li₂O indicates the presence of Rb,O or Cs O Reacts with Cl, S, and P Heated in O, Li, 9 is superficially changed to peroxide Thomsen gives [Li2,O,Aq] =166,50 (Th 3, 227), and Beketoff (Bl 41, 312) gives $[L_{1,0},Aq] = 13,000$, hence $[L_{1,0}]$ - 153,520

Lithium peroxide is said to be formed by heating Li₂O, or Li₂CO₂, for some time in air or O, but to be decomposed at a little above the temperature of formation

Lithium, phosphide of According to Troost (A Ch [3] 51, 103) L1 and P combine, when heated together, to form a brown substance which is decomposed by water with evolution

of inflammable P hydride

Lithium, silicofluoride of Li,SiF,2H,O Transparent monoclinic crystals, obtained by adding H,SiF,Aq to Li acetate or carbonate evaporating, treating the residue with water, filtering, and crystallising (Stolba, J pr 91, 456) S 526 at ordinary temperature, sol alcohol, insol ether S G 2 33 Dehydrated at 100°, melts at a higher temperature with evolution of

Lithium, salts of Compounds produced by replacing H of acids by Li The Li salts belong to one series Li,\text{\text{ where } X = 2Cl, 2NO, SO, CO,} ²₃PO₄, &c , they are generally obtained by dis solving Li, CO, in the different acids, some are prepared by double decomposition from LiCl or Li₂SO₄ Most of the salts of Li are sol in or Li,SO, Most of the salts of Li are sol in water, but Li,PO, and Li,CO, are considerably less sol than the corresponding salts of the other alkalı metals, LiOH is also less soluble than the other alkalis (cf Alkalis, METALS OF THE, vol 1 p 114) Few, if any, basic salts of Li are known The chief Lisalts are the following (v CAR BONATES, NITRATES, SULPHATES, &c) Antimonate, arsenati, borates, bromate, carbonate, chlorate, chromates, dithionate, hypochlorite, hypophos pnite, iodate, nitrate and ite, perchlorate, perio date, phosphates, selenate and ites, silicates, ulphates and ite, tellurate and ite, thio-arsenate Lithium, sulphide of Li₂S Li and S

Li and S combine when heated together, the solution in water is yellow from presence of polysulphides Li₂S is obtained by reducing Li₂SO₄ by an equivalent quantity of C at full red heat, excess of C makes the product pyrophoric (Berzelius, P 6, 439) Naudin a Montholon (C R 83, 58) say that Li₂S may be prepared by the long-continued passage of H₂S through Li₂CO, sus pended in water Li₂S is easily sol water and alcohol [Li₂, S, Aq] = 115,260 (Th. 3, 227)

Lithium polysulphides are said to be obtained by melting LiOH with S (Vauquelin,

A Ch 7, 284), they closely resemble the poly sulphides of the other alkali metals

Lithium, sulphydrate of, v Lithium, HY DROSULPHIDE OF, p 150
LITHO-BILIC ACID C_{so}H_{so}O_s MMPM

LITHO-BILIC ACID C_{so}H_{so}O₆ [199°] Occurs, together with lithofelic soid, in Oriental bezoar, and is prepared by decomposing the barium salt with hydrochloric acid and recrystallisation from alcohol Long pale-yellow needles, insol water, v sol alcohol, m sol ether Its alcoholic solution is dextrorotatory It resembles lithofellic and the biliary acids in its behaviour with Pettenkofer's reaction and its distillation products (Roster, G 9, 462, Grattarola, J 1880, 831)—BaA'₂6aq Ppd by adding BaCl₂ to a warm aqueous solution of crude sodium lithofellate, usually a yellowish semi transparent resin, was obtained on one occasion in minute monoclinic crystals

LITHOFELLIC ACID C₂₆H₃₆O₄ [205°] S (alcohol) 3 4 at 20°, 15 at 78° S (ether) 225 at 20° (Göbel) [a]_D = 13 8 at 9 5° (independent of concentration) Forms the chief constituent of some kinds of Oriental bezoars (Gobel, A 39, 237, Ettling, A 39, 242, Wöhler, A 41, 150, Heumann, A 41, 303, Malaguti a Sarzeau, C R 15, 518) The finely powdered bezoars are extracted with boiling alcohol, and the solution evaporated The crude acid then deposited is converted into sodium salt, and then into the Ba salt On recrystallising, barium lithobilate remains undissolved, and the solution of barium lithofellate is then decomposed by HCl (Roster, G 9, 364) Minute hexagonal crystals (con taining aq) (Hoppe Seyler, Vinchow's Arch. 25, 528, Grattarola, J 1880, 831) Insol water Dextrorotatory Its salts are also dextro rotatory, somewhat bitter in taste On distillation it gives off aromatic fumes

Reactions -1 When heated with sugar and H,SO, it gives a crimson colour (Pettenkofer's reaction) (Strecker, A 67,53) -2 Boiling HClAq resimifies it -3 Hot nitric acul gives a yellow acid, C20H2(NO2),O3, which may be crystallised from HOAc

Salts -The sodium salt forms a paleyellow gummy mass, exceedingly sol water and alcohol $[a]_D = +1816$ at 145° —BaA', 10aq large prisms, sol boiling water and alcohol [a]_D = +197 at 15°—AgA' flocculent pp

LITHOSPERMUM ERYTHRORHIZON (M. hara, C. J. 35, 22) The Japanese Kuhara, C J 35, 22) The Japanese prepare a dye called Shikon or Tokio purple from the root of this plant The colouring matter may be ex tracted by exhausting successively with water and alcohol Lead subacetate is added to the latter extract, and the purple pp washed and decomposed by aqueous H₂S. The dye is ex tracted from the dried pp by means of alcohol It is resinous with green lustre. Its composition may be represented by $C_{20}H_{30}O_{10}$ Its alcoholic solution is purple, and shows an absorption spectrum similar to that of alkanet Alkalis turn the solution blue, acids turn it red Baryta gives a purple pp C 0H25BaO10 The dye is readily oxidised to a brown scaly substance, C2H30O15 Bromme forms a product of substitution, C₂₀H₂₁Br₂O₁, With PCl₂ it forms black resincus body, C₂₀H₂₂Cl₂O₁, LITHURIC ACID C₁₅H₁₅NO₂ (?) [205°].

Occurs as magnesium salt in some urinary

calcult of oxen (Roster, A 165, 104) Slender, silky needles M sol boiling water and alcohol -MgA'₂ minute monoclinic prisms, m sol boiling water, v sl sol cold water, insoluble in

LITMUS Obtained chiefly from various species of Roccella, Variolaria, and Lecanora, the same lichens that yield archil The blue colouring matter appears to be developed by fermentation after the mass has been treated with alkaline carbonate (Gélis, Rev Scient 6,

50, J Ph 24, 277)
When 2 pts of Roccella tinctoria and 1 pt of K₂CO₂ are repeatedly moistened with a solu tion of ammonium carbonate, the mass acquires a fine blue colour in forty days The mass 18

then mixed with chalk and gypsum
According to Kane (T 1840, 298), litmus contains azolitmin, spaniolitmin, erythrolein, and erythrolitmin Azolitmin is a reddish brown amorphous powder, which dissolves in ammonia with blue colour, and forms blue and violet lakes Spaniolitmin was not isolated by Kane, but appeared to be light red According to Kane, erythrolem is a red viscid mass, form ing a purple solution in ammonia, while ery throlitmin forms deep red crystalline grains, forming a purple solution in ammonia The method employed by Kane to isolate these sub stances is as follows Litmus is exhausted with boiling water, the residue is acidified by HCl, again washed, and then boiled with alcohol The alcoholic solution is evaporated to dryness, and the residue extracted with ether, which leaves erythrolitmin undissolved The ether leaves erythrolein on evaporation The reddish brown powder left after boiling with alcohol is impure azolitmin

De Luynes (C R 59, 49), by heating orcein with aqueous NH, and Na₂CO, at 70°, obtained a blue substance, which he regarded as the blue

colouring matter of litmus

According to Wartha (B 9, 217), cold alcohol extracts from litmus a red substance, which is not affected by acids, and the residue yields to water the blue colouring matter If the aqueous extract be evaporated, and the residue treated with absolute alcohol and some HOAc, a scarlet dye, turned purple by NH3, is extracted, while the residue is the pure litmus blue, left as a brown powder

A blue ethereal extract of litmus shows an absorption-band at D, a red ethereal extract shows an absorption-band extending to E (Vogel)

An aqueous solution of litmus, kept in a closed vessel, gradually becomes decolourised This is due to the action of a micrococcus, which reduces the colouring matter to a leucoderivative, which is readily re-oxidised by air (Dubois, Bl [2] 49, 963, cf Bellamy, J Ph [5] 18, 488)

According to Förster (Fr 28, 428), litmus is best purified by exhausting with alcohol in the cold, digesting with water, filtering, and evaporating The residue is dissolved in water, filtered, and ppd by a mixture of alcohol and HOAc The pp is washed with alcohol, and the solution, ppn , and washing repeated as long as any reddish-violet substance is removed thereby The pp is then dried, dissolved in water, the solution filtered and ppd by feebly ammoniacal

alcohol The pp is finally washed with alcohol and dried

LIVER OF SULPHUR A name formerly applied to a mixture of the polysulphides of potassium, obtained by heating together K, CO3 and S in a closed vessel (v Potassium, sulphides

LIXIVIATION The application of water to solid mixtures, for the purpose of extracting the soluble parts

LOBARIC ACID C17H16O5 A resmond acid obtained by extracting the lichen Lobaria adusta with ether (Knop, C C 1872, 172) Warty masses, made up of thin plates Insol water and baryta water In aqueous or alcoholic NH₃ it forms colourless solutions, which turn rosered on exposure to air KOHAq forms a yellow solution, turning brown on evaporation.

LOBELINE An alkaloid existing in Lobelia inflata (Bastick a Procter, Ph 10, 270, 456) Obtained by extracting the leaves with dilute acetic acid, and ppg with magnesia Thick, oily mass, decomposed by heat V sol water, alcohol, and ether Narcotic Forms crystal line salts with HCl, HNO₃, H₂SO₄, and oxalic acid Its solutions are ppd by tannin

Lobelia nicotianæfolia contains also a second alkaloid, dissolved by CHCl, from solutions made alkaline by NH, It resembles lobeline in physiological action, and, like it, exhibits no characteristic colour reactions (Dragendorff a

von Rosen, C C 1886, 873)

LOGANIN $C_{75}H_{34}O_{14}$ [215°] A glucoside found by Dunstan and Short (Ph [3] 14, 1025) in the pulp in which the seeds of Strychnes nuv vomica are embedded Extracted by alcohol chloroform, and recrystallised from alcohol Prisms V sol water and alcohol, less sol ether, CHCl₃, and benzene The aqueous solu tion is not ppd by reagents for alkaloids, nor by lead acetate or AgNO, Not coloured by FeCl, HNO₃, or H₂SO₄ and K₂Cr₂O₇ Conc H₂SO₄ gives a red colour on warming, changing to purple Loganin does not reduce Fehling's solution Boiling dilute H,SO, splits it up into glucose and loganetin Loganetin is sol water and alcohol, less sol ether and CHCl, It also gives a purple with H,SO,

LORÂOÑIC ACID C₄₂H₄₈O₂₇ (K) or C₅₆H₆₈O₄₄ a G) Lokarn The colouring matter of (C a G) Lokarn Chinese green, obtained from the berries of the buckthorn (Rhamnus utilis), contains lokaonic acid (Kayser, B 18, 3417, of Cloez a Guignet, J 1872, 1068) Lokao, the commercial article, consists of calcium and aluminium lokaonates It is decomposed by boiling with ammonium carbonate, and on adding alcohol to the filtrate ammonium lokaonate is ppd This is deammonium lokaonate is ppd This is de-composed by oxalic acid Lokaonic acid is a deep blue or bluish black mass, which exhibits metallic lustre when rubbed It is insol water, alcohol, ether, and chloroform In aqueous alkalis it forms a blue solution, changed to red by mild reducing agents, such as H.S. Boiling dilute H2SO, splits it up into a sugar, lokaose, and lokanic acid

Salts -NH,HA" (at 100°) deep blue pp with bronze lustre when dry, sol water, insol alcohol—(NH₄)₂A" similar to the preceding. Begins to lose NH₂ at 40°—K₂A" dark blue powder - BaA" (at 100°) deep blue powder,

insol water —PbA" (at 100°) blue black pp

Lokanic acid C₁₆H₁₆O₂₁ (K) or C₁₈H₁₆O₁₆
(C a G) Lokaëtin Obtained by boiling lokaonic acid with dilute H,SO4, dissolving the pp in NH₄Aq, and ppg with oxalic acid Violet black crystalline powder, which exhibits a bronze lustre when rubbed insol water, alcohol, ether, and chloroform Alkalis form a violet solution At 120° it becomes C₃₀H₃₁O₂₀ H₂SO, dissolves it in the cold, and on adding water a reddish brown powder, $C_{36}H_{26}O_{16}$, is ppd This dissolves in NHMq, and the solution gives, with BaCl₂, a reddish brown pp, BaC₃₆H₂₄O₁₆ Lokanic acid is decomposed by boiling conc KOHAq into phloroglucin and delokanic acid Hot dilute nitric acid forms nitro phloroglucin

Salts -NH,HA" (dued at 100°) bluish black powder, sol water insol alcohol Dyes cotton, silk, and wool deep violet without moi dant Mixed with Na₂S₂O₃ it dyes cotton a per manent sky blue (C a G)—BaA" (dried at 100°) blue black powder, insol water and alcohol PbA" deep blue powder, insol water and

alcohol

Delokanic acid C₁₅H₂O₆ Formed as above Brown powder, insol water, sol alcohol solution in alkalis is cherry red. It reduces Fehling's solution with difficulty in the cold

Lokaose C.H.2O. A sugar formed by hydro lysis of lokaonic acid. It reduces chloride of gold and Fehling's solution in the cold It re duces half as much CuO as glucose

LOPHINE v vol 1 p 474

LOTURINE [234°] Occurs to the extent of 24 pc, together with 02 pc of colloturine and 06 pc of loturidine, in lotur bark from Symplocos racemosa, growing in India (Hesse, B 11, 1.42) The alkaloids are extracted from the bark by hot alcohol, and are converted into acetates Loturine and collecturine are ppd from the neutral solution by potassium sulphocyanide, leaving loturidine in solution The crystalline pp is decomposed by Na₂CO₃, and the alkaloids are extracted with ether and recrystallised from The efflore-cent crystals of loturine are separated mechanically from the non efflor escent crystals of collecturine

Properties -Long prisms May be sublimed Insol water, sol alcohol, acetone, ether, and chloroform Its acid solutions exhibit violet chloroform Its acid solutions exhibit violet fluorescence It gives no colour with FeCl₃, conc H SO, HNO, or bleaching powder followed by ammonia Its hydrochloride forms white prisms The hydrochloride, nitrate, and chromate crystallise in needles The platino-

chloride is a yellow pp

Colleturine Long prisms, may be sublimed Its solutions in aqueous HCl and H,SO, fluoresce Its aurochloride is a yellow amor

phous pp

Loturidine Extracted from the filtrate from the ppd sulphocyanides of loturine and col lcturine by adding NH, and shaking with ether Yellowish brown amorphous mass Forms amorphous salts Its solutions in dilute mineral acids fluoresce violet

LOXOPTERYGINE C H34N2O2 [81°] Occurs, together with another alkaloid and tannin, in red Quebracho bark from Loxopterygium Lorentzii (Hesse, A 211, 274) Extracted by alcohol,

the alcoholic solution being evaporated, the residue treated with aqueous NaOH and the alkaloids extracted with ether The acetic acid solution of the alkaloids is mixed with potassium sulphocyanide, which ppts one alkaloid and leaves the loxopterygine in solution, whence it is ppd by ammonia White amorphous mass, sl sol cold water, v sol alcohol, ether, chloroform, and benzene Its solutions exhibit alkaline reaction Tastes intensely bitter Conc H2SO4 and a lattle K2Cr2O, gives a violet colour

LUPANINE C₁₄H₂₁N O Occurs in the seeds of the blue lupine (Lupinus angustifolius), from which it is extracted by alcohol containing HCl (Hagen, A 230, 370) Viscid yellow liquid with green fluorescence, characteristic smell, and very bitter taste Sl sol water, but separates on warming, m sol cold alcohol, v sol ether and chloroform Not volatile with steam Strongly

alkaline, fuming with HCl

Salts —B'HCl 2aq [127°] M sol water and alcohol, insol ether The base is set free from this salt by kOH but not by NH, B'HI 13aq yellow crystals (from hot water), sol. CS, insol alcohol and ether -B'HCyS aq pale yellow crystals, v sol hot alcohol, sl sol water, insol ether —B'H PtCl, 31 aq —B'HAuCl, splen did yellow needles, sl sol ether, insol water and alcohol

Methylo iodide B'MeI [215°] Crystals, sl sol water, insol alcohol and ether methylo hydroxide is formed by treatment with Ag,O but not with KOH

Methylochloride B'MeCl 2aq Extremely deliquescent crystals, insol ether-B'MeHPtCleaq red crystals, insol ether, sl sol alcohol — B MeAuCl, AuCl, lemon vellow needles

LUPETIDINE v DI METHYL PYRIDINE HEXA-HYDRIDE

LUPINIDINE v LUPININE

LUPININ C₂₉H₃₂O₁₆ Lupinin A glucoside in the buds of the yellow lupine (Lupinus luteus) Extracted by 50 p c alcohol (Schulze a Barbieri. B 11, 2200) Slender yellowish white needles (containing 7aq) Sl sol water and alcohol Alkalıs form a deep yellow solution moniacal solution gives a lemon yellow pp with lead acetate Boiling with water or dilute acids splits it up into glucose and lupigenin

Lupigenin $C_1 H_{12}O_6$ Formed as above Minute yellow needles, insol water, sl sol alco Forms a deep yellow solution in aqueous - NH, A'aq len.on yellow powder

LUPININE C₂₁H₄₀N₂O₂ [68°] (256°) An alkaloid in the seeds of the yellow lupine (Lupinus luteus), and extracted by alcohol containing HCl The extract is evaporated to a syrup, treated with KOH, and shaken with light petro-The petroleum is shaken with aqueous HCl, the solution treated with KOH, and the alkaloid extracted by ether, from which it is recrystallised (Baumert, L V 27, 15, cf Beyer, L V 14, 161, v also lupinidine, infra)

Rroperties — Trimetric crystals, may be dis ed in a current of hydrogen Tastes bitter tilled in a current of hydrogen V sol cold water and alcohol, less sol hot water, v sol benzene, chloroform, and CS₂ Strong base, liberating NH₂ from its salts and fuming with HCl In its solutions tannin gives a flocculent pp , phospho-molybdic and phos154 LUPININE

photungstic acids give yellow pps , iodine gives

a dirty brownish red pp Reactions — 1 HI gives C25H50N2O12 2 With fuming HCl at 200° it forms anhydro lupinine C21 H38N2O and finally di-anhydro lupinine $C_{21}H_{36}N_2$ (Baumert, A 214, 366) —3 P_2O_3 heated with the hydrochloride at 180° forms oxylupinine, which with platinic chloride forms C. H., N. 2O. H. 2PtCl., crystallising in yellow plates If the mother liquor be heated with P₂O₅ to a higher temperature anhydro lupinine is formed (Baumert, A 214, 360) -4 Sodium dissolves in fused lupinine, but the product is decomposed by water into NaOH and lupinine (Baumert, B 15, 631)

Salts -B"H2Cl2 large trimetric crystals crystals, v e sol water and alco B'H₂SO. deliquescent prisms -B"(HAuCl₄)₂ needles, v sl sol B"H₂PtCl 6aq crystals, sol water water -

Acetyl derivative C1H38Ac.N2O2 Ob tained by heating lupinine with AcCl or with Ac₂O and NaOAc (Baumert, A 224, 313) Oil — B"H₂PtCl₆ orange trimetric plates

Methylo-rodide B"Me,I2 white hexa gonal plates, sl sol alcohol (Baumert, B 14, 1221)

Methylo-chloride B"Me₂Cl₂ pearly plates —B"Me₂PtCl₆aq orange red needles -

B"Me Au₂Cl₈ yellow pp Ethylo-rodrde B"Et₂I₂ hexagonal plates (Baumert, B 14, 1321) Decomposed by Ag O, but not by KOH From it may be obtained

Bu'Et, PtCl, aq and B''(EtAuCl,), [70°]

Anhydro-lupunne C, H, N, O Formed by heating lupunne with fuming HCl at 150°-200° (Liebscher, B 14, 1880) Liquid which cannot be distilled Oxidised by air Smells like conine Forms crystalline salts -B"H₂PtCl₆ red tables, v sol water

Di-anhydro-lupinine $C_{21}H_{36}N_2$ (220°) From lupinine and cone HClAq at 200° (Liebscher a Baumert, A 214, 371) Oil Readily oxidised by air -B"H,PtCl, dark red crystals, v sol warm water

Lupinidine $C_8H_{15}N$

Preparation - Lupine seeds are extracted with dilute alcohol acidified with H.SO., and, after as much fat as possible has been removed, the sulphate solution is evaporated to a syrup and the residue triturated with absolute alcohol, when it solidifies to a mass of crystalline plates This mass is again triturated with absolute alcohol, when a white crystalline meal of acid lupinidine sulphate separates The mother liquors are treated again in the same manner, until the residue, on trituration with alcohol, either remains liquid or at least redissolves on washing with absolute alcohol, in this case it consists for the most part of lupinine sulphate The mother liquors containing the lupinine sulphate are freed from alcohol, dissolved in water, and ppd by BaCl₂ The filtrate now contains chiefly lupinine chloride, from which any lupinidine salt present can be ppd as platino chloride (G. Baumert, A. 225, 365). Lupinidine is obtained by decomposing the acid sulphate by one of the stronger bases, shaking with ether, and distilling in a current of hydrogen The fact that this alkaloid distils over in a stream of hydrogen, between the wide limits of 250°-820°.

is explicable on the assumption that the lupin-idine golffom the seeds of the yellow lupine is a mixture of crystallisable hydrate (see below) and a liquid anhydride The formula C₈H₁₅N is calculated from analyses of its salts

Properties -Thick yellow oil of intensely bitter taste and disagreeable hemlock like smell, but this smell is probably due to a decomposition product Strong base Very easily oxidisable by the air when in contact with acids or with KOHAq, but not with NH3Aq Gives no acetyl derivative or ethylo iodide (liaumert, A 225, 365) Lupidine is a feeble poison, acting on frogs like curare (Kobert, A 227, 219)

Salts—B'HCl yellow deliquescent crystals
—B'HI laq rather large crystals resembling alum, v sol hot water, m sol alcohol—B'2HI(?) Formed by heating lupinidine with EtI lupinidine resembles berberine in giving a hydro iodide when heated with EtI (Baumert, A 227, 207) —B'H₂SO, minute crystals, v e sol water, v sl sol alcohol —B',H.PtCl, 2aq trimetric crystals, a b c = 885 1 1 171 (Luedecke, Z K 12, 297), sl sol water, m sol HClAq, v sol dilute

alcohol (Baumert, A 225, 365)

Hydrate C₈H₁₈Naq? The liquid and crys
talline portions of the lupine alkaloid are to be considered as modifications of the same base (the hydra e being crystalline), since both yield the same double salt with PtCl. The existence of a hydrate, stable only in the cold, may also explain why cold aqueous solutions of lupinidine, lupinine, and confine become milky on heating A further proof of the correctness of this view is that the yellow oil only (probably the pure anhy dride C.H., N) was got on treating the lupinidine with P2O, (Baumeit)

Lupinine A crystalline alkaloid, called by this name, was obtained by Bettelli (G 11, 240) by extracting white lupine (Lupinus albus) with alcohol It forms white needles, v sol water An alcoholic extract of the plant has been used with some success in cases of intermittent mala rial fever Solutions of the alkaloid give white pps with tannin, HgCl, and AgNO, in the last case reduction soon takes place Platinic and gold chlorides and pieric acid give canary yellow pps HIAq containing iodine gives a red amorphous It does not reduce Fehling's solution Boil ing KOH gives off ammonia

A liquid alkaloid, also called Lupinine lupinine, was obtained by Campani (G 11, 237) from the white lupine It boiled between 210°

and 218° and was poisonous

The young shoots of the yellow lupine contain an alkaloid called Arginine $(q \ v)$ The danger to sheep from eating lupines appears to be due to another substance 'icterogen,' perhaps pro duced by a parasite growing on the lupines (Baumert, Ar Ph [3] 24, 49, Kobert a Lieb scher, J 1886, 1696, Kuhn, ibid)

LUPULIN The yellow granular aromatic powder situate at the base of the cones of the hop and forming from 8 to 18 pc of the cones It contains hop oil, a resin, a nitro genous substance, a gummy substance, and a bitter principle Lermer (D P J 179, 54) extracted the bitter principle by ether, shook the ether with aqueous KOH, ppd by CuSO₄, decomposed the copper compound with H.S. and recrystallised from ether He describes the 'lupulin' so obtained as large with prisms, insol water, v sol alcohol, ether, and chloroinsol water, v sol alcohol, ether, a form The alcoholic solution, diluted with water, had a bitter taste and acid reaction also obtained a compound [110°] which likewise formed a copper salt Lupulic acid, as described by Bungener, appears to be Lermer's lupulm Issleib (Ar Ph [3] 16, 345) found a 'pseudo glucoside' $C_{*0}H_{46}O_{10}$ which he extracted by cold The extract was treated with animal charcoal, the charcoal dried and exhausted with 90 pc alcohol, and the yellow solution partially, evaporated A brown resin C10H24O3 is deposited while a bitter uncrystallisable substance remains in solution From the aqueous solution of this bitter substance ether extracts only the bitter principle (which amounts to 004 of the hops) and leaves in the water $C_{1n}H_{1n}O_s$, a tasteless product of the oxidation of oil of hops C10H18O The bitter principle, according to Issleib, forms a yellow solution in alkalis, and is split up by boiling dilute H2SO, into lupuliretin CH16O, and lupulic acid C₄₀H₈ O₁₉. This lupulic acid forms a crystalline barium salt BaC₄₈H₈₀O₁₉ 5aq According to Bissell (Ph [3] 8, 508) lupulin does not con tain all the active principle of the hop The bitter principle may usually, but not always, be ppd from an infusion of hops by lead acetate (Allen An 13, 43) According to Hayduck (C C 1887, 694), when hops are exhausted with ether, and after evaporating the ether, the residue is treated with alcohol, a white wax is left behind alcoholic solution gives a yellow pp with lead acetate, and the filtrate contains two resins, one soluble, and the other insoluble, in light petro leum

Lupulic acid C H O [93°]

Preparation—By extracting hop flour with light petroleum spirit, distilling off the solvent, cooling, filtering off the black liquid from the crystals formed, and recrystallising the crude acid from alcohol and petroleum spirit

Properties — Colourless prismatic crystals, rapidly altered by exposure to the air V sol alcohol, ether, benzene, CHCl., CS, and the ethereal oil of the hop, sol petroleum spirit, insol water Easily reduces ammoniacal AgNO₂ Exposed to the air is transformed into a yellowish resin This product of oxidation is all sol water, to which it imparts an intense bitter taste, and this resin is the bitter principle of the hop — CuA' A crystalline powder (Bungener, Bi [2] 45, 487)

LUPULINE v HOPFINE

LUTEIC ACID $C_{20}H_{20}O_{12}$ (?) [274°] S 009 in the cold, 03 at 100° S (alcohol) 4 2 in the cold S (ether) 37 A yellow colouring matter prepared from the flowers of Euphorbia Cyparissias (Hohn, Ar Ph [2] 140, 218) fresh flowers are exhausted with alcohol of 60 pc, the greater part of the alcohol distilled off, and the residual liquid filtered and ppd with basic lead acetate The pp is suspended in water, decomposed by H.S., and filtered The filtrate is evaporated over H.SO,, and the yel lowish crusts that separate are recrystallised from ether-alcohol, and then from hot water containing 4 pc of alcohol Slender yellow Has no smell and a bitter taste needles limes at 220° Its solutions exhibit acid reaction Lutein somewhat resembles luteolin and, like the latter, gives protocatechine acid by potash fusion. It dissolves in caustic and carbonated alkalis forming yellow solutions. It reduces AgNO₃ mercurous nitrate, and Fehling's solution on heating FeCl, gives a green colour, changing to reddish brown on further addition of FeCl, Conc H₂SO₄ dissolves luteïc acid, but water reppts it unaltered Boiling dilute H₂SO₄ does not attack it

LUTEIN This name is given by Thudi chum (Pr 17, 253) to the yellow substance ob tained by Piccoli and Lieben (Z 1868, 645) from the ovary of the cow, and called by them 'hæmoluteïn' (cf Holm, Z 1867, 779) It occurs also in the human ovary The same or a similar substance occurs in butter, yolk of egg, serum of blood, in some diseased swellings, in carrots, &c It occurs also in the retina of the eyes of fowls (Capranica, J Th 1877, 317, Kuhne, J Th 1877, 317) According to Maly (C C 1881, 485, M 2, 359), the lutein in yolk of egg of hens and shrimps is a mixture of vitello lutein and vitello rubin If the yolk is extracted with alcohol, and the extract treated with hot baryta water, vitellorubin is ppd while vitellolutein remains in solution Or the yolk extract may be boiled with a little acid, and the ppd albumen treated with petroleum which extracts vitellolutein, while CS2 extracts vitellorubin from the residue Vitellorubin contains no nitrogen It is red, and forms a Mg compound sol ether, chloroform, and CS2 but ppd by alcohol in red flakes An alcoholic solution of vitellorubin shows a broad but weak absorption band including the line F lutein forms a yellow alcoholic solution which exhibits two narrow absorption bands, one including F, the other between F and G It con tains no nitrogen

LUTEOCHROMIUM SALTS, v vol 11 p

LUTEOCOBALTIC SALTS, v vol n p 228 **LUTEOLIN** $C_{20}H_{14}O_8$ (Moldenhauer, A 100, 180) or (C12H3O3)2 daq (Schutzenberger a Paraf, A Suppl 1, 256) [320°] S 007 in the cold, 02 at 100° S (alcohol) 2 7 S (ether) 16 007 in the cold, The vellow colouring matter of weld (Reseda luteola) (Chevreul, J Chim Med 6, 157) tained by boiling weld with water (16 pts) mixed with alcohol (1 pt), filtering, evaporating. dissolving the yellow flakes in alcohol, and pouring into water It is recrystallised from a mixture of water and glycerin (Rochleder, J pr Yellow, four sided needles in radiate 99, 433) May be sublimed Partially decomgroups posed on fusing Has a slightly bitter, astringent taste Reddens litmus slightly solves with deep yellow colour in caustic and carbonated alkalıs Conc H SO, forms a yellow solution, whence water reppts it Potash-fusion CO2, phloroglucin, and protocatechuic Very dilute FeCl, gives a green pp, excess of FeCl, forms a brownish red solution Alcoholic lead acetate gives a pp C₁₂H_oPbO₃aq

Mol w 107 (166°) S G 2 956 (W), 958

(6)-LUTIDINE C.H., N Ethyl pyrdine (?) Mol w 107 (166°) S G 2 956 (W), 959 (C) V D 3 79 (calc 3 70) S (W) Ob tained, together with homologues, by distilling cinchonine with KOH, a mixture of some ten bases is obtained and these are separated by fractional distillation (Greville Williams, J

1855, 549, 1864, 437, Pr 13, 305, Oechsner de Comneke, C R 92, 413, Bl [2] 35, 296, R T C 1, 132, A Ch [5] 27, 462, 488) The same base appears to be formed by distilling with zinc dust the syrupy acid formed by oxidis ing cinchonine with chromic acid mixture (Weidel a Hazura, M 3, 780) This, or an someric ethyl pyridine, is formed by distilling brucine with KOH (O de Coninck, Bl [2] 42, 100) Liquid, sl sol water, sol alcohol and ether The aqueous solution does not become turbid on warming, the base being more soluble in hot than in cold water It appears to form an unstable hydrate C,H,NH₂O Smells some what like nicotine Physiologically it is a vio lent poison and stops tetanus produced by strychnine (Greville Williams a Waters, Pr32, 162) By chromic acid mixture or by KMnO. it is exidised to pyridine carboxylic (nico tinic) acid [231°] When heated with sodium it appears to form di (\$) lutidine C14H18N2 (Gre ville Williams, Pr 33, 159) Chlorine passed into (β) lutidine containing dissolved iodine appears to form tri-chloro (β)-lutidine Chloro acetic acid gives C₇H₆NClCH₂ CO₂H (163°) forming (C₉H₁₂NO₂Cl)₂PtCl₄ 2aq (Pictet, *J* 1882, 1079)

Salts —B'HCl Very deliquescent crystals —B'HBr —B'₂H₂PtCl₆ orange red leaflets Its pp is not retarded by presence of excess of HCl (difference from bone oil lutidine) Hot water decomposes it forming B'2PtCl4 crystallising in pale yellow leaflets —B'2PtCl2 From platinous chloride (1 pt) and lutidine (1 pt) combina tion takes place with rise in temperature (of 70°), the product being a hard brittle mass (Williams)—B'HAuCl. Yellow pp On boiling with water it forms yellow B'2HAu2Cl, and ultimately B'2AuCl3 a red crystalline powder -B'2H2PdCl, garnet red prisms, obtained by mixing solutions of the hydrochloride and of palladium chloride (W) Decomposed at 100°, giving off HCl and leaving B'2PdCl2, sl sol water -B'2H2Cl2Ur2O2Cl2 Formed from uranyl chloride and (β) lutidine hydrochloride Yellow -B'₂H₂SO₄(UrO)₂(SO₄)₃ From uranyl sulphate and (β) lutidine sulphate Small yellow needles -Picrate B'C₆H₂(NO₂)₃OH Yellow needles (Williams, Pr 33, 159)

Combinations — B'₂CuSO₄ 4aq When (\$\beta\$) lutidine is added to a solution of cupric sulphate a copious pale green pp is formed, which desolves in excess, forming a rich blue liquid, which deposits blue prisms of B'₂CuSO₄ 4aq — B'₂AgNO₄ Formed by ppg silver nitrate solution with (\$\beta\$)-lutidine and recrystallising from alcohol

D1 (3) lutidine When sodium is warmed with (3) lutidine dissolved in toluene a product is obtained from which it is possible to get a platinochloride containing a percentage of platinum corresponding to the formula $C_{14}H_{18}N_1HPtCl_3$ (Williams, C N 44, 308) Tetra-(3)-lutidine When sodium is warmed

Tetra-(β)-lutidine When sodium is warmed with (β)-lutidine a violent action takes place, and from the product a platinochloride may be obtained certaining a percentage of platinum corresponding to the formula C₂₈H₃₆N₄HPtCl₃ (Williams)

Hydride of (β)-lutidine C₇H₁₈N Greville Williams found that sodium amalgam had no

action on (8) lutidine According to Oechsner de Coninck (Bl [2] 42, 121), however a hexa hydride (155°-160°) may be formed by the action of sodium on an alcoholic solution of the base (cf Wyschnegradsky, B 13, 2401) It combines with MeI and the product, when distilled with KOH, yields C₈H₁₇N (160°) It also combines with EtI, and the product treated with potash yields a tertiary base boiling at 175°

Lutidine C,H_uN (173°) Obtained by distilling strychnine with zinc dust (Scichloni a Magnanin, G 12, 445) Yellow hiquid, insolwater, sol alcohol and ether Smells like pyridine Gives with sodium phosphomolybdate a dark yellow pp., sol ammonia Potassio mer curic iodide gives a yellow amorphous pp. Mer curic chloride gives a white pp. Iodine in KIAq gives a crimson pp., insol dilute HClAq

LYCACONITINE v Aconite alkaloids

LYCINE The base from Lycrum barbarum to which this name was applied has been shown to be identical with betaine

LYCOPODINE C₁₂H₃₂N₂O₃ [115°] Occurs in Lycopodium complanatum (club moss), from which it is obtained by extracting the root with alcohol, evaporating the extract, dissolving the residue in water, adding lead subacetate, removing excess of lead by H S, adding NaOH, and shaking with ether. When the ether is evaporated the alkaloid is left, and may be purified by dissolving in HClAq and ppg with conclusion of the conc

LYCOPODIUM BITTER The alcoholic and aqueous extracts of Lycopodium chamacyparissus are evaporated, and the residues mixed and extracted with water The solution is treated with lead acetate and subacetate, filtered, freed from lead by H₂S and evaporated The residue is then washed with alcohol and dissolved in water From this solution lead subacetate ppts the bitter principle, and the pp is then suspended in water and decomposed by H.S. The filtrate is concentrated, freed from sugar by careful fermentation with yeast, dried, and ex tracted with absolute alcohol, which leaves the bitter principle on evaporation (Kamp, A 100, 300) Slender needles (from water) V e sol Slender needles (from water) V e sol , alcohol, and ether Extremely bitter water, alcohol, and ether Contains no nitrogen Neutral to litmus Colours tincture of iodine orange red Does not reduce Fehling's solution, but after boiling with dilute H2SO, it does so

LYCÓPODIUM OIL The oil from the fresh spores of club moss contains phytosterin C₂₁H₄₂O, together with glyceryl ethers of lycopodie

C18H38O4, oleso, arachic, stearic, and palmitic [acids (Bukowski, Chem Zeit 1889, 174, cf

Langer, Ar Ph [8] 27, 625) LYCORESIN C₀H₁₈O [170°] Extracted from Lycopodium chamæcyparissus by alcohol, and remaining in the mother liquor after lyco stearone has separated (Kamp, A 100, 300) Minute crystals, almost insol boiling water, v sol alcohol and ether, v sl sol cold alkalıs

LYCOSTEARONE C₁₅M₃₀O₂ [75°-100°] amorphous tasteless substance, which may be extracted by alcohol from Ly opodium chamacy

parissus (Kamp, A 100, 300) Insol cold water. sol hot water forming a jelly on cooling sol cold alcohol and ether, v sol alkalıs

A violet dye obtained by pouring LYDINE a solution of aniline (100 g) in fuming HClAq (100 g) diluted with water (120 cc) into a solu tion of K₂FeCy₆ (90 g) in water (850 cc), and heating the mixture to boiling. The product is dissolved in dilute oxalic acid and ppd by alkalıs Violet powder, sol alcohol, sl sol ether and benzene, insol water Poisonous (Guyot, C R 69, 829) Possibly identical with mauvine.

\mathbf{M}

C,H19NO, (?) [201°] MACLEYIN (CHCl_s) 7 S (ether) 1 An alkaloid in Macleya cordata the Japanese Tachiobaku (Lijk man, R T C 3, 182, Ph [3] 13,87) Fxtracted from the root by alcohol and dilute H2SO4, and separated from sanguinarin by ether in which it is very slightly soluble Prisms Almost water and alkalis, v sl sol hot alcohol Almost insol salts have a bitter taste Its chemical proper ties resemble those of protopine Conc H2SO4 gives a faint yellow changing through violet to green Fumes of nitric acid give an ultramarine colour H₂SO₄ and a little K₂Cr₂O₂ give a blue colour

Salts — B'HCl Prisms B'.H.PtCl₆2aq yellowish whitepp -B'.H Cr₂O, prisms - Hydrolodide crystalline -Normal sulphate spheres colourless Thiocyanate needles -Acetate needles needles - Acid oxalate crystals -Acid tarneedles -Benzoate [166°] trate needle

MACLURIN $C_{13}H_{10}O_{6}$ (H a P), $C_{15}H_{12}O_{8}$ Morintarnic acid [200°] (Wagner) 52 at 14° Occurs, together with morin $(q \ v)$, in old fustic, the wood of Morus tinctoria, from which it is obtained by extracting with water The evaporated extract deposits morin, and from the filtrate maclurin may be ppd by HCl (Hlasiwetz a Pfaunder, A 127, 352, J pr 94, 55, Löwe, Fr 14, 117, Benedikt, A 185, 114) Almost pure maclurin is also found in patches in the wood (Wagner, J 1850, 529)

Properties - Yellow, crystalline powder (con-

taining aq), v sol alcohol and ether, sl sol water Above 270° it gives CO, and pyrocatechin Its aqueous solution is ppd by alkaloids, gelatin, and albumen FeSO, gives a greenish black pp Its alkaline solution turns brown in air It dyes mordanted cotton pale brownish-yellow Boiling cone KOHAq gives phloroglucin and protocate chuic acid $C_1, H_{10}O_6 + HO = C_6H_6O_3 + C_7H_6O_4$ Dilute H SO, at 120° does the same Bromine gives tri bromo maclurin C₁₂H₁Br₂O₅ aq minute needles Conc H₂SO₄ at 190° gives brown C₂₂H₁₄O₁₅ (Hlasiwetz, A 143, 308) Reduction with zine and H2SO, gives phloroglucin and When its solution is heated with machronin sodium amalgam and the product acidified, ether extracts phloroglucin and amorphous Cit HisOs, which is sol water and alcohol, is ppd by lead acetate, gives a grass green colour with FeCl₂, and reduces AgNO₂ and Fehling's solution.

Salts - PbC, H,O, aq · yellow crystals -C₁₅H₁ O₇3PbO (L)

Acetylderivative C18H2AcO4 11aq viscid

Machronin C14H10O33aq (?) Formed by the action of zinc and dilute H2SO, on maclurin, and separated from phloroglucin by ppn with lead acetate The pp is decomposed by H2S Colourless spangies composed needles (from dilute alcohol) V sl sol water Turns dark blue less spangles composed of tufts of minute when exposed to air or when heated aqueous solution turns violet blue in air, and then yields an indigo blue pp with HCl FeCl, gives, in a very dilute alcoholic solution, a violetred colour, changing to blue Alkaline solutions AgNO, gives also turn blue on exposure to air a violet colour with reduction of silver Reduces hot Fehling's solution Cone H2SO4 gives an orange solution, turning emerald green on warming or diluting

Rufimoric acid C₁₆H₁₄O₂ (?) Obtained by boiling maclurin with dilute HCl (Wagner, J Obtained by 1851, 420) Dark red mass, v sol alcohol, m sol water, v sl sol ether Forms a crimson

solution in alkalis

Dewar, Pr 44, 241)

Occurrence — The metal does not occur native, but compounds of Mg are very widely distributed, and are found in some places in large quantities, they usually accompany Ca compounds Magnesite MgCO,, dolomite a mixture of the isomorphous carbonates of Mg and Ca, kieserite MgSO, H2O, carnallite MgCl2 KCl 6H2O, various silicates e g asbestos (MgCa)SiO,, spinelle MgAl2O,, &c, occur as minerals Borate, phosphate, sulphate, chloride, nitrate, and hydroxide, of Mg are found in mineral waters, and some of them in sea water, Mg compounds, chiefly phosphate and carbonate and compounds of organic acids, are found in plants and animals

Magnesia alba (a basic carbonate of Mg) was introduced as a medicine in the beginning of the 18th century, the name is said to have been given merely in contradistinction to magnesia nigra, a term applied to the mineral pyrolusite because of its colour and supposed magnetic Magnesia was long supposed to be properties the same, or nearly the same, as lime Hoff-mann, Bergmann, Marggraff, and especially Black (1755) established the characteristic properties of magnesia Black showed magnesia alba to be a compound of fixed air (CO2) with an earthy base, to this base he gave the name magnesia In 1800 Davy obtained a small quantity of a metal by reducing magnesia at white heat by vapour of K, in 1830 Bussy ob tained the metal in greater quantity and purity, by heating together MgCl₂ and K

Formation —1 By heating together MgCl₂ and K in a Pt crucible, and washing out KCl by water (Bussy, Buff, P 18, 140, Liebig, P 19, 137) —2 By electrolysing fused MgCl₂ (Bunsen, A 82, 137), or a mixture of MgCl₂ and KCl with a little NH₄Cl (Metthiessen, C J 8, 107) —3 By reducing a molten mixture of MgCl₂, CaF, KCl, and NaCl, by Na (Deville a Caron, C C 1863 993) —4 By reducing MgF₂ NaF by Na (Thisser, C R 56, 848) —5 By electrolysing a mixture of MgSO₄ and (NH₄)₂SO₄ dissolved in water (Gerhard, English Patents, No 16,691, 1884) —6 Puettiner patented a method for reducing MgCO₃ by heating with Fe₂O₃ and (German Patents, No 31,319) —7 Lauterborn reduces a double Mg Na cyanide by Zn (German Patents, No 39,915)

Preparation —1 The upper part of a porcelam crucible is divided vertically into two halves by a thin porcelain plate, the crucible is closed by a porcelain cover, through which pass the carbon electrodes of a battery of 8-10 Bunsen cells, one electrode on each side of the dividing vertical plate, indentations are cut in the negative electrode, the crucible is heated to redness, then filled with fused MgCl₂, and the current is passed through the molten mass. The Mg lodges in the cavities of the negative electrode, and is thus prevented from floating to the surface, the dividing plate serves to prevent contact be tween the Cl, evolved at the positive electrode. and the Mg (Bunsen, A 82, 187) -2 A mixture of MgCl, and KCl, prepared by evaporating a mixture of the salts, in the ratio 4MgCl, 3KCl, to dryness, is mixed with a little NH₄Cl, and is electrolysed when fused in the apparatus de scribed in 1, as Mg is heavier than the molten mixture of salts it is not necessary to form ser rations in the negative electrode (Matthiessen, C J 8, 107) -3 A mixture of 6 pts dry MgCl, 1 pt of a mixture of 7 pts NaCl and 9 pts KCl, 1 pt powdered CaF₂, and 1 pt Na carefully freed from oil, is heated to bright redness in a covered earthen crucible The Mg, which separates in globules, is heated nearly to whiteness in a boat of compact charcoal, placed in an inclined tube of the same material through which is passed a stream of dry H, the Mg condenses on the upper part of the tube, it is then melted into large globules with a flux of MgCl₂, NaCl, and CaF₂ To free the Mg from C, Si, and N, it may be distilled in a current of H at a high temperature (Deville a Caron, A 83, 137, for ar apparatus in which the distillation may be conveniently conducted v Sonstadt, J pr 90, 307) In a later trial D a C ured 7 pts MgCl, 48 pts CaF₂, and 23 pts Na ($C \ \hat{C} \ 1863 \ 993$) -4Wöhler (A 101, 362) reduces a fused mixture of MgCl, NaCl' with excess of NaCl by Na, the mixture is obtained by adding excess of NaCl to MgCl₂Aq and evaporating to dryness The amount of MgCl2 in the mixture must be known in order that the quantity of Na to be used may be calculated, for every 1 pt MgCl, about 1 pt Na should be used

Properties - A silver white, very lustrous, moderately hard, metal, malleable, not very tenacious, may be filed and polished, SG c 175 Mg occludes c 2 its volume of H, by heating in vacuo the H is suddenly evolved Ob tained in lustrous, white, crystals, hexagonal, a c = 11639, isomorphous with Zn (Des Cloi zeaux, C R 90, 1101) Unchanged in dry air, superficially oxidised in ordinary air Heated in air, burns to MgO giving out a brilliant white light, very rich in actinic rays Burns when heated in steam, also in CO2, and in SO. bines directly with the halogens, S, P, As, N Hot water is slowly decomposed by Mg Dissolves readily in dilute acids

Mg is a distinctly metallic element, it forms one series of salts MgX, where X = Cl, NO₃, \(\frac{1}{2} \)SO₄, \(\frac{3}{2} \)PO₄, \(\frac{3}{2} \)Co, \(\frac{1}{2} \) for \(\frac{1}{2} \) each salts, and many double salts, are known. In its chemical relations, Mg is analogous to the alkaline earth metals Ca, Sr, and Ba, and also to the metals Be, Zn, Cd, and Hg MgO and MgO, H₂ are alkaline, MgO H. is formed by the reaction of H₂O and MgO, and is dehydrated to MgO by heat As the V D of no binary compound of Mg with H or one of the halogens has been determined, the valency of the atom of Mg in gaseous molecules is not known with certainty, but from the close similarities between Mg, Zp, and Cd, there is little doubt that the atom of Mg is divalent in gaseous molecules (v Magnesium Group of Elements, pl 163, cf Alkaline earths, metals of the, vol 1 p 112)

The atomic weight of Mg has been determined (1) by determining SO₄ in MgSO₄7H₂O

(Gay Lussac, A Ch [2] 13, 308, Scheerer, P 69, 535), (2) by converting MgO into MgSO, Gerzelius, P 8, 188, Svanberg a Nordenfeldt, J pr 45, 474, Jacquelain, A Ch [3] 32, 202, Marignac, A Ch [6] 1, 289), (3) by converting MgO₂O, 2H₂O into MgO (8 a N lc), (4) by converting MgCO₃ into MgO (Marchand a Scheerer, J pr 50, 385), (5) by determining Cl in MgCl₂ by ppn with Ag (Dumas, A Ch [3] 55, 189), (6) by determining S H of Mg

Molecular weight of magnesium—Ramsay (C J 55, 521) has determined the lowering of vapour pressure of Hg produced by dissolving Mg in Hg, the results make it probable that the molecular weight of Mg is the same as the atomic weight This conclusion assumes the accuracy of Van't Hoff's law, th t equal volumes of dilute solutions contain equal numbers of molecules of the dissolved substances, and it also supposes the molecular weight of liquid Hg to be the same as the atomic weight of Hg

Reactions -1 Slowly oxidised in moist air 2 Decomposes warm water slowly, heated in steam burns to MgO -3 Heated in air or oxygen to above its M P burns to MgO, with bril liant white light, rich in actinic rays -4 Heated in chlorine, bromine, or iodine forms MgCl, MgBr₂, or MgI₂—5 Heated in sulphur forms MgS -6 Heated in nitrogen forms Mg, N, with phosphorus forms Mg,P2, and with arsenic forms Mg, As, -7 Decomposes carbon monoxide and dwxide, also sulphur dwxide, when heated in these gases, forming MgO -8 Reduces ferric chloride and sulphate solutions to 1 eCl, and reso, (Pfeiffer, J pr 61, 441) —9 Reduces nitric acid to HNO₂ (Jenzsch, N T für Mine ralogue 1853 535) -10 Reduces carbonates of the alkali metals except Cs, also oxides of copper, silver, and gold, when heated with them in solid form (Winkler, B 23, 44), also reduces oxides of Ca, Sr, Ba, Zn, Cd, and Hg (W B 23, 120) — 11 Dissolves in delute acids with formation of salts MgX₂, X = Cl \ SO₄, &c, and evolution of H, or N oxides from HNO₅. Cone hot H, SO₄ forms MgSO₄ and SO₂—12. Dissolves in hydroaen peroxide solution with formation of MgO₂H₂. From solutions of salts of copper, iron, man ganese, and cobalt Mg ppts the metals, with evolution of H, from some metallic salts Mg ppts hydrated oxides, eg AlO,H, from solu tions of Al salts, from solutions of salts of arsenic or antimony, Mg evolves AsH, or SbH, -13 Mg forms alloys with most of the metals (v Magnesium, alloys of)

Detection and estimation—Solutions of Mg salts are not ppd by HClAq, H,SO,Aq, H S, or NH,HS Fixed alkalis and their carbonates pt MgO₂H₂ or MgCO₃, insoluble in excess, but soluble in NH, salts, especially in NH,ClAq, hence Mg salts are not ppd by NH,Aq in presence of NH,Cl Na,HPO,Aq, added to Mg salt solutions, in presence of NH,Aq, ppts MgNH,PO₄

Mg is usually estimated by ppn as MgNH, PO, by addition of NH, Aq and Na, HPO, Aq, when strongly heated, the pp is changed to Mg P, O, For details, and methods of separation of Mg from other metals, Manuals of Analysis must be consulted

Magnesium, alloys of Mg forms alloys with most of the metals By reason of the easy

oxidation of Mg, the preparation of alloys of this metal is somewhat difficult. They may be prepared by melting the metals in H, also by melting the other metal and rapidly immersing the Mg in it. According to Parkinson (J. pr. 101, 375), Mg forms alloys with the alkali metals, Al, Sb, Bi, Cd, Cu, Au, Pb, Hg, Pt, Ag, Tl, Sn, Zn, also with Cu and Ni together, but not with Co, Fe, or Ni alone. The alloys of Mg are generally very brittle.

pp 529,530

Magnesium, boride of According to Phipson (C N 9, 219), a greenish black mass, which is probably a boride of Mg, is produced by heating Mg with boric acid

Magnesium, borofluoride of $Mg(BF_4)_2$ (Ber zelius, P 2,113), v Borofluorides, vol 1 p 526

Magnesium, bromide of MgBr, Mol w unknown, as VD has not been determined Occurs in small quantity in sea water, and in some mineral springs, also in the Stassfurt salt deposits Obtained by passing Br vapour over melted Mg The reaction is very violent (Lerch, J pr [2] 28, 338) A white, very deliquescent, fusible, wax like, crystalline mass By concentrating a solution of MgO in HBrAq, white deliquescent crystals of the hydrated bromide, MgBr 6H,O, are obtained (Rammels berg, P 55, 239), the same hydrate is formed, along with an insoluble oxybromide, by the re action between Mg and Br under water (Lerch, lc) Evaporation of MgBr, Aq to dryness, or heating the crystals of MgBr 6H O, is attended with evolution of HBr and formation of an oxybromide Heated in a stream of O, MgBr₂ 19 entirely decomposed to MgO (Schulze, J pr [2] 21, 407) Kremers (P 108 118) and Gerlach (Fr 8, 285) give the following data for S G, and percentage composition, of MgBr,Aq -

P et MgBr,	SG of solution	Pet. MgBr,	SG of solution
5	1 043	30	1 310
10	1 087	35	1 377
15	1 137	40	1 451
20	1 191	45	1 535
25	1 247	50	1625

The double compounds MgBr KBr 6H₂O and MgBr, NH₄Br 6H₂O are obtained by evaporating mixed solutions of the constituent salts (Lerch, J pr [2] 28, 338)

Magnesium, chloride of MgCl, Mol w unknown, as VD has not been determined

Occurrence —In sea water and in several mineral springs, also in the salt deposits of Stassfurt

Formation -1 The mother liquor, after re-

moving KCl from the Stassfurt salts, is evapoiated to SG 1375 and allowed to orystallise. The crystals of MgCl₂ 6H₂O are heated to melting, whereby they are partially dehydrated, but at the same time some oxychloride is formed. By exposing the crystals to a temperature of c 100° under greatly reduced pressure almost pure MgCl₂ is obtained —2 MgCl₂ is obtained as a by-product in Weldon's process for making Cl, and in Solway's soda ammonia process when MgO is used to decompose NH₄Cl —3 By heat ing MgO with NH₄Cl, adding some NH₄Cl from time to time

Preparation—1 Powdered MgO, or magnesia alba, is dissolved in HClAq, NH₄Cl is added in quantity sufficient to prevent ppn of MgO₂H₂ on addition of NH₈Aq, the solution is made slightly alkaline by NH₄Aq, any silica which separates is filtered off, the liquid is neutralised by HClAq, and evaporated to dryness. The double salt NH₄Cl MgCl₂xH₂O is thus obtained, it is heated to melting (o 460°) in a Hessian crucible, in the bottom of which is placed a smaller Pt dish (Bunsen, A 82, 137), until NH₄Cl is entirely removed, the MgCl₂ collects in the Pt dish at the bottom of the Hessian crucible (cf Dobereiner, S 28, 90)—2 By heating MgCl₂6H₂O in a current of HCl (Hempel, B 21, 897).

The hydrated chloride MgCl₂ 6H₂O is obtained by evaporating the solution of MgO in HClAq to

the crystallising point

Properties — A white, deliquescent, solid, con sisting of a mass of small pearly crystals, SG 2 177 (Playfair a Joule, C S Mem 2, 401) Can be distilled in H at red heat Dissolves readily in water with production of much heat, $[MgCl^2,Aq]=35,920$ (Th 3, 243) Thomsen (lc) gives the thermal data $[Mg,Cl^2]=151,010$, $[Mg,Cl^2,Aq]=186,930$ Sol in alcohol, also in amylic alcohol Gerlach (J 1859 43) gives the following table —

P ct.MgCl_	S G MgCl,Aq	P ct MgClg.	S G MgClaAc
1	1 0084	19	1 1686
2	1 0169	20	1 1780

The hydrate ${\rm MgCl_2~6H_2O}$ crystallises in mono clinic forms, S G 1558 (Filhol, A Ch [3] 21, 415) S 167 cold water, 367 hot water (Casaseas, C R 37, 350) S 20 in alcohol 9 S G, 50 in alcohol 817 S G

Reactions — 1 When the crystals of MgCl₂6H₂O are heated in air, water is given off and at the same time partial decomposition occurs with evolution of HCl and formation of

oxyc_lorides -2 MgCl₂ is partly decomposed by much water to MgO and HCl

Combinations —1 With magnesia to form oxychlorides (v Magnesium, oxychlorides of, p 162)—2 With potassium chloride to form MgCl, KCl 6H,O, occurs native as carnallite, crystallising in rhombic forms according to Marignac (C R 155, 650), in hexagonal forms according to Rammelsberg (Hand der Krystall Chemie, 204) The double salt is prepared by mixing solutions of the constituents in the proper ratio, evaporating, and crystallising -3 With ammonium chloride, and calcium chloride, to form MgCl₂. H₂Cl 6H₂O (v Pfaff a Hantz, A 66, 250), and MgCl₂ CaCl₂12H₂O, respectively — 4 With sodium chloride to form MgCl, NaCl H₂O (Poggiale, C R 20, 1180) — 5 With ferric chloride, and chromio chloride, to form 2MgCl, Fe,Cl, 2H,O, and 2MgCl₂ Cr₂Cl₈ 2H₂O, respectively (Ne₃mann, A 244, 328) —6 With phosphorus oxychloride to form MgCl₂ POCl₃ (9MgCl₂ 10POCl₃ according to Cronander, B 4, 753), a deliquescent solid, decomposed by hot water (Casselmann, A 98, 223) 7 With wodine trichloride to form deliquescent, easily decomposed, crystals of MgCl, 2ICl, 5H2O, obtained by dissolving Mg(IO₃)₂ in conc HClAq, leading HCl into the liquid to saturation, and surrounding by a freezing mixture (Filhol, J Ph 2, 442)—8 With ammonia to form MgCl₂4NH₃, a white sublimate by heating $MgCl_2$ in NH_3 (Clark, A 78, 369)

Magnesium, chromate of, v Chromates,

vol 11 p 155

Magnesium, fluoride of MgF₂ Mol w unknown as VD has not been determined Occurs native as sellatte. Formed by dissolving magnesia alba in Hl Aq, evaporating to dryness, and heating the residue, also by ppg a Mg salt in solution by a soluble fluoride. Obtained in crystals, either by melting the salt, prepared as described, with NaCl or KCl (Cossa, Z K [2] 1, 207), or by melting together 5 parts MgCl₂, 4 parts NaF, and 4 parts NaCl (Roder). Four sided, very hard, white needles. S G 2 856 at 12° (Cossa, B 10, 295). Guntz (A Ch. [6] 3, 5) gives the thermal data [MgO'H', 2HF] = 28,400. Forms a double compound with NaF, vir. MgF₂ NaF. Obtained by adding MgO, H to NaFAq and evaporating, the decomposition according to Tissier (J. pr. 90, 50) is

3NaF + MgO₂H₂ = 2NaOH + MgF, NaF Magnesium, haloid compounds of Mg forms a single compound, MgX₂, with each of the halogens None of these compounds has been gasi fied, hence the molecular weight of none is known with certainty, but the great similarities between Mg, Zn, and Cd, make it extremely probable that the formula MgX₂ expresses the composition of the molecules of the compounds in question MgCl₂, MgBr₂, and MgI₂ crystallise with 6H₂O, when these crystals are heated they are partly decomposed to MgO and HX(X = Cl₂Br, or 1)

Magnesium, hydrosulphide of MgS₂H₂ A solution of this compound is obtained by passing H₂S through MgO suspended in water, the MgO dissolves and leaves a nearly colourless solution, which evolves H₂S when exposed to air or heated The solution thus prepared contains c 16 p c MgS₂H₂, and bas S G 1 118 at 13°

(Divers a Shimidzu, C J 45, 699) MgS₂H₂Aq is also formed by treating MgS with water A solution of MgS₂H₂ is a convenient source of H₂S, a steady stream of the gas is obtained by heating to 60° - 65° (D a S lc) Thomsen gives the thermal data [Mg, S², H², Aq] = 114,880 (Th 3, 243)

Magnesium, hydroxida of $\rm MgO_2H_2$ Occurs native as $\rm brucite$, forming white, pearly, crystaline tablets (hexagonal rhombohedra), S G 2 35 to 2 46 Prepared by ppg a Mg salt by NaOHAq, washing, and drying at 100° , also by direct combination of water with MgO, and drying at 100° , S G 2 36 at 15° (Schulten, C R 101, 72) MgO which has been heated to whiteness does not combine with water (p Deville, C R 61, 975, Knapp, D P J 202, 513, Schwarz, D P J 186, 25, Dittle, C R 73, 111, 191, 270 [Mg,O²,H²] = 217,320, [Mg,O,HO] = 148,960 (Th 3, 243) Soluble c 100,000 parts water, MgO₂H₂Aq is feebly alkaline to litmus, with acids MgO,H₂ reacts as a strong base, forming salts MgV₂, X = Cl, NO₃, $\frac{1}{2}$ SO₄, $\frac{1}{2}$ PO₄, &c, [MgO²H²,H²SO¹Aq] = 31,220, [MgO'H²,2HNO³Aq] = 27,520, [MgO'H²,2HClAq] = 27,520, [MgO'H²,

Magnesium, todide of MgL₂ Mol w unknown as VD has not been determined Obtained by throwing I, in small quantities at a time, on to molten Mg (Lerch, J pr [2] 28, 338), reaction is very violent A white, waxy solid, very de liquescent A hydrate, MgL₂8H₂O according to Lerch (lc), is formed by the reaction between I and Hg under water (L), or by dissolving magnesia alba in HIAq and evaporating over H₂SO₄, very deliquescent MgL₂ is decomposed by heating in air, giving off I, and forming MgO, heated in O it is entirely changed to MgO (Schulze, J pr [2] 21, 407) MgI forms double compounds with KI and NH₂I (Lerch, lc) The following table is given by Kremers (P 108, 118)—

Pc MgIa	SG MgI,Aq	Pc MgI,	SG MgI Aq
5	1 043	35	1 395
10	1 088	40	1 474
15	1 139	45	1 568
20	1 194	50	1 668
25	1 254	55	1 780
30	1.320	60	1 915

Magnesium, nitride of Mg,N2 Mol w un known, as VD has not been determined Ob tained in small transparent crystals by Deville a Caron in making Mg Brieglieb a Geuther (A 123, 236) prepared Mg, N₂ by heating Mg turnings in a stream of dry pure N Mg,N_2 is also formed, according to Mallet (C N 38, 39), when Mg is heated in a small quantity of air Prepared by heating Mg in N, Mg, N, is an amorphous, greenish yellow, powder, becomes brown on heating Heated in air it is slowly oxidised to MgO, the oxidation is rapid when O is sub stituted for air With water, forms MgO and NH, With dilute acids, forms Mg salts and NH, salts Heated in HCl, MgCl, and NH,Cl are formed. Heated in dry H₂S, MgS and (NH₄)₂S are slowly formed Heated to redness in OO or CO₂, MgO, C, and C₂N, are produced PCl₃ vapour reacts to form MgCl₂ and P nitride Vol. III.

Magnessim, oxide of. MgO (Magnessa) Mol w unknown, as compound has not been gasified SG 3 642 at 12° (Cossa, B 10, 1747), SG crystallised 3 636 (Ebelmen, J 4, 15), for SG of MgO heated to temperature from 350° to bright redness v Ditte, C R 73, 111, 191, 270

A new medicine was introduced in Rome in the beginning of the eighteenth century, the name magnesia alba given to it is supposed to have been suggested as a distinction from magnesia nigra, a term then applied to pyrolusite, MnO. The preparation of the new medicine was kept secret. In 1709 Slevogt showed that magnesia alba could be obtained by ppg the mother liquor from the preparation of saltpetre by K.CO. Magnesia alba was supposed to be the same as lime, but Hoffmann found that some of its reactions differed from those of this compound. In 1755 Black demonstrated magnesia alba to be a compound of CO. with a new earthy base, to which he gave the name magnesia

Occurrence —MgO occurs as percelase, crystallised in regular octahedra, SG 3 67, usually coloured green from presence of a little FeO

Formation—1 By adding NaOHAq or KOHAq to solution of a Mg salt, washing, and strongly heating the pp of MgO H₂—2 By cal cining magnesia alba, a basic Mg carbonate ob tained by ppg a Mg salt by an alkaline carbonate (v Carbonates, vol 1 p 699)—3 By burning Mg in O—4 By decomposing MgCl₂Aq by calcined dolomite, MgCl₂Aq + CaO MgO = 2MgO + CaCl₂Aq —5 In crystals same as periclase, by strongly heating powdered MgO in a slow stream of HCl gas (Deville, A 120, 183), also by heating powdered MgO in a porcelain oven (H Rose)

Preparation—1 A boiling solution of pure MgSO, 7H_O, is pad by Na_CO_AAq, after boiling for a little the pp is washed and dried, and the product (4MgCO_3 MgO_H xH_O) is calcined in a Pt vessel until every trace of CO_2 and H_O is removed—2 Magnesia alba is treated with enough dilute HNO_AQ to dissolve nearly but not quite all, after standing for some time in the air with frequent stirring, to ppt Fa_O_xXH_O, the liquid is filtered, the filtrate is mixed with a little pure MgSO_3 alcohol is added, and, after digesting for some time with pure CaSO_3, the liquid is evaporated to crystallisation, and agair filtered, finally the filtrate is evaporated to dry ness, the Mg(NO_3) thus obtained is calcined, the residue is very thoroughly washed, and again calcined (Wurtz) (For preparation of pure MgO from magnesite v Caron, C R 66, 840)

Properties —A white powder, more or less floculent according to the temperature and length of time it has been heated MgO absorbs water and CO₂ from the air, slowly forming MgCO₂ xMgO₂H₂ yH₂O It is slightly soluble in water, 1 part requires 55,368 cold or hot water for solution according to Fresenius, 100,000 to 200,000 according to Bineau. The solution of MgO is feebly alkaline to litmus. When very strongly heated MgO does not melt but gives out a very clear white light. Made into a paste with a little water, MgO sets to a hard, white mass (Deville, C. R. 61, 975), MgO which has been heated to whiteness does not set with water (v. Knapp, D. P. J. 202, 513, Schwarz, D. P. J. 186, 25). MgO reacts with acids as a strong base

forming salts MgX_2 , X = Cl, NO_2 , $\frac{1}{3}SO_4$, $\frac{1}{3}PO_4$,

Reactions -1 With water to form the hydroxide MgO₂H₂.—2 Heated with ammonium chloride NH, is evolved and MgCl₂ formed —8 With acids MgO reacts as a strong base forming salts MgX₂, X = Cl, \(\frac{1}{2}SO_4, &c -4 \) With salts of heavy metals MgO reacts similarly to CaO, BaO, and SrO, ppg hydrated oxides — 5 With and SrO, ppg hydrated oxides — 5 With carbon dioxide and water, basic carbonates MgCO, xMgO H, yH₂O are formed — 6 Sus pended in water through which is passed a current of hydrogen sulphide, a solution of MgS2H2 18 obtained (v Magnesium, hydrosulphide of, p 160) —7 Heated in carbon disulphide vapour, MgO MgS is formed (Reichel, J pr [2] 12, 55)

Magnesium, oxychlorides of When freshly heated MgO is moistened with MgCl2Aq, S G 1 16 to 1 26, the whole sets to a firm, hard mass, which probably consists of a mixture of oxychlorides xMgO yMgCl₂ (v Sorel, C R 65, 102) By warming 30 parts MgO with 1500 parts MgCl, in solution, in an atmosphere free from CO, needle shaped crystals slowly form, when washed free from MgCl₂, pressed, and dried over soda lime, the crystals are 10MgO MgCl₂ $18H_2O$, dried at 110° they lose $4H_2O$ (Krause, A 165,38)

Magnesium, oxysulphide of

 $Mg_2OS(=MgO MgS)$ An amorphous, reddish, solid, obtained, along with COS, by passing CS2 vapour over heated MgO (Reichel, J pr [2] 12,

Magnesium, phosphide of Mg,P, A hard, brittle, steel grey solid, obtained by heating molten P with Mg in H (Parkinson, C J [2] 5, 127, 309), or in a sealed glass tube (Emmerling, B 12, 152) Decomposed by water, evolving PH, and forming MgO, with acids gives Mg salts and PH.

Magnesium, salts of. Compounds obtained by replacing H of acids by Mg The salts of Mg belong to one series, MgX₂, where X = Cl, NO₃, $\frac{1}{3}$ SO₄, $\frac{1}{3}$ CO₂, $\frac{1}{3}$ PO₄, &c A few basic salts, and many double salts, of Mg are known MgCO₃, the basic carbonates and phosphates, and a few other salts are insoluble in water, but most of the Mg salts readily dissolve in water The salts are usually prepared by dissolving MgO, MgO₂H₂, or MgCO₃, in the various acids, and evaporating, some are prepared by double decomposition from the soluble salts, generally from MgSO. As none of the salts of Mg has been gasified the formulæ given are not necessarily molecular, they are based on the results of analysis and considerations of the similarities between the salts of Mg, Zn, and Cd (v MAGNESIUM GROUP OF ELEMENTS) The Mg salts are numerous, and as a class very definite and stable bodies, the fol lowing are the chief salts derived from oxyacids -bromate, carbonates, chlorate, dithionate, hypochlorite, hypophosphite, iodate, nitrate and -te, perchlorate, todates, phosphates and ste, selenate and ste, selecates, sulphate and ste, tellurate and ste, throsulphate (v Carbonates, NITRATES, SULPHATES, &c)

Magnesium, selenide of A flesh coloured pp, probably a selenide of Mg, is obtained by adding K2Se to solution of a Mg salt, the p. 18 decomposed by heat, and by acids, with separa tion of Se (Berzelius)

Magnesium, silicides of A compound of Mg and Si is prepared by placing a layer of fused and powdered NaCl in the bottom of a Hessian crucible, adding one half of a mixture of $2\frac{1}{2}$ parts NaCl and 7 parts Na₂SiF₆, then $2\frac{1}{2}$ parts Mg, and then the other half of the mixture of NaCl and Na, SiF, covering the whole with NaCl, and heating in a wind furnace, when the reaction is completed the contents of the crucible are stirred with a polcelain rod, and allowed to The regulus formed at the bottom of the crucible is a mixture of Mg and Mg silicide, by washing with NH ClAq the Mg is dissolved out (Geuther, J pr 95, 424) As thus prepared the silicide has the composition Mg₈Si₂ It forms metal like, lustrous crystals Reacts with HClAq to form MgCl₂, C1H₄, H₂S1O₃, and H This sub stance may be a compound, or a mixture, of Mg₂S₁ and MgS₁ (Mg₃S₁ = 2Mg₂S₁ + MgS₁) A silicide Mg2Si is obtained by pulverising, in a warm mortar, 40 parts fused MgCl₂, 35 parts Na₂SiF₆, 10 parts NaCl, adding 20 parts Na in small pieces, and projecting the mixture into a hot Hessian crucible After fusion and cooling, the greyish black mass in the crucible is found to contain metal like tablets and globules, these consist of Si and Mg₂Si, by treating with HClAq Si remains and SiH, is evolved (Wohler, A 107, 113, cf Martius, A 107, 112)

Magnesium, silicofluoride of MgSiF, said to be obtained as a gum like, very soluble substance, by dissolving MgO in H,SiF,Aq (Berzelius)

Magnesium, sulphydrate of, v Magnesium,

hydrosulphide of, p 160

Magnesium, sulphides of MgS has been isolated, polysulphides, probably MgS, MgS, and MgS, seem to exist in the solution obtained by warming MgS with S and H2O

MAGNESIUM MONOSULPHIDE, MgS Produced by passing H laden with S vapour over red hot Mg (Reichel, J pr [2] 12, 55, cf Parkinson, C J [2] 5, 125, 309) According to Fremy, MgS is formed, along with CO,, when MgO is strongly heated in dry H_s S, but Reichel (l c) says that the products of this reaction are MgO MgS and COS MgS is also said to be formed, along with $(NH_4)_2S$, by heating Mg_3N_2 in dry H_2S (Briegheb a Geuther, A 123, 236) Fremy (A Ch [5] 38, 324) gives $[Mg_3S] = 39,800$ MgS is formed, but only in very small quantity, by strongly heating MgSO, with C Alkaline sulphides do not ppt MgS, but MgO₂H₂, from solutions of Mg salts

MgS, formed by heating Mg and S, is described as a yellowish grey amorphous, or as a reddish brown crystalline, mass, analysis always gives rather more S than required by MgS water, MgS is decomposed to MgO2H2 and MgS₂H₂Aq, the latter being afterwards converted into MgO₂H₂ and H₂S

By warming, MAGNESIUM POLYSULPHIDES not boiling, MgS and S with water, a dark yellow solution is obtained, containing Mg and S in a ratio varying from Mg 3S to Mg 5S (Reichel, J pr [2] 12, 55) The solution decompos air, giving off H₂S and ppg MgO₂H₂ and S Magnesium, sulphocyanide of, The solution decomposes in

Mg(SCN), 4H₂O, v vol 11 p 350

MMPM MAGNESIUM ETHIDE Mg(C2H3)2 nesium filings act rapidly on ethyl iodide, gas being given off If the product be heated in a sealed tube at 125° the contents solidify to a white mass which on distillation gives off MgEt, and leaves a residue of MgI₂ (Cahours, A 114, 227, 354, Hallwachs a Schafarik, A 109, 215) These statements are contradicted by Löhr (A 161, 48), who finds that EtOAc must be added to the mixture of Mg and EtI, and that the resulting magnesium ethyl is a non volatile solid.

MAGNESIUM GROUP OF ELEMENTS—
Beryllium, Magnessum, Zinc, Cadmium, Mercury Of these five metals, only Zn and Hg
are found native, and these in small quantities
Be occurs chiefly as silicate in combination with
Al silicate, not widely distributed, Mg salts,
especially MgCO, and MgSO, ar found in large
quantities, the chief ores of Zn are ZnCO, and
ZnS, they occur fairly widely distributed and in
considerable quantities, small quantities of
CdS and CdCO, accompany many Zn ores, the
chief ore of Hg is HgS, which is found only in

a few localities Be is classed with the rare elements, approximately pure Be was not prepared until 1885 Mg was obtained by Davy, in small quantity and impure, in 1800, in 1830 Bussy prepared the metal in a state of approximate purity Although brass has been made for very many centuries, yet it was not till the middle of the eighteenth century that the art of preparing metallic Zn was known in Europe. Cd was discovered and prepared in 1817 by Stromeyer Hg has been known certainly from the beginning of the Christian era

Be and Mg are prepared by reducing the chlorides MCl₂ by Na or K, ZnO and CdO are reduced by heating with C, Hg is prepared from HgS by heating with CaO, whereby CaS and CaSO₄ are formed and Hg is vapourised, or by heating with scrap iron, when FeS, SO₂, and Hg

are produced

The following table presents some of the prominent physical and chemical properties of the magnesium metals —

Chemical	Scarcely changed by heating in air or O, burns in O H flame to BeO Scarcely acted on by S at red heat Burns in Cl to BeCl. Dissolves slowly in acids to form salts Only one series of salts known, BeX. where X = Cl, \$804, \$704, &c Dissolves slowly in alkali solutions, evolving H Distinctly positive metal, does not show allo tropy, BeO has no acidic properties Atom of Be is divalent in gaseous molecules.	Unchanged in dry air, heated in air, or O, burns to MgO Decomposes hot water slowly, burns when heated in steam, forming MgO Decom poses CO ₂ at red heat Combines directly with halogens S, P, As, and N Dissolves in acids to form salts Only one series of salts is known, MgX ₂ , &c MgO ₂ H. is a strong base, compounds of Mg do not show any acidic properties Valency of atom of Mg not cer tainly known, as no binary haloid compounds have been gasified Mol w probably same as at w	Unchanged in air, heated strongly in air, or O, burns to ZnO Decomposes steam at red heat Com bines directly with halogens, but not with S Slowly soluble in alkali solution, with evo lution of H Dissolves in acids to form salts One series of salts known, ZnX ₂ , X = Cl, &c ZnO ₂ H ₂ dis solves in alkalis, but is ppd again on eva poration over H,SO ₄ invacuo There are indications of existence of a hydride of Zn Atom of Zn is divalent in gaseous mole cules Mol w same as at w	Slowly oxidised on surface in air, heated in air or 0, burns to CdO Cd vapour and steam heated together form H and OdO Combines directly with halogens, also with S and P Dissolves in acids to form salts Onlyone series of salts known, CdX, X = Cl, &c CdO,H ₂ is not soluble in alka his No compound of Cd shows any acidic proper ties Atom of Cd is divalent in gaseous molecules Mol w same as at w	Unchanged in air, heated nearly to BP is slowly oxidised to HgO Does not de compose water or steam Combines directly with halogens and S Dis solves in acids to form salts Two series of salts are known, HgX and HgX2, X = Cl, &c , salts of both series are numerous and stable HgO dissolves in molten KOH to form K2O 2HgO, HgS dissolves in Na or K sulphide solution to form compounds xNa,SyHgS forms very many ammonio - compounds Atom of Hg is mono and di valent in gascous molecules Mol w same as at w			

General formulæ and character of compounds Oxides -MO, also in case of Hg, Hg₂O Oxides —MO, also in case of rig, rig, of Hydroxides —MO₂H₂ Sulphides —MS, also in case of Hg, Hg₂S Haloid compounds —MX₂, also in case of Hg, HgX Salts —MX₂, also in case of Hg, MX, X = NO₃, ClO₃, ½CO₃, ½CO₄, ½CO₅, ½CO₆, ½CO₇, ½CO₈, ¼CO₈, ¼CO

acids to form salts MX_2 , $X = NO_3$, $\frac{1}{2}SO_4$, &c MgO reacts with water to form MgO₂H₂, the other hydroxides MO H2 are formed by ppg solutions of salts by alkalis HgO shows feebly marked acidic properties, it dissolves in molten KOH, and the compound 2HgO K₂O is obtained on cooling ZnO₂H₂ is sol KOHAq, but is reppd on evaporation in vacuo over H₂SO₄ Mercurous oxide Hg2O is the only representative of the class M2O, it is very easily resolved into Hg and HgO, it reacts with dilute acids, in the cold, as a basic oxide, forming salts HgX Hg2O in some respects resembles Cu₂O and Ag₂O, and exhibits the relations of Hg to the copper group

by heat to MO and H2O, HgO,H2 if it exists is extremely easily separated into its oxide and H2O, the only hydroxide obtained by direct re action between MO and HO is MgO,H, The hydroxides are basic, MgO2H, is slightly

The sulphides MS are basic The existence of BeS is extremely doubtful, MgS is readily decomposed by water, giving MgS,H,Aq, and finally MgO,H₂ and H₂S, ZnS, CdS, and HgS are more stable than MgS, HgS shows slightly acidic properties, it dissolves in K.SAq or Na₂SAq to form compounds xK_2SyHgS Mercurous sulphide Hg2S is very easily decomposed to HgS and Hg

The halord compounds MX2 may be obtained by the direct union of the elements, the mercurous compounds HgX are also obtained in this way MX2 and HgX are also prepared by dissolving the corresponding oxides in HXAq and evaporating, but MgCl, cannot be thus obtained, as evaporation towards dryness of MgCl,Aq re-(v COPPER GROUP OF ELEMENTS, vol 11 p 250). sults in formation of HCl and MgO mixed with The hydroxides MO₂H₂ are all decomposed oxychlorides xMgO yMgCl₂ The compounds BeCl, BeBr, ZnCl, CdBr, HgCl, HgI, and probably HgCl, have been vapourised without de-The haloid compounds form composition many double compounds They all combine with NH₃, various ammonio derivatives of HgX₂ and HgX are known Numerous oxyhaloid com pounds, xMO yMX2, are known

The salts MX2 are numerous and well marked, they are obtained by dissolving the corresponding oxides or carbonates in acids, and evaporating Mercurous salts HgX are prepared by digesting excess of Hg with the various acids Many basic salts of Be, Zn, and in the cold Hg have been prepared, most of the salts of Mg

are normal

The five metals Be, Mg, 7n, Cd and Hg belong to Group II, as the elements are arranged in accordance with the periodic law The following table shows their positions in the Group -

Even Serves

The properties of Be, the first mentoer of the group, suggest those both of the even and odd series members Physically it approaches Mg, Zn, and Cd more than Ca, Sr, and Ba, in the conditions under which it is oxidised, the basic but non alkaline character of its hydroxide, the existence of many basic salts, &c, Be shows closer resemblances to Zn, Cd, and Hg than to Ca, Sr, and Ba The solubility of BeO2H2 in KOHAq also suggests the solubility of ZnO₂H₂ in KOHAq, and of HgO in molten KOH, the hydroxides of Ca, Sr, Ba, and Mg are quite insoluble in alkalis Mg is closely related in many respects to the metals of the alkaline earths, Ca, Sr, and Ba, but its much greater stability in air, its non decomposition of cold water, the easy resolution of its hydroxide into MgO and H O by heat, &c, exhibit the analogies between Mg and Zn, Cd, Hg Sulphides of Ca, Sr, and Ba are readily formed, but MgS is only produced by heating Mg to redness in H laden with S vapour, the difficulty of forming MgS recalls the nonisolation of any compound of Be and S Alkalı carbonate solutions ppt MCO, from solutions of salts of Ca, Sr, and Ba, but the pps obtained from Mg salts are basic carbonates xMgCO, yMgO,H2 The sulphates of Ca. Sr. and Ba are reduced to MS by heating with C, but MgSO, is scarcely, if at all, reduced in this way Hg is distinguished from the other members of the magnesium family by its physical properties, the formation of two series of salts, the formation of a large number of ammonio-derivatives of both series of Hg salts, and in other ways

In the composition of their salts, and sometimes in the isomorphism of salts, the metals of the Mg family resemble those of the Fe family, viz Mn, Fe, N1, Co (v Iron GROUP OF ELEMENTS, For a further treatment of the elements of Group II v CLASSIFICATION, vol 11 pp 204-207, of also Alkaline marths, metals of the, vol i p 112

MAGNETIC ROTATORY POWERS of liquid compounds, v Physical methods, section Optical methods

MAIROGALLOL C₁₈H,Cl₁₁O₁₀(?)[190°] (From μαίρω, I glitter) Obtained, together with leuco gallol, by passing chlorine through pyrogallol (15 g) dissolved in 60 p c acetic acid (45 g) until the liquid is brown, and allowing the liquid to stand (Groves, A 179, 237, Stenhouse a Groves, C J 28, 706, Webster, C J 45, 208) Tri metric prisms, insol water, v sol hot alcohol, extremely sol ether, insol CS, and petroleum ether Decomposed by boiling with water yielding CO, oxalic acid, and tri chloro pyrogallol. Reduced by zinc and H₂SO₄ to tri chloro pyrogallol (Webster, C J Proc 3, 130, Hantzsch a. Schniter, B 20, 2033) Bolling with dilute H₂SO, gives a condensation product, and also a substance that is ppd from aqueous solution by Aqueous NaHSO, and zinc dust reduce it to tri chloro pyrogallol and an amorphous substance which yields furfuraldehyde when distilled with dilute H2SO, Mairogallol gives a crimson colour with solution of sodium sulphite (Cross a Bevan, C J 43, 18) Mairogallol when gradually heated gives a sublimate of tri chloro quinone and tetra chloro quinone These reactions indicate that mairogallol is derived by condensation from CO CCI CCI CCI CCI

MALACHITE GREEN v TETRA METHYL-DI-AMIDO TRI PHENYL-CARBINOL

MALAMIC ACID v MALIC ACID

MALEIC ACID C,H,O, ve CO₂H CH CH CO₂H Mol w 116 (confirmed by Raoult's method, Paterno, B 21, 2158) R_{∞} 386 (in a 69 p c aqueous solution, Kanonnikoff, J pr [2] 31, 347, cf Knop, A 248, 175) H C v 331,702 (Louguinine, C R 106, 1290) H C v 326 900 (Stohmann, Kleber a Langbein, J pr [2] 40, 217) HC p 326,300 (S K a L) HF 187,700 (S K a L) Heat of solution -4,438 (Gal a Werner, Bl [2] 47,158) Heat of neutralisation 26,648 (G a W)

Formation -1 Together with fumaric acid (q v) by the distillation of malic acid (Lassaigne, A Ch. [2] 11, 93, Pelouze, A Ch. [2] 56, 72, Liebig, A 11, 276, Buchner, A 49, 57, Kekulé, A Suppl 1, 129, 2, 85, Von Richter, Z [2] 5, 453) -2 By heating silver succinate at 180° (Bourgoin, C R 72, 52) -3 By saponification of the ether obtained from di chloro acetic ether by heating with reduced silver at 220°, or by the action of sodium upon its ethereal solution in the cold (Tanatar, B 12, 1563) -4 By the action of KCN on a di bromo propionio acid (Tanatar, B 13, 159) —5 From (δ)-bromo pyromucic acid and dilute HNO, (Hill a Sanger, A 232, 55) -6 By the action of baryta on tri-

chloro phenomalic acid CH C(OH) CCl,?

Preparation - Malic acid is rapidly distilled until the residue thickens, the flame being then withdrawn, the distillation then continues by itself until the residue is solid (furgaric acid) The distillate consists of maleic acid and maleic annydride, and may be wholly converted into maleic anhydride by AcCl The maleic anhydride may be purified by crystallisation from HOAc and then converted by hot water into maleic acid (Anschutz, B 12, 2281, cf Perkin,

B 14, 2547)

Properties — Monoclinic prisms V sol water and alcohol, m sol ether Its aqueous solution reddens litmus strongly Begins to boil at 160°, being then restored into maleic anhydride and water, which partially re unite in the receiver An aqueous solution of maleic acid is ppd by baryta (difference from fumaric acid) Unlike fumaric acid, maleic acid is not ppd by adding mineral acids to solutions of its salts

Reactions — 1 Reduced by water and sodium amalgam to succinic acid Zinc added to an aqueous solution of maleïc acid yields zinc maleate and succinate -2 Calcium maleate fermented in contact with cheese also changes to succinate (Dessaignes) —3 Electrolysis gives acetylene, succinic acid, and a small quantity of fumaric acid (Kekulé, A 130, 1) -4 Combines readily with bromine in the cold, forming iso dibromo succinic acid and some di bromo succinic acid derived from fumaric acid into which a portion of the maleic acid is at the same time transformed (Kekulé, Petri, A 195,59) Chlorine gives a di chloro succinic acid (Petrieff, Bl [2] 41, 309) Bromine in presence of water forms 180 di-bromo-succinie, bromo fumaric, bromo succinic, and fumaric acids (Wislicenus, A 246, 53) -5 Dissolves easily in aqueous HBr, the solution even at 0° soon depositing fumaric acid and bromo succinic acid in equimolecular proportions The bromo succinic acid may easily be extracted from the product by water (Fittig a Dorn, B 9, 1191)—6 Converted into fumaric acid by boiling cone HIAq, HBrAq, dilute HNO₃, or HClAq (Kekulé, A Suppl 1, 184, 2, 93, Kekulé a Strecker, A 223, 186) When HIAq is used the ultimate product is successed. succinic acid Dry HCl does not convert maleic acid into fumaric Maleic acid is converted into fumaric acid by heating its aqueous solution at 100°-180° (Semenoff, Bl [2] 46, 816) An aqueous solution of sodium maleate is not affected by being heated for 10 hours in a sealed tube at 100° to 185° -7 With hypochlorous acid it forms a compound which reduced by sodium amalgam yields inactive malic acid, oxymaleic acid (?), and a liquid which breaks up on heating into CO2 and $C_6H_{10}O_8$ (Petrieff) —8 KMnO₄ oxidises it to in active tartaric acid —9 Alcoholic NH₃ at 150° slowly forms aspartic acid (Engel, C R 104, 1805) —10 The acids of the maleic series readily split off H.O from their acid aniline salts, when the aqueous solution of the latter is left to stand for several days or boiled, a crystalline pp being formed of the acid anilide X" CO.HPh

an isomeride thereof Under the same conditions the acid aniline salts of the acids of the fumaric series are quite stable. This constitutes a ready method of determining to which of the two isomeric series a given acid belongs. The acid is half neutralised with aniline and either left to stand or heated to boiling, if a pp. s obtained insoluble in dilute HCl the acid belongs to the malric series (Michael, B 19, 1872).

Salts—KA" (dried at 100°). Radiating

Salts — K.A. (dried at 100°). Radiating crystals, v sol water, insol alcohol — KHA" aq small crystals, v sol water The solution reddens litmus.—Na.A". needles Ppd as a

granular crystalline powder by adding alcohol to its aqueous solution. Is not deliquescent—
NaHA" 3aq Triclinic crystals (Bodewig, J. 1881,
716) Sl sol cold water—KNaA" aq deliques cent crystalline powder (Büchner, A. 49, 60)—
BaA" 2aq gelatinous pp, changing to scales 8 11 at 20° (Regnault)—BaA"aq (Anschütz)—
BaH₂A", 5aq indistruct crystals, which redden litmus, v sol water (Büchner)—CaA"aq (dried at 100°) small needles, sol water—CaH₂A", 5aq long prisms, v sol water, insol alcohol—SrA"5aq silky needles—SrH₂A", 8aq rect angular prisms—MgA' 3aq—MgH₂A", 6aq hard crystals, v sol water, insol alcohol—ZnA" 2aq crystals, v sol water, insol alcohol—NiA"aq apple green crystals—CuA" light blue crystals, sl sol boiling water, v sol NH₂Aq, forming a solution whence alcohol ppts an azure blue crystalline powder—rbA" 3aq amorphous pp, changing to needles—Pb₂A"O (dried at 100°), Otto, A. 127, 178)—Ag,A' white pp, changing to lustrous needles—AgHA" (dried at 100°) needles

Acid aniline salt C₆H₅NH₃HA" jaq prisms, sol water On allowing the solution to stand for some days it forms phenyl aspartic acid C₆H₅NH C₂H₃(CO₅H₂ [132°] (Anschutz a Wirtz, A 239, 140, cf Michael, B 19, 1373, Am 9, .83, 197)—The neutral aniline maleate when boiled in aqueous solution de posits the phenylimide of phenyl aspartic acid C₆H₅NH C₂H₃ CO NC₆H₅, a body [212°] which was formerly described as the di anilide of maleic acid C₂H₂(CONHPh)₂

Phenyl-ımıde C₂H₂ CO NC₈H₈ [91°] (162° at 12 mm) Formed by the dry distilla tion of acid aniline malate (Anschutz a Wirtz, Am 9, 238, cf Michael a Wing, Am 7, 280) Long yellow needles, v sol benzene, CHCl, ether, and alcohol, sl sol CS₂ and ligroin Its solution in chloroform takes up bromine, forming the phenyl imide of di bromo succinic acid [159°] Baryta water at 40° gives the acid anilide of fumaric acid

Mono methyl ether HMeA" Probably exists in the solution of maleic anhydride in MeOH Such a solution becomes hot when mixed with NaOMe, probably forming NaMeA", but the solution presently deposits a bulky white, partly crystalline, pp, which forms an alkaline aqueous solution, becoming neutral on boiling, the neutral solution contains the methyl derivative of sodium methyl malate

C₂H₂(OMe)(CO₂Na)(CO₂Me) (Purdie, C J 47, 873)

Di methyl ether Me,A" (205° 1V) S.G. 14 1 158 H.C. 669,570 (Ossipoff, C. R. 109, 812) From silver maleate and MeI, excess of iodine being avoided, as this would convert it into di methyl fumarate (Ansohutz, B. 12, 2282) Bromine effects the same change

Mono-ethyl ether HEtA" From the anhydride and boiling alcohol Also from HAgA' and EtI (Ossipoff, J R 20, 254) Not identical with the mono ethyl ether of fumaric acid Forms a salt NaEtA" By treating HEtA" with NaOEt and boiling the product with water C_.H₂(OEt)(CO_.Et)(CO_.Na) is obtained, identical with that derived from fumaric acid (Purdie)

Diethyl ether Ei,A" (225° 1 V) From Ag,A" and Etl (Ansohutz, B 11, 1644, 12, 2281) Vapour density corresponds to the formula (O) Colourless liquid Converted by iodine into the fumaric ether Bromine gives di bromo succinic ether Boiling with NaOMe forms a product whence boiling water produces $C_2H_4(OMe)(CO_2Et)_2$ (Purdig, C J 47, 868)

Di-isopropyl ether Pr₂A" Vapour density corresponds to the formula

CH CO Anhydride C,H2O, ve [53°] CH CO

(Anschutz), [57°] (Pelouze, A Ch [2] 56, 72), [60°] (Fittig, A 188, 87) (202° 1 V) (A) V D 48 (H=1) (calc 49) (Hubner a Schreiber, Z [2] 7, 712) HC 336,920 (Ossipoff, C R 109, Appears to be the sole anhydride of both maleic and fumeric acids

Formation —1 By rapidly distilling maleic or fumaric acid, and frequently rectifying the pro duct (Pelouze, A 11, 263, Kekulé, A Suppl 2, In vacuo, maleïc acid splits up into water and anhydride even at 100° (Reicher, R T C 2, 312) -2 By heating fumaric acid with AcCl and HOAc at 100° -3 From silver fumarate and fumaryl chloride (Perkin, B 14, 2545) -4 By distilling chloro or bromo succinic anhydride (Anschutz a Bennert, B 15, 643) - \$5 By dis tilling malic anhydride

Preparation -1 Malic acid is treated with an excess of acetyl chloride, and the product (which probably chiefly consists of acetyl malic anhydride) is distilled, when it splits up into acetic acid and maleic anhydride, the yield is 45 pc (Perkin, C J 39, 562, B 14, 2547) — 2 By dry distillation of malic acid and treatment of the residue and distillate with AcCl, the yield is 56 pc of the theoretical (Anschutz, B 12, 2281)

Properties — Trimetric crystals, a b c = 6408 1 4807 (Bodewig, B 14, 2788) In contact with water it is converted into maleic acid, which is conveniently prepared in this way The abnormal rapidity of the etherification of maleic acid by heating with alcohols appears to be due to an intermediate formation of anhydride (Reicher, R T C 2, 308) Maleïc anhydride heated in a sealed tube at 260° gives a carbonaceous residue and gases (Semenoff, Bl [2] 46, 816)

Reactions -1 Unites with bromine at 100°, forming iso-di bromo succinic anhydride, which is resolved at 180° into HBr and bromo maleic anhydride —2 PCl₂ gives the chloride of fumaric acid (Perkin, B 14, 2548), but maleyl chloride (71° at 11 mm) appears to be first formed (Anschutz a Wirtz) -3 With a saturated solution of HCl in HOAc it forms at 100° chlorosuccinic acid -4 When heated with phenylhydrasine (1 mol) at 150° it forms the phenyl hydrazide C.H. C.O. N.HPh, which crystallises in needles [259°], and turns brown at 180° (Hötte, J pr [2] 35, 295)—5 When heated with phenois it produces therescent compounds analogous to the phthaleins, which may therefore be called 'maleins'. The resorcin malein has a green fluorescence, (a) naphthol malein has a greenish-red fluorescence (Burckhardt, B 18, 2864)

Constitution -The constitution of fumaric

and maleic acids is discussed under Fumario ACID, vol 11 p 585 The anomalous formula CO₂H C CH₂ CO₂H for male c acid, based on the formula CO₂H CBr, CH₂ CO₂H, 1s rendered improbable by the observation that bromofumaric and not pyruvic acid is the product formed, together with CO₂, when baruum iso-di bromo succinate is treated with moist Ag₂O in the dark (Demuth a V Meyer, B 21, 264) Racemic acid is formed when silver iso di bromo succinate is boiled with water The representation of maleic and fumaric acids by formulæ in space has been discussed by Wisli cenus in his treatise Ueber die raumliche Anordnung der Atome in organischen Moleculen

MALIC ACID C.H.O., 10
CO.H CH. CH(OH) CO.H Mol w 134 [100°]
S G 2 1 56 (Schröder, B 12, 1611) S G of solution -3148 Heat of neutralisation 24,919 (Gal a Werner, Bl [2] 46, 803) [a]_D = -3 in dilute solutions, as the liquid becomes more concen trated it approaches + 59

Occurrence - Malic acid was discovered by Scheele in 1785, but its composition was first correctly determined by Liebig (A 26, 166) It is very widely diffused in the vegetable king dom, being contained in plants sometimes in the free state, sometimes in the form of potassium. calcium, or magnesium salt. It is found in abundance, together with citric acid, in unripe apples, in the fruits of the barberry, sloe, elder, and mountain ash, and in gooseberries, cherries. bilberries, strawberries, raspberries, and many other fruits It is likewise found in the roots of marsh mallow, angelica, aristolochia, bryony, liquorice, primrose, and madder, in carrots and potatoes, in the leaves and stems of aconite, belladonna, hemp, celandine, holy thistle, lettuce, tobacco, poppy, rue, sage, house-leek, tansy, thyme, valerian, and melliot, in the flowers of chamomile, elder, and mullein, in pine apples and grapes, in the seeds of carraway, cumin, parsley, anise, flax, and pepper, in asafeetida, opoponax, and myrrh It also occurs in the leaves of the common ash (Gintl, Z [2] 5, 377), and in the fruit of the sumach (Reinsch, Z 1866, 221) Yolk, the sweat of sheep, contains potassium malate to the extent of 25 pc. of the solid residue (Buisine, C R 106, 1426).

Formation —1. Malic soid, with the same

optical properties as those with which it exists in plants, may be formed from asparagine or active aspartic acid by treatment with nitrous acid (Piria, A Oh [3] 22, 160) —2 Malio acid, with a rotatory power equal and opposite to that contained in plants, may be obtained from ordinary tartaric acid by the action of phosphorus, indine, and water (Dessaignes, A 117, 134, Bremer, Bl [2] 25, 6, B 8, 861, 1594)

Preparation —1 The juice of mountain-ash

berries, not quite ripe, after being pressed, boiled up, and filtered, is partly neutralised with carbonate of potassium, leaving, however, a suffi-cient excess of acid to redden litmus pretty strongly, then precipitated by nitrate of lead, set aside for a few days, till the curdy precipitate is completely converted into small needles, these crystals freed from the admixed mucous or flocculent compound of lead oxide and colour ing matter by careful elutriation with cold water, are, lastly, well washed with water The needles of impure malate of lead are boiled with a slight excess of dilute sulphuric acid, the filtrate divided into two equal portions, one portion exactly neutralised with ammonia, the other por tion then added, and the reddish liquid evaporated and cooled, it then yields nearly colourless crystals of acid malate of ammonia, which may be rendered quite colourless by recrystallisation These crystals are then precipitated by acetate of lead, and the precipitate, after thorough washing, is decomposed by sulphydric or sulphuric acid (Liebig) —2 The juice is boiled for some time with milk of lime in quantity not quite sufficient for neutralisation, and the pp poured into a boiling mixture of HNO₃ (1 pt) and water (10 pts) The acid calcium malate which crystallises out on cooling is recrystallised from water, dissolved in water, ppd by lead acetate, and the lead malate decomposed by H2S (Liebig, A 38, 259) By similar processes malic acid may be obtained from house leek, from cherries or barberries, from the berries of Rhus coriaria, from the stems of rhubarb, from apples, and from tobacco

Properties -The aqueous solution, concen trated to a syrup and left to evaporate in a warm place, yields groups of colourless shining needles or prisms of 4 or 6 faces They melt at 83° (Pelouze) or 100° (Pasteur), and do not suffer any loss of weight at 120° They deliquesce in the air, and are v e sol water and alcohol Dilute solutions of malic acid are lævorotatory, but the rotation changes so rapidly with concentration that concentrated solutions are dextro-These dextrorotatory solutions are rotatory rendered laworotatory by the addition of H2SO4 or of HOAc $[a]_{D} = 5.891 - 0.895q$ (where q = percentage of water in solution) (Schneider, A 207, Solutions of sodium malate containing about 54 pts of the salt to 46 pts of water are inactive at 20°, stronger solutions are lævorotatory, while more dilute solutions are dextrorotatory (Thomsen, J pr [2] 35, 153) soid kills algo (Zygnemaceæ) (Loew a Bokorny, J pr [2] 36, 272) Malic acid prevents the ppn. of cupric and ferric salts by alkalis, 2 mols holding 1 mol of CuO in solution (Hofmeister, A 189, 27, of Juette, Fr 7, 489) A dilute to-lution of malic acid or of a malate is not immediately ppd. by lime water or by CaCl, either in

the cold or on heating, but on the addition of alcohol a white pp of calcium malate separates (Braconnot, A Ch [2] 51, 331, H Rose, P 31, However, a solution of malic acid (1 mol) mixed with pure milk of lime (2 mols) may solidify to a pasty mass (Iwig a Hecht, A 238, A concentrated solution of an alkaline 171) malate is ppd by CaCl₂, but presence of NH,Cl hinders the ppn, which, however, takes place on adding alcohol Lead acetate gives a white pp, soluble in excess of malic acid and in ammonia, when the pp is heated in the mother liquid it melts to a semifluid translucent mass are not blackened by heating with fuming H,SO, Dilute HOAc at 60° dissolves lead malate, but not lead tartrate or citrate (Hartsen, Fr 14, 373, Ar Ph [3] 6, 110) Malic acid may be separated from oxalic and tartaric acids by ppg the latter with CaCl2, filtering, and ppg calcium malate by adding alcohol to the filtrate (Barfoed, Fr 7, 403) Ammonium malate may be separated from ammonium citrate, tartrate, and oxalate by solution in alcohol (Barfoed)

Reactions -1 Heated for some hours at 140° it yields water and fumaric acid it gives off water and maleic anhydride, while fumaric acid remains as a solid residue If the malic acid be suddenly heated to 200° and kept at that temperature a comparatively large quan tity of maleic anhydride is obtained The ma leic anhydride, combining with the water in the distillate, is partially converted into maleic acid Malic acid is carbonised when suddenly exposed to a red heat -2 By treatment with potash and bromine, bromoform is obtained (Cahours, A Ch. [3] 19, 507) -3 Nitric acid easily oxidises it to oxalic acid and CO2-4 Cone HIAq at 180° reduces it to succinic acid (Schmitt, A 114, 106) Succinic acid is also formed when calcium ma late is fermented in contact with yeast (Piria, A 70, 102, Liebig, A 70, 104, 363) Fermentation of calcium malate by certain Schizomycetes produces succinic, acetic, butyric, and propionic acids and ethyl alcohol (Fitz, B 11, 1896, 12, 481, cf Dessaignes, C R 28, 16, Liebig, A 70, 104, 363, Kohl, A 78, 252, Baer, Ar Ph [2] 69, 147, Winckler, Jahrb pr Pharm 22, 300, Rebling, Ar Ph [2] 67, 300, Béchamp, C R 70, 999) -5 By slow oxidation in the cold with K₂Cr₂O₇ it is converted into malonic acid (Des saignes, A 107, 251) -6 When boiled in dilute aqueous solution with MnO2 it yields a distillate containing aldehyde (Liebig, A 113, 14) -7 Heated with KOH it yields acetic and oxalic acid -8 When calcium malate (1 pt) is heated with PCl_s (4 pts) the chloride of fumaric acid passes over (Perkin a Duppa, A 112, 24, Lies Bodart, A 100, 327) —9 Boiling aqueous H₂SO at 135° gives aldehyde, CO₂, water, and CO (Weith, B 10, 1744)—10 The electrolysis of potassium malate gives aldehyde, CO2, and some acetic acid (Bourgoin, Bl [2] 9, 427) —11 Water containing a few drops of H₂SO, at 160° gives fumaric acid (Markownikoff, A 182, 351) — 12 When heated with phenol and H2SO, it gives

CO and C₀H, O-CO | (Pechmann, B 17, 929,

1649) —18 Long boiling with cone HClAq gives fumaric acid —14 Cone HBr at 100° gives brome-succinic acid and fumaric acid (Kekulé,

A. 180, 11) -15 Chloral at 125° forms | O CH CH₂ CO₂H | CCl₂ CH | [140°] This forms |

targe crystals, sl sol cold water (Wallach, A. 193, 42) With PCl₃ it gives the oily chloride C₂H₄Cl₄O₄, whence alcohol forms C₃H₄Cl₄(OEt)O₄ [46°], and MeOH gives C₂H₄Cl₃(OMe)O₄ [85°] — 16 Phenyl hydrazine at 120° forms C₁₃H₁₈N₁O₃ e C₂H₄O(CO N₂H₂Ph)₂ [223°], which crystallises from dilute alcohol in plates (Bulow, A. 236, 195, cf Fischer a Passmore, B. 22, 2734) — 17 Malic acid (3 p.s.) heated with mamidobenzoic acid at 150° forms a product whence by washing with hot water and alcohol, dissolving in aqueous NH₃ and ppg by HCl₃ there is obtained a white powder C₂H₄O(CO NH C₃H₄ CO₂H)₂. The ammonium salt of this acid forms with cupric acetate a pp of Cu₁(C₁₃H₁₃N₂O₇)₂. Ac₂O decomposes it, forming NHAC C₃H₄ CO₂H (Schiff, G. 16, 28, A. 232, 166)

Salts - Malic acid has a tendency to form At 200° the salts give off water and acid salts are converted into fumarates -NH4HA" trans parent trimetric prisms Not hemihedral, but becomes so after fusion and recrystallisation SG 125 1 55 +S 32 at 15 7° $[a] = -6^{\circ}$ dry distillation it forms fumarimide, fumaric, and maleic acids, and active and inactive malic acid Combines with acid ammonium tartrate Normal ammonium malate (NH₄)₂A" is v e sol water, and its solution gives off NH, to the air, becoming acid In a solution containing 63 p c of the salt $[a]_D = -42$ In a 17 p c so lution $[a]_D = -72$ (Schneider, A 207, 276)—

RHA" crystals Begins to decompose at 100° Sol water, insol alcohol $[a]_D = -5$ in a 21 p c solution, = -57 in a 94 pc solution at 20° K A" Uncrystallisable and deliquescent mass $[\alpha]_D = -22$ in a 62 pc solution, = -68 in a 94 pc solution at 20° (Schneider) —NaHA" Crystallisable and permanent in the air, sol water, insol alcohol $[a]_{D} = +0.15$ in a 60 6 p c solution, = -5 64 in a 20 pc solution at 20° (Schneider) — Na₂A" Uncrystallisable Uncrystallisable $[a]_{D} = +4.7$ in a 65.5 p c solution, = -8.4 in a 53 pc solution - *LiHA" Uncrystallisable $[a]_{p} = -4.6 \text{ in a } 50 \text{ pc solution}, = -8.4 \text{ in a}$ 10 pc solution - Li2A" Uncrystallisable $[a]_{D} = -41$ in a 39 pc solution, = -12 in a 6 pc solution at 20° (Schneider, A 207, 273) — BaA''aq thin plates $[a]_b = +82$ in a 9 4 p c solution, = -26 in a 2 p c solution at 20° — *BaH,A''₂ Uncrystallisable and more soluble than the neutral salt — SrA"aq (dried at 100°) Crystalline mass, v sol water — *SrH₂A" Crystalline pp formed by adding malic acid to a sotution of the preceding Sl sol cold, m sol hot, water—CaA" 3aq S 839 at 15°, 711 at 45°, 566 at 58°, 600 at 65°, 663 at 72°, 737 at 86° (Iwig a Hecht, A 233, 170) Granular crystalline mass When a solution of malio acid is added to lime water a pasty mass of A"Ca2(OH)29aq(?) is first formed, but when the theoretical quantity of malic acid has been added this dissolves up again, and the clear liquid deposits nodules of CaA" 3aq in the course of 24 hours —CaH₂A", 6aq (Hagen, A 38, 263) Occurs in stems of Geranium zonale, the berries of Rhus glabrum (Rogers, Am S 27, 294), and in tobacco Separates in well formed trimetric

octahedra from a solution of the neutral salt in warm dilute nitric acid S (of CaH₂A"₂) 1 287 at 15°, 8514 at 45°, 32 236 at 57°, 13 127 at 68°, 7437 at 78° (I a H) $[a]_D = +5$ (Bremer, R T C 3, 164) When the solution obtained by neutralising malic acid with CaCO, is boiled a nearly insoluble granular pp is got, which consists of CaA"aq (Richardson a Meundorf, A 26, 135), or of CaA" (Hagen, A 38, 257) — MgA" 5aq Prisms, which separate from a highly concentrated solution (Liebig, A 5, 148) Alcoholppts MgA" -MgH2A"24aq (or 3aq) Flattened prisms - ZnA"3aq Monoclinic crystals (Handl, J 1859, 289) Slowly deposited in the cold from the product of solution of zinc carbonate in aqueous malic acid at 30° When these substances are boiled together a basic salt ZnO(ZnA")2 4aq is deposited as a jelly, changing to a sandy powder, while the filtrate deposits ZnA" 3aq as hard, four sided prisms S 17at 20° — ZnH₂A"₂ 2aq Elongated octahedra S 4 in the cold — The neutral manganese salt is very soluble and uncrystallisable, by adding malic acid to its solution the acid salt is ppd as a white powder, S 25 From boiling water it separates in rose coloured crystals -The neutral and acid ferric salts are gummy masses. sol water and alcohol - CuA" aq gummy mass, v sol water —CuH₂A"₂2aq blucrystals, obtained by evaporation at 40°-CuO(CuA"), 4aq green insoluble powder obtained by boiling aqueous malic acid with cupric If evaporated at 45° dark green carbonate crystals of CuO(CuA"), 6aq may be got H Schulze (Ar Ph [2] 57, 273) obtained green crystals of a double salt of cupric malate and ammonium sulphate -PbA"3aq Obtained by ppg neutral lead acetate with a solution of calcium or potassium malate, as a white curdy pp which slowly changes to radiating four sided needles Melts in boiling water V sl sol cold, m sol boiling, water, from which it is deposited in needles Dissolves easily in nitric acid, acetic and malic acids do not dissolve it more readily than water When dry it does not melt at 170° but at 220° it forms lead fumarate—PbA" aq (dried at 100°) (Otto, A 127, 175) — PbO(PbA')... Obtained by digesting the neutral salt with am monia, or by dropping a solution of a neutral malate into a boiling solution of lead subacetate Amorphous pp, not becoming crystalline Does not melt under water Melts under hot dilute HOAc, evidently changing to the neutral salt Nearly insol water, to which, however, it imparts an alkaline reaction—AgoA" White parts an alkaline reaction —Ag₂A" White granular pp, formed by adding silver nitrate to a solution of neutral or acid ammonium malate Anılıne malate C.H.,NH,HA" [144°] White prisms (from alcohol) On dry distilla tion it gives water, aniline, the phenyl imide of phenyl aspartic acid [211°], and the phenylimide of maleic acid [91°] (Anschutz a Wirtz, Am 9, 237, A 239, 140)
Acetyl derivative CH, (OAc) (CO₂H),

Acetyl derivative CH₃(OAc)(CO₂H)₂ [132] From the acetyl derivative of the an hydride and water (Anschutz, A 254, 165) Dr-methylether Me₂A" (1223 at 10 mm)

by passing HCl into a cooled solution of malic acid in MeOH (Demondesir, A 80, 301; C. R

23, 227, Anschütz, B 14, 2790, 18, 1953) — Ca(MeA"), 18 sol alcohol

Acetyl derivative of the di methyl

ether CaH₂(OAc)(CO₂Me), (129° at 11 mm)

From the ether and AcCl

De-ethyl ether Et.A" (128° at 10 mm) Formed in like manner Can only be distilled en vacuo -Ca(EtA"), is sol alcohol

Acetylderivative of the di ethylether

C₂H₃(OAc)(CO₂Et)₂ (187° at 12 mm)

Nitroxyl derivative of the di-ethyl

ether C₂H₃(ONO₂)(CO₂Et)₂ S G ¹² 1 202 From the ether, fuming HNOs, and conc H, SO, (Henry,

B 3, 532) Thick oil

Din . n . propyl ether C.H. (OH)(CO.Pr). (151° at 10 mm) (Anschutz)

Acetyl derivative of the di-n propyl ether C₂H₂(OAc)(CO₂Pr)₂ (157° at 12 mm)

Mono isoamyl ether

C₂H₃(OH)(CO₂H)(CO₂C₅H₁₁) From malic acid
and isoamyl alcohol at 120° (Breunlin, A 91,
323)—NH₄A' needles—CaA'₂aq plates

Acetyl derivative of the anhydride CH(OAc) CO [54°] (161° at 14 mm)

CH,-Formed, together with maleic anhydride, by heating malic acid with AcCl (Anschutz, B 14, 2791) Decomposed by distillation under atmospheric pressure into HOAc and maleic anhydride

 $C_2H_3(OH)(CONH_2)_2$ Amide Malamide When gaseous NH, is passed into an alcoholic solution of malic ether crystals of malamide are deposited Separates from water in well defined Resolved by hydrolysis into NH, and crystals malic acid

Amicether $C_2H_3(OH)(CO_2Et)(CONH_2)$ Malamic ether Formed as a crystalline mass when gaseous NH, is passed into malic ether (Pasteur, J 1853, 411)

Dr-antlide C.H. (OH)(CONHPh), [175°] Formed, together with the phenylimide, by boiling aniline (2 mols) with malic acid (1) The phenyl imide is extracted by boilmols) ing water, and the residue recrystallised from alcohol, using animal charcoal (Arppe, A 96, Colourless scales Nearly insol water. dilute acids, and alkalis

Mono anrivac C₂H₃(OH)(CO₂H)(CONHPh) Malanthe acrd [145°] Obtained by boiling the phenyl-imide with aqueous ammonia, the product is ppd by baryta, and the Ba salt de composed by H.SO., avoiding any excess White granules composed of very minute needles (from alcohol), v sol water, m sol alcohol, sl sol ether Reddens litmus Hot dilute H,SO, re solves it into water and the phenyl imide white pp, salts are soluble in water -AgA' erystallising from water in shining scales

Phenyl - 1mide C2H3(OH) CONPh. [170°] Formed by heating malic acid with aniline and crystallising from water Groups of delicate needles, v sol water, alcohol, and ether

Inactive malic acid CO_H CH_ CH_(OH) CO_H [c 108°] (Pictet, B 14, 2648), [c 114°] (Kekulé), [183°] (Pasteur, Loydl, Bischoff) Occurs as calcium salt in the leaves of the common ash (Fraxinus ex-ectsion) (Gintl, J 1868, 800, Garot, J 1853, 409)

Formation -1 By mixing equal parts of levo- and dextro main acids (Van't Hoff, jun, B 18, 2170, R T C 4, 130) -2 By reducing racemic acid with HIAq (Bremer, Bl [2] 25,6) — 8 By the action of nitrous acid on inactive aspartic acid obtained from fumarimide (Pasteur, A Ch [3] 34, 46, A 82, 330) -4 By the action of moist Ag.C on bromo succinic acid (Kekulé, A 117,126, 130, 24) -5 By heating fumaric soid with a large quantity of water at $150^{\circ}-200^{\circ}$ (Jungfleisch, Bl [2] 30, 147) -6 By heating fumaric acid (1 pt) with NaOH (4 pts) and water (40 pts) for 100 nours at 100 (Linne mann a Loydl, A 192, 80, B 9, 925) —7 To gether with fumaric acid, by treating di \$\beta\$ chloro propionic ether with a weak alcoholic solution of KCy, and boiling the product with potash (Werigo a Tanatar, A 174, 367) Also in like manner from di & bromo propionicacid (Tanatar, B 13,160) —8 From chloro ethanetri carboxylic ether CO2Et CH2.CCl(CO2Et)2 and dilute alcoholic KOH (Bischoff, A 214, 49)

Properties - Crystallises more readily than active malic acid, being less soluble in water and not deliquescent, or at any rate less deliquescent than the active acid V e sol water, v sol alcohol, v sl sol ether When heated at 200° it yields fumaric acid

Salts -NH, HA" trimetric crystals (Van't Hoff) -NH, HA"aq monoclinic crystals a b c = $5856 \ 1 \ 5377$, $\beta = 68^{\circ} \ 12'$ —CaA" granular pp, sl sol water—CaA" aq—CaA" 2½ aq no dules of transparent crystals (Pasteur) The acid calcium salt resembles that of the active acid except that its crystals exhibit hemihedral faces The lead salt melts under water, but crystal lises less easily than the mactive salt. The lead salt obtained by Tanatar from di bromo propionic acid did not melt under water -Ag, A"

By crystallising the cinchonine salt Bremer (B 13, 352) was able to separate it into salts of

lævo and dextro malic acid

EthylderivativeC₂H₄(OEt)(CO₂H)₂. [86°] Obtained by saponifying its di ethyl ether (Purdie, C J 39, 348) Transparent crystals (from ether), sol water Not ppd by lead subacetate, but in neutral and feebly acid solution it is ppd by lead nitrate and, more slowly, by neutral lead acctate Fuming HI at 120° reduces it to succinic acid —CaA" insoluble —Ag₂A" sl sol water —BaA"aq hygroscopic, v sol water

Dr ethyl ether of the ethyl deriva tive O.H. (OEt) (CO.Et), (195°-200°) at 250 mm From fumaric ether and NaOEt, the product being neutralised (Purdie)

Isobutyl derivativeC,H,(OC,H,)(CO,H), Crystalline, deliquescent mass (Purdie) -CaA msol water -Ag,A" flocculent, insol water

The following compounds are probably also derivatives of the same inactive malic acid -

Amic acidCO₂H CH₂ CH(OH) CONH₃ [146°] Obtained, together Malamic acid with its ether, by boiling the amide of diazosuccinic ether with water (Curtius, J pr [2] 88, 479) Colourless prisms, v sol water, alcohol, and ether

Methyl ether of the amic acid CO.Me CH, CH(OH) CONH, [1056]. Formed, together with methyl fumaramate, by boiling water, forming di bromo barbituric acid Nitiis methyl diazo succinamate

CO2Me CH, CN, CONH,

with slightly acidified water (Curtius, J pr [2] 88, 482) Silky plates, v e sol alcohol, ether, and water With benzoic acid at 150 it forms crystalline CO2Me CH2 CH(OBz) CONH2 [80°], v sol ether

of the ethyl Benzoyl derivative ether of the amic acid CO,Et CH, CH(OBz) CONH, [97°] Formed by heating ethyl diazo succinamate with HOBz

Colourless hombohedra

Dextro-malic acid CO2H CH2 CH(OH) CO2H [c 100°] Formed from dextro asparagine (from sprouting vetch seeds) by treatment with nitrous acid (Piutti, B 19, 1693) The cinchonine salt is obtained by crystallisation from the cinchonine salt of mactive malic acid Resembles ordinary malic acid, except that it is dextrorotatory

Isomeride of malic acid C₄H₆O₅ [155°-168°] Formed by heating acetylene dibromide (5 pts) with KCy (4 pts) and alcohol (28 pts) at 100° and saponifying the resulting nitrile with potash (Sabanejeff, A 216, 275) Crystals, v sol water -Ag₂A"

Isomalic acid of Kammerer (J pr 88, 321 A 139, 257) is identical with citric acid (Ostwald, B 21, 3534)

Paramalic acid is described as Dictycollic

Iso-malic acid CH₃ C(OH)(CO₂H)₂ [c 140° From brome iso succinic acid and moist Ag.O (Schmoger, J pr [2] 14, 77, 19, 168, 24, 38) Crystals, v sol water, alcohol, and ether At In 170° it splits up into CO2 and lactic acid active Its neutral solutions give no pp with CaCl2 (unlike methyl tartionic acid, which gives a pp on warming) -BaA" 2aq amorphous pp S 1 at 100° Loses its water of crystallisation at 130° (unlike methyl tartionic acid) -PbA'

Does not melt under water —Ag,A" needles

Methyl-tartronic acid CH, C(OH)(CO H)2 Obtained from pyruvic acid by addition of KCy and HCl, the product being boiled with baryta water (Bottinger, B 14, 148, 17, 144) Rhombohedial crystals Decomposes on fusion, giving off CO Boiling conc HClAq splits it up into CO and lactic soid -BaA"aq (dried at 130°) Heavy crystalline powder, ppd on boiling — ZnA" 2aq crystalline powder —

Ag2A"aq white crystalline powder Reference -Bromo Malic acid

MALLOTOXIN C11H10O, or C18H16O, be extracted by CS, from finely-divided kamala, a yellow dye got from the seeds of Mallotus Phillipensis (A G Perkin a W H Perkin, jun, B 19, 8109) Flesh coloured needles, insol water, v sol hot alcohol Dissolves readily in alkalis, forming a yellowish red solution Ac.O yields a di acetyl derivative, r ROTTLERIN

MALOBIURIC ACID C.H.N.O. s.e

CO NH CO CH CO NH (?) Formed, as am monium salt, by heating barbituric acid (malonyl urea) with urea at 160° (Baeyer, A 135, 312) Formed also by boiling cyanuromalic acid with HClAq (Nencki, B 5, 888) Ppd by adding HCl to solutions of its salts as a granular pp which, when quite pure, can be obtained in crystals Dissolves completely in bromine and

acid converts it into nitro barbituric (dilituric) acid —KA'aq long needles S 16 in hot water MALONAMIC ACID v MALONIC ACID

MALONAMIDE v Amide of Malonic acid MALONANILIC ACID v Mono-analide of MALONIC ACID

MALONIC ACID C,H,O, ** e CH,(CO,H), Mol w 104 [134°] (Krafft a, Noerdlinger, B 22, 816) S 109 at 1°, 138 at 16° (Miczynski, 22, 816) \$ 109 at 1°, 138 at 16° (Miczynski, M 7, 258), 109 at 15° (Bourgoin, Bl [2] 33, 428) HF 212,700 (Stohmann, Kleber a Langbein, J pr [2] 40, 206) HC v 207,900 HC p 207,300 (S, K a L), 208,650 (Lougunine, C R 107,597) Heat of solution = -4573 Heat of neutralisation by NaOH 27,120 (Gal a Werner, Bl [2] 46, 803), 26,650 (Massol), by KOH 27,300, by NH, 25,040, by BaO₂H, 30,135, by CaO₂H₂ 27,090 (Massol, C R 107, 257, 393, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 108, 813, 10 1060, 109, 27) SH (0° to 50° 110°) 3262 (Hess, P [2] 35, 410) SH (0° to 50°) 2832, (0° to

Occurrence - In beet root (Lippmann, B 14, 1183)

Formation -1 Discovered by Dessaignes (C R 47, 76) as a product of the slow oxidation of malic acid by cold aqueous K2Cr2O, -2 By the action of alkalis or acids on cyano acetic acid (semi nitrile of malonic acid) or cyano acetic ether (Kolbe, A 131, 349, Hugo Muller, C J 17, 109) -3 By oxidation of allylene or propylene with cold alkaline KMnO, (Berthelot, J 1867, 335) -4 By boiling barbituric acid with potash (Baeyer, A 130, 143, Heintzel, A 139, 129) -5 By boiling mucobromic acid with baryta water (Jackson a Hill) -6 From di chloro acrylic ethei by treatment with Ag,O at 125°, and saponifying the product (Wallach a Hunaeus, A 193, 25) -7 By treating CBr, CO CH, CBr, with fuming HNO, (Demole, B 11, 1714)

Preparation -1 From ethylic, or better from

Chloro acetic acid potassic, chloro acetate (100 g) dissolved in water (200 g) is neutralised by K₂CO₃ (75 g), mixed with KCy (70 g), and warmed The reaction heats the liquid to boil KOH (100g) is now ing and is soon over added, and the liquid boiled as long as NH, escapes The liquid is then acidified with HCl, evaporated to dryness, and the malonic acid ex tracted by ether (H v Miller, J pr [2] 19, 326, cf hinkelstein, A 133, 338) —2 Chloro acetic acid (100 pts) is dissolved in twice its weight of water, and neutralised with potassium carbonate (75 pts) To the solution is added 75 to 80 pts potassium cyanide (98 pc), and the mixture heated for two hours, with continual renewal of the evaporated water The remaining mass is decomposed with concentrated potash When the odour of ammonia has disappeared the solution is neutralised with hydrochloric acid, and ppd as a calcium salt. This is decomposed with the requisite quantity of oxalic acid, the residue extracted with ether, and the solution evaporated (Conrad, A 204, 121) -3 By dissolving chloro acetic acid (100 gms) in double its weight of water, saturating the solution with potassium bicarbonate (110 gms), adding potassium cyanide (75 gms), and warming on the water bath At the end of the reaction double the volume of odnoentrated hydrochloric acid is added and the precipitation of potassium chloride rendered com plete by passing in a current of HCl gas The potassium and ammonium chlorides are filtered off, and the filtrate evaporated The nearly dry residue is taken up with ether, which on evaporation yields pure malonic acid (70 gms) (Bourgoin, A Ch [5] 20, 271) —4 Chloro acetic ether is boiled with pure KCy dissolved in 70 pc alcohol for 4 hours The alcohol is distilled off, and the residue mixed with dilute HCl and evaporated to dryness The cyano acetic ether is extracted with ether and decomposed by fuming HClAq at 100° (Petrieff, J R 10, 64, B 7, 400) —5 In like manner from bromo acetic ether (Franchimont, B 7, 216)

Properties —Triclinic lamins or prisms De composes a little over its melting point into CO₂ and acetic acid, but when heated under 10 mm pressure it may be sublimed V sol water, alcohol, and ether When heated with Ac.O, ma lonic acid gives a reddish yellow liquid with greenish yellow fluorescence — 001 g is sufficient for this test (Kleemann, B 19, 2030) A small quantity of malonic acid treated with urea and POCl₃ yields a product which when evaporated with nitric acid leaves a residue which gives with ammonia the purple colour due to

murexide (Grimaux, C R 88, 85)

Reactions -1 A solution of the free acid is hardly affected by the passage of an electric cur rent But the electrolysis of a concentrated al kaline solution gives off oxygen, CO, and CO2 at the positive pole, without any hydrocarbon (von Miller, Bourgoin, A Ch [5] 20, 80, C R 90, 608)—2 Malonic acid (5g) heated with bromine (10 cc) and water (12 cc) for 18 hours at 120° to 145° gives bromoform, tri bromo acetic acid, CO_2 , and HBr (Bourgoin, Bl [2] 34, 215) -3 HNO₃ (S G 153) in the cold gives off CO_2 (2 mols) (Franchimont, R T C 3, 422) -4PCl, gives malonyl chloride and a compound C₈H₄ClO₆, crystallising in needles [122°], decom posed by water and alcohol with evolution of CO₂ (Behal a Augur, Bl [2] 50, 631) —5 Malonic acid (1pt), NaOAc (1pt), and Ac₂O (3pts) at 100° forms a brownish yellow acid CilH4Os The sodium salt C₁₁H₃NaO₈ is v sol water, alkalis, and cone H₂SO₄, m sol HOAc Its solu tions exhibit fluorescence, but on heating CO2 is evolved and the fluorescence disappears acetic acid solution of the salt C11H3NaOs boiled with a solution of phenyl hydrazine acetate forms CO₂, NaOAc, and C₁₀H₄O₄(N NHPh)₂, a substance insol water and ether, v sol alcohol and HOAc, forming a green solution in conc H₂SO₄, and melting with decomposition about 180° (Kleemann, B 19, 2030) -6 Benzoic alde hyde and HOAc forms benzylidene malonic acid C₂H, CH C(CO₂H)₂ —7 Propionic aldehyde and HOAc gives CH, CH, CH CH CO2H (Komnenos, 4 218, 168) -8 o Oxy benzoic aldehyde and HOAc at 100° forms coumarin-carboxylic acid (vol 11 p 269) —9 Cunnamic aldehyde and HOAc at 100° gives phenyl-butinene dicarboxylic acid C₆H₅ CH CH CH C(CO₂H)₂ (Stuart, C 49, 366) -10 Heated with phenyl throcarbimide it gives acetanilide and the dianilide of malonic soid (Moine, Ann Chim Farm [4] 4, 201)
Salts The salts, with the exception of

Salts—The salts, with the exception of those of the alkali metals, are sparingly soluble in water, more soluble in dilute malonic ackl, HOAc, or nitric acid (Finkelstein, A 133, 338)—NaHA" 4aq: well defined crystals (F.).—

ethylimide of fumaric acid # NEt,

whence concentrated caustic potash solution forms NHEt CO CH CH CO₂H [126°] (Piutti, C C 1888, 1529)

Methyl ether Me,A" (1815° cor) SG 15 11603, 25 11511 (Perkin, C J 45, 509), 5 11753 (W) M M 528 at 17° SV 1376 (Wiens, A 253, 297) From silver malonate and MeI (Osterland, B 7, 1286) Oil, sol alcohol and ether

Mono-ethylether CO₂Et CH₂ CO₂H When alcoholic KOH (1 mol) is added to alcoholic malonic ether the liquid forms a crystalline pulp of CO₂Et CH₂ CO₂K composed of needles (Van't Hoff, B 7, 1571, Freund, B 17, 780) PCl₃ converts it into CO₂Et CH₂ COCl (170°-180°)

Ethyl ether CH_(CO,Et), (198° cor) (Per kin, C J 45, 508), § 1 0761 (Wiens) SG ½ 1 0610, § 1 10625 M M 7 41 at 14° SH 439 at 0°, 45 between 10 6° and 82 2° (R Schiff, Zert Phys Chem 1, 376, G 16, 454) SV 185 1 (Wiens, A 253, 297)

Preparation.—1 Calcium malonate is bailed with H₂SO, and 4 times the theoretical quantity of alcohol for 24 hours (Conrad, B 12, 749)—

2 Chloro acetic acid (250 g) is dissolved in water (500 g) and K,CO, (187 g), KCy (175 g) is added, and the whole heated on a sand bath until the reaction begins. The product is evaporated until its temperature is 135° , and is then allowed to cool. When cold it is treated with two-thirds of its weight of alcohol and gaseous HCl is passed in. The product is poured into iced water, extracted with ether, dried over CaCl₂, and distilled (Venable a Claisen, A 248, 131). Tricarballylic ether (287°) is obtained as a by product (Dau michen, C C 1888, 1347).

Reactions —1 Water at 150° gives CO, and acetic ether (Hjelt, B 13, 1949) —2 Boiling with m amido benzoic acid and a little alcohol forms CH2(CO NH C6H4 CO2H)2, a powder which will not melt and is insol water, hardly sol boiling alcohol, sol dilute NH, Aq, and dissolves without change in conc H,SO, (Schiff, A 232, 143, B 17, 403, G 15, 534) The intermediate com-17, 403, G 15, 534) The intermediate compound CO₂Et CH₂ CO NH C₆H₄ CO₂H [173°] is also formed at the same time -3 Chlorine forms chloro malonic ether -4 Cautious treatment with nitric acid (5 pts of S G 15) gives nitro malonic ether (Franchimont a Klobbie, R T C 8, 283) -5 According to Lang (B 19, 2937) zinc methyl or zinc ethyl act in the cold, forming phloroglucin tricarboxylic ether, methane, and ethane -6 When a mixture of malonic ether (1 mol) and LtI (2 mols) is heated with zinc there is formed ethane and ethyl-malonic ether (90 pc of the theoretical amount) (Daimler, B 20, 203) When malonic ether (20 g), EtI (100 g), and granulated zinc are heated with inverted condenser at 100° there is formed di ethyl malonic ether (Joulowsky, J pr [2] 39, 446) 7 With allyl rodide and zinc there is formed di-allyl malonic ether and propylene (Matvéeff, J pr 39, 452) - 8 When malonic ether (2 mols) is treated with glyoxal (1 mol) and zinc chlor ide it forms di oxy butane tetracarboxylic ether (CO₂Et)₂CH CH(OH) CH(OH) CH(CO₂Et)₃ (Polonowsky, A 246, 1) -9 With benzoic aldehyde and HCl it forms benzylidene malonic ether C.H. CH C(CO.Et) (Claisen a Cremer, A 218, 129)—10 Furfuraldehyde and acetic anhy dride give furfuryl methenyl malonic ether C4H3O CH C(CO2Lt)2 which boils with slight de composition at 293°, and gives on saponification the acid ether C,H,OCH C(CO,H)(CO,Et) [102 5°], and finally the acid C,H,O CH C(CO,H), [187°], which may be reduced by sodium amalgam to C₄H₃O CH₂ CH(CO₂H)₂ [125°] (Marckwald, B 21, 1081) -11 Aldehyde formsCH, CH C(CO.Et), and CH₃ CH₃(CH(CO₂Lt)₂)₂ (Komnenos, A 218, 145)—12 Diazobenzene chloride forms benzene azo malonic acid, identical with the phenyl hydrazide of mesoxalic acid (R Meyer, B 21, 118)

Sodium malonic ether CHNa(CO,Et)₂
Formed, with evolution of hydrogen, by dissolving sodium in malonic ether. The reaction is stopped by the crust of the sodium compound which forms on the surface of the metal, but this may be removed by adding alcohol (2 vols) which first forms NaOEt, and his then reacts with the malonic ether. The sodium malonic ether crystallises on cooling, and may be freed from alcohol by heating to 150° in a current of hydrogen (Conrad, B 12, 750). If, however, it be required merely for synthetical purposes the presence of alcohol is for the most part not injurious, and

the mixture of malonic ether and alcoholic NaOEt may be used at once This reacts upon organic halogen compounds thus —

CHNa(CO₂Et)₂ + XI = CHX(CO₂Et)₂ + NaI, the reaction being energetic at first but often requiring heat to finish it. If the substances are mixed in the right proportion the end of the reaction is recognised by the solution becoming neutral. Water is then added, and if X is a hydrocarbon radicle, CHX(CO₂Et)₂ separates as an oil, which may be purified by fractional distillation. The resulting CHX(CO₂Et)₂ still contains hydrogen displaceable by sodium, and if it be mixed with alcoholic NAOEt and another halogen compound say YI, the reaction

 $\begin{array}{c} \bar{C}NaX(C\bar{O}_2Et)_2 + Y\bar{I} = NaI + CXY(CO_2Et)_2 \\ takes place (Conrad a Bischoff, A 204, 121) \\ When the substituted malonic ethers are sapon fied acids are obtained, which at 150° or 160° give off <math>CO_2$ and leave derivatives of acetic acid $CHX(CO_2H)_2 = CO_2 + CH \times CO_2H \\ \end{array}$

 $CXY(CO_2H)_2 = CO_2 + CHXYCO_2H$ Hence malonic ether may be used, like aceto acetic ether, to effect the synthesis of organic acids of the general formula CXYH CO2H where X and Y may be alkyls, groups like CH₂ CO₂Et, or other radicles When it is desired to prepare a di alkyl malonic ether it is not necessary to perform the operation in two stages, for the proper quantity of NaOEt (2 mols) may be added all at once, and then the alkyl rodide (2 mols) By the action of AcCl on sodio malonic ether in ethereal solution it may be converted into acetylmalonic ether (120° at 17 mm), which is soluble in KOHAq, the yield is 55 pc of its weight. This ether forms an oxim and a phenyl hydrazide and therefore appears to be CH, CO CH(CO,Et)2. When sodio aceto-acetic ether is acted upon by chloroformic ether ClCO2Et the same ketonic ether CH, CO CH(CO₂Et)₂ should be formed, but the product is found to be insol conc KOHAq, and to boil at a higher temperature (127° at 17 mm) It is decomposed by cold dilute KOH, and gives CO₂ and alcohol The latter compound would therefore appear to be CH, C(OCO,Et) CH CO,Et (Michael, Am 10, 158, J pr [2] 37, 473, cf Lange, B 20, 1325

Reactions—1 EtI gives ethyl malonic ether 2 Bensyl chloride gives mono and di benzyl malonic ether and regenerated malonic ether Bischoff a Siebert, A 230, 94)—3 Malonic ether (32 g), sodium (9 2 g), dry alcohol (200 g) and chloroform (12 g) react thus (Conrad a Guthzeit, A 222, 250)—2CNa (CO_Et)₂ + CHCl, = 3NaCl+CNa(CO Et)₂ CH C(CO_Et)₂ torming sodium di carboxy glutaconic ether (q v)—4 Trimethylene bromide reacts with formation of

(CO_LEt)₂ CCCH₂ CH₂ (Perkin, jun, C J 51, 1, 702, 820)—5 NaOEt, allyl iodide, and iso butyl iodide gives an acid C₁₀H₁₄O₄ instead of allyl isobutyl-malonic acid—6 Chloro-formic ether ClCO₂Et forms methane tricarboxylic ether CH(CO₂Et)₃ (Conrad a Bischoff, A 214, 31, Claisen, B 21, 3567)—7 Tri bromo-denatro-bensene dissolved in ether reacts with formation of C₈H₂Br(NO₂)₃CH(CO₂Et)₂[75°], although bromo-benzene does not react (Jackson a Robinson, B 21, 2034)—8 Phthalyl chloride (1 mol) added to sodium-malonic ether (2 mols) dissolved in ether forms phthalyl malonic ether C₁₆H₁₄O₆

[75°], phthalyl-dimalonic ether $C_{22}H_{26}O_{10}$ [48 5°], and 'phthaloxyl dimalonic' ether (c_2H_{2i}) , 116 5°] (Wishcenus, A 242, 28) —9 Treatment with the chloride of mono-eth_il phthalate CO₂Et C₆H₄ COCl dissolved in benzene forms (CO,Et C,H, CO),C(CO,Et), [above 180°] (Zelinsky, B 20, 1012) —10 In alcoholic solution it is probably converted by carbonic acid gas into (CO,Et)₂CH CO₂Na (Michael, *J pr* [2] 35, 458) — 11 Carbon disulphide added to an alcoholic solution of sodium malonic ether gives yellow plates of (CO₂Et)₂CNa CS₁Na —12 SO₂ acts according to the equation SO₃ + CHNa(CO₂Et)₂ + HOEt = CH₂(CO₂Et)₂ + NaO SO OEt —18 Resorcin dissolved in alcoholic sodium malonic ether gives a greenish blue fluorescence, when after a few days the liquid is poured into water and acidified a small pp of needles of a condensation product $C_{11}H_0O_0$ [191°] is got A little above its melting point it is split up into CO2 and (β) methyl um belliferone of which it is probably the carboxylic acid (Michael, J pr [2] 37, 469) -14 Sulphur dissolves in alcoholic sodium-malonic ether, and at 100° crystals separate From these, acids liberate a stinking oil (thiotartronic ether?) -15 With alcohol and cinnamic ether at 100° The wind according to Containing the resulting acid, phenyl glutaric acid CO_H CH₂ CO₂H. The resulting acid, phenyl glutaric acid CO_H CH₂ CHPh CH₂ CO₂H. is got (Michael, J pr [2] 35, 349) -16 Phenyl cyanate PhNCO acts violently upon an alcoholic solution of sodium malonic ether with formation of (CO2Et)2CH CONHPh [124°] and the salt of an acid C₁₂H₂NO₂ [172°] (Michael, J pr [2] 35, 452) —17 Phenyl thio carbinide forms crystalline C₁₄H₁₅NaSNO₄, whence acids separate NHPh CS CH(CO₂Et), [60°] (Michael, Am 9, 124)—18 Urea dissolves in malonic ether and rhombic prisms of CHNa CO-NH CO sepa rate, whence acids liberate barbituric acid (Michael, J pr [2] 35,456) -19 Thro wrea gives similarly flat plates of sodium thio barbiturate CHNa CO-NH CS, whence acids liberate thiobarbituric acid, which crystallises in six sided plates from water -20 Acetamide forms crystalline C₁O₄N₂Na₂H₃, the reaction which occurs being 2CHNa(CO₂Et)₂+2CH₃CO NH₂ = C₀Na₂Na₂N₃H₄+CH₂(CO₂Et)₂+2HOEt -21 CSCl₂ forms CS C(CO₂Et)₂, which crystallises in flesh coloured needles [178°] (Bergreen, B 21, 337) – 22 Iodine forms (CO₂Et)₂CH CH(CO₂Et) Di bromo maleic ether yields 'di malonyl maleic' ether [75°], whence by saponification the corresponding acid C10H8O12 [148°] may be obtained. This acid, the formula of which is (CO₂H)₂CH C(CO₂H) C(CO₂H) CH(CO₂H)₂, may be better called butylene hexa-carboxylic acid It crystallises in plates, v sol water, and forms the salts, Na_eA^{vi} 10aq and Ag_eA^{vi}, and the ethers Me_eA^{vi} [129°] and Et_eA^{vi} [75°] (Pum, M 9, 450) When the acid is heated it splits up into CO2 and butylene tetracarboxylic acid CO₂H CH₂C(CO₂H) C(CO₂H) CH₂CO₂H [176°] 24 Dry cyanogen chloride forms cyano malonic ether (Halles, A Ch [6] 16, 419)

Di-sodium - malonic ether CNa₂(CO₂Et)₂. Obtained by ppg malonic ether (1 mol) with NaOEt (2 mols) (Bischoff a Rach.

From C₆H, CHBr CO₂H and alcoholic KOEt

Viscid mass -AgA' pulverulent pp Phenyl derivative Ph CH(OPh) CO₂H [108°] From methyl a chloro phenyl acetate and sodium phenate (R. Meyer a. H. Boner, A. 220, 51) Radiating groups of slender needles (from water) V sl sol cold water, v e sol alcohol or ether KOH and KMnO, convert it into phenyl glyoxylic acid HNO, forms pieric acid and benzoicaldehyde -NaA', 3aq -CuA', -

Acetyl derivative of the ethyl ether C.H. CH(OAc) CO2Et [74°] From mandelic acid by successive treatment with AcCl and alcohol (Naquet a Luguinin, A 139, 302) Slender needles (from ether) Insol. water, v sol alcohol and ether

Amide C.H. CH(OH) CONH, [132°] S 3 at 24° S (boiling 93 pc alcohol) 100 (Z) Formed, together with benzoic aldehyde, by heating the compound (C.H. CHO) CNH with water or alcohol at 180° (Zinin, Z [2] 4, 709) Formed also by allowing a mixture of the nitrile with fuming HClAq to stand in the cold (Tie mann a Friedlander, B 14, 1967) Likewise obtained by the action of NH, on mandelic ether, and by heating mandelic imido-ether (C Beyer, J pr [2] 31, 386) Prismatic needles or plates Sol hot, al sol cold, water, al sol ether, v sol alcohol Decompose by acids and alkalis with production of mandelic acid A polymeride (?) melts at 190°

Nutrule CeHsCH(OH) CN [-10°] 1 124 Obtained by adding furning HClAq to a mixture of benzoic aldehyde and KCy (Spiegel, B 14, 239, Völkel, A 52, 861) Oil, sol alcohol and ether Dissolved in ether, mixed with alcohol (1 equivalent), and treated with HCl gas at forms C₄H₃ CH(OH) C(OEt) NH,HCl [125°] This is decomposed by water, forming NH,Cl and mandelic ether (Beyer, J pr [2] 28, 190) At 170° mandelonitrile splits up into benzoic aldehyde and HCy Boiling aqueous HCl gives NH,Cl and mandelic acid Fuming HClAq forms the amide in the cold, but on heating it gives a chloro phenyl acetic acid NH₃ in the cold forms C₄H₃ CH(NH₂) CN Methylamine yields C₄H₃ CH(NHMe) CN Phenyl hydrazine produces the phenyl hydrazide of benzoic aldehyde (Reissert, B 17, 1451)

(dextro) Mandelic acid [133° cor] [a]_b at 20° = +156 Prepared by converting inactive mandelic acid into the cinchonic salt and adding a crystal of cinchonine dextro mandelate to the aqueous solution when the dextro salt crystallises out, leaving the lævo salt in solution. It can be also obtained by growing Penicillium glaucum in the inactive acid, which destroys the lævorotatory acid, leaving the dextrorotatory (Lewkowitsch, B 16, 1568) Resembles the lævoacid, having the same solubility in water

(larro)-Mandelic acid [133°] S 864 at 20° [a]_D at 20° = -158 Prepared by heating amyg dalin with strong HCl for several hours on the water bath It can also be obtained from in active mandelic acid which can be separated into equal quantities of the lævo and dextrorotatory acids by crystallisation of the cinchonine salt (Lewkowitsch, B 16, 1565, cf Wöhler, A 66, 240)

Nitro mandelic acid v Nitro OXY-PHENYL-

MANDELIC IMIDO ETHER

Ph CH(OH)C(NH)OEt [72°]

Preparation — Benzoic aldehyde (100 g) treated with KCN, dilute HCl and ether forms the exanhydrin Ph CH(OH)CN which is dissolved by the ether. If this is mixed with an equivalent of alcohol and dry HCl be passed in, the liquid being cooled, needles of the hydrochloride of mandelic imido ether (80g) are formed (C Bever, J pr [2] 31, 3*4) Ph CH(OH) CN+EtOH+HCl = PhCH(OH) C(NH) OEL, HCl These melt at [125°] The free ether is got by shaking these simultaneously with cone KOH and ether After evapor tring the ether the residue is crystal lised from ligroin

Projecties — White needles Extremely soluble in ether, alcohol, and benzene

Reactions —1 At 140° the hydrochloride splits up thus PhCH(OH)C(NH)OEt,HCl = EtCl+PhCH(OH)CONH,, forming mandel-amide —2 Alcoholic NH, converts the hydrochloride into the hydrochloride of the amidine, PhCH(OH)C(NH)NH,HCl This forms prisms [214°] Shaken with ether and potash, the free mandel amidine, *PhCH(OH)C(NH)NH, is dissolved by the ether It forms feathery needles of narcotic odour, melting at [110°]—8 Water quickly converts the hydrochloride into mandelic ether (q v) C,H,CH(OH) C,NH)OEt,HCl+H,O = C,H,CH(OH) COOEt+NH,HCl

MANDRAGORINE C, H₂₁NO, [e 79°] Extracted from powdered mandragora root by alcohol The extract is evaporated and the residue treated with very dilute acid The alkaloid is liberated from the acid solution by Vol. III

adding K₂CO₃ and shaking with ether (Ahrens, A 251, 312) Hygroscopic brittle mass Pierra card gives with a solution of mandragorine hydrochloride light yellow needles of the pierate. Iodine in KIAq gives an oily periodide K₄FeCy, gives no pp Phosphotungstate gives a white pp The sulphate is crystalline and very de liquescent Dropped into the eye, its solution causes enlargement of the pupil —B'HAuCl₄· [155°], yellow plates, sol hot water and HClAq —B'₂H₂PtCl₄, [194°] Red nodules or yellow plates (from hot water) —B'HCl4HgCl₂· [160°] Plates or needles (from water) or long slender needles (from alcohol) V sol alcohol (Ahrens, B 22, 2161)

Mandragora root also contains a second alkaloid of which the platinochloride [181°] and aurochloride [147°-153°] are crystalline (Ahrens)

MANGANATES Salts of the form MI₂MnO₄ derived from the hypothetical acid H₂MnO₄, v. Manganese, oxyacids or, p 185
MANGANESE Mn At w 55 Mol w

MANGANESE Mn At w 55 Mol w probably same as At w (v infra) [c 1800°–1900°] S G 6 85 to 8 01, according to Glatzel, S G of pure Mn is 7 3921 at 22° (B 22, 2857) S H 14° to 97° 1217 (Regnault, A Ch [3] 67, 427, specimen contained Si) Chief lines in emission spectrum are 6521, 6016, 6013, 4823, 4763, 4765, 4762, 4753, 4235, 4027 (Thalén) For absorption spectrum of Mn vapour v Lock yer a Roberts (Pr 23, 344)

Occurrence—The metal does not occur uncombined Mn compounds are widely distributed, the chief are pyrolusite MnO₂, braunite Mn.O₃, manganite Mn.O₄, H.O., hausmannite Mn₃O₄, psilomelane (Mn,Ba,K.)O 4MnO₃, manganese Spar MnCO₃, manganese blende MnS small quantities of Mn compounds are found in sea water (Forchhammer, Pr E 2, 303), in many mineral waters (Buchanan, Pr 24, 593), in blood (Cottereau, J 1849 530, Burin de Buisson, J 1852 377, Campani, B 5, 287), in the liver (B(champ, C R 49, 895), in milk (Polacci, Naturforscher, 4, 122), in human urine (Horsford, J 1851 602), in wines, cereals, most veretibles used as human food, and in considerable quantities in tea (Maumené, C R 98, 1050, 1410) Mn also occurs in the sun's atmosphere (Coinu, C R 80, 315, 530)

Manganese dioxide was recognised as a compound of a distinctive metal by Scheele in 1774, it had pieviously been looked on as a compound of iron. The metal Mn was first isolated by Gahn Native MnO was long known as magnesia nigra (probably because of its supposed magnetic properties), a new medicine was introduced in the early years of the eighteenth century, and was called magnesia alba, seemingly in contra distinction to magnesia nigra, when magnesia nigra was shown to contain a distinctive metal, this metal was called sometimes magnesium and sometimes magnesium and sometimes magnesium was retained for the metal of magnesia alba, and the name manganesium (hence manganesis) was given to the metal of magnesia nigra.

Formation —1 By reducing the oxides by C at a white heat.—2 By reducing MnF₂ or MnCl₂ by Na or by Mg —3 By heating Mn amalgam is a stream of H, the amalgam is made by the reaction of Na amalgam with MnCl₂Aq (Giles,

P M [4] 24, 328, Roussin, Bl 6, 93) —4 By electrolysing MnCl.Aq in a porous cell placed in a carbon crucible containing HClAq (Bunsen, P.

Preparation — 1 Crystallised MnCl₂ is thoroughly dried by heating, it is then finely powdered and 100 grams are intimately mixed with 200 grams well dried and powdered KCl, the mixture is packed into a Hessian crucible which is loosely covered and heated in an airfurnace until the contents melt (the temperature must not be raised so high that white vapours begin to come off), the lid is removed and 15 grams Mg are thrown into the crucible in four or five portions, each weighing 3 to 4 grams, two to three minutes being allowed to elapse between the entrance of each piece, the lid is now replaced and the crucible is strongly heated for a few minutes, and then allowed to cool very slowly in the furnace About 20 to 25 grams Mn are thus obtained as a compact regulus If the temperature of the final heating is not sufficiently high, the regulus does not form a compact mass, if the temperature is too high and the heating is unduly prolonged, the KCl is vaporised and the surface of the Mn is oxidised (Glatzel, B 22, 2857) —2 Brunner (P 101, 264) recommends the following method -2 pts MnF₂ (obtained by dissolving moist MnCO₃ in HFAq, evaporating and drying at 100°) and 1 pt Na are arranged in alternate thin layers in a Hessian crucible, the mixture is pressed down and covered with NaCl over which is placed a layer of CaF2 in small pieces (to prevent spirting), the crucible is covered and heated in an air furnace, at first gently, and then to near a white heat for about 1/4 an hour, the crucible is then allowed to cool very slowly in the furnace - 3 For an account of the older methods of preparing Mn from MnO2, v John (Gehlen's Journ Chem Phys 3, 452), and Deville (A Ch [3] 46, 182) Tamm describes a method for obtaining approximately pure metal (99 91 pc Mn, 05 pc Fe, 115 pc Si, and 025 pc C) from MnO₂ (C N 26, 73, 111)

Properties —A white grey, lustrous, metal, very hard, brittle, may be highly polished, non magnetic (Glatzel) According to Glatzel (B 22, 2857), Mn prepared by reducing MnCl, by Mg (v Preparation No 1) is unchanged by keeping for months in a bottle closed with a glass stopper, but in moist air the surface undergoes slight oxidation Mn is usually described as very easily oxidised in ordinary air, and as capable of decomposing water, with evolution of H, almost as rapidly as K Mn obtained by Brunner (vPreparation No 2) by reducing MnF₂ by Na was scarcely oxidised in cold water According to Bullock (C N 60, 20), Mn prepared by reducing the oxides by C is very easily oxidised, while specimens obtained by reducing MnCl₂ by Na are no more oxidisable than iron. It is probable that some specimens have contained small traces of S1 and C which have affected the properties of the metal Mn melts at a very high temperature (c 1800°-1900°), and is said to volatilise at a full white heat

The atomic weight of Mn has been determined (1) by estimating Cl in MnCl₂ (Arfvedson, S 42, 202, Dumas, A Ch [3] 55, 151; Berzelius, P. 18, 74), (2) by dissolving Mn in HNO₂,

evaporating, and calcining the nitrate (Berzelius, P 8, 185), (3) by oxidising MnO to Mn,O, by heating in air (v Hauer, W A B 25, 133), (4) heating in air (v. Hauer, W. A. B. 20, 150), (4p) by reducing Mn₂O₄ in H, and weighing H₂O produced (Rawack, P. 107, 605, 616), (5) by analysing MnC₂O₄ (Schneider, P. 107, 605), (6) by reducing AgMinO₄ and estimating Ag produced (Dewar a Scott, Pr. 35, 44), (7) by determining S H (Regnault, A. Ch. [3] 67, 427)

Molecular weight of manganese—Ramsay (2, 7, 55, 591) her determined the lowering of

(O J 55, 521) has determined the lowering of the vapour pressure of Hg produced by dissolving Mn in Hg, the results render it probable that the molecular weight of Mn is the same as the atomic weight. This conclusion assumes the accuracy of Van't Hoff's law that equal volumes of dilute solutions contain equal numbers of molecules of the dissolved substances, and it also supposes the molecular weight of liquid Hg to be the same as the atomic weight of Hg

Mn is metallic in its physical, and some of its chemical, properties, but in many of its ieactions it behaves as a non metal The oxides MnO and Mn₂O₃ are basic, forming salts, such as MnSO₄ and Mn₂(SO₄)₃, of which the man ganous salts, corresponding with MnO, are much the more stable The oxide MnO reacts as a basic peroxide, e g with H2SO, it forms MnSO. and O, it lso reacts with some positive oxides, $e\,g$ CaO, to produce salts of the form xMO yMnO , when this oxide is treated with molten KOH in presence of O the salt K.MnO. is formed, in which Mn forms part of the acidic radicle The oxides MnO₃ and Mn O₇ have also been isolated, both are very unstable, both react with water to form manganic acid HMnO. the former (MnO₃) at the same time also producing MnO., these oxides are distinctly acidic The acid HMnO, has been isolated, and many salts derived from the hypothetical acid H MnO. are known

Mn shows marked analogies with the iron metals Fe, N1, and Co, 1t 1s also related, although less distinctly, to the halogens, and it is also related to the chromium metals, Cr, Mo, W, In the classification of the elements based on the periodic law, Mn occupies a position different from that of any known element it is placed in the same group as the halogens (Group VII), and in the same family (evenseries members) as F, but no member of this family coming after Mn (i.e. with a greater atomic weight than Mn) has yet been isolated, Mn finds a place in series 4 (K, Ca, Sc, Ti, V, Cr, Mn), all the members of which are metallic, and it is immediately followed by Fe, Ni, Co, and Cu The strongly marked negative charac ter of the halogens is impressed on Mn, but this is counterbalanced by the positive characteristics of the metals which come before and after Mn in order of atomic weights (v Halogen ele MENTS, vol 11 p 666, also Iron GROUP OF ELE-MENTS, this vol p 65)

The atom of Mn is divalent in the gaseous

molecule MnCl₂.

Reactions —1 Mn is oxidised in air or oxy gen, forming MnO -2 Mn reacts energetically with dilute mineral acids forming salts of MnO 3 Fused with potassium nitrate or chlorate KMnO41s produced -4 Heated in bromine MnBr. is formed -5 When Mn is heated in a stream of hydrogen chloride MnCl₂ is produced —6 Mn decomposes water readily, with evolution of H. The reactions of the metal have not been much examined

Combinations -Mn forms alloys with many metals, and compounds with most of the non metals, but few have been formed by the direct union of their elements

Detection and estimation -Mn is usually detected by the colour its' compounds impart to a borax-bead, and by the ppn of buff-coloured MnS by addition of NH, sulphide to an alkaline Mn is usually or neutral solution of Mn salts estimated gravimetrically by ppn with NH3Aq, heating the pp in air, and weighing as Mn.O. As MnO2 is much used in technical chemistry it is necessary to have accurate and rapid methods for determining the quantity of this oxide in specimens of Mn ores, for descriptions of these methods, and also for other methods for estima ting Mn, reference must be made to Manuals of

Manganese, alloys of Several alloys of Mn have been prepared, none has been made by

directly alloying Mn with other metals

1 With aluminium Wöhler a Michel (A 115, 102) obtained a crystalline powder, having the composition MnAl,, by fusing together MnCl2, Al, and a mixture of NaCl and KCl

- 2 With copper Alloys of Mn and Cu are obtained by reducing mixtures of MnO, and Cu with charcoal, an alloy containing 25 pc Mn is white, fairly haid, very elastic, and tolerably easily melted (Allen, C N 22, 184) Alloys con taining from 3 to 20 pc Mn resemble bronze (Valenciennes, C R 70, 607, v also Schrötter, D P J 210, 355, Prieger, ibid 177, 303, Gintl, sbid 221, 653)
- 3 With iron Alloys of Mn and Fe, containing from 8 to 80 p c Mn, are used in the manufacture of steel, under the names of spiegeleisen These alloys are prepared and ferromanganese by heating MnO with non filings and charcoal in the blast furnace, or in graphite crucibles, or by reducing a mixture of FeO and MnCO, on the hearth of a Siemens' furnace, and then fusing under a reducing flame
- 4 With mercury An amalgam of Mn is obtained by reducing MnCl2Aq by Na amalgam (Giles, P M [4] 24, 328), also by electrolysing MnCl₂Aq in contact with Hg (Ramsay, C J 55, 532, Moissan, Bl [2] 31, 149) Alloys of Mn with Pb, Sn, and Zn are described by Allen (lc) and Valenciennes (lc)

Manganese, arsenates of, v vol 1 p 309 Manganese, arsenade of Mn and As com bine when heated together to redness An arsenide, approximately As₃Mn₄, occurs native (Kane, P 19, 145)

Manganese, arsenite of, v vol 1. p 306 Manganese, boride of By heating Mn.C

(v Manganese, carbides of) with B,O, in a graphite crucible, Troost and Hautefeuille obtained small greyish violet crystals of MnB₂ (C R 81, 1263) This compound decomposes water at 100° and dissolves in acids with evolution of H, it reacts with moist HgCl, to produce MnCl, boric acid, and HCl

Manganese, bromides of Only one bromide. MnBr., has been isolated, the tetrabromide also perhaps exists in solution

MANGANOUS BROMIDE, MnBr. Manganese romide The hydrate MnBr. 4H₂O is obdibromide tained as clear, red, deliquescent, crystals, by dissolving MnCO, in HBrAq, or by digesting Mn with Br (Balard, J pr 4, 178, Marignac, Ann M [5] 12, 7), crystallises in monoclinic forms, a b c = 645 1 1 165 (Marignac) The anhydrous salt MnBr, is obtained by heating powdered Mn in Br vapour, it forms a rose red deliquescent mass, heated in air it gives Br and Mn,O4 Thomsen gives the thermal data -[Mn, Br2, Aq] =106,120 (Th 3, 271)

MANGANIO BROMIDE, MnBr. (Manganese te-bromide) This compound perhaps exists in trabromide) the green solution obtained by treating Mn.O. or MnO, with HBr gas and dry ether, the solution is easily decomposed with formation of MnBr. (Nicklès, C R 60, 79)

Manganese, carbides of According to Brown (J pr 17, 492), the compound MnC is obtained by heating Mn(SCy)2, and MnC, by heating MnCy2. Troost and Hautefeuille obtained graphite-like, lustrous, crystals of Mn₃C by melting Mn in a charcoal crucible, and cooling slowly (C R 80,

Manganese, chlorides of The only chloride of Mn which has been isolated is MnCl. A solution of MnO2 or Mn2O3 in conc cold HClAq very probably contains Mn2Cl8, perhaps also some The existence of MnCl, described by MnCl,

Dumas, is very doubtful

Manganous chloride, MnCl₂ Mol w 125 74, Rose-coloured crystals of MnCl 4H O are ob tained by dissolving MnCO, or any oxide of Mn, in HClAq, and evaporating, by heating the dried crystals in a stream of dry HCl, the an hydrous salt, MnCl₂, is obtained MnCl₂ is also formed by heating Mn, MnCO₃, or Mn₃O₄, in a stream of dry HCl By heating very finely powdered MnO with half its weight of NH,Cl gradually to redness, MnCl, is formed very deliquescent, Brandes (P 22, 263) gives S at $10^{\circ} = 62 \, 16$, at $31 \, 25^{\circ} = 85 \, 72$, at $62 \, 5^{\circ} =$ 122 22, at 87 $5^{\circ} = 122$ 22, and at 106 $25^{\circ} = 123$ 81 S in alcohol at $11^{\circ} = 50$ S G of MnCl, = 2 478 (Schröder), of MnCl₂ 4H₂O = 1913 (Schröder), 2015 (Boedeker) The tetrahydrated salt is isomorphous with FeCl 4HO, monoclinic, All water is removed at 100° Thomsen the thermal a b c=1 1409 1 1 6406 (Marignac, 15) gives the thermal data $[Mn,Cl^2] = 111,990$ $[MnCl^2,Aq] = 16,010$, $[MnCl^2,4H,0] = 14,470$ (Th 3, 270) Heated in O, a crystalline oxide containing 37 p c MnO2 is produced (Schulze, J pr [2] 21, 407) MnCl, melts, in absence of air, at a red heat and sublimes at higher temperature Scott found V D at c 1200°-1500° to be 1323 $(Pr \ E \ 14, 410)$

MnCl, forms double salts with the alkall chlorides, of the composition MnCl. 2XCl 3H,O The best examined are those in which X = NH, Rb, and Cs, the NH, salt contains one H,O only according to Rammelsberg $(J \ pr \ 65, 181, \ con firmed by Pickering, <math>C \ J \ 85, 672)$ The double salts are obtained by mixing MnCl₂Aq or a solu The double tion of an oxide of Mn in HClAq, with the alkali chloride, and evaporating slowly (v Godefiroy, B 8, 9, v Hauer, J pr 63, 436) Another double salt MnCl, 3CuO 3H,O, is formed by boiling MnCl,Aq with powdered CuO, filtering, and cooling (André, C R 106, 854) The double salt MnCl₂ HgCl₂ 4H₂O, is described by Bons dorff (P 17, 131)

Manganic chloride, Mn_2Ol_4 , and Manganese Tetraceloride, $MnCl_4$ Neither of these chlorides has been isolated Mn_2O_4 and MnO_2 dissolved in cold cone HClAq to form deep-brown liquids, which slowly evolve Cl and after a time contain MnCl. Nickles (A Ch [4] 5, 161), by passing HCl into ether in which MnO₂ was suspended, obtained a green liquid, of varying composition and very unstable, one analysis gave results approximately agreeing with the formula MnCl, 12C,H₁₀O 2H₂O These results are quite inconclusive of the formation of MnCl, (cf Pickering, C J 35, 672) Fisher's experiments (C J 33, 409) led him to conclude that a solution of MnO2 in cold cone HClAq contains MnCl₄, but the more complete experiments of Pickering (C J 35, 654) make it very probable that Mn₂Cl₈, and not MnCl₄, is produced when either Mn₂O₃ or MnO₂ is dissolved in cold conc When the solutions are decomposed by adding water, the pp varies in composition but may always be expressed as $xMnO_2yMnO$, x varying from 16 to 36 and y being usually 5 Pickering expresses the reactions of HClAq with Mn₂O₃ and MnO₂, and the decomposition of the solutions by H.O, in the following equations -

 $\begin{array}{l} Mn_2O_3 + 6HClAq = Mn_2Cl_6Aq + 3H_2O \\ 2MnO_2 + 8HClAq = Mn_2Cl_6Aq + Cl_2 + 4H_2O \\ \{xMn_2Cl_6Aq + 2H_1O = MnO_3 + MnCl_6Aq + 4HClAq \\ \{yMn_2Cl_6Aq + 3H_1O = Mn_2O_3 + 6HClAq \\ \end{array} \right\}$

The average values of x and y are 4 and 1 respectively Christensen (J pr [2] 35, 57) thinks that $\mathrm{Mn_2Cl_8}$ is the product of the reaction of cold HClAq with MnO₂, he supposes that some MnCl₄ is produced at 10° According to C, ether holding HCl in solution produces a solution of Mn₂Cl₄ when shaken with Mn₂O₃ According to Vernon (C S Proc 1890 58), a solution of MnO₂ in cone HClAq evolves less than half the Cl, at ordinary temperatures, required by the equations given by Pickering (supra), at -18° Cl is evolved very slowly, and at -26° only 35 pc of the available Cl comes off when air is drawn through the solution for two hours Vernon thinks that MnCl₄ is the only higher chloride formed by dissolving MnO₂, Mn₂O₃, or Mn₃O₄ in cold cone HClAq

Franke (J pr [2] 36, 38) obtained chloromanganic acid, H.MnCl, by adding KMnO, to ether containing HCl, shaking with dry ether, and surrounding the deep-blue liquid thus pro

duced with a freezing mixture

Manganese Heptachloride, MnCl, (?) Dumas (B J 7, 112, 8, 177) described a greenish gas, condensing at — 15° to — 20° to a green brown liquid, produced by adding excess of cone H₂SO₄ to KMnO₄ and throwing in small pieces of fused KCl or NaCl, he gave the formula MnCl, to this substance Aschoff's analyses of the compound proved the presence of O in it, and led to the formula MnO₄Cl (J pr 81, 29) The exact composition of the substance is not yet settled.

Manganese, chromate of, v vol 11 p 155 Manganese, cyanides of, v vol 11 p 842 Manganese, ferri- and ferro cyanides of, v vol 11 pp 835, 839

Manganese, fluorides of Two fluorides of Min have been certainly isolated, Min, and

Mn₂F₄ The existence in solution of MnF₄ is doubtful Wohler obtained a gas by the reaction of H₂SO₄ with a mixture of K₂MnO₄ and KF To this gas he assigned the composition MnF₇, but the composition of the substance cannot be regarded as settled Nicklès asserts the existence of Mn₂F₈

MANGANOUS FLUORIDE, MnF₂ (Manganese ds-fluoride) A reddish crystalline powder, obtained by dissolving MaCO₂ in excess of HFAq and evaporating, undecomposed by heating to

redness (Berzelius)

MnF₂ forms double compounds with SiF₄, &c (Berzelius, Stolba, C \tilde{C} 1883 292, Marignac, J pr 83, 202) These compounds, better regarded as silicofluoride, titanofluoride, &c, of Mn, have the composition MnXF₆6H₂O, where $X = S_1$, T_1 , or S_1 , they are isomorphous, crystallising in hexagonal forms, ac = 1 515 (Marignac, Ann M [5] 15) There is also a zircofluoride of Mn, $MnZnF_6$ 5H₂O, which crystallises in monoclinic forms, ab c = 2 09 1 1 2515 (M l c)

MANGANTSE SESQUIFLUORIDE, Mn.F. Crystals of Mn.F. 6H,O were obtained by Christensen (Jpr [2] 35, 57) by dissolving artificially prepared MnO2 in HFAq, filtering through spongy Pt, evaporating, and placing over H₂SO₄. Boiling or diluting the solution of MnO2 in HFAq pro

duces an o yfluoride

The double salts Mn₂F₆ 4KF 2H₂O, Mn₂F₆ 4NH₂F, Mn F, 4NaF, and Mn₂F₆ 2AgF 8H₂O are described by Christensen (*lc* and *ibid* p 161) They are obtained by adding solution of the alkali fluoride to solution of Mn₂O₂ or MnO₂ in HFAq, washing with water containing HF, and drying on Pt, the Ag salt is obtained by dissolving freshly ppd Ag CO₂ in HFAq, adding Mn₂F₆ in HFAq, and evaporating Ac cording to Christensen, the salt Mn F, 4KF 2H.O is identical with the compound to which Nickles gave the formula MnF₄ 2KF (*C* R 65, 107)

Manganese tetra and hepta fluorides, MnF, and MnF, (?) The former compound was supposed by Nickles to exist in the solution of MnO, in HFAq (C R 65, 107), by adding kF or NaF the double salts MnF, 2K(Na)F were said to be formed The investigations of Christensen (J pr [2] 35, 57, 161) have made it very probable that MnF, and not MnF, is formed when MnO, or MnO, is dissolved in Hi Aq (v supra, cf Mangane chloride, supra)

The formula MnF was given by Wohler (P 9, 619) to a purple yellow gas obtained by adding cone H₂SO₄ to a mixture of 2 parts commercial K₂MnO₄ and 1 part CaF₂ in a Pt retort The gas dissolves in water to form HMnO₄Aq and HFAq, and on evaporation HF and O are evolved, and MnF₂ remains The composition of the gas is still very doubtful, no analyses are given in Wohler's paper

MANGANO MANGANIC FLUORIDE, Mn₂F₆ According to Nicklès (C R 67, 448), brown crystals, having the composition Mn₂F₆ 10H₂O, are obtained by reacting on MnO₂ with warm HFAq and evaporating

Manganese, haloid compounds of The compounds MnX₂(X = F, Cl, Br, I) have been isolated. Mn₂F₆ has also been obtained in definite form. There are very strong reasons in favour of the existence of Mn₂Cl₆ in the solutions obtained by dissolving Mn₂O₆ or MnO₂ in cold cone HClAq.

The existence even in solution, of tetra haloid | and then decomposed, the formation of higher compounds, MnX, is doubtful Nickles claims to have obtained mangano manganic fluoride Mn_3F_s , corresponding with Mn_3O_s . The only haloid compound of Mn which has been gasified is $MnCl_2$. The general formula MnX_2 probably expresses the atomic composition of the mole cules of the more stable haloid compounds of Mn, the formula Mn X_c may or may not be mole cular The existence of hepta-haloid compounds MnX, might be expected from the position of Mn in the periodic scheme of classification, but the existence of these compounds is extremely **dou**btful

Manganese, hydroxides of, v Manganese, oxides and hydrated oxides of, for HMnO, v

Manganese, oxyacids of

Manganese, 10dide of MnI_2 Obtained. with 4HO, in rose red deliquescent crystals, isomorphous with MnCl₂4H₂O, by dissolving MnCO₃ in HIAq, and evaporating Turns brown when exposed to air and light, heated in absence of air, it is not decomposed, heated in O it burns like tinder, evolving vapours of I Thom sen gives the thermal data [Mn, I^2 , Aq] = 75,700 (Th 3, 271)

Manganese, oxides and hydrated oxides of The oxides MnO, Mn₂O₄, Mn₂O₃, MnO₂, probably also MnO, and Mn,O,, have been isolated number of oxides intermediate between Mn,O, and MnO2, having the general form xMnO2 yMnO, also exist Hydrates of most of these oxides exist, but their stability is generally small Mn₂O, H₂O $= H_2Mn_2O_0$ is known, it is an acid The acid corresponding to MnO₃ (H,MnO₄) has not been isolated, but salts of this acid (manganates) are The oxides MnO, Mn₂O₄, and Mn₂O₃ MnO reacts with acids to form man ganous salts MnX_2 ($\lambda=NO_3$, $\frac{1}{2}SO_4$, &c), Mn_1O_4 forms manganic salts Mn_2V_3 , which are readily reduced to MnX_2 , Mn_3O_4 does not form corre sponding salts, but with acids yields Mn 1, and Mn X₃, or in some cases MnX₂ and MnO₂ Nickles, however, asserts the production of Mn₃F₆ by the action of HFAq on Mn₃O₄ (v Mangano manganic fluoride, p 180) MnO₂ reacts with acid to form manganic salts Mn₂X₃ MnO₂ or manganous salts MnX, according to tempera It is possible that a few salts correspond ing with MnO2 may exist, but their isolation is MnO, also combines with some oxides more basic than itself to form manganites, salts of the form $xMO yMnO_s$ MnO_s is very unstable, The existence of it does not form salts (MnO₃)₂SO₄ is probable With water MnO, forms H2Mn2O8Aq and MnO2 Mn2O, is very unstable, with water it forms permanganic acid, H2Mn2O.

The molecular weight of none of the oxides of Mn is known with certainty, as none has

been gasified

MANGANOUS OXIDE, MnO (Manganese monoxide or protoxide) S G 5 09, crystalline (Rammelsberg), 5 18, manganosite (Blomstrand, B 8,

Occurrence - In small quantities, as manganosite, in bright green hexagonal forms (Blomstrand, lc)

Preparation -1 By heating to redness in a Pt vessel a mixture of equal parts MnCl₂ and Na₂CO₃, with a little NH₄Cl, MnCO₃ is formed

oxides is prevented by the NH,Cl, the residue is washed and dried (Liebig a Wohler, P 21, 578) 2 By heating any of the higher oxides of Mn, very finely divided, to redness in a stream of H until the powder is green According to Wright a Menke (C J 37, 28), pure MnO can be thus obtained, even from specimens of MnO2 contain ing c 10 p c of potash - 3 MnCO₃ or MnC₂O₄ is strongly heated in absence of air, and the pro duct is then heated in H (Liebig, A 95, 116) 4 Deville (C R 53, 199) obtained MnO in bright green regular octahedra by heating MnO, in H

containing a very little HCl
Properties and Reactions — A grass green powder, Deville's crystalline specimen (v supra) formed lustrous, diamond like, green regular octahedra According to Moissan (A Ch [5] 21, 199, 251), MnO prepared by reduction of higher oxides by CO at 140° is pyrophoric When pure, MnO does not oxidise by exposure to air (Wright a Menke, C J 37, 28 note), but if it contains minute quantities of potash oxidation occurs Heated in air or O, Mn₂O₄ is produced, if the heating is done carefully till the weight is con stant at dull redness, Mn₂O₃ is produced (v Gorgeu, C R 106, 743) MnO melts at white heat in absence of air It is not reduced by heating in H or CO, or with C at 500° 600° (Wright a When heated in H.S. MnS Luff, C J 33, 523) and H₂O are formed MnO reacts with acids to form manganous salts, MnX₂ (X = NO₃, ClO₃,

1SO, 1PO, &c)

HYDRATE OF MANGANOUS OXIDE, MnO H2O Occurs in small quantities in Sweden, in white crystalline tablets, as pyrochroite Prepared, as small white hexagonal prisms, by adding 300 grm KOH in 500 c c air free water to an air free solution of 15-17 grm crystallised MnCl in 15 cc air free water, in a vessel filled with H or coal gas, heating to 160°, and allowing to cool (A de Schulten, C R 105, 1265) Rapidly oxi dises in air When a manganous salt is present the compound 2MnO MnO, xH2O is formed, when exposed to O for several years the product is MnO₂ MnO (Gorgeu, C R 108, 948) When NH, Aq is added to solution of a manganous sait, MnO H.O is not ppd, as it is soluble in NH.Aq. but this solution rapidly absorbs O from the air, and after a time all the Mn is ppd as hydrates of Mn,O, The presence of NH, salts hinders the oxidation process, solutions of double NH, Mn salts are scarcely changed in air if free NH, is absent Thomsen gives the thermal data $[Mn,O,H^2O] = 94,770$, $[MnO^2H^2,O] = [MnO^2H^2,H^2SO^4Aq] = 26,480$ (Th. 8, 271) $[MnO^2H^2,O] = 21,560$

MANGANO MANGANIC OXIDE, Mn.O. (Red oxide

of manganese)

Occurrence -As hausmannite, in small brownish black tetragonal forms, a c = 1 1 1537, 8G 48

Preparation -1 Pure MnCl2Aq is ppd by Na₂CO₃Aq, the pp is thoroughly washed, dried, and then heated to whiteness for some time until the weight is constant (cf Wright a Luff, C J 33, 520, with Reissig, A 103 27) —2 By strongly heating MnC₂O₄ in air (Lassaigne, A Ch [3] 40, 829) —3 Crystals of hausmannite were obtained by Debray by strongly heating a mixture of MinSO, and K2SO, in a Pt crucible (C R 52 985), also by passing a very slow stream of HCl over amorphous Mn₂O₄ heated to redness (Deville, C R '53, 199), also by keeping molten MnCl₂ in an atmosphere laden with moisture (Gorgeu, C R 96, 1044), also by melting amorphous Mn₂O₄ with borax (Nordenskjold, P 114, 112, v. also Debray, Ann M [5] 1, 124, Sidot, C R 69, 201, v Hauer, J pr 63, 425, Ebell, D P J 220, 64, 155)

It is generally stated that Mn₂O₄ is produced by heating any of the other oxides of Mn to red ness in air, according to the experiments of Dittmar (C J 1864 294) the composition of the product of heating MnO₂ in a mixture of O and N varies according to the pressure of the O, if the pressure of the O is about 19 atmos the product is approximately Mn₃O₄, while if the pressure of the O is greater than about 26 atmos the product approximates more or less closely to Mn₂O₅. The experiments of Wright and Luff (C J 33, 520), on the effect of heating MnCO₅ in air, showed that unless the heating is continued for a long time and the temperature is kept very high the product contains more O than Mn₃O₄. According to Gorgeu (C R 106, 743), finely powdered Mn₃O₄ can be oxidised to xMnO₂ yMnO, finally to Mn₂O₅, by heating in air

Properties and Reactions—A reddish brown solid powder, crystalline Mn₂O₂ is brown S G crystalline 4 856, amorphous 4 918 Mn₂O₄ is not changed when heated to a very high temperature It is reduced to MnO by H, CO, and C (Bell, C N 23, 258, Muller, P 136, 160), reduction by CO begins at c 100°, by H at c 240°, and by C at c 420° (Wright a Luff, C J 33, 520) Mn₂O, with cone H₂SO, forms a solution containing MnSO₄ and Mn₂(SO₄)₂, when the acid is hot, only MnSO₄ is formed and O is evolved With boiling HNO₃Aq, Mn(NO₃)₂ and MnO₂ are produced Hot cone HClAq produces MnCl₂ and evolves Cl Fused with alkalis, alkaline manganate is formed Cl in presence of an al kaline solution reduces an alkaline permanganate The reactions of Mn₃O₄ with acids, KlAq, &c, suggest the constitution 2MnO MnO₂ (Pickering, C J 35, 657)

HYDRATES OF. MANGANO - MANGANIC OXIDE, $Mn_2O_4xH_2O$ Such hydrates appear to exist, but their composition values Gorgeu (C R 84, 177) says a yellowish green hydrate is formed by shaking an aqueous solution of a manganese salt with alkali in presence of air Hydrates of Mn_sO₄ are also said to be formed by placing finely-powdered MnO₂ in excess of an ammonasal solution of MnCl₂ and heating (cf J Otto, A 93, 372) Veley (C J 41, 63) obtained a substance nearly agreeing in composition with $8Mn_9O_43H_2O_7$ formula by heating xMnO₂ yMnO xH₂O in H to 200°

Manganic oxide, Mn₂O₃ (Sesquioxide of manganese)

Occurrence —As braunte in quadratic octahedra, S G 4 752 (Rammelsberg, P 124, 513) The hydrate Mn₂O₃ H₂O occurs native as mangamts

Preparation -1 The pp-approximately MnO_2xH_2O —obtained by passing Cl into Na_2CO_3Aq holding finely powdered MnCO₃ in suspension, is made into a thin cream with sone H_2SO_4 and slowly heated on an oil bath to 100° , at which temperature O is suddenly evolved, and the mass becomes thicker and

greyish violet in colour, it is then heated to 138° until it is dark green. The impure Mn₂(SO₄), thus produced is placed on a warm porous plate, by which H₂SO, is absorbed, it is then rubbed with conc HNO, Aq, free from HNO2, again dried on a porous tile, and then warmed to 130° The Mn₂(SO₄), thus produced is exposed to air, when it rapidly deliquences to form a violet solution, which afterwards becomes turbid from separation of Mn₂O₃.H₂O $(Mn_2(SO_4)_3 + 4H_2O = Mn_2O_3 H_2O + 3H_2SO_4)$ The brown solid which separates is washed, dried at 100° and then gently heated until the water is removed (Carius, A 98, 53)—2 According to Schreider (P 107, 605), Mn₂O₄ is obtained by heating MnO₂, MnO, or Mn₂O₄ in O (but v. account of Dittmar's experiments under Mangano manganic oxide, supra) Moissan says that artificially prepared MnO₂ goes to Mn O₃ when heated in O to 250° (A Ch [5] 21, 232) According to Berthelot (A Ch [5] 15, 185) and Knab, Mn₂O₂ is obtained by heating MnCl₂, MnBr₂, or MnI₂ in air or O This oxide is also said to be formed, with evolution of O, by passing H₂O vapour over heated K MnO₄ Gorgeu (C R 108, 1106) obtained Mn O₃ by allowing ppd MnCO, to remain in contact with aerated water for 10 years, also by exposing MnO H2O to O in presence of excess of a man ganous salt, also by exposing solutions of MnSO₄, MnCl₂, and Mn(C₂H₄O₂)₂ to sunlight Properties and Reactions—A black powder,

Properties and Reactions—A black powder, S G 4325, the mineral braunite forms brownish black, very hard, lustrous quadiatic octahedra, S G 4752 Deoxidised at white heat to Mn₂O₄ Soluble in conc H₂SO₄, forming a reddish liquid, which evolves O on warming, and then contains MnSO₄, boiled with dilute H₂SO₄Aq or HNO₃Aq, MnO₆ is separated, and manganous sulphate or nitrate goes into solution (Christensen, J pr [2] 28, 1) Soluble in cold conc HClAq, forming a brown liquid, which most probably contains Mn Cl₅ (v Manganic chloride, p 180)

Mn₂O₃ is a basic oxide, the corresponding salts are not numerous, they are readily reduced to manganous salts Mn (SO₄)₃ combines with alkali sulphates to form alums Mn₂O₁ leacts with hot HClAq, with KIAq, and other reagents, as if it were MnO MnO₂ (Pickering, C J 35, 657) Laugier (C R 104, 1508) describes several compounds of Mn₂O₃ with SeO₃, prepared by the reaction of MnO₂ with H₂SeO₃Aq

Hydrate of manganic oxide, Mn.O., H₂O Occurs native as manganite, S G 4 335, iso morphous with göthite and diaspore, the corresponding Fe and Al compounds The preparation of Mn₂O₃ H₂O is described under Mangania oxide (v supra), it forms a brownish black powder Warmed with cone H₂SO₄ to c 100°, Mn₂(SO₄), is formed without evolution of O (Carius, A 98, 53) According to Carius (le), Mn₂O₄ H₂O is not dissolved by dilute H₂SO₄Aq even on gently warming, but if a little MnO is present solution occurs in the cold Mn₂O₄H₂O is said by Hermann (P 74, 303) to dissolve in tartaric acid, forming a brownish red liquid, from which manganous tartrate separates on standing, the liquid becoming colourless and now containing formic acid and CO₂ In a stream of H₂S₄ a little MnSO₄ and also MnS

and Mn₂O₂ are formed (Wagner, D P J 195, When moist Mn₂O₂ H₂O is shaken with magnesia alba, K.CO3, or Na.CO3, or even with water, and much air, nitrates are produced according to Reichardt (Henneberg's J für Landwirthsch 26, 167)

MANGANESE PEROXIDE, MpO2 (Manganese

dioxide)

Occurrence - As pyrolusite, in iron black, opaque, rather brittle trimetric crystals, a b c = 776 1 1 066, SG 4 82 to 4 97 The name is supposed to have been given from the use of the mineral to remove the colour from glass: coloured by compounds of iron $(\pi \hat{v} \rho = \text{fire}, \text{ and }$ Aveir = wash out)

Preparation - Pure MnCO3 is dissolved in as small a quantity as possible of dilute HNO, Aq, the solution is evaporated to a syrup, which is heated to 160°-165° for some hours, the product is thoroughly washed with boiling water, then dried over H.SO4, and heated to c $180^{\circ}-200^{\circ}$, until every trace of water is ie moved Pure MnO. is thus obtained, exactly resembling pyrolusite (Gorgeu, C R 88, 796, Wiight a Menke, C J 37, 45, cf Schlösing, C R 55, 284, and Kuhlmann, D P J 211, 25) Even it the Mn(NO₃)₂ used contain a large quantity of KNO₃, MnO₂ practically free from K₂O is obtained by this method

Very many attempts have been made to obtain pure MnO, by ppn from Mn salts, eg by ppg with BrAq in presence of Na acetate, by passing Cl into an alkaline solution containing MnCOs in suspension, by reacting on a Mn salt solution with KMnO, Aq, &c The various methods have been examined by Gorgeu (C R 88, 796, A Ch [3] 66, 153), Guyard (Bl [2] 1, 89), Hannay (C J 33, 269, cf Beilstein a Jawein, B 12 1530), Pickering (C J 35, 654), Volhard (A 198, 318), Kessler (T) 18, part 1), Pattinson (C J 35, 365), Veley (C J 37, 581), Wright a Luff (C J 33, 504), and Wright a Menke (C J 37, 22) The outcome of the work is that pure MnO, cannot be obtained by any of the ppn methods, either the pp is x MnO y MnO, or, if all the Mn is present as MnO, the pp contains also K O or some other base besides H,O Volhard's method-adding excess of kMnO₄Aq to MnSO₄Aq in presence of HNO3 (exact quantities are given by V)—gave all the Mn as MnO accompanied by a small quantity of KO (c 3 pc), which could not be removed by washing (W a M, lc)

Properties -A black, or brownish black, hard, crystalline powder SG 502 Heated to moderate redness, Mn.O, is formed, heated to whiteness, Mn₃O, remains (cf Heated Mangano manganic oxide, Preparation, 182) MnO. is a conductor of electricity, it is Reacts strongly electro negative to the metals with acids to form salts corresponding with MnO, with cold cone HClAq most probably

forms Mn Cl.

Reactions —1 Heated, gives Mn₂O₃ at moderate redness, and Mn₃O₄ at white heat —

8 Heated in hydrogen, or carbon monoxide, is reduced to MnO, reduction in H begins at c 190°, and in CO at c 87°, when heated with carbon reduction begins at c 390° (Wright a Luff, CJ 38, 518) -3 Heated with polassium chlorate, O is evolved and MnO₂ and KCl remain: KnO 2 when 2 with a reducing agent such as SO₂, carbon reduction begins at c 390° (Wright a Luff, CJ 38, 518) -3 Heated with polassium in combination with MnO₂, but that the ratio of chlorate, O is evolved and MnO₂ and KCl remain: KnO 20 when 20 with a reducing agent such as SO₂, carbon reduction begins at c 390° (Wright a choice of the color o

a little Cl is evolved, and at one stage of the change KMnO, is produced. The reaction between MnO, and KClO, probably produces KMnO, Cl, and O, the KMnO, then decomposes to K_2MnO_4 , MnO_2 , and O, and the K_2MnO_4 reacts with Cl to form KCl, MnO2, and O The following equations are given by McLeod as expressing approximately the various changes: (1) $2MnO_2 + 2KClO_3 = 2KMnO_4 + Cl_2 + O_2$,

(2) $2KMnO_4 = K_2MnO_4 + MnO_2 + O_2$, (2) $\Sigma_{NM10} = N_{1M10} + M_{10} + M_{10} + V_{2}$, (3) $K_{2}M10 + Cl_{2} = 2KCl + M_{10} + C_{2}$ (v McLeod, C J 55, 184, Hodgkinson a Lowndes, C N 59, 63, Fowler a Grant, C J 57, 272, Baudimont, J Ph [4] 14, 84, 161, Warren, C N 58, 247, Veley, T 1888 [1], 271, Spring a. Prost, 1898 [1], 271, Spring a. Prost, 1888 [1], 271, Spring a. Prost, 18 Bl 1889 340) -4 With hot conc sulphuric acid, MnSO, is formed and O evolved -5 With cold cone hydrochloric acid, Mn₂Cl₂ is very probably produced, on warming, Cl is evolved and MnCl, remains (cf Manganic chloride, p 180) —6 Heated with sulphuric acid and oxidisable bodies, MnO acts as an oxidiser, $e g H_2C_2O_4$ is thus oxidised to CO_2 and H_2O -7 Not acted on by moderately dilute nitric acid alone, but in presence of an oxidisable body, Mn(NO₃)₂ and oxidised products are formed, e.g. with HNO, and HCl, Clis evolved -8 Compounds of Mn O, with SeO, were obtained by Laugier (C R 104, 1508), by heating ppd MnO₂ with selenious and -9 With hydrogen peroxide and an acid, forms a salt of MnO and H2O and evolves O, with hydrogen peroxide alone, O is evolved and the same quantity of MnO₂ remains as was originally used (v Hydrogen Peroxide. Reactions 11 and 19, vol 11 pp 723, 724) -10 Heated with magnesium chloride, MnCl, and MgO are formed and Cl is evolved -11 Fused with alkalis in presence of air or oxygen, manganates Mi MnO, are formed (v Manganates under Manganese, oxyacids of, p 185)

12 MnO₂ combines with a number of basic orides to form salts of the form aMO yMnO, known as manganites According to Gorgeu (A Ch [3] 66, 153) MnO, decomposes neutral solutions of many salts of Ca, Ba, Ag, and Mn, making the solutions acid to litmus and combining with the bases From dilute solutions of K2CO. and Na CO₂ MnO₂ withdraws and combines with 7 pc K₂O, and 41 pc Na₂O, respectively, according to Gorgen, the manganites thus produced approximately correspond with the formula M₂O 15MnO₂ According to Jolles (Chem. Zeitung, 11, 1394) K₂MnO₃ is obtained, as a brown yellow solid, by mixing equivalent quantities of K VinO, and C.H.O Wright and Menke (C J 37, 22) have examined the potassium manqanites formed by ppg MnO₂ in presence of K salts, by passing Cl into K₂CO₂Aq holding MnCO, in suspension, by adding MnSO, Aq to KMnO,Aq, &c , they conclude that the amount of K₂O ppd in combination with MnO₂ varies according to the relative masses of the reacting bodies, the temperature, the quantity of free acid present, &c, and that it tends to the maximum 5M3O2 K2O W a M failed to obtain 5MyO, K.O W a M failed to obtain 8MnO, K.O 3H,O described by Stingl a Morawski (J pr [2] 18, 91) as produced by acting on 109) gave the formulæ CaO MnO, and CaO 2MnO, to the manganutes formed by oxidising MnO H₂O by air in presence of lime Manganutes of the form MO 5MnO,, where M = Ca, Ba, Sr, Zn, and Pb, are described by Risler (Bl [2] 30, 110) as produced by heating KMnO, with slight excess of various metallic chlorides, and washing with water By heating metallic chlorides with MnO, and then adding MnCl, Rousseau obtained manganutes, which he classes as MO 5MnO, MO MnO, and 2MO MnO, (C R 101, 167, cf also Post, B 12, 1484, 1537, Rammelsberg, B S, 233, Rousseau, C R 102, 425, 615, 103, 261, 104, 786, 1796) Various compounds of MnO with MnO, seem to exist, these may be regarded as manganese manganutes, v Oxides intermediate between manganuc oxide and manganese percarde. wifra

oxide, mira13 While MnO₂ reacts as an acidic oxide towards the oxides of the more positive metals, it also reacts as a basic oxide with some acids. The usual reactions of MnO₂ with acids are those of a basic peroxide (v Reactions, 3 to 6, supra). The salt MnO₂ SO₃ is said by Fremy to be formed by carefully reacting on MnO₂ xH₂O with cone H.SO₄, and allowing to stand in air (C R 82, 475). By adding MnSO₄ to a freshly prepared solution of Pb₂O₄ in acetic acid, as long as PbSO₄ was ppd, Schönbein (J pr 74, 325) obtained a deep brownish red liquid, which had strongly oxidising properties, and from which MnO₂ separated on standing, or more quickly on boiling. Schönbein thought that this liquid contained an acetate of MnO₂, but he did not succeed in isolating this salt.

HYDRATES OF MANGANESE PEROXIDE approximately pure MnO2 is ppd, by oxidising manganous salts in alkaline solutions, or by re actions between manganous salts and permanganates, or by decomposing KMnO, Aq by H SO, or HNOs, the pp always contains water, but it is very doubtful whether any definite, and fairly stable, hydrate of MnO₂ exists When the process of formation results in ppn of all the Mn as MnO_2 the composition of the pp approximates to MnO_2 H₂O, but this body loses water in dry air (v Wright a Menke, C J 37, 22) When the whole of the Mn is not ppd as MnO2, the pp consists of compounds of the form xMnO2.yMnO zH2O containing variable quantities of metallic oxides according to the conditions of formation It appears to be possible to obtain hydrates which are stable for many hours within definite limits of temperature, but these hydrates are of the form $xMnO_2yMnOsH_2O$ (v Veley, C J 37, 581, 41, 56)

References — The following papers contain the chief experiments bearing on the formation and composition of supposed hydrates of MnO — Rammelsberg, B 8, 233, Fremy, C R 82, 1231, Van Bemmelen, B 13, 1466, Gorgen, A Ch [3] 66, 154, C R 108, 948, Von Hauer, W A B 13, 453, Reisig, A 103, 206, Böttcher, J pr 76, 235, Guyard, Bl 6, 81, Morawski a Stingl, J pr [2] 18, 90, 97, Volhard, A 198, 318, Suckow, D P J 177, 231; Wernicke, P 141, 116, Veley, C J 37, 581, 41, 56, Pickering, C J 35, 654, Wright a Luff, C J 33, 504, Wrighta Menke, C J 37, 22, Franke, J pr [2] 36, 166, 451

OKIDES INTERMEDIATE BETWEEN MANGANIC

OXIDE AND MANGANESE PEROXIDE These oxides belong to the general formula xMnO yMnO The composition of the pp obtained by adding water to solutions of MnO or Mn₂O₃ in cold cone HClAq varies between 16MnO₂5MnO and 36MnO₂5MnO (Pickering, C J d5, 659) By passing Cl for a limited time into solution of Mn acetate, Veley obtained a pp approxi mating in composition to 5MnO, MnO xH,O (C J 37, 581, 41, 56,, by heating this pp in a current of air, the compound 11MnO MnO H2O was produced, and by heating the first compound in O, the body produced had the composition 23MnO₂MnO₂H₂O Wiight a Menke (C J 37, 22) obtained a number of bodies xMnO₂ yMnO xH₂O by various processes of oxi dising manganous salts, and reducing permanganates, in every case, however, KO, or other alkalı, was held in combination Further ac counts of these intermediate oxides, many of which were probably mixtures of the better de fined oxides of Mn, will be found in the memoirs referred to under Hadrates of Manganese per OXIDE (v supra), especially in the memoirs of Gorgeu

MANGANFSE TRIONIDE, MnO, This compound is formed, in very small quantities, by slowly dropping a solution of KMnO, in cold conc H₂SO₄ (c f grams KMnO₁ in 100 cc H SO₄) on to dry Na₂CO₃ The Na CO₃ is placed in a dis tilling flask surrounded by cold water The flask is connected with a U tube filled with fragments of glass, and surrounded by a mixture of ice and salt, and this tube is connected with another \bigcup tube containing a little dilute H_2SO_4Aq As each drop of the green solution of $KMnO_4$ in H_2SO_4 falls on to the Na CO_3 , a pink cloud is formed, the cloud partly condenses in the first U tube, and part of it passes on and is dissolved in the HSO, in the second tube (Franke, C J [2] 36, 31, 166, v also Thorpe a Hambly, C J 53, 175) Only a very small Only a very small quantity of MnO₃ can be obtained It appears as a reddish, amorphous, deliquescent mass slowly decomposes at ordinary temperatures, but is fairly stable if surrounded by ice and salt (T a H, l c) MnO₃ is decomposed by water yielding HMnO, Aq and MnO, (T a H), according to Franke, H.MnO, is produced, but quickly decomposes to MnO₂, O, and HMnO, and probably also H Mn₂O, MnO, dissolves in conc H SO4, forming a green solution Franke thinks this liquid contains (MnO,) SO, MnO, dissolves in KOHAq, forming K2MnO liberates I from KI, and acts on Hg similarly to ozone (T a H)

Manganese hpproxide, Mn₂O₇ (Permanganic anhydride) This oxide was obtained by Thenard (C R 42,382) Its composition was determined by Aschoff (J pr 81, 34) Pure KinO₁, free from Cl compounds, is added little by little to cone H SO₄, S G 1 845, kept cold by a freezing mix ture. To the green solution thus obtained a few drops of water are added, when Mn₂O₇ slowly separates in dark redaish-brown oily drops. If acid of the composition H₂SO₄ HO (S G c 1 78) is used, oily drops of Mn₂O₇ are formed without addition of water. According to Franke (J pr. [2] 36, 31), a solution of KMnO₄ in cone H₂SO₄ contains (MnO₂)₂SO₄, and this is decomposed by a little water, giving Mn₂O₇ and H₂SO₄.

Terreil (Bl 1862 40) prepares Mn₂O, by dissolving KMnO₄ in well cooled H₂SO₄, con taining water in the ratio H_2SO_4 $\frac{1}{2}H_2O$, placed in a stoppered retort, the beak of which passes into a glass balloon surrounded by a freezing mix-Corks or organic material must not be used in any part of the apparatus He heats the retort to 60°-65° (not over 70°), when purple red vapour is evolved and condensed to a thick greenish black liquid, which is Mn,O Only a few drops of Mn₂O, can thus be prepared at a time As soon as a certain quantity collects in the balloon, decomposition occurs, with slight

detonation (v also Spiess, J pr [2] 1, 421)
P Thenard (J pr 69, 58) describes Mn₂O, as a dark olive green liquid, with a smell recalling Cl compounds and ozone Ascholf (J pr 81, 34) describes it as dark brownish red oily drops, which do not solidify at -20° Mn₂O, slowly decomposes in air at ordinary temperatures, with evolution of O It may be heated to 60° - 65° , under reduced pressure, without vola tilising, at a somewhat higher temperature it is suddenly and violently decomposed to MnO2 and O Mn O, is very hygroscopic It dissolves in water to form a puiple liquid, probably containing HVnO. This liquid is slowly decomposed on warming into MnO2 and O Mn O, dissolves in cold conc H SO4, appare tly with out decomposition, to form an olive green liquid (this liquid contains (MnO₃)₂SO₄ according to Franke, J pr [2] 30, 31) Mn O, is at once de composed by contact with small quantities of MnO_2 , Ag O, or HgO (Aschoft, l c) Mn O, 18 a powerful oxidiser It inflames paper or alcohol.

MANGANESE TETROXIDE (?) Franke (J pr [2] 36, 31, 166) states that a blue gas is obtained by leading air or CO, saturated with water at $40^{\circ}-50^{\circ}$, over the green liquid formed by dissolving KMnO, in well cooled conc H2SO, this blue gas he gives the formula MnO. Thorpe and Hambly repeated Franke's experiments (C J 53, 178), but failed to obtain any indications

of the formation of a blue gas

Manganese, oxyacids of, and their salts Two series of salts derived from oxyacids of Mn are known—the manganates Mi2MnO, and the permanganates M'MnO, The and corresponding to the manganates, viz H₂MnO, has not been isolated, but its anhydride MnO, is known The anhydride of permanganic acid, viz Mn.O. is known, and the acid itself has also probably been isolated

MANGANATES, M, MnO, derived from the hypothetical acid H2MnO4 The anhydride of this acid, viz MnO, is known A solution of this oxide ip water perhaps contains H2MnO4, but it decomposes almost at once to HMnO, and MnO, (v Manganese trioxide, p 184) an acid is added to solution of a manganate, the manganic acid produced at once decomposes to permanganic acid and MnO₂. This change occurs even when CO2 is passed into solution of a manganate The manganates are isomorphous with the sulphates

The fact that the product of fusing together pyrolusite, potash, and saltpetre dissolved in water to form a green liquid, which became blue, violet, and then red, on addition of much water, was known to Scheele To the green substance Scheele gave the name 'Chamaleon minerale.'

Chevillot and Edwards, in 1817, showed that the green substance was a definite compound of potash with an acid of Mn (A Ch [2] 4, 287, 8, 337) Forchhammer (Annals of Phil 16, 310, 17, 150) and Fromherz (P 31, 677) investigated the manganates Mitscherlich, in 1830, showed that two salts are obtained by the action of alkali on pyrolusite in presence of air or alkali nitrate (P 25, 287)

Manganates of the alkalis and alkaline

earths are obtained by heating MnO2 with KOH, CaO₂H₂, &c, to c 150° in absence of air, or to higher temperatures in presence of air, or by strongly heating any Mn salt with KOH, CaO.H., &c, in presence of O or an oxidiser, eg KClO. K.MnO. and Na.MnO. dissolve with out decomposition in water containing alkali In pure water, KMnO, or NaMnO, is formed and MnO₂ ppd Solutions of the alkali manganates are decolourised, with ppn of MnO_2 , by easily oxidised bodies, eg SO Aq, As O_3 Aq, H_2 SAq, or ferrous salts Ba and Sr manganates are in soluble in water

Barrum manganate BaMnO, A dark green powder SG 485 Insol water Unchanged in air, decomposed by acids pared by calcining Ba(NO₃)₂ with MnO₂, or by projecting finely powdered MnO₂ into a molten mixture of KClO, and BaO, H2, washing with hot water, and drying By heating MnO₂ with Ba(NO₃), BaMnO₄ is obtained as a green powder consisting of minute hexagonal crystals (Forch hammer, Annals of Phil 16, 130, 17, 150, Rosenstiehl, J Ph 46, 544, Schafavik, J pr The salt is also obtained by digesting Ba(MnO4)2 with BaOAq

Didymium manganate Di. (MnO4)3 black powder, insol water Obtained by heating for 30 minutes 1 pt MnO with 4 pts Di3NO. and washing with water (Frerichs a Smith, A

191, 353)

Lanthanum manganate La. (MnO.), Resembles the Di salt, prepared similarly (F a. S lc)

Potassium manganate K.MnO.
Formation —1 A mixture of equal parts of

finely powdered MnO2 and KOH is heated to bright redness in air, or in O, 3MnO2+2KOH $= \bar{K}_2 MnO_4 + Mn_2O_3 + H_2O \quad K \quad MnO_4 \text{ is formed by}$ heating MnO, and KOH in absence of O to c 150° (Beketoff, Bl 1, 43), the reaction occurs in N at c 180° (Elliot a Storer, P Am A 5, 192) If the mixture is heated above 180° O must be present, because at c 190° K2MnO4 is decomposed with reformation of MnO₂—
2 By boiling cone KMnO₄Aq with KOHAq; 2KMnO,Aq + 2KOHAq = 2K MnO,Aq + \mathbf{H} ,O + $\hat{\mathbf{O}}$ (Aschoff, J pr 81, 29) According to Thenard (J pr 69, 58), this reaction only occurs when the KOH contains some oxidisable substances, eg a little organic matter —3 By long continued heating KMnO, to 240°

 $2KMnO_4 = KMnO_4 + MnO_2 + O_2$ (Thenard, lc) 4 By fusing any oxide of Mn with KOH in presence of O, or an oxidiser such as KClO,

Preparation -2 pts KOH are dissolved in the smallest quantity of water, 1 pt KClO, and 2 pts very finely powdered MnO2 are added, the mi ture is dried, and then heated, nearly to redness, for a long time in a Pt dish, the fused mass when cold is treated with a little water, the conc green solution is decanted, after standing until quite clear, and evaporated in vacuo

over H2SO.

Properties and Reactions - Dark green crystals, isomorphous with K.SO, and K.CrO, Soluble in water containing KOH without decomposition, dissolves in pure water with decomposition to KMnO₄Aq and MnO₂ Dilute acids, even CO2, quickly decompose K2MnO4, forming K permanganate and a manganous salt, e q with H.SO₄, —5K₂MnO₄Aq +4H₂SO₄Aq =2K₂Mn.O₆Aq + MnSO₄Aq +3K₂SO₄Aq +4H.O Heated in CS₂, MnS, CO₃, and polysulphides of K are formed (Muller, P 127, 404) Heated in a stream of water vapour, Mn₂O₅, KOH, and O are produced

 $(2K_a \text{MnO}_4 + 2H_2O = \text{Mn}_2O_3 + 4KOH + 3O)$ fusing MnO2 with KOH in air, and then passing water vapour over the product, then again fusing the products together, and repeating these processes, O may be obtained from the atmosphere

Sodium manganate Na2MnO, 10H2O Obtained by long continued heating equal pts finely powdered MnO2 and NaNO3, boiling with water, filtering, and allowing to cool (Gentele, J pr 82, 58) Said to form colourless crystals, resembling Glauber's salt, and to dissolve in water with partial decomposition to form a green solution

PERMANGANIC ACID and PERMANGANATES acid HMnO4, or H2Mn2O8, has probably been isolated, a series of salts derived from this acid is known Permanganic anhydride, Mn₂O₂, is a very unstable liquid, it dissolves in water to form HMnO,Aq, which slowly decomposes to MnO₂ and O Permanganic acid and its salts readily part with O, and hence act as energetic oxidisers The permanganates are isomorphous with the perchlorates M'ClO₄, they are purple red, all are soluble in water, the least soluble is the Ag salt These salts are produced by the action of dilute acids, or of Cl, on the man ganates, or by the reaction of several oxidisers, e q Pb₃O₄ and dilute HNO₃Aq, on Mn salts — (Tamm, J 1872 910, Fresenius, Fr 11, 415, 425, Crum, A 60, 219, Gibbs, Am S [2] 14, 204, Chatard, C N 24, 196, Pichard, C R 75, 1981 Colored R 18 (1981) Pichard, C R 75, 1981 Colored R 18 (1981) Pichard, C R 75, 1981 Colored R 18 (1981) Pichard, C R 75, 1981 Colored R 18 (1981) Pichard R 18 (1981 1821, Deshayes, Bl [2] 29, 541, Volhard, A 198, 354, Rose, P 105, 289) KMnO is reduced to K,MnO by boiling cone KMnO, Aq with potash (cf. Potassium Manganate, Formation No 2, p 185) Solutions of permanganates are decomposed by NH₃Aq with separation of xMnO2 yMnO, they are reduced to manganous salts by HNO₃Aq, fairly cone HClAq, SO₂Aq, Na.S.O.Aq, many organic compounds, &c H.SO.4 decomposes solid permanganates with separation of MnO, and evolution of O tions of HMnO4 and KMnO4 absorb the green and yellow green rays of the spectrum, the absorption spectrum has been examined by Lecoq de Boisbaudran (Spectres lumineux, p According to Vogel (B 8, 1534) $\frac{1}{250000}$ pt of Mn may be detected, in presence of Cu and Fe compounds, by boiling with PoO2 or Pb,O4 and dilute HNO,Aq free from Cl com pounds, and examining the absorption spectrum of the solution (of permanganate) produced

Ammonium permanganate NH, MiO,. Resembles KMnO, with which it is isomorphous, v sol water, decomposed by gently

heating Prepared by rubbing together AgMnO. and NH, ClAq in the ratio AgMnO, NH, Cl, filtering, and evaporating at the ordinary temperature over H₂SO₄, also by decomposing BaMnO₄ by (NH₂)₂SO₄ (Böttger, N R P 25, 115)

Barium permanganate BaMnO, Small, hard, rhombic ontahedra, almost black, with violet sheen Prepared by adding excess of violet sheen Prepared by adding excess of H₂SiF₆Aq to KMnO₄Aq, filtering from K SiF₆ through asbestos, saturating with BaOAq containing BaO2H2 in suspension (BaCO2 should not be used as it causes ppn of MnO₂ xH O), decanting from $BaSiF_{e}$, and ϵ /aporating (Rousseau a Bruneau, C R 93, 229) Böttger (N R P 25, 115) prepares BaMnO, by dissolving in water the product of the fusion of 2 pts KOH and 1 pt MnO₂, filtering, and adding BaCl₂Aq until the green colour of the liquid disappears, he collects the violet blue pp , and washes it with cold water till the washings begin to appear reddish, he heats this pp, which is Ba(MnO4), with water, passes in CO2 till the liquid is purple red, filters from MnO₂, and evaporates

Calcium permanganate CaMnO, 5H2O A crystalline, deliquescent mass, prepared by decomposing AgMnO₄ by CaCl₂Aq, following directions given for obtaining NH₄MnO₄ (v

Cobast permanganate does not seem to have been isolated, but Klobb has prepared several luteo cobaltic permanganates, viz Co2(NH3)12(MnO4)6, $Co (NH_3)_{12}Cl_4(MnO_4)$, $Co_2(NH_3)_{12}Br_4(MnO_4)_2$ (C R 103, 384, Bl [2] 48, 240)

Potassium permanganate KMnO, Formation -1 By fusing together KOH and an oxide of Mn in the air or with KClO3, dis solving the K2MnO4 in water, passing in CO2 filtering from MnO2, and evaporating

 $(3K_2MnO_4Aq + 2CO_2 = 2KMnO_4Aq + 2K_2CO_3Aq + MnO_2) - 2$ By warming solution of a Mn salt with KCO, and KClOAq -3 By melting MnO, with kHO, making a conc solution of the fused mass, adding saturated MgSO,Aq, and filtering

 $\begin{array}{l} (3 \text{K}_2 \text{MnO}_4 \text{Aq} + 2 \text{MgSO}_4 \text{Aq} \\ = 2 \text{KMnO}_4 \text{Aq} + 2 \text{K}_2 \text{SO}_4 \text{Aq} + 2 \text{MgO} + \text{MnO}_2) \\ (\text{Tessié du Mothay}, \ D \ P \ J \ 186, 231) - 4 \ \ \text{By} \end{array}$ passing Cl into a solution of the fused mass ob tained as in 1 and 3, and evaporating (Stadeler, $J pr 103, 107) (2K_2MnO_1Aq + Cl)$

 $=2KClAq + 2KMnO_{\bullet}Aq)$

Preparation -A mixture of 2 pts KOH and 1 pt KClO₃ is melted in a thin sheet iron crucible, the crucible is removed from the lamp, and 2 pts very finely powdered and sifted MnO, are added, little by little, heating is then continued, with stirring, until the mass gets quite hard, the temperature is then raised for a short time to full redness, when cold, the mass is broken up, and boiled with so much water that no crystals separate on cooling (c 40 pts water for 1 pt KClO, used), a rapid stream of well washed CO2 is passed into the boiling liquid until a drop placed on paper makes a red stain (showing no green at the edges), the outer part of which soon becomes brown After cooling the greater part of the liquid is poured off, the rest is filtered (from MnO) through glass wool. and the whole is evaporated until a drop placed on a cold surface quickly deposits crystals. After standing 12 to 24 hours the greater part of the KMnO₄ separates out, a little is obtained by further evaporating the mother liquor 100 grms pyrolusite give about 30 grms KMnO₄ (Böttger, J pr 90, 156, for modification of this method, v Grager, J pr 96, 169, Wöhler, P 27, 626, Gregory, J Ph 21, 312, Mitscherlich, P 25, 287, Elliot a Storer, P Am A 5, 192) Béchamp (A Ch [3] 57, 293) heats MnO₂ with KOH, and oxidises by passing O over the fused mass, he then dissolves in water, passes in CO₂, and evaporates

Properties — Dark purple red, almost black, rhombic crystals, a bc = 79523 1 6478 S G 2 71 (Kopp) Isomorphous with KClO, S at 15° = 6 25 (Mitscherlich) Decomposed by heat, giving K,MnO, and O Pure conc KMnO, Aq can be boiled without change, in presence of oxidisable bodies KMnO, Aq is quickly reduced Reactions—1 Heated to 240°, MnO, K,MnO,

and O are produced (Chevillot a. Edwards, A Ch [2] 4, 290) At higher temperatures xMnO yk O is formed (Rousseau, $C \hat{R}$ 104, 786) -2 Sulphunc or nitric acid separates HMnO, which decomposes with evolution of O and ppn of MnO2, Mn2O3, or xMnO2yMnO, with consider able excess of warm H2SO, Aq or HNO, Aq, MnSO, or Mn(NO₃) is produced Cold cone H SO₄ dis solves kMnO, forming a green liquid, from which a few drops of water cause separation of Mn O, (cf Manganese heptoxide, p 184, v also Manganese trioxide, p 184) —3 Hydrochloric acid in excess forms MnCl, and evolves Cl Dry HClevolves Cl, and forms H_aO , hCl, $Mn_2O_3xH_2O$, MnCl., and probably Mn.Cl. (Thomas, C J 33, 372) -4 Sulphunc acid and oxidisable bodies either separate MnO, or vMnO, yMnO, the oxidisable body being simultaneously oxi dised, or if there be enough acid to prevent ppn of xMnO₂yMnO, MnSO₄ is formed With H₂CO₄ and H₂SO₄, CO₂ and HO (besides K₂SO₄ and MnSO₄) are produced (of Berthelot, A Ch [5] 21, 176, Harcourt, C J [2] 5, 460, Jones, C J 33, 95)Harcourt (lc) represents the re action thus

 $2kMnO_1Aq + 3HSO_1Aq + 5H_2C_1O_1Aq$ $= K SO_4 Aq + 2 MnSO_4 Aq + 10CO_2 + 8H O$ Jones (lc) says that HO, KCO, and MnCO, are at first produced on adding KMnO,Aq to HCO,Aq, and that further addition of KMnO,Aq forms KCO, ppts Mn₂O, and evolves CO, and O Alcohol gives Kacetate and a pp containing MnO2, MnO, and K.O, glycerin gives a similar pp and forms K.CO2 (Morawski a Stingl, J pr [2] 18, 78, cf Berthelot, lc)—
5 According to Aschoff (J pr 81, 29) cone
KMnO₄Aq is reduced to K.MnO₄ by boiling with potash solution (2KMnO,Aq+2KOHAq = $2K_2MnO_4Aq + HO + O$, Thenard (J pr 69, 58) says that this action does not occur unless traces of oxidisable substances, e.g. organic matter, are present—6 kMnO₄Aq acidified by H2SO, reacts with hydrogen peroxide to form H₂O, O, and MnSO. At low temperatures, c 12°, the KMnO₄ is decolourised, but O is not evolved, according to P Thenard (C R 75, 177), Berthelot (A Ch [5] 21, 176) thinks that H₂O₄ (?) is formed (v also Swiontrowski, A 141, 205, Aschoff, P 111, 217) -- 7 KMnO, Aq is decomposed with separation of MnO2, Mn2O2, or xMnO2 yMnO, by ammonia (Cloez & Guignet,

C R 47, 710, Wohler, A 136, 256, Wanklyn a Gamgee, C J [2] 6, 25, Tamm, C N 25 47), by hydrogen (Jones, C J 33, 96, Wanklyn a Cooper, P M [5] 6, 288), by phosphine, arsine, and stibine (Jones, Ic, Schobig, J pr [2] 14, 289, Parsons, C N 1877 236), by chlorine dioxide [ClO₂] (Furst, A 206, 75)—8 With potassium sulphocyanide, K₂SO₄ and KCNO are produced (Morawski a Stingl, J pr [2] 18, 78)—9 Sodium thiosulphate in boiling solution is wholly oxidised to Na₂SO₄ by fairly cone KMnO₄Aq, if the KMnO₄Aq is very dilute from to 2½ p c Na₂S₂O₃ remains (Glaser, M 7, 651) Combination—From cone mixed solutions of

Combination — From cone mixed solutions of KMnO, and K₂MnO, the salt KMnO, K.MnO, separates in small, six sided, monoclinic tablets

(Gorgeu, J pr 80, 123)

Sodium permanganate NaMnO, 3H O Formed similarly to KMnO,, or by the reaction between AgMnO, and NaClAq V sol water, and hence obtained in crystals with difficulty

Silver permanganate AgMnO, Monoclinic crystals S 91 in cold water Obtained by mixing cone warm kMnO, Aq with AgNO, Aq, and allowing to cool (Dewar a Scott, Pr. 35, 44) Klobb (C R 103, 384) obtained AgMnO, 2NH, by saturating KMnO, Aq with NH, and then adding an equivalent quantity of AgNO.

Per manganates of copper, didymium (Frenchs a Smith, A 191, 354), lanthanum (F a S, lc), lead, lithium, magnesium, strontium, and zinc,

have been isolated

Permanganic acid, HMnO, The solution obtained by decomposing powdered Ba(MnO,), by an exactly equivalent quantity of HSO,Aq, contains this acid Hunefeld (Schweiger, Jahrb der Chem und Phys 30, 133) says that the acid can be obtained, in indigo like crystals, by washing Ba(MnO,), with hot water, whereby it is decomposed to MnO and BaMnO, filtering, adding exactly enough phosphonic acid to decompose the Ba salt, heating to 60°-100°, filtering, and evaporating at a low temperature (No analyses are given)

Manganese, oxychlorides of Several oxychlorides of Vin appear to exist, but they have not been satisfactorily examined P de Saint Gilles (C R 55, 329) says that MnCl₂ 3Mn O₄ is formed as a black powder, resembling MnO₂, by heating to 280°, in a partially closed vessel a mixture of MnCl, and NaNO₃ Gorgeu (A Ch. [6] 4, 515) obtained an oxychloride, to which he provisionally assigned the formula MnCl MnO by heating MnCl₂ in water vapour According to Aschoff (J pr 81, 29) the gas which Dumas obtained by adding pieces of fused KCl or NaCl to a mixture of kMnO₄ and cone H SO₄, and which he said was MnCl₇, is probably an oxychloride having the composition MnO₂Cl

Manganese oxyfluoride of. According to Nickle's (C R 65, 107) the compounds MnOF KF and Mn₂OF₂ 2k.F are ppd, when solution of MnO₂ in ethereal HCl is poured into boiling KFAq or NaFAq Christensen (J pr [2] 30, 57), however, asserts that the double compound obtained as described above is MnOF.

Manganese, oxysulphide of The compound MnO MnS is said to be formed, by Arfvedson (P. 1, 50), by heating MnSO, in H, it is a green solid, which dissolves in acids with evolution of H_2S , heated in air it burns to Mn_2O_4

Manganese, phosphides of Several compounds of Mn with P have been described Mn₃P an amorphous powder, SG 494, ob tained by heating Mn and P together to low red ness (Schrötter, J pr 51, 385) Also formed, according to H Rose, by heating MnCl₂ in PH₃ By heating Mn pyrophosphate mixed with sugarcharcoal, in a crucible filled up with charcoal, Struve (J pr 81, 321) obtained a brittle substance resembling pig iron, the composition of which varied between Mn₂P₂ and Mn₂P Merkel Merkel and Wohler (A 86, 371) obtained a crystalline, greyish, regulus, S G 5 95, by heating together 10 parts MnO, 10 parts well burnt bones, 5 parts quartz sand, and 3 parts lamp black The composition agreed with the formula Mn₅P₂, but as part was soluble, and part insoluble, in HClAq, they regarded the substance as a mixture of two phosphides, Mn₃P₂ (soluble in HClAq) and Mn₇P₂ (insoluble in HClAq)

Manganese, salts of Compounds obtained by replacing the H of acids by Mn Mn forms two series of salts manganous salts, MnX2, and manganic salts, Mn_2X_3 , $X = NO_3$, ClO_3 , $\frac{1}{2}SO_4$, $\frac{1}{2}PO_4$, &c One or two salts of the form $MnX_4 = g - Mn(SO_4)_2$ —are also said to exist. The manganous salts are considerably more stable than the manganic salts A number of double salts of manganic sulphate are known, those with the alkali sulphates are alums, eg Mn₂(SO₄)₃ K₂SO₄ 24H₂O The manganous salts form a fair number of double salts and a few basic salts The chief salts of Mn are the following antimonates, arsenates and arsenite, borate, carbonates, chlorate and perchlorate, chromates, ferri- and ferro cyanides, vodate, molybdate, nitrates and nitrites, phosphates and phosphites, selenates and selenites, silicates, sul phates and sulphites, throsulphate, tungstate, vanadate v Carbonates, Nitrates, Sulphates, &c

Manganese, selenide of Said to be produced in combination with H2O as a red powder, decomposed in air, by adding an alkali selenide so-

lution to solution of a manganous salt

Manganese, silicides of Mn and Si combine when heated together (Troost a Hautefeuille, C R 81, 264) Silicides of Mn, containing from 65 to 13 pc Si, have been obtained by Wohler (4 106, 54) by fusing together MnF., Na, K silicate, and cryolite, or MnCl. 2NaCl. CaF., and K silicate, or MnCl., CaF., K2SiF., and Na These silicates form hard, brittle masses, they dissolve in HClAq with evolution of H and SiH,

Manganese, silicofluoride of. MnSiF₆ 6H₂O Hexagonal crystals, ac=1 515, SG at 175°=19038 (Stolba, C C 1883 292) Formed by dissolving MnCO₃ or MnF₂ in H₂SiF₆Aq, and evaporating When heated, the crystals give off water, and then SiF4, and leave MnF2 (Berzelius)

Manganese, sulphides of Two sulphides are

known, MnS and MnS₂

MANGANOUS SULPHIDE, MnS Occurs native, as manganese blende, in hexagonal crystals, S G Produced by heating together MnO or MnCO, and S, not by heating S with Mr formed by heating Mn in CS2 (Gautier a Hallopeau, C R 108, 806), also by heating various Mn compounds in H_2S (Carnot, Bl [2] 32, 162) Sidot (J 1868 229) obtained MnS in hexagonal crystals by heating the amorphous substance in a stream of H_aS MnS is ppd from solutions of

Mn salts by NH, sulphide, as a pale buff coloured amorphous solid, which quickly oxidises in air, if this pp is rapidly dried and then warmed in H₂S, pure MnS is obtained MnS is a greenish solid, decomposed by weak soids, e g acetic soid, with evolution of H₂S. Heated in air, SO₂ is evolved and Mu₃O₄ remains (P. W. Hofmann, D. P. J. 181, 364). Heated in H₂O vapour, H₂S. and H are given off and Mn.O. is formed MnS is slowly decomposed by Cl with formation of MnCl, and S2Cl2

There appear to be two forms of MnS ob tainable by ppn from Mn salts by NH, sulphide the pp from conc MnCl₂Aq or MnSO₄Aq is rose coloured, if NH₄Cl is present the pp is greenish and consists of small 8 sided plates The green sulphide is not produced when K2S or Na,S is used as potant (Fresenius, J pr 82, 265, Muck, Z 1869 580, de Clermont a Guyot, Bl 27, 353, Geuther, Z 1865 347) The rose coloured sul phide is said to be changed to the green sulphide by heating with a little water, but it may be heated to 305° with much water without changing The change from rose to green is accomplished by heating with NH₃Aq to 250° in a closed tube, and the reverse change by heating in NH3 gas The rose sulphide is not changed by heating alone to 250° but in presence of H S the green sulphide is formed at 220° (De C a G, lc) The green sulphide is thought by Muck to be an oxysulphide of Mn

Double compound, 3MnS K2S Obtained by heating a mixture of 1 pt dry MnSO₄, ½ pt lamp-black, and 3 pts K2CO3 and S, and treat ing the fused mass with water, the compound remains insoluble in water, forming small lustrous

dark red tablets (Voelcker)

MANGANIC SULPHIDE, MnS. Occurs native as hauerte, in large, brown black, lustrous, regular octahedra, S G 3 463 Said to be obtained as a red amorphous powder, by heating MnSO₄Aq with solution of K polysulphides to 160°-180° in a closed tube (Senarmont, J pr 51, 385) Not changed in air, decomposed by acids

Manganese, sulphocyanide of, v vol n p
M M P M

MANGANITES Salts in which MnO2 acts as the acidic radicle, v Manganese peroxide, Reactions 12, under Manganese, Oxides and hydrated oxides of, p 183
MANGANOCYANIDES v vol 11 p 342

MANGOSTIN C₂₀H₂₂O₅ [c 190°] Contained in the husk of the fruit of Garcinia mangostana The dry husks are boiled with water to extract tannin, then treated with hot alcohol, and the alcoholic extract left to evaporate The man alcoholic extract left to evaporate gostin which is deposited is dissolved in alcohol and ppd by lead subacetate The pp is decomposed by water and the mangostin finally crys tallised from dilute alcohol (Schmid, A 93, 83) Thin golden lamine without taste or smell Insol water, v sol alcohol and ether Warm dilute acids dissolve it without alteration Hot conc HNO₃ gives oxalic acid Alkalis dissolve it with yellowish brown colour Reduces chloride FeCl, gives a dark greenish of gold solution black solution, decolourised by acids Its solution is not ppd by any metallic salt except lead sub acetate -(C20H21O3),5PbO (dried at 100°), ppd. by adding alcoholic lead acetate and ammonia to an alcoholic solution of mangostin

MANNITE C.H., O, te CH., (OH) CH(OH) CH(OH) CH(OH) CH, (OH) Mol w 182 (181 by Raoult's method, Brown a. Morris, C J 58, 620) [165°] S G 15 [α]_D = -25 8 156 at 18° (Berthelot, A Ch [3] 47, 301), 13 at 14° (Krusemann, B 9, 1467), 16 at 16 5° (Wanklyn a Erlenmeyer, J 1862 480) S (alcohol) 07 at 14° H C v 728,200 H C p 728,500 (Berthelot a Vieille, Bl [2] 47, 868, A Ch [6] 10, 456) HF 318,500 (B a V), 287,000 (Von Rechenberg)

Occurrence -Discovered by Proust (A Ch [1] 57, 143) Occurs to the extent of 30 to 60 pc in manna, the aried juice which exudes from the manna ash (Frazinus Ornus) Mannite occurs in many other plants, eg the roots of Aconitum napellus, celery, Apium graveolens, Meum athamanticum, Enanthe crocata, Poly podium vulgare, Scorzonera hispanica, and Triticum repens, and in the root bank of Tunica granatum Mannite also occurs in the bark of Canella alba (8 pc), and of Fraxinus excelsior, in the leaves and voung twigs of Syringa vulgaris, in the leaves of Liquis trum vulgare and of Cocos nucifera, and in the fruit of Laurus Persea and of Cactus opuntia Mannite also occurs in Laminaria saccharina, in olives, and in several fungi, eg Lactarius rellereus, L turpis, L pyrogalus, and L palli dus Aganeus integer contains 20 p c of its dry substance It also occurs in the cambium layer of Conifera (Payen, A 12, 60, Meyer a Reiche, A 47, 234, Stenhouse, A 51, 349, Knop a Schnedermann, A 49, 293, Dopping a Schloss beiger, A 52, 117, Muntz, CR 76, 649, 82, 210, Smith J 1850, 545, Roussin, J 1851, 550, Ludwig, J 1857, 503, De Luca, J 1861, 740, 1862, 505, Thorner, B 12, 1635, Reinsch, J 1863, 612, Bourquelot, C R 108, 568, Kuchler, M 7, 410)

Formation -1 In the lactic fermentation of sugar (Liebig, J 1847, 466, Pasteur, J 1857, 511, Diagendorff, Ar Ph [3] 15, 47) -2 In the vi-cous fermentation of sugar, 100 pts of sugar yielding 51 pts mannite and 46 pts gum (Pis teur, J 1861, 728) – 3 In the spontaneous fer mentation of the juice of the sugar cane in tropical climates (Maicano, C h 108, 955) -4 by reducing glucose, lavulose, or invert sugar with sodium amalgam (Linnemann, A 123 136, Dewar, P M [4] 39, 345, Bouchaidat, Bl [2] 16, 38, Krusemann B 9, 1465, Scheibler, B 16, 3010) -5 By reducing mannose (Γ Fischer, B 21, 1808), or 'glucosone' (L Fischer, B 22, 94), with sodium amalgam -6 From the dilac tone of meta sacchanic acid by treating with weter and sodium amalgam (3 p c), acidifying with H₂SO₄ (Kiliani, B 20, 2714, v L ±vo-MANNITE, infia)

Preparation -1 Manna is extracted with boiling dilute alcohol, and the crystals which separate on cooling are recrystallised from water -2 Manna (2 pts) is boiled with water (1 pt) after addition of a little white of egg The crystals which separate from the filtrate are boiled with water (6 pts) to which some animal charcoal has been added, and the filtrate is allowed to crystallise (Ruspini, A 65, 203)

Properties - Needles or four sided prisms V sol water, v al sol alcohol, insol ether An aqueous solution, does not become syrupy on

spontaneous evaporation (difference from sugar) Only slightly sweet to the taste It has little, if any, action on light, but if borax be added to the solution it becomes dextrorotatory in a 10 pc solution containing 12 8 g borax $\alpha = +22.5^{\circ}$, so that $[\alpha]_{\rm p} = c + 225^{\circ}$ (Vignon, A Ch [5] 2,433, C R 77, 1191, Muntz a Aubin, C R 83, 1213, Pasteur, C R 77, 1192, Bouchardat, C R 80, 120, 84, 34) Arsenic acid slowly develops levorotation in a solution of mannite Salts of the alkalis and alkaline earths develop dextrorotation Free alkalis render the solution lævoiotatory A solution containing 8 g mannite and 8 g NaOH in 100 cc gives $a = -34^{\circ}$, so that $[a]_{D} = -42^{\circ}$ A solution of 12 g mannite and 4 g sodium tungstate made up to 100 cc shows $a = +0^{\circ} 40'$ (Klein, C R 89, 484) These rotations vary with the amount of dissolved substances The mannite may be recovered from these solutions without having undergone any change in optical properties Mannite renders a borax solution acid, forming boracic acid and sodium metaborate (Dunstan, Ph [3] 13, 257, 14, 41, Lambert, \hat{C} R 108, 1016) Mannite does not reduce Fehling s solu It hinders the ppn of ferric and cupric salts by potash It is not turned brown by boil ıng KÖHAq With a solution of ammonio sulphate of copper it gives a blue pp, sol in ammonia, forming a blue solution which is not affected by boiling (Guignet, C R 109, 528, 645) Mannite does not reduce boiling solutions of silver or mercurous nitiates, of HgCl, or of chloride of gold, but it reduces Ag O and silver acetate (Hirzel, A 131, 50) When alcohol is added to a solution of mannite mixed with lime, strontia, or baiyta water, pps (C₆H₁₄O₆)₄3CaO, (C₆H₁₄O₆)₄SrO, and (C₆H₁₄O₆)₂BaO are formed (Hirzel, A 131, 50, of Ubaldini, A Ch [3] 57, 213) Ammoniacal lead acetate gives a pp On adding to an aqueous solution of mannite (1 mol) and of lead nitrate (2 mols) sufficient ammonia to neutralise two thirds of the nitric acid present in the salt, a voluminous white pp separates, which, if fitered off and dried over calcium chloride, forms a white crystalline powder C₈H₈O₅Pb₄(NO₃)₂2H₂O, S 1 10 at 14°, decom posing with explosion on heating, and separated into its constituents on long boiling with water and by carbonic anhydride with formation of lead carbonate (Smolka, M 6, 198)

Reactions -1 Mannite begins to sublime at

c 200, in a sealed tube it is unaltered at 250° At 280° it splits up into water and mannitan C.H.O. When distilled in vacuo it yields isomannia. C.H.O. —2 A mixture of HNO, and H.SO, forms the nitrate, so called 'nitro mannite ' (Flores Domonte a Menard, J 1847. 1145) -3 Nitric acid oxidises it to saccharic, racemic, and oxalic acids, no mucic acid being formed (Backhaus, J 1860, 522, Carlet, J 1861, 367) -4 Boiling HIAq gives sec-hexyl iodide (Wanklyn a Erlenmeyer, Domac, M 2, 309, cf Le Bel a Wassermann, C R 100, 1589) -5 Boiling cone HClAq slowly forms mannitan — 6 Potash fusion yields formic, acetic, and propionic and oxalic acids and acetone (Gottlieb, A 52, 122) -7 On oxidation with KMnO in alkaline solution it gives oxalic acid, formic acid, a little tartaric acid, a sugar which reduces Fehling's solution, and erythric acid C,H,O,, which forms 190 MANNITE.

the salts CaA'₂ 2aq, BaA'₂ 2aq, and C₄H₆BaO₅ 2aq (Hecht a Iwig, B 14, 1760, 19, 468, cf Pabst, C. R 91, 728, who states that he obtained a dibasic acid $C_0H_0O_0$, which he names dioxyisocitric acid) —8 Air and $platinum\ black\ yield\ mannitio acid <math>C_0H_{12}O_0$, and mannitose $C_0H_{12}O_0$. 9 MnO₂ and H₂SO₄ give formic acid and acrolein (Backhaus) —10 When mannite (2 pts) is heated with 80 pc formic acid (5 pts) for 8 hours a mixture of formyl derivatives of mannitan appears to be formed This mixture yields on distillation CO, CO₂, isomannide C₅H₁₀O₄, a liquid C₆H₁₆O₅ (?) (157° at 17 mm) and a liquid C₆H₈O (108°), S G $\frac{9}{4}$ 9396, $[a]_{\rm p} = -168°$, almost insol water, and smelling like a carbamine and mustard oil (Fauconnier, C R 100, 914, cf Henninger, B 7, 264) -11 Distillation with oxalic acid yields formic acid, a formyl derivative of mannite or of mannitan being probably first formed (Lorin, Bl~[2]24,437)—12 Electrolysis of a solution of mannite acidulated by H_2SO_4 yields hydrogen, CO2, CO, oxygen, tri oxy methylene (? formic paraldehyde or mannitose), formic acid, oxalic acid, and a small quantity of an acid whose calcium salt is C₆H₆CaO₈ 2aq This acid having

reducing properties may be CO'H CO (CH OH)2 CO'H (Rénard, A Ch [5] 17, 316) -13 PCl, gives tetra chloro-hexmane (Bell, B 12,1273) —14 PI, forms methylene iodide (Butlerow, A 111,247) — 15 Organic acids (e.g. acetic and butyric) heated with mannite at 200° form alkoyl derivatives of mannitan - 16 Mannite heated with uater suffers no change below 280°, but at that tem perature a viscid product is got containing 'mannitic ether ' $C_{12}H_{28}O_{11}$ ([a]_j = -56) and 'mannitone,' a crystalline isomeride of mannitan Both bodies are reconverted into mannite by heating with water at 295° (Vignon).—17 Mannite does not react when heated with acetic, valeric, or benzoic aldehydes (Lochert, A Ch [6] 16, 65) But when acetic aldehyde is passed into a solution of mannite in H₂SO₄ or HClAq the alde hyde is absorbed and there is formed a compound crystallising in needles [174°], insol cold water S 1 at 95° It is sl sol cold, v sol hot, alcohol Boiling dilute (2 pc) H_2SO_4 resolves it into aldehyde and mannite Paraldehyde gives the same compound When a mixture of acetic and benzoic aldehydes is used the above product is formed first (Meunier, C R 108, 408) -18 When a mixture of mannite (10 g), absolute alcohol (20 g), and fused ZnCl₂ (5 g) is saturated with HCl, left for two days, and then mixed with benzoic aldehyde, there is formed 'tribenzoic mannitoid' $C_cH_sO_s(C,H_cO)_s$ [207°] This crystal lises from benzene, and is insol water, sl sol alcohol It is not affected by boiling alcoholic KOH, but dilute H2SO4 yields mannite and benzoic aldehyde (Meunier, C R 106, 1425, A solution of mannite in HClAq or H.SO. also reacts with benzoic aldehyde (Meunier, CR 107, 910) -19 A solution of mannite in alcohol containing ZnCl₂ and saturated with HCl reacts with BzCl, forming di-benzoyl mannide C.H.O.(OBz), [132°] (Meunier, C R 107, 346) 20 Valeric aldehyde, ZnCl, and HCl convert mannate in alcoholic solution into C₆H₄O₅(C₅H₁₆O)₅, which is deposited as silky needles [91°] (Meunier) -21 Not fermented by yeast In contact with water, chalk, and cheese at 40° it gives

alcohol, carbonic, lactic, butyric, and acetic acids. and hydrogen, but no sugar or glycerin (Berthelot, J 1856, 664) When the fermentation is induced by a slit testicle a fermentible sugar is produced Upon fermentation by Schizomycetes in presence of CaCO, and ammonium phosphate there is formed alcohol, n butyl alcohol, butyric, lactic, acetic, hexoic, and succinic acids (Fitz, B 10, 281, 11, 43) Bacillus butyricus gives similar products Under other conditions formic acid is among the products of fermentation (Fitz, B 11,

among the products of fermentation [Fitz, B 11, 1895, 15, 876, 16, 845) —22 Heating with phenyl cyanate forms $C_nH_0(OH)(OCONHPh)$, [260°] (Tessmer, B 18, 96s)

Pentanitrate $C_nH_0(ONO)$, O Pentanitroxyl derivative [79°] S 2 at 60° S (alcohol, S G ?1) 150 at 12 8° S (ether) 180 at 9° Formed, together with nitro mannitan, by pass ing NH₃ into an ethereal solution of the hexa nitrate (Tichanovitch, J 1864, 582) Long needles Dextrorotatory Explodes when struck, and also, more feebly, when heated Ammonium

sulphide reduces it to mannite

Hexanitrate C,H₈(ONO),O Nitro mannite Mol w 452 [113°] (Socoloff) S G 2 1604 S (alcohol of S G 81) 3 at 128° S (ether) 5 at 9° (Tichanovitch) $\alpha = +12.4$ in a 3 p c solution, so that $[a]_D = +400^\circ$ (Muntz a Aubin) Piepared by treating mannite (1 pt) with HNO₃ (5 pts of S G 1 5) at 0°, and adding H₂SO₄ (10 pts) The product is collected on a filter, washed with water and aqueous Na CO3, and recrystallised from alcohol (Domont a Menard, J 1847, 1145, Sobrero, A 64, 397, Strecker, A 73, 62, Socoloff, J R 11, 136) Beautiful white needles, insol water, sol alcohol and ether Explodes violently on being struckit also explodes when suddenly heated, but if carefully heated it may be decomposed without explosion Ammonium sulphide conveits it into mannite (Dessaignes, A 81, 251) Inon and acetic acid and HIAq also convert it into man nite (Bechamp, A Ch [3] 46, 354, Mills, J 1864, 584) NH, passed into its ethereal solu tion forms crystalline C.H.O(NH.), (Tichano

Disulphuric acid CoH8(SO4H)2(OH)4. From mannite and conc H2SO4 (Favie, B J 25, 560) The free acid is decomposed by boil-

ing water It gives no pp with BaCl₂ or CaCl₂ —
Pb₂C₆H₁₀S O₁₂2PbO insoluble pp
Tri sulphuric acid C₆H₁₀(SO₄H)₄(OH)₄ From mannite and conc H.SO, (knop a Schnedermann, A 51, 130) Both the acid and its salts are decomposed by water into mannite and H₂SO₄—Na₃A"—K₃A" deliquescent gummy mass, insol alcohol—Ba₃A"₂ crystal line powder, sol water, insol alcohol—Pb₃A'₂ amorphous deliquescent mass

Tetra sulphuric acid $C_0H_2(SO_4H)_4(OH)_2$ [a]_D = +9° Obtained when, in the preparation of the hexa sulphuric acid, the neutralisation with BaCO, is delayed for two

days --- Ba2Aiv

Hexa-sulphur c acid $C_eH_s(SO_4H)_e$.

[a]_D = +24° Formed by adding mannite in small portions to chloro sulphuric acid (CISO.H) The product is dropped upon ice, and the ice solution neutralised with BaCO,cold Ba, Avi 5aq When alcohol is added to its solution this salt is thrown down as an oil, which presently changes to a crystalline mass insol The other salts are very soluble, and do not behave thus (Claesson, J pr [2] 20, 10)

Boric acid When mannite (4 pts) is heated with boric acid (3 pts) for eight hours at 145°, and the product is dissolved in water and neutralised by BaCO₃, a filtrate is obtained which deposits barium borate on evaporating, after which alcohol gives a pp which, when dried at 100°, has the composition (C₆H₁₃B₂O₆) Ba (Klein, Bl [2] 29, 363)

Hexa acetyl derivative C.H. (OAc), [119°] [α]_D = +18° (Bouchardat, C R 84, 34) From mannite (18 pts) and Ac₂O (80 pts) at 180°, with or without addition of a little ZnCl, (Bouchardat, A Ch [5] 6, 107, Schutzenberger, A 160, 94, Franchimont, B 12 2059) Limit of etherication from mannite (1 mol) and HOAc (6 mols) 264 (Menschutkin, B 13, Trimetric crystals (from HOAc) Insol water, cold alcohol, and ether, sl sol hot alco Destrorotatory hol May be sublimed in a current of CO

Penta benzoyl derivative

 $C_{e}H_{o}(OBz)_{s}(OH)$ [c 80°] From mannite (3 g), water (15 g), BzCl (20 g), and NaOHAq product is extracted with ether (Skraup, M 10, 391) Amorphous mass

Hera benzoyl derivative CH,(OBz), [149° From the preceding and BzCl Crystal

line grains, v sl sol alcohol

Mannite dichlorhydrin $C_1H_8(OH)_1Cl_2$ Dichloro tetra oxy herani [174°] S 4 5 at 14° [a]_D = -37 Formed by heating mannite (1 pt) with cone HClAq (6 pts) at 100° for eight hours (Bouch adat, C R 75, 1187, 76 1550, Bl [2] 19, 199) Formed also by heating isomannide with furning HClAq at 100° in sealed tubes (Fauconniei, Bl [2] 41, 119) Prepared by heating mannite (1 pt) with fuming HClAq (10 pts) at 106°, evaporating at low temperatures. dissolving the crystals in water filtering the solution through animal charcoal, and re crystallising from hot alcohol (Siwoloboff, A 233, 368)

Properties - Monoclinic crystals Lavoro tatory Its aqueous solution is neutral and tasteless, and is not ppd by AgNO, Insol alcohol and ether Decomposed on fusion

Reactions -1 Boiling water or conc NaOHAq rapidly convert it into C_eH₈O(OH)₃Cl -2 A of HNO and H,SO, C,H,(ONO2)4Cl2, which crystallises from hot alcohol in needles [145°], insol water —3 So dium amalgam removes HCl in two stages, forming mannitan chlorhydrin, and finally (3) mannide [119°]

Mannite dibromhydrin C_eH_s(OH), Br [178°] Obtained by heating mannite with conc HBrAq for 2 hours at 100° (Bouchardat, A Ch [5] 6, 120) Small colourless plates (from hot water) Decomposed on fusion Insol cold water, al cohol, and ether Converted by a mixture of HNO, and H₂SO₄ into C₂H₃(ONO₂)₄Br₂, which crystallises in long needlas, sol hot alcohol, msol water

Mannitan C₆H₁₂O₅ is C₆H₈O(OH)₄ anhydride of mannite According to Alechin (J R 16, 883) the various mannitans described below are mixtures of isomannide and other bodies

(a) Berthelot's mannitan CeH12O3 Obtained in small quantity by heating mannite at 200° A better method is by protracted boiling of man nite with cone HClAq (Berthelot, A Ch [3] 47, 306) Slightly sweetish syrup Differs from mannite in being soluble in absolute alcohol-V sol water, insol ether Slightly de tatory (Bouchardat, A Ch [5] 6, 102) Slightly dextroroexposed to the atmosphere it is partially reconverted into mannite Boiling alkalis or dilute acids accelerate the change Above 140° it partly volatilises

(b) Vignon's mannitan C_6H_1 , O_5 [a]_j = +36 5° Prepared by heating mannite for an hour or two with half its weight of water at 295° Also by heating mannite (2 pts) with conc H SO, (1 pt) at 120°, saturating with BaCO, exhausting with alcohol, and evaporating (Vignon, A Ch [5] 2, 433) Deliquescent mass, v e sol water and absolute alcohol, insol ether Does not ferment with yeast Boiling dilute H.SO, or baryta water does not reconvert it into mannite Amix ture of mannitan (1 pt), $H_{\circ}SO_{+}$ (10 pts), and HNO_{3} (41 pts of SG 15) forms in the cold C, H, O (OH)(ONO), which is obtained on pouring into water and extracting with ether. It is dex trorotatory $[a]_i = +53^\circ$

(c) Vianon's mannitone $C_0H_1O_2$ [a] = -25° Obtained by heating mannite with water for 3 hours at 280° and extracting the viscid product with alcohol (Vignon, A Ch [5] 2, 433) Has a sweet taste Lævo tals (from alcohol) rotatory Does not reduce Fehling's solution In the preparation of this body the syrupy mother liquor yields a viscid mass, which appears to be the anhydride of mannite or 'mannitic ether 'C, H.,O,, it does not reduce Fehling's solution, and is levolotatory, $[a]_j = -5.6^{\circ}$ This mannitic ether is not converted into mannite or munnitan by boiling dilute acids or alkalis

(d) Crystalline mannitan C.H. O. S 25 at When Berthelot's mannitan is allowed to stand for some months in a dry atmosphere it deposits a solid variety (Bouchardat) This crystallises in monoclinic tables It is strongly hevorotatory Sl sol cold alcohol Boiling water quickly converts it into mannite variety of mannitan is probably identical with Vignon's

Mannetan tetra netrate C, H,O(ONO). Precipitated by adding water to the alcoholis mother liquor from which mannite pentanitrate has separated (Tichanovitch, J 1864, 583) Syrup, v sol alcohol and ether, insol water Explodes when struck Alcoholic KOH converts it slowly into_syrupy mannitan

Di acetyl derivative C.H.O(OH)2(OAc). From mannite and HOAc at 210 $\lceil \alpha \rceil = +226$ Mannite dissolves in boiling Ac2O, (Berthelot) and on cooling crystals of C1 H2AcO10 separate Further action of Ac O yields hexa acetyl man nite and di acetyl mannitan (Schutzenberger, A 160, 74, Grange, C R 68, 1326) Extremely bitter substance, v sol water, HOAc, and alcohol Dextrorotatory Boiling baryta water converts it into acetic acid and mannitan

Tetra acetyl derivative C.H.O(OAc), Formed, together with hexa acetyl mannite, by heating mannite with Ac,O at 180° (Bouchardat, A Ch [5] 6, 110) Amorphous viscid mass, which partially crystallises on long standing

192 MANNITE.

Insol water, v e. sol alcohol, ether, and HOAc Dextrorotatory Aqueous alkalıs at 100° decompose it into acetic acid and mannitan Ac.O forms hexa-acetyl mannite A mixture of HNO. and H2SO4 has no action in the cold

Ds-butyry l derivative

C₅H₂O(O(H₂O)₂(OH)₂ From mannite and butyric acid at 200° (Berthelot, C R 38, 673, A Ch [3] 47, 319) Semi solid, partly crystalline, mass Insol water, v sol alcohol and ether

Tetra butyryl derivative

 $C_{\rm e}H_{\rm e}O({\rm OC}_4H_7{\rm O})_4$ From mannite and excess of butyric acid at 200°-250° Oil

Di-benzoyl derivative

C₆H₈O(OBz)₂(OH)₂ From mannite and HOBz at 200° (Berthelot, Chimie organique, 2, 193) Soft resin, v e sol alcohol and ether

Di-ethyl derivative C₆H₈O(OH)₂(OEt)₂ From mannite, KOH, and EtBr at 100° (Berthelot) Syrup, v sl sol water, sol alcohol, v e

sol ether

Mannitan chlorhydrin C,H,O(OH),Cl From mannite dichlorhydrin by boiling for two hours with 100 pts of water, neutralising with K₂CO₃, evaporating, and extracting with ether (Bouchardat, A Ch [5] 6, 118) Solid mass, v e sol water, alcohol, and ether Dextrorotatory Conc HClAq at 100° reconverts it into mannite dichlorhydrin Boiling water converts it into HCl and mannitan

Mannitan dichlorhydrin From mannite (1 pt) and $\mathbf{C_6H_8O(OH)_2Cl_2}$ fuming HClAq (15 pts) by heating for 3 days at 100° (Berthelot, J 1856, 661) Crystals, sol ether KOHAq converts it into mannitan

Mannitan bromhydrin C,H,O(OH),Br From mannite dibromhydrin by boiling with water V e sol water, alcohol, and ether Dextrorotatory

Mannide C.H.O. Second anhydride of

mannite

(a) Berthelot's mannide C₆H₁₀O₄ (297°-317°) Obtained by heating mannite with butyric acid at 200° - 250° (Berthelot, A Ch [3] 47, 312, Liebermann, B 17, 874) Thick deliquescent syrup, v e sol cold water and alcohol Decomposes partially on distillation In contact with

the air it partially forms mannite

(b) (β)-Mannide C₆H₁₆O₄ [119°] (212° at 16 mm) S 150 at 15° S (alcohol) 2 7 at -16°, 78 at 12° Obtained by treating mannite dichlorhydrin with sodium amalgam (Siwoloboff, A 233, 368) Prisms, v e sol water and alcohol, insol ether Dextrorotatory Sublimes at 14°, forming long needles Does not yield mannite when heated with water Air and platinum black oxidise it, forming a syrupy liquid

(c) Isomannide C₆H₁₀O₄ i e 0

СН₂(ОН) СН СН СН СН СН ОН ? [87°] (176° at 30 mm) $(274^{\circ} \text{ at } 760 \text{ mm})$ $[a]_{D} = +914 \text{ m}$ a 6 p c aqueous solution Obtained by distilling mannite in vacuo, the product being fractionally distilled in vacuo (Fauconnier, C R 95, 991) Prepared by boiling mannite (200 g) with HClAq (2,000 g) for 24 hours, cooling, filtering, and distilling in vacuo The distillate is allowed to stand for a fortnight, extracted with cold alcohol, the extract distilled in vacuo, and the frac-

tion boiling at 176° recrystallised from alcohol (Fauconnier, Bl [2] 41, 119) Large monoclinic, somewhat deliquescent, crystals Boils at 2740 with partial decomposition V e sol water, m sol alcohol, sl sol chloroform, msol ether and benzene Dextrorotatory Not affected by heating with water at 150° By heating with fuming HClAq in sealed tubes at 100° for 25 days it is converted into mannite dichlorhydrin $C_dH_s(OH)_4Cl_2$ [174°] It is not acted upon by POCls, by bromine in the cold, or by sodiumamalgam

Di-formyl derivat ve C.H.O. (OCHO)2. [115°] (166° at 18 mm) Small plates, sl. sol

cold water, v sol alcohol, sol ether

Acetyl derivative C₆H₈O₂(OH)(OAc) (186° at 25 mm.) From isomannide and Ac₂O Colourless oil, sol ether

Dr-acety'l derivative $C_{\mathfrak{g}}H_{\mathfrak{g}}O_{\mathfrak{g}}(OAc)$ (198° at 28 mm) From isomannide (1 pt) by boiling with Ac.O (3 pts) for 8 hours Viscid boiling with Ac₂O (3 pts) for 8 hours Viscid liquid, with bitter taste Not altered by further treatment with Ac2O

Di-benzoyl derivative C,H,O,(OBz), [132°] From mannite, alcohol, ZnČl₂, HČl, and BzCl (Meunier, C R 107, 346) Monoclinic or triclinic ciystals, v sl sol water and cold alco hol, sol chloroform and benzene Not decom posed by queous acids or alkalis

Methyl derivative C₆H₈O₂(OH)(OMe) [48°] (174° at 24 mm) From isomannide, KOH, MeI, and a little water at 150° Crystals

Ethyl derivative C₆H₆O₂(OH)(OEt) (165° at 17 mm) Formed by heating mannite, $C_aH_aO_2(OH)(OEt)$ EtI, and conc KOHAq in sealed tubes for 4 hours at 120° Colourless mobile liquid, sol water, alcohol, and ether

Isomannide dichlorhydrin C, H,O2Cl2 [49°] (143° at 43 mm) From isomannide (1 pt) by warming with PCl_s (2 pts) White needles or plates, v sol ether, m sol alcohol insol cold, sol hot, water Has a strong aro matic odour and a peppery taste May be dis tilled with steam It is very stable, not being attacked by alcoholic KOH at 150°, by PCl, at 125°, or by sodium amalgam

Anhydride of mannide $C_{12}H_{18}O_7$ is (C₆H₈O₂OH),O (?) Deposited on standing from a sample of butyric acid (Geuther, A 221, 59)

Levo mannite C₆H₁₄O₅ [164°] Formed by reducing levo mannose with sodium amalgam. Globular groups of fine needles, v sol water, sl sol absolute alcohol, much more sol methyl alcohol It tastes sweet, and does not reduce Fehling's solution A solution of this mannite containing borax turns the ray of polarised light to the left This substance is probably the one obtained by Kiliani (B 20, 2714) by reduction of the double lactone of metasaccharic acid (Emil Fischer, B 23, 375)

Inactive mannite a Acrite [168°] Formed by reducing inactive mannose with sodiumamalgam Small prisms (from water), v sol water, m sol hot giacial acetic acid, sl sol methyl and ethyl alcohols It is easily distin guished from ordinary mannite by its crystalline form and by its optical mactivity A solution containing borax remains wholly inactive This mannite is identical with (a) acrite, a substance obtained by the action of sodium amalgam on (a)-acrose, a sugar obtained by the action of alkalıs on acrolein dibromide (Fischer, B 22, 100) By oxidation with dilute HNO, mactive mannose is formed (Emil Fischer, B 23, 383)

The mannites may be distinguished optically by means of their phenyl hydrazides 1 g of the phenyl hydrazide dissolved in 1 c c of cold conc HClAq and 5 c c of water gives in a tube 100 mm long a rotation of $+12^{\circ}$, -12° , and 0° , with the lævo-, dextro , and mactive mannite respectively In the course of 3 or 4 hours the rotation vanishes, the phenyl hydrazide being decomposed by the HCl When the di phenyl dihydrazide is used 1 g is dissolved in warm HOAc, cooled, and examined in a 100 mm tube gives a rotation of $+0.85^{\circ}$, -0.85° , or 0° in the case of the lævo, dextro, and mactive compounds respectively The dextro and lævo mannites themselves scarcely exhibit a rotation, but 15g of the mannite dissolved in 5 cc water containing $37 \, \mathrm{g}$ borax exhibits a rotation of $+0.85^{\circ}$, -0.85° , or 0° , according as the mannite 18 dextro, lævo, or mactive (Fischer)

MANNITIC ACID C.H.2O, Prepared by mixing mannite (2 g) with platinum black (4 g), moistened with water, and exposing the mixture at 30° to 40° to the air for 3 weeks The mass is then exhausted with water, the solution ppd. by lead subacetate, the pp decomposed by H2S, and the solution evaporated in the cold over H₂SO₄ (Gorup Besanez, A 118, 257) Gummy mass, sol water and alcohol, nearly insolether. It is a strong acid, and dissolves zince with evolution of hydrogen. It begins to de compose at 80°. It reduces silver nitrate solution and hot Fehling's solution It is ppd by baryta and by lime water —CaA" amorphous powder, ppd by adding alcohol to its aqueous solution CuA" green amorphous mass left by evaporating its solution -PbA" granular Ag.A" curdy pp

MANNITINE C₆H₈N₂ (170°) Prepared by distilling a mixture of mannite (1 mol) and ammonium chloride (2 mols) The distillate is mixed with KOHAq and shaken with ether (Scichilone a Denaro, G 12, 416, Etard, C R 92, 795) Brown oil, with strong odour, sol alcohol and ether, m sol water Gives an orange yellow pp with sodium phosphomolybdate, a reddish yellow pp with iodine in KIAq, a pink pp with HgCl, and a black pp with aurio chloride Hypodermically injected it produces diminution of the cardiac systole, and irregular respiration, followed by insensibility and death

MANNITOSE C.H.₁₂O₄ Produced, together with mannitic acid, by the atmospheric oxidation of mannite in the presence of platinum black (Gorup Besanez, A 118, 273) Optically Fermentable Reacts like glucose with alkalis, Fehling's solution, basic bismuth nitrate, and Na_2CO_3 , but it does not unite with NaCl Its alcoholic solution gives with alcoholic potash a pp of $(C_3H_{12}O_3)_2K_2O$ Mannitose is perhaps identical with levilose (Dafert, B 17, **228** , **19**, 911)

MANNONIC ACIDS C.H.2O,

Inactive mannonic acid Lactona C.H., O. [155°] Formed from inactive mannose by oxidation with bromine (E Fischer, B. 28, 876)
Long glittering prisms, grouped in stars or
Vol. III

needles (from alcohol), v sol hot water, sl sol hot alcohol Has a sweet taste and does not reduce Fehling's solution By means of the strychnine salt it can be split up into dextromannonic acid and arabinose carboxylic acid, the strychnine salt of the latter being extremely sl sol alcohol The morphine salts may also be employed, morphine dextro mannonate crystallising out Penicillium glaucum partly decom poses mactive mannonic acid, liberating some arabinose carboxylic acid -- Ca(C₈H₁₁O₇)₂ Groups of slender needles Less soluble than calcium ævo mannonate

Phenyl hydraside C₁₂H₁₈N₂O₆ [230°] Colourless cubes, sl sol hot water, v sl sol alcohol Solder had been solder by the solder Phenyl hydraside C12H16N2O6 cohol Split up by hot baryta water into phenyl hydrazine and inactive mannonic acid

Dextro-mannonic acid Formed from gluconic acid by heating with twice its weight of quinoline for 40 minutes to 140° (Emil Fischer, B 23, 801) Formed also as above and by oxidation of dextro mannose by bromine By heating dextro mannonic acid with quinoline, gluconic acid is formed For this purpose 20 g of dextro mannonic acid, 5g water, and 40g quinoline are heated to 140° for 40 minutes The unchanged mannonic acid is separated by means of its brucine salt Dextro mannonic acid, like the other mannonic acids, when liberated from its salts condenses at once to the lactone CaH10Oa [149°-153°] Its rotation, $[\alpha]_D = 53.8$, is equal and opposite to that of the lactone of arabinosecarboxylic acid, which is therefore levo mannonic acid

Salts -Ca(C₈H₁₁O₁) 2aq -Si A'₂3aq -BaA'₂

(dried at 100°)

Phenyl hydrazide C1H18N2O6 Small colourless prisms, v sol, hot water De composed by hot baryta water into dextro man nonic acid and phenyl hydrazine

Lactone C₆H₁₀O₆ icul [145°-150°] Lævo-mannonic acid carboxylicaculArabinose $[a]_{D} = -548$ Formed from anabinose (v Arabid ACID and SUGARS) by treatment with HCy and sa ponification of the product (Kiliani, B 19, 3033) Formed also from mactive mannonic acid, as above

MANNOSE C.H., O. 16
CHO CH(OH) CH(OH) CH(OH) CH(OH) CH(OH)

Dextro mannose [a]_D = +13° Formed by heat ing 3 kilos of mannite with 20 litres of water and 10 litres of HNO, (SG 141) in the water bath with shaking to 40°-45° until a test portion rendered neutral with soda gives a thick paleyellow pp of the hydrazide with phenyl-hydra The whole is then cooled with zine acetate ice to about 25°, made feebly alkaline with crystallised Na₂CO₃, acidified with acetic acid, and treated with 1 kilo of phenylhydrazine dissolved in dilute acetic acid. The phenylhydrazide crystallised from hot water is con verted into the sugar by solution in HCl (S G 1 19), allowing to stand, cooling, filtering, and neutralising the diluted filtrate with pure car-bonate of lead The whole is again filtered, made alkaline with Ba(OH), and shaken with ether The aqueous solution separated from ether contains the sugar, which remains as a syru, on evaporating, and is ppd from absolute alcohol by ether (Emil Fischer a, Josef Hirschberger, B 21, 1806, 22, 365), Mannos may more easily be got from vegetable ivory nuts, v SEMINOSE infra

Properties — Light yellow syrup, with sweet taste V sol water and alcohol Reduces Fehling's solution, 1 cc corresponding to 004307g of mannose Turned brown by heating with 20 p c HClAq, the solution then containing levulic acid Ferments easily with yeast, giving CO, and alcohol The aqueous solution is dex trorotatory, but less so than glucose Sodiumamalgam (2 p c) reduces mannose to mannite Furfuraldehyde is formed by heating a dilute solution of mannose at 110° for four hours

AcCl forms a substance like acetochlorhydrose Phenyl hydrazide C₁₂H₁₈N₂O₅ [195° 200°] S 1 at 100° Prepared as above Slender prisms (from water) Sl sol alcohol and acetone Its solution in dilute HClAq is levorotatory Concentrated mineral acids convert it into mannite and phenyl hydrazine even in the cold When it is heated with phenyl hydrazine hydrochloride (3 pts), NaOAc (4 pts) and water (80 pts) at 105° for 4 hours there is formed the 'osazone' of glucose C18H22N4O4, which crystallises from alcohol in slender yellow needles [206°]

Oxim C₆H₁₃O₆N Crystalline, ▼ sol hot water, insol alcohol When slowly heated it melts at 176°-180°, but when quickly heated, at 184° (Fischer a Hirschberger, B 22, 1155)

Inactive mannose Formed by reducing the lactone of mactive mannonic acid with sodiumamalgam (E Fischer, B 23, 381) Colourless syrup, v sol water, sl sol absolute alcohol, m sol hot methyl alcohol Resembles (dextro) mannose except in being inactive When subjected to fermentation levo mannose is left Bromine oxidises it to inactive mannonic acid

Phenyl hydrazide [195°] Decomposed on fusion Sl sol water Its solution in HCl is optically mactive Cold cone HCl splits it up

into sugar and phenyl hydrazine

Di-phenyl hydrazide C18H22N4O4 [218°] Formed by heating the mactive mannose with phenyl hydrazine (2 mols), the corresponding quantity of acetic acid and water Fine yellow glittering needles, sl sol water, cold alcohol, and ether Decomposes on fusion At 45° conc HCl forms the corresponding osone The solution in 60 pts glacial acetic acid is optically The properties of this diphenylhydrazide are the same as those of (a) acrosazone (the di phenyl hydrazide of (a) acrose), and Emil Fischer (B 23, 383) considers that they are identical

Lævo-mannose To prepare this body 1 pt of the lactone of arabinose carboxylic acid is dissolved in 10 pts water, acidified with H.SO., and cooled to 0° 2½ pc sodium amalgam is added in small portions The liquid must re main acid Colourless syrup, v sol water, sl sol absolute alcohol, m sol methyl alcohol The aqueous solution is slightly lævorotatory It ferments little, if at all, with yeast

Phenyl hydrazide C₁₂H₁₈N₂O₅ [195°] Formed by adding phenyl-hydrazine acetate to a solution of the sugar Slender, almost colour less crystals It is more sol water than the dextro mannose phenyl hydrazide The hydro chloric acid solution is dextrorotatory 'Cold HCl splits up the compound into phenyl-

hydrazine and mannose

Di-phenyl hydraside [2050] Formed by heating the lævo mannose phenyl hydrazide with phenyl hydrazine acetate and 30 pts water Fine yellow needles (from water) De composed on fusion It is extremely like the di phenyl hydrazide of dextro mannose, lævulose, and dextrose It, however, turns the ray of polarised light strongly to the right (Emil Fischer, B 23, 373)

Isomannitose, a sugar obtained, together with glucose, by boiling salep with acids, is probably identical with mannose (Tollens, B 21, 2150) Its phenyl hydrazide C₁₂H₁₈N₂O₅ [188°] is sl sol alcohol

Seminose, obtained by digesting with dilute H.SO, the cel ulose composing the thick walled cells of the endosperm of vegetable avory nuts, is identical with mannose (Reiss, B 22, 609, Schultz, B 22, 1192, Fischer a Hirschberger, B 22, 3218)

'Mannose carboxylic acid' C,H,,O. 16. $C_eH_{13}(CO_2H)O_e$ From mannose (50 g) by dis solving in water (250 g) and adding anhydrous HCy (18 c c) and a few drops of ammonia After three days the mixture is heated to 50° for 4 hours. The product appears to contain the ammonium salt of the acid and its amorphous a nide [183°], which may be ppd by alcohol (Fischer a Hirschberger, B 22, 365) The acid changes to anhydride when set free from In preparing the lactone (v infra) an acid [c 169°], probably the free mannose carboxylic acid, is sometimes formed

Salts -BaA', Obtained by boiling the ammonium salt with baryta Colourless, semicrystalline mass, m sol hot, v sl sol cold, water, insol alcohol Boiling cone HIAq re-

duces it slowly to n heptoic acid

Lactone $C_7H_{12}O_7$ [150°] Obtained by decomposing a hot solution of the Ba salt with the theoretical quantity of H₂SO₄ N sol water, m sol alcohol, insol ether Needles, v.

Phenylhydraside C,H,,O,N,H,Ph [220°-3°] Formed by boiling the Ba salt with aqueous NaOH, and adding HOAc and phenyl hydrazine acetate (Fischer a Passmore, B 28, 2732) Very small prisms, sol hot water Decomposed on fusion

MANTLE MUCIN v PROTEIDS, Appendix O. MARGARIC ACID C17H24O2 (Heptadecore acid) Mol w 270 [60°] The name margaric acid was originally applied to an acid C1,H34O2 sup posed to occur in the product of the saponifica tion of solid natural fats, but this acid was shown by Heintz to be a mixture of palmitic acid C16H32O2 and stearic acid C18H36O2 An acid C1,H3,O2 occurs, however, according to Ebert (B 8,775), in adipocere, a substance formed in dead tissues of animals Formed by boiling its nitrile (cetyl cyanide) with alcoholic potash (Heintz, P 102, 272) White crystals —BaA', white amorphous powder -AgA' white amorphous powder

Nutrule C_{1e}H_{ss}CN [58°] (?) (Köhler, J 1856, 579, cf Becker, A 102, 21d) According to Heintz (J 1857, 445), margaronitrile prepared from potassium cetyl sulphate and KCy is an

Margaric acid C₁₆H₃₃ CO₂H [60° uncor.]. (277° at 100 mm) Prepared by the oxidation

of methyl-heptadecyl-ketone (Krafft, B 12, 1672)

Probably identical with the preceding acid
MARJORAM OIL S G 1= 911 (Bruylants) The essential oil obtained by steam distillation from the flowers of sweet marjoram (Majorana hortensis or Origanum majorana) Yellow oil which becomes brown on standing. It has a pungent smell, a hot peppery taste, and an acid reaction According to Bruylants (J Ph [4] 30, 33, cf Mulder, A 31, 69) it begins to boil at 185° and the thermometer remains stationary at 215°-220° Bruylants found it to consist of 5 pc of a dextrorotatory terpene, 85 pc of a mixture of dextrorotatory camphor and borneol, According to Kane (A 32, and 10 pc of resin 285) the essential oil of wild marjoram (Origanum vulgare) contains a terpene which boils at 161° and has SG 867 According to Beilstein a Wiegand (B 15, 2855) oil of sweet marjoram contains a terpene $C_{10}H_{16}$ (178° 1 V) SG 185 846, which absorbs HCl, forming liquid C10H18HCl By distilling the oil of marjoram over sodium Beilstein a Wiegand obtained liquid C15H26O (200°-220°)

Cretan oil of marjoram from Origanum hirtum has S G 15 951, and 100 mm produce a rotation of -04° It contains 50 pc of carvacrol [2°] and dissolves in half its volume of 15 pc soda solution (Jahns, Ar Ph [3] 15, 1, 16, 277) The oil also contains a mixture of terpenes, and a phenol that is coloured violet by FeCl, found a little carvacrol in the oil from Ori

ganum vulgare

[160°] The bitter principle MARRUBIIN of white horehound (Marrubium vulgare) (Kro mayer, Ar Ph [2] 108, 257, Harms, J 1863, 593) Prepared by exhausting the dried herb with hot water, evaporating, and extracting with alcohol Large tables (from ether) or needles (from alcohol) Almost insol cold, sl sol hot, water Not affected by alkalıs Metallic salts do not ppt it Not ppd by tannin Hot conc HClAq does not affect it Conc H,SO, gives a brownish yellow solution Cold HNO, has no action, hot HNO, forms a yellow solution

MARSH GAS v METHANE

MARTYLAMINE v p Amido diphenyl.

MASOPIN C22H36O [155°] Occurs in a resin used in Mexico for chewing, said to be the dried juice of a tree called Dschlite resin occurs in porous lumps, smelling like rotten cheese, but with little taste The masopin is obtained by boiling the resin with water, and crystallising the residue from alcohol (Genth, A White silky needles (from ether) 46, 124) After fusion, it melts a second time at 70° distillation it yields a terpene and a crystalline acid, of which the Ag salt contains 45 5 pc of

MASTIC A resin obtained by incisions in the bark of Pistacia lentiscus, a tree growing in Chios Small round transparent grains with Used for making var faint agreeable odour nishes and, from the earliest times, for chewing Softens when masticated S G 1074 Aqueous alcohol dissolves the greater part C₄H₄₅O₄, leaving masticin C₄₄H₄₇O₂ undissolved (Johnston, P T 1839, 182) Fluckiger (Ar Ph. 219, 170) found 2 p c of a dextrorotatory terpene in mastic.

MATEZITE C, H, O, [187°] $[a]_D = 64 \text{ T}$ Occurs in Madagascar caoutchouc (mateza rori tina) (Girard, Bl [2] 21, 220, C R 110, 84) Identical with (3) Pinite (Combes, C. R 110, 46). Crystalline nodules, v e sol water, m sol alco hol Sublimes above 200° Resembles dambonite but is dextrorotatory Fuming HIAq splits it up on heating into McI and matezo dambose $C_0H_{18}O_9[246^\circ][\alpha]_D=67.6$, which is dextrorotatory and more soluble in water than dambose Matezo dambose is identical with the (β) inosite of Maquenne (C R 109, 812) It forms small tetrahedra when ppd by adding alcohol to its aqueous solution

MATICIN A bitter substance which remains dissolved in the water in the retort in the preparation of the essential oil of matico by distilling the leaves of Piper asperifolium with steam It is sol water and alcohol, and insol ether (Hodges,

P M [3] 26, 204, C S Mem 1, 123) Its solution is not ppd by lead acetate MATICO-CAMPHOR $C_{12}H_{20}O$ [94°] Occurs in the essential oil of matico leaves (Piper angustifolium), from which it is obtained by distilling off the greater part and allowing the residue to crystallise (Kugler, B 16, 2841) Hexagonal crystals V sol alcohol, ether, benzene, petroleum ether. &c With HCl it gives a violet colour, passing into blue, and finally becoming green. H2SO, colours it yellow, then red, and lastly violet A mixture of H,SO, and HNO, first produces a yellow, which then becomes violet, and finally a splendid blue

MAUVANILINE C. H., N. A by product in the preparation of rosaniline by the oxidation of crude aniline (De Laire, Girard a Chapoteaut, C R 64, 416, Bl [2] 7, 366), cf Girard a Pabst, Bl [2] 34, 37) Light brown crystals (containing aq, which is given off at 130° with decompo sition) Insol cold, v sl sol hot, water, sol alcohol, ether, and benzene Its salts form lus trous bronze green crystals, v sl sol cold water, Trı ethyland dye silk and wool mallow red mauvaniline C19H1, Et3N, dyes bluish violet, while tri phenyl mauvaniline C, H, Ph, N, is a blue dye

The first aniline dye MAUVEINE C₂₇H₂₄N. The first amline dye introduced (Perkin, 1856) Obtained by adding a cold dilute solution of a salt of crude aniline to a cold dilute solution of K₂Cr₂O, and leaving the mixture to stand for 12 hours The resulting black pp is dried, extracted with benzene, dissolved in alcohol, and the filtrate evaporated When aniline sulphate is used the product is (C₂,H₂,N₃,SO₄, aniline hydrochloride yields C₂,H₂,N₄Cl (Perkin, A 131, 200, C J 35, 717) On adding aqueous KOH to a solution of a salt of mauveine the base separates as a violet black crystalline substance It dissolves in alcohol, forming a violet solution, which on addition of acids turns purple Mauveine is insol benzene and ether With dilute acids it forms purple solutions, with stronger acids, blue Conc H2SO4 forms a dirty green solution Dyes silk mauve Used for postage stamps Oxidised by PbO, and boiling HOAc it gives para safranine C20H18N4

-B'HCl tufts of small prisms with Salts green metallic lustre Insol cold, sl sol hot, water, m sol alcohol, nearly insol ether—
"B'H,Cl, blue, with coppery lustre Unstable.
Becomes B'HCl when dissolved in alcohol—

green crystalline powder, v sl sol B' H,PtOl slcohol -B'H2PtCl₆ blue -B HAuCl₄ -B'HBr -B'Hl lustrous prisms -B'₂H₂SO₄ -B'H₂CO₃ prisms, with green metallic lustre On boiling prisms, with green metallic lustre

its solution CO2 is given off

Ethyl mauveine C₂₇H₂₃EtN₄ Formed by heating mauveine with EtI at 100° Its colour is redder than that of mauveine During the manufacture crystals of $C_{27}H_{28}EtN_4HI_8$ sometimes ap pear $-C_{27}H_{28}EtN_4HCl$ Forms a reddish purple solution in alcohol - (C2,H2,EtN,HCl)2PtCl4

Golden green lustre

Pseudo-mauveine C₂₄H₂₀N₄ (Perkin, C. J 35, 5) Present in commercial mauveine It is 725) more soluble in alcohol than mauveine strong base, and dyes silk almost exactly like mauveine Pure aniline gives pseudo mauveine on oxidation, hence it does not contain methyl Mauveine is probably derived from aniline and p toluidine The violet colouration given by bleaching powder to a dilute solution of aniline is probably due to pseudo mauve-ine —C₂H₂N₄HCl Greenish-golden lustre —

(B'HCl), PtČl, MAYER'S REAGENT v Alkaloids, Re-

action 3

MAYNAS RESIN Calaba or Galba of the Antilles (Lewy, A Ch [3] 10, 380) A resin extracted by mension from Calophyllum calaba Alcohol extracts from it $C_{14}H_{18}O_4$, which sepa rates on cooling in yellow monoclinic prisms Maynas resin is insol water, but v sol KOHAq and ammonia It melts about 105°

MECCA BALSAM Balm of Grlead produce of Balsamodendron grieadense, a shrub growing in Arabia Felix. There appear to be several varieties of it It contains a fragrant volatile oil, an acid resin sol alcohol, and a resin, insoluble in alcohol (Bonastre, A 3, 147, Trommsdorff (Trommsd Neues Journal, 16, 62)

MECONIC ACID C,H,O, 3aq, te C₅HO₂(OH)(CO₂H)₂ Mol w 200 S 25 at 100° Heat of neutralisation (4 mols NaOH) 87,382 (Gal a Werner, Bl [2] 47,162) Electrical conductivity Ostwald (J pr [2] 82,368) Occurrence — In opium (Sertumer, Am S 55,

72, 57, 183, 64, 65, Robiquet, A Ch 5, 282, 51, 236, 53, 425, Liebig, A 7, 87, 26, 113,

Preparation —Opium is exhausted with water at 38°, the extract is neutralised with CaCO, evaporated to a syrup, and mixed with a concentrated solution of CaCl2, which ppts calcium meconate The pp (1 pt) is suspended in conc HClAq (3 pts) mixed with boiling water (20 pts), and kept near 100° till dissolved On cooling, acid calcium meconate separates in crystals These (1 pt) are again dissolved in a mixture of HClAq (3 pts) and boiling water (20 pts), and, on cooling, meconic acid separates (Gregory, A 24, 43) It may be further purified by crystallising its ammonium salt from water (How, A 83, 850)

Properties - Micaceous scales or small trimetric prisms (containing 3aq) (Burghardt, C J 27, 937) It gives off its water of crystallisation at 100°, then becoming a white opaque mass Has a sour taste and strongly reddens litmus Sl sol cold water, v sol alcohol, sl sol ether FeCl, colours its solutions blood red This This colouration, like that with sulphocyanides, is

much weakened by oxalic acid and by metaphos phoric soid (Dupré, C N 32, 15), but it is not destroyed by boiling or by dilute HClAq conic acid may be regaided as a derivative of the hypothetical CH CH CH CH

Reactions -1, Heated at 120° it gives off CO2, and comenic acid C₅H₂O₂(OH)(CO₂H) remains At a higher temperature the comenic acid is further resolved, pattly into CO₂ and pyrome conic acid C₅H₃O₂(OH), and partly into water, acetic acid, and oily and carbonaceous products

When boiled with water or with HClAq it
gives CO₂ and comenic acid—3 Nitric acid
oxidises it, forming oxalic acid—4 Boiling cone KOHAq also yields oxalic acid -5 Boiling aqueous ammonia forms comenamic acid Comenamic acid yields C₅H₃NO(OH)CO₂H pyridine on dry distillation with zine-dust (Lieben a Haitinger, B 16, 1263) The comen amic acid is di oxy picolinic acid, and comenic acid is probably an intermediate product in its formation -6 Bromine, acting on its aqueous solution, forms a brominated comenic acid -7 Aqueous HI gives comenic acid —8 Sodium amalgam reduces it to hydro meconic acid -9 Gives with alcohol and HCl a di ethyl ether, C₂HO₂(OH)(CO₂Et)₂, whence a silver compound, C₂HO₂(OAg)(CO₂Et)₂, which gives with EtI a tri-ethyl derivative C₃HO₂(OEt)(CO₂Et)₂ [61°] This gives no colour with FeCl₃ (Ost a Mennel, J pr [2] 23, 439) -10 PCl, converts it into a liquid chloride, probably C₅HCl₅(COCl)₂, whence ice water forms 'chloro mecenic' acid, C.ClO(OH)(CO,H), aq [165°], whereas waim water forms only oxalic acid (Hilsebein, J pr [2] 32, 136) Chloro mecenic acid gives a green colour, with solution of ferric chloride. It forms an ether, C_ClO(OH)(CO_H)(CO_2Et), [148°], which gives an acetyl derivative O_ClO(OAc)(CO_2H)(CO_2Et), [70°] It also forms become acids. Chloro mecenic acid is decom barium salts posed by sublimation into carbonic acid and yellowish needles of pyro chloro mecenic acid, C_bH₂ClO(OH), aq [174°] The solution of this acid is turned dark green by FeCl, Its alcoholic solution turns the skin red It forms a crystal line calcium salt, (C,H,ClO2),Ca Chloro mecenic acid dissolves in cone NH,, the solution turning successively red, violet, and blue, owing to the formation of two nitrogenous colouring matters, 'mecenic blue' and 'mecenic red' mecenic acid is reduced by treatment with sodium amalgam, forming di-hydro chloro mecenic acid $C_bH_2ClO(OH)(CO_2H)_2$, [145°] Fuming HI at 100° reduces chloro mecenic acid to an oxy pentane di carboxylic acid, C₃H₁₀O(CO₂H)₂
This body forms groups of needles [149°] Its
silver salt, Ag₂A", is a crystalline powder, insol
water Its barium salt, BaA", forms white
prisms Its ether, Et₂A", is an oil, boiling about (250°) Oxy-pentane di carboxylic acid, about (200') CAy-pensane when distilled with lime, yields amyl alcohol, (c 130°) (Hilsebein J pr [2] 32, 129-158)
Salts—(NH,)H₂A" aq granular crystals, sl sol water—(NH,)₂HA" xaq slender needles

-A barium salt is ppd by adding BaCl₂ to a solution of an alkaline meconate, in white flakes, soluble in acetic acid — CaH,A", 2aq ppd by adding CaCl₂ to aqueous meconic acid — CaHA" aq yellow gelatinous pp, formed by adding CaCl, to a solution of ammonfum meconate -The cupric salts are green pps -Pb,A", 2aq white flocks, ppd by adding lead acetate to a solution of meconic acid (Sten house, A 51, 231) -A sparingly soluble ferric salt may be obtained by the action of ferric sul phate on ammonium meconate (Stenhouse) Fe₂Ca₃A'''₄ 5aq (Rennie, C N 42, 75) —Ag₂HA''' white pp got by adding AgNO, to a solution of meconic acid -Ag.A" yellow pp from ammo nium meconate and AgNO, -Aniline salt (C_aH_aNH₂)₂C₇H₄O₇ arystalline (Korff, A 138, 195)—Urea salt (CON₂H₄)₃C₇H₄O₇ (Hlasi wetz, J 1856, 699)—Narceine salt [126°] from narceine (1 mol) and meconic acid (1 mol) Lemon yellow crystals, sol hot water (Merck, C C 1889, 384) -The acid morphine salt could not be obtained by Dott (Ph [3] 17, 690) It will be observed that meconic acid has but little tendency to form tribasic salts, so that it might perhaps be more correctly regarded as a dibasic acid (cf Dittmar a Dewar, Pr E 1867, Dott, Ph [3] 11, 576)

Ethyl derivative C₅HO₂(CO₂H)₂(OEt) [200°] Formed by boiling C₅HO₂(CO₂Et)₂(OEt) for forty eight hours with water, and evaporating the solution Small prisms grouped in lumps Decomposed by fusion Gives no cclour with FeCl₃ Gives, with most metallic salts, no pp Lead acctate is an exception Heated alone till it melts, CO₂ is given off, and the ethyl derivative of comenic acid formed Its aqueous solution is converted by bromine into a brominated derivative of comenic ether —PbA" 1½aq Crys-

talline pp

Mono ethyl ether

C₃HO₃(CO.Łt)(CO,H)(OH) [179°] Prepared
by dissolving meconic acid in alcohol, heating
to 100°, and subjecting to a current of HCl
till crystals begin to appear The liquid on
cooling deposits crystals of the mono ethylic
ether (E Mennel, J pr [2] 26, 450) It
gives a red colour with FeCl₃—Silver salt
C₃HO₂(CO,Et)(CO,Ag)(OH)₂aq—Barium salts
BaC₆H₆O, and Ba(C₆H,O)₂

Dr ethyl ether C₃HO₂(CO₂Et)₂(OH) [112°] Prepared by passing HCl into an alco holic solution at 100° until the crystals (of mono ethylic ether) which are first formed are dissolved up again. On pouring into water, plates of the di ethylic ether separate (How, A 83, 350, Mennel, J pr [2] 26, 453) Plates From dilute solutions it crystallises with laq as needles. Gives a red colour with FeCl₃. An amorphous pp is formed by adding AgNO₄ and then exactly neutralising with NH₃—NH₄C₁₁H₁₁O₇, needles (from alcohol), v sol water. Its solution is ppd by various metallic salts.

Ethyl derivative of the diethyl ether C₅HO₂(CO₂Et)₂(OEt) [61°] From C₅HO₂(CO₂Et)₂(OAg) and EtI Gives no red colour with FeCl₃ Boiled with water it changes to the ethyl derivative of meconic acid (q v)

Not acted upon by bromine

Mono-amide
C₂HO₂(CONH₂)(CO₂H)(OH) aq Meconamic acid
From the above by the action of aqueous NH₂,
followed by HCl Crystallises in hard lumps
from water Not decomposed by cold NaOH,
converted by boiling NaOH into meconate
Copper salt C₂H₂O₂Cu 2sq

Basic ammonium salt of amide C₂HO₂(CONH₂)(CO₂NH₃)(ONH₄) This yellow pp is the first product of the action of NH₂ upon mono ethylic meconate

Di amide C₂HO₂(OH)(CONH₂)₂ From the diethyl ether and boiling aqueous NH₃ (How)

Powder, sl sol cold water

Oxim C,H,O,NH Formed by treating me conic acid with hydroxylamine hydrochloride (Odernheimer, B 17, 2081) Small colourless needles (containing H,O) V sol water, sl sol alcohol, ether, and chloroform, insol ligroine Decomposes suddenly at 190° It gives a red colour with Fo,Cl₆ It reduces Fehling's solution By boiling with HCl hydroxylamine is split off —A"Na₂ colourless crystals —A"Ag, aq white sparingly soluble pp—A"Ba 10aq sparingly soluble concentric needles —A"Ca 2aq. sparingly soluble needles

Hexahydride CH₁₀O, Hydromecome acid Obtained by reducing meconic acid suspended in water by adding sodium amalgam (Korff, A 138, 191) Separated by decomposing the lead salt by H₂S and evaporating the filtrate Strongly acid syrup, v sol water, m sol alcohol, insol ether Ppd as deliquescent flocks on adding ether to its alcoholic solution Not affected by HI Gives no colour with FeCl₂—BaA" 2aq amorphous pp, sol water, insol alcohol — PbA" 1½aq amorphous pp—Ag,A" ½aq white granular pp

Reference -Pyromeconic acid and Pyrome

CAZONIC ACID

MECONIDINE C₂₁H₂₃NO₄ [58°] An alkaloid contained in the aqueous extract of opium (Hesse, A 153, 47) The aqueous extract is ppd by Na₂CO₃, the pp dissolved in ether, the ethereal solution shaken with dilute acetic acid, and the acid solution poured into aqueous NaOH After 24 hours the pp of thebain and papaverine is removed by filtration, the filtrate neutralised by HCl, rendered alkaline by NH3, and shaken with chloroform The chloroform is then shaken with acetic acid, and the acid solution exactly neutralised by ammonia, which ppts lanthopine The filtrate is mixed with KOH and shaken with Codanine and laudanine separate, and the mother liquor is then shaken with dilute acetic acid, the solution saturated with NaCl, the ppd meconidine hydrochloride decomposed by NaHCO, and the base extracted with ether and dried at 90°

Properties — Brownish yellow transparent amorphous mass Cannot be sublimed Tasteless Insol water, v sol alcohol, ether, benzene, chloroform, and acetone Its alcoholic solution turns red litmus blue Sl sol NH,Aq, v sol NaOHAq Can be extracted by ether from its solution in ammonia but not from that in caustic soda Its solution in dilute H₂SO₄ becomes rose coloured in a few minutes, and purple red on standing for sometime, or immediately on boiling Conc H₂SO₄ gives an olive-green solution Conc HNO₃-colours it orange red The dilute solutions of the salts have an intensely bitter taste — B'₂H₂PtCl₆ yellow amorphous pp which soon turns reddish The aurochloride is a dingy yellow amorphous pp

MECONIN $C_{i_1}H_{i_0}O_{i_2}$ a.e $C_{e}H_{2}(OMe)_{e} < \stackrel{CH}{CO}>O$. [1.6.3]? Anhydride of

108 MECONIN.

Meconomo acid. Opennyl Mol w 194 [99°] (M a F), [102 5°] (Wegscheider, M 3, 351, Prinz, J pr [2] 24, 371) S 4 in the cold, 5 at 100° A neutral substance existing in opium (Dublanc, A Ch [2] 49, 17, Couerbe, A Ch 49, 11, 50, 337, 59, 148) It may also be extracted by either from the root of Hydrastis canadeness (Freund, B, 22, 459)

densis (Freund, B 22, 459)

Formation—1 Together with cotarnine, opianic acid, and hemipic acid, by the action of warm dilute nitric acid on narcotine (Anderson, Tr E 20, 347, 21, 204)—2 From opianic acid by the action of sodium-amalgam, or of zinc and H.SO. (Matthiessen a Foster, C J 16, 849)—8 Together with hemipic acid by the action of caustic alkalis on opianic acid (M a F)

Preparation -1 A concentrated aqueous extract of opium is ppd by dilute ammonia, and the filtrate evaporated to crystallisation crystals are extracted with alcohol, which after evaporation deposits crystals of meconin, which are recrystallised from water and ether suc cessively (Couerbe) -2 The aqueous extract of opium is precipitated by chloride of calcium, the precipitated meconate of calcium is filtered, the filtrate evaporated to the crystallising point, and separated from the deposited hydrochloride of morphine, and the dark mother liquor is diluted with water, filtered from the flocks which separate, and treated with ammonia, which pre cipitates narcours, thebaine, and a large quantity of resin The filtrate is mixed with acetate of lead the excess of lead is removed from the filtered liquid by dilute sulphuric acid, and the filtrate is neutralised with ammonia, and evaporated to the crystallising point at a moderate heat, whereupon narceine separates out, and then sal ammoniac by further concentration mother liquor is repeatedly digested with } vol ether at 26°, and the ether is distilled off from the extracts, a brown syrup then remaining On treating this syrup with dilute hydrochloric acid, papaverine dissolves, and meconin remains in the form of a dark-grey crystalline powder, which, to free it from resin and purify it com-pletely, must be several times crystallised from boiling water, with addition of animal charcoal (Anderson)

Properties — Colourless hexagonal prisms Appears tasteless at first, but afterwards acrid May be sublimed SI sol cold water, m sol alcohol and ether Sol KOHAq, nearly insol NH,Aq Inactive Its aqueous solution ppts lead subacetate but not lead acetate Dilute H,SO, forms a colourless solution which becomes dark green when evaporated (Couerbe) Conc H,SO, forms a colourless solution which becomes purple on heating

Reactions—I Cone HClAq at 100° gives MeCl and methyl normeconin C₅H₅O₄ (M a F) HI acts in like manner—2 Baryta water dissolves meconin forming 'barium meconinate' (C₅H₄(OMe)₅(CH₄OH) CO₂)₂Ba This salt crystal lises in needles, but the free acid splits up at once into water and its anhydride meconin (Hessert, B 11, 240, Prinz, J pr [2] 24, 373) B Potash-fusion forms methyl-normeconin C₅H₂O₄ [125°] and, finally, protocateching acid Cyndised by MnO₅ and dilute H₂SO₄ to opianic acid.—5. KMnO₄ oxidises it to hemipic said [180°].

Chloro-meconin $O_{10}H_0\text{ClO}_4$. [175°] Obtained by passing chlorine into a cold saturated aqueous solution of meconin (Anderson, A 98, 47) Colourless needles May be sublimed Sl sol cold water, v sol alcohol and ether Hot $H_2\text{SO}_4$ gives a greenish blue colour

Bromo-meconin C₁₀H₂BrO₄ [167°] (Ander son), [177°] (Salomon, B 20, 888) From me conin and bromine water Colourless needles,

sl sol water
Indo-meconin C H IO [11

Iodo-meconin C₁₀H₉IO₄ [112°] From me conin and chloride of iodine (A) Needles, nearly insol water, m sol alcohol and ether

Nitro-meconin C₁₀H₉(NO₂)O₄ [158°] Frommeconin and HNO₃ White needles (from alcohol)

Amido-meconin C₁₀H₂(NH₂)O₄ [171°] Obtained by reducing nitro meconin with iron and acetic acid (S) M sol hot benzene

Methyl-normeconin C,H,O, ve

 $C_eH_2(OH)(OMe) < CH_2 > O$ [125°] Obtained

by heating meconin with cone HClAq (Matthiessen a Foster), by heating meconin with KCy at 180° (Bowman, B 20, 890), or by potash fusion from meconin or narcotine (Beckett a Wright, J 1876, 810) Monoclinic prisms, v sol hot water and alcohol, sl sol ether FeCl, colours it blue It reduces silver salts in the cold Potash fusion converts it into protocatechuic acid—CaA'₂—BaA'₂

Meconin acetic acid C12H12O : e

C₆H₂(OMe)₂COO [167°] Obtained

by heating opianic acid with a mixture of malonic acid, acetic acid, and sodium acetate for 10 hours at 100° (Liebermann a Kleemann, B 19, 2290) Glistening needles By boiling with baryta water it is converted into opianyl acetic acid C₆H₂(OMe). (CO₂H) CH(OH) CH CO₃H By heating with HI it is dimethylated, giving

C_sH₂(OH)₂CO CH CH₂CO H ethyl ether melts at 131⁶ [228°], of which the

Salts -A'Ag white slightly soluble crystals $-A'_2Ca$ needles, al. sol water $-A'_2Cu^{\times}$ blue crystalline pp

Methyl ether A'Me [124°], glistening plates

Ethyl ether A'Et [83°], plates, sol alcohol, ether, and hot water

Nitro meconin acetic acid

CO C_oH(NO₂)(OMe)₂ O [176°] Nearly CH CH₂ CO₂H colourless crystals Obtained by nitration of meconin acetic acid It dissolves in cold H₂SO₄ with a yellow colour, which becomes red on warming from formation of an indigo derivative By tin and HCl it is reduced to the lactone of

(Py 1 3)-di-oxy-(B'2.3) di methoxy-di hydro-

Salts —A'2Ca. yellow needles.--A'Ags; curdy pp.—A'2Cux; green pp

Ethyl ether AEt [129°], glistening | in 50-75 pc acetic acid. It contains 59 pc of needles, insol water, sol alcohol and benzene | sulphur and 2 pc Fe (Liebermann & Kleemann, B 19, 2295)

 ψ Meconin $C_0H_2(OMe)_2 < CH_2 > O [16\frac{2}{3}]$? De methyl derivative of de oxy phthalide [124°] When hemipimide, the imide of hemipic acid C.H.2(OMe)2 CO NH, is heated with tin and hydrochloric acid it is red seed to hemipimidine $C_6H_4(OMe)_2 < \stackrel{CH}{CO}^2 > NH$ [181°], which yields a

nitroso derivative • C₆H₂(OMe)₂<CH₂>N NO [156°], which on treatment with dilute NaOH in the cold yields pseudo meconin (Salomon, B Obtained also by boiling hemipimide with zinc dust and acetic acid Long colourless needles (from water) Sl sol cold water, sol benzene, alcohol, and ether Unlike meconin it is not affected by boiling with dilute H SO, and MnO. Dilute HNO, at 150° forms nitro hemipic acid and nitro ψ meconin, whereas meconin yields only nitro meconin Fusion with KOH or KCy does not affect ψ meconin

Brome \(\psi \) meconin C₁₀H₀BrO₄ [142°] From \(\psi \) meconin and bromine White flocculent pp,

sol benzene, msol petroleum

Nitro \(\psi\) meconin C₁₀H_n(NO₂)O₄ [166°] From \(\psi\) meconin and fuming HNO₄ Yellow needles, which yield oxalic acid on further treatment with nitric acid

Amido ψ meconin $C_{10}H_9(NH_2)O_4$ [165°] Ob tained by reducing the preceding More basic

than amido meconin

MECONOISIN C₈H₁₀O₂ [88°] S 37 Oc curs in opium, and found in the mother liquor after separation of meconin When this is allowed to stand, crystals are deposited, which are washed with alcohol and recrystallised from water (T a H Smith, Ph [3] 8, 981) Large, leaf shaped crystals, v e sol hot water It gives a green colour when heated with dilute H.SO

MEDULLIC ACID C₂₁H₄₂O₂ [72 5°] A fatty acid said to be produced, together with stearic and palmitic acids, by the saponification of beef-

marrow (Eylerts, Ar Ph [2] 104, 129) MELAM v CYANIC ACIDS

MELAMINE v Cyanuramide in the article CYANIC ACIDS

MELAMPYRITE v DULCITE

MELANILINE v DI PHENYI GUANIDINE

MELANIN C 60, H 48, N 108, ash 22 A black pigment covering the choroid membrane of the eye (Scherer, A 40, 63) Insol water, alcohol, and ether

Phymatorhusin C 557, H 60, N 123, S 8 to 9, Fe 07 to 2 A pigment occurring in melanotic urine and tumours It is obtained by ppg with baryta, dissolving in Na,CO₃, and ppg with dilute H,SO₄ (Berdez a Nencki, *J Th* 1886, 477, Mörner, *H* 11, 81) It is a brownishblack amorphous powder, insol water, alcohol, ether, chloroform, and dilute mineral acids, v e sol ammonia, aqueous NaOH, Na2HPO4, and Na₂CO₂ Ppd from its solution in NaOH by baryta, MgSO₄, and BaCl₂ With potash fusion it gives skatole, volatile fatty acids, nitriles, KCy, and K₂S Hot H₂SO₄ forms pyridine Phymatorhusin is accompanied by another black substance, which differs from it in being soluble

C 535-556, H 27-89, Hippomelanin N 105-109, S 28-30 Occurs in melanotic tumours of horses May be obtained by diluting the emulsion of a melanotic spleen with water The pp 18 and adding CaCl₂ and Na₂HPO₄ washed at 40°, and then treated with a digestive fluid until the solution ceases to give a reaction for peptones The residue is washed with aqueous soda, alcohol and ether (Miura, C C 1887, 250). Brownish black powder, insol water, alcohol, and ether Dissolves on warming in dilute acids and alkalis Potash fusion gives KCy, succinic acid, formic acid, and hippomelanic acid Hippomelanic acid is a black amorphous body, sol ammonia, and reppd by HCl It contains less S and more C than the melanin (Nencki a Sieber, C C 1888, 587) The black pigment in dark hair and in bird's feathers after purifying by al coholic NH, and dilute H SO, may be represented by the formula $C_{18}H_{16}N_2O_8$ (Hodgkinson a Sorby, J 1876, 936) Black powder Not affected by dilute acids and alkalis

Sepiaic acid C 563, H 36, N 123, S 5, 0 27 2 Obtained by digesting the pigment from the ink bag of sepia with 15 pts of 10 pc Sol alkalis, ppd from ammoniacal potash solution by ammonia zinc chloride or copper

sulphate (Nencki a Sieber)

MELANTHIN C₂₀H₃₃O, [205°] Occurs in the seeds of Nigella sativa (Greenish, Ph [3] 10, 909, 1013) Prepared by extracting the seeds with alcohol, evaporating the extract, dissolving the pp in alcohol, and fractionally ppg with water Minute grey crystals (from alcohol) Insol water, benzene, CS2, and light petroleum, v sol alcohol, sol alkalıs, sl sol chloroform Conc H₂SO₄ gives a red colouration H₂SO₄ and sugar give a violet blue colour Boiling dilute HCl splits it up into a sugar and melanthigenin C14H202, which forms minute crystals, sl sol. water

MELANURENIC ACID v AMMELIDE

MELEM v CYANIC ACIDS

MELENE C₃₆H₅₀ [62°] (370°-380°) S G 89 VD 10-118 S (alcohol) 13 in the cold, 3 6 at 78° An olefine (?) produced by the dry distillation of bccs' wax (Lttling, A 2, 252, Lewy, A Ch [3] 5, 395, Brodie, A 71, 156)— White nacreous plates (from ether) Insol water, sl sol cold alcohol, v sol ether Not attacked by cold H_2SO_4 , slightly attacked by boiling HNO. Attacked by chlorine MELEZITOSE $C_{12}H_{22}O_{13}$ [148°] [a]_D=94°

(B), 88 5° (V) A sugar discovered by Bonastre in the manna of Briancon which exudes from the young branches of 'mélèze' (Pinus Larix) (Berthelot, A Ch [3] 55, 282) It occurs also in 'taranjobine' or Turkestan manna (Villiers, Bl [2] 27, 98, Alekhine, Bl [2] 46, 824) tained by extracting the Briancon manna with boiling alcohol, and evaporating After a few weeks melezitose separates, it is then recrystallised from alcohol Monoclinic crystals containing aq (V), or anhydrous crystals (A) About

Dextrorotatory V sol water, nearly insol cold, sl sol boiling, alcohol, insol ether Its aqueous solution is ppd by ammoniacal lead acetate Boiling dilute H.SO. forms glucose It is turned brown by alkalis. It does not reduce Fehling's solution Does not ferment with yeast It forms a compound with phenyl hydrazine It gives an octo acetyl derivative.

MELIDO-ACETIC ACID C, H, N,O, 26 (CN), N, H, CH, CO, H Formed by treating cyanamide with chloro acetic ether and NaOEt (Drechsel, J pr [2] 11, 332) Amorphous mass, but obtained in a crystalline state by ppg its ammonium salt with HCl Decomposed by heat without previous fusion Insol alcohol and ether, v sl sol cold water Sol aqueous HClAq, baryta, and KOHAq, but insol NH, Aq -HA'HCl needles, sl sol cold water— HA'HNO,Aq—AgA'HNO,Aq—(HA'),H,SO,4aq MELILOTIC ACID v OXY PHENYL PROPIONIC

MELILOTOL $C_{18}H_{16}O_5$ (?) An oil found, together with coumarin, in the yellow melilot (Melilotus officinalis) Extracted by distilling the plant, when in flower, with steam, and ex tracting the distillate with ether (Phipson, C N 32, 25, C R 86, 830) Liquid, v sl sol water, alcohol, and ether Has an agreeable odour When boiled with cone KOHAq it yields oxy phenyl propionic (melilotic) acid C₂H₁₀O₃ Melilotol is perhaps identical with the lactone of

CH, CH, melilotic acid C_sH₄< O CO

MELINOIN - TRI - SULPHONIC ACID

 $\mathbf{C_{34}H_{17}O_3(SO_3H)_3}$

Formation -1 By warming a mixture of p oxy benzoic aldehyde, (β) naphthol, and H₂SO₄
2 From benzoic aldehyde, (β) naphthol, and H₂SO₄—3 By heating Baeyer's condensation product C₃₄H₂₆O₃ (from benzoic aldehyde and (8) naphthol) with H_2SO , (Trzcinski, B 16, 2835, 17, 500) — Yellow crystalline powder Insol absolute alcohol, tolerably sol water, the dilute solution being of a rose red colour with a It dissolves in strong green fluorescence H₂SO₄ or HNO₃ with a splendid green fluor escence, and is not attacked even on boiling It forms unstable compounds with HCl and H2SO4, although it is itself a strong acid

Salts -A"K, easily soluble fine colourless needles -A", Ca, aq colourless soluble crystals -A"2Ba, sparingly soluble white amorphous

pp or microscopic needles

MELISSIC ACID C.0H.00, 1 e C.1H.00C0, H, or C.1H.0C0, 1 e C.2H.0C0, H [90°] Occurs in bees' wax (Nafzger, A 224, 225) Formed by heating the myricyl alcohol of bees' wax with soda lime at 270°-300° in absence of air (Brodie, 4 71, 156, Von Pieverling, A 183, 344, Sturcke, A 223, 295, Schwalb, A 235, 106) Sol alco scales, composed of minute needles hol, light petroleum, chloroform, and CS2, sl sol According to Schalfeeff (B 12, 697) melissic acid is a mixture of acids

Salts —PbA'₂ [119°] Insol alcohol and ther, sl sol boiling toluene, chloroform, and glacial acetic acid — MgA'2 — CuA'2 — AgA'

[95°], amorphous pp

Methylether MeA' [71°] Needles (from

Occurrence — As, aluminium mellitate in honey stone or mellite (Klaproth, A D 1799,

Bacyer, A Suppl 6, 1)
Formation —1 By the oxidation of hexamethyl benzene by cold alkaline KMnO, (Friedel a Krafts, A Ch [6] 1, 470) -2 By the oxidation of charcoal by KMnO₄ (Schulze, B 4, 802, 806) -3 By the electrolysis of acidified water or of KOH using a positive electrode of gas carbon (Bartoli a Papasogli, G 11, 468, C C 1881, 327) —4 In very small quantity by oxidis ing coal, animal charcoal, or lampblack by alkaline NaOCl (Bartoli a Papasogli, G 15, 446)

Preparation - Powdered honey stone is boiled with ammonium carbonate, ammonia is added, and the filtrate evaporated to crystallisa tion The ammonium mellitate is recrystallised with addition of a little ammonia, dissolved in water, ppd by lead acetate, and the pp decomposed by H.S (Wohler, A 37, 263, Schwarz, A

66, 47, Claus, B 10, 559)

Properties - Stellate groups of delicate silky needles (from alcohol), v sol water and alcohol Decomposed by heat into CO and pyromellitic acid $C_{10}H_0O_8$ (Erdmann, J pr 52, 432), which solidifies in the neck of the retort as a radio-When strongly heated with crystalline mass glycerin it yields CO2 and trimesic acid C9H6O6 When heated to redness with soda lime it yields benzene (Baeyer, A Suppl 7, 5) Not decom posed by boiling HNO, sulphuric acid, HIAq, chlorine, or bromine When its aqueous solution is electrolysed, CO, hydrogen, CO, and oxygen

are given off (Bunge, J/R 12, 421) Salts —(NH₄)₆C₁₂O₁₂ 3aq trimetric crystals (Schwarz, A 66, 47) Decomposed at 150° with formation of paramide and ammonium eu chroate -(NH₄)₂H₄C₁₂O₁₂ 4aq trimetric prisms From ammonio cupric mellitate and H2S -K₈Av1 9aq trimetric crystals -K₄H₂Av1 8aq - $K_2^*H_3A^{*1}$ and large prisms, more soluble in water than the normal potassium salt — $(K_3H_3A^{*1})_4(KNO_3)_3$ 9aq (?) —Na_3A^{*1}2aq needles (from a hot cone solution) — Na, Avi 18aq large striated triclinic crystals — Ba, Avi 3aq white gelatinous pp, changing to scales — Mg, Avi 18aq crystalline mass - Mg,(NH,)2Avi 15aq glassy prisms — $Zn_3A^{v_1}15aq$ — $Zn_2A^{v_1}9aq$ — $Mn_3A^{v_1}18aq$ minute needles, more sol cold than hot water S (hot water) 125 - Co. Hg, A^{vi} 6aq (dried at 100°) granular pp — Pb, A^{vi} (dried at 180°) bulky white pp — Pd, A^{vi} (A^{vi} 81, 164) — A^{vi} white crystals (Karmrodt, A^{vi} 81, 164) — A^{vi} white crystal into powder (Wöhler, A^{vi} 30, 1) — A^{vi} white crystal into powder (Wöhler, A^{vi} [187°] From silver mellitate and MeI (Kraut, J^{vi} 1862, 281, A^{vi} 777, 273) Plates H C 1,825,600 H F 487,400 (Stohmann, J^{vi} 274,0356) — Ethyl ether Et, A^{vi} [73°] Isoamyl ether (O,H,,), A^{vi} Onl

Isoamyl ether (C,H11),Avi Oil

Chloride C.(COCI). [190°] (Claus, B 10,) Formed, together with an oxychloride C12O8Cl2, from PCl5 and mellitic acid Hard vitreous prisms (from ether) Sublimes in lamine at 240° Slowly decomposed by water laminæ at 240° into HCl and mellitic acid

Tri imide C12H2N3O6 te

 $\mathbf{c}'\left\{<_{\mathrm{CO}}^{\mathrm{CO}}>\mathrm{NH}\right\}$ Paramide Formed, to-

gether with euchroic acid, by heating ammo nium mellitate at 160° as long as NH3 escapes Water extracts ammonium euchroate from the residue leaving paramide undissolved (Wohler, A 37, 268, Schwarz, A 66, 52) White amor phous powder, insol water and alcohol Sol H SO, but reppd by water Boiling with water slowly converts it into (NH4)3H3C12O12 Alkalis convert it first into euchroic and then into mellitic acid AgNOs forms in its ammoniacal solution a gelatinous pp which gives off NH, when heated, leaving Ag₃N₂C₁₂O₆. An ammoniacal solution of paramide dropped into HClA; gives a white crystalline pp called 'paramic

gives a wine crystainte processed parameter acid. $C_{12}H_0N_3O_7(?)$ or CO_2H CO_3 CO_4 CO_5 CO_5 CO

tic acid or ammonium mellitate (1 mol) with aniline (6 mols) at 160° for 7 hours (Hotte, J pr [2] 32, 238) White amorphous mass

 $\begin{array}{c} D_1 \text{ i mide } C_{12}H_4N_2O_8 \text{ i e} \\ (CO_2H)_2C_6 \left\{ \left\langle \begin{array}{c} CO \\ CO \end{array} \right\rangle NH \right\}_{r} \end{array}$ Euchroic

Prepared by heating ammonium mellitate at 160° for several hours, dissolving in water, and adding HCl to the hot solution. The crystals which separate on cooling are recrystallised from water (Wohler, P 52, 610, Schwarz, A 66, 49) Small prisms (containing 2aq), sl sol cold water Strongly acid Melts about 280° Euchroïc acid is not decomposed by boiling water or HClAq When a solution of euchroïc acid is treated with zinc the metal becomes covered with a dark blue deposit of 'euchrone' This deposit detaches itself when the zinc is immersed in dilute HClAq After drying, euchrone is a black mass which becomes colourless when heated in air, being re-oxidised to euchroïc acid Euchrone forms a deep purple solution in NH, Aq or KOHAq, but the solution is quickly decolourised by the When a solution of euchroic acid is electrolysed, the negative platinum becomes coated with the blue deposit

Salts - (NH₄)₂C₁₂H₂N₂O₈ white crusts -An acid ammonium salt separates from hot solutions in yellowish crystals—BaA"aq pale-yellow powder—PbA"aq—PbA"4aq—Ag₂A".

sulphur-yellow powder.

Hexahydride C.H. (CO.H). Hydromellithe acid Formed by treating an ammoniacal solution of mellitic acid with sodium amalgam. neutralising with acetic acid, ppg by lead acetate, and decomposing the pp with HS (Baeyer, A Suppl 7, 15) Formed also in the electrolysis of aqueous KOH with a positive electrode of carbon (Bartoli a Papasogli, C C 1881, 327) Hygroscopic syrup, v e sol water By heating with H₂SO₄ (5 pts) there is formed, together with CO₂ and SO₂, trimesic acid C₆H₄(CO₂H)₄, prehnitic acid C₆H₂(CO₂H)₄, mello phanic acid C₆H₂(CO₂H)₄, and prehnomalic acid C₁₀H₈O₆

Salts -The alkaline salts are gummy, v e sol water—The calcium salt is more soluble in hot than in cold water—Pb_A^i (dried at Amorphous pp --- AgaAv1 150°) amorphous

Isohexahydride CoH6(CO2H). Isohydromellitic acid Formed by heating the preceding hexahydride with conc HClAq for 3 hours at 180° (Baeyer) Prisms (from water) V sol water, but ppd on addition of HCl Not affected by heating with fuming HClAq at 300° De composed in the same manner as its isomeride when heated with HSO. Chromic acid mixture oxidises it to acetic acid and CO. -Pb,A'

Methyl ether of the Isohexahydride $\mathbf{M}e_{s}\mathbf{C}_{12}\mathbf{H}_{s}\mathbf{O}_{12}$ [125°] Needles, \mathbf{v} e sol alco

References - Hemi mellitic acid, Pyro MELLITIC ACID

TRIMELLITIC ACID C.H.O. 1.6

C₆H₃(CO H), [1 2 4] Benzene tricarboxylic acid Mol w 210 [218°]

Formation -1 Together with isophthalia acid and pyromellitic anhydride by heating the tetrahydride of pyromellitic acid C,H₆(CO₂H)₄ with 5 pts of H₂SO₄ (Baeyer, A Suppl 7, 40)—2 By oxidising the acid C₆H₄Me(CO₂H)₂, prepared from ψ cumene, by KMnO, (Krinos, B 10, 1491) -3 By oxidising alizarin carboxylic acid with dilute HNO, (Hammerschlag, B 11, 88) — 4 By oxidising the acid C₈H₃Me(C₄H₂)CO₂H

with dilute nitric acid (S G 1 12) at 240° (Effront, B 17, 2338) -5 By the action of cuprous cyanide upon the diazo compound from amido terephthalic acid, and saponification of the product with aqueous KOH (Ahrens, B 19, 1634) heating mono potassic (\$) sulphophthalate with sodium formate, isophthalic acid

being also formed (Graebe a Rée, Č J 49, 532)

Preparation—100 g pulverised colophony
and 2 litres of nitric acid (1 vol commercial acid to 2 vols water) are introduced into a retort with its beak directed upwards, and the liquid is heated to boiling, whereupon the colophony melts, and is quickly attacked, with copious evolution of red vapours, and converted into an orange yellow viscid mass. After the boiling has been continued for 6 or 8 hours, fresh resin and strong nitric acid are added alternately, till about 1 kg resin has been introduced, the con tents of the retort being kept in constant ebulli tion, this process takes about a fortnight. The resulting wine yellow liquid, which on addition of water should merely show turbidity, and not yield any lumpy precipitate, is then distilled off till the remaining liquid begins to froth, and

this liquid, while still hot, is poured into a ten fold volume of cold water, decanted after twentyfour hours from the varnish like resin which separates, and evaporated to a syrupy consist-The whole then solidifies after a while to a thick crystalline pulp, which may be freed from the syrupy mother-houor by means of an aspi rator and porous earthenware plates, and afterwards boiled with water The extract on cooling deposits isophthalic acid in slender needles, and on further concentration, first a little more of the same acid and then trimellitic acid, which may be purified by solution in alcohol and crystallisation from water 30 g of trimellitic acid may be thus obtained from 50 g of resin (Schreder, A 172, 93)

Properties —Rosettes of small needles, m sol water and ether When heated above its melting point the anhydride distils over, con densing in concentrically arranged groups of needles On fusion with NaOH it gives benzene and diphenyl (Barth a Schreder, B 12, 1257) It also yields benzene when distilled with lime

Salts $-Ba_3A'''_2$ 4aq (when air dried) Gives off 3aq at 160° Sl sol water $-Ba_3A'''_2$ 3aq (when dried over H_2SO_4) $-Ag_3A'''$ white pp, not much affected by light sl sol water

Anhydride C₈H₃(CO₂H) CO O [158°] Formed by heating the acid (Baeyer, A 166, 340) Crystalline mass, sl sol cold, v sol hot, water

Reference — Sulpho trimellitic acid
MELLITYL ALCOHOL v Penta methyl
BENZYL ALCOHOL

MELLOGEN C₁₁H₂O₂ On the electrolysis of water by a battery of 1,200 Daniell's cells, the anode being gas carbon, the liquid becomes of an inky colour, and there is deposited in the voltameter a black residue This is washed with water until the filtrate is quite colourless, from the washings the mellogen is ppd with a small quantity of dilute hydrochloric acid (Bartoli a Papasogli, G 11, 468, 12, 117, 13, 37, 15, 464, C R 94, 1339, A Ch [6] 7, 364) A black solid, of conchoidal fracture, sol water and al kalıs, ınsol alcohols and hydrocarbon, and in most mineral acids and salts It is not readily combustible, and is converted by oxidising agents, eg NaOCl, into mellitic and pyromellitic acid and their hydrides At ordinary temperatures it has the composition $2C_{11}H_2O_4 + 3H_2O_7$, at 100° it may be represented by $2C_{11}H_2O_4H_2O$ aqueous solution of mellogen is dark coloured, and is ppd by acids and by many salts baryta mellogen gives an insoluble pp acid (8 G 1 36) oxidises mellogen forming an amorphous compound C₁₁H₂O₂, sol water, alcohol, and ether a soluble acid C₁₁H₂O₂ 2 aq, forming the salts $Ba_3(C_{11}H_3O_7)_2$ and $Ag_3C_{11}\hat{H}_3\hat{O}_7$, and a black compound resembling mellogen.

MELLONE v CYANIC ACIDS
MELLOPHANIC ACID C10H6O8 1 e

C₆H₂(CO₂H), [1 2 3 5] Bensene 1-tetra carboxylic acid [238²] Obtained, together with prehnitio acid C₆H₂(CO₂H), [1 2 3 4], by heating the hydride of pyromellitic acid C₆H₂(CO₂H), [1 2 4 5] with H₂SO₂ (Baeyer, A 166, 327) Formed also by the oxidation of iso-durene C₆H₂Me₄ (Jacobson, B 17, 2516). Small four-sided prisms, v. sol water, but ppd by HCl from a conc. solu-

tion Converted into an anhydride on fusion Calcium acetate gives in hot solutions of the acid a pp which re-dissolves on cooling Baryta-water gives a pp which becomes crystalline on heating Lead acetate gives a floculent pp, insol acetic acid Sodium amalgam forms a hydride of mellophanic acid

Anhydride [238°] Formed by fusing the

cid Insol ether

MELOLONTHIN $C_3H_{12}N_2SO_3$ Found, toge ther with leucine and hypoxanthine, in cockchafers (*Melolontha vulgaris*) The insects are extracted with water, the extract boiled, ppd with lead subacetate, and the filtrate freed from lead by H_sS and evaporated The crystals are freed from leucine by treatment with alcohol (Schreiner, B 4, 763) 30lbs of cockchafers yield 15 g melolonthin Silky needles (from water), sl sol cold, m sol hot, water, v sl sol dilute alcohol and ether, v sol acids and alkalis Does not act on light

MELMESIDINE v DI MESITYL GUANIDINE MENAPHTHYLAMINE $C_{11}H_{11}N$ 2 e

C₁₀H, CH₂NH₂. (292°) Formed by treating the amide of (a)-thionaphthoic acid C₁₀H, CS NH₂ with zinc and HCl (Hofmann, B 1, 100) Alkaline liquid, readily absorbing CO, from the air—B'HCl long, sparingly soluble crystals—

B',H2PtCl, yellow crystalline pp

MENISPERMINE C₁₈H_{.4}N₂O₂ (?) [120°] Occurs in the seeds of Menispermum cocculus (Pelletier a Caventou, A Ch [2] 54, 178) extract the menispermine, the alcoholic extract of the seeds is first treated with cold water, then exhausted with hot acidulated water, the brown solution is ppd by an alkali, and the pp is ex hausted with very weak acetic acid, which leaves a brown black mass undissolved Or the seeds may be made up into a heap, and exhausted with alcohol of specific gravity 0 833, the alcohol distilled off, the residue boiled with water, and the liquid filtered at the boiling heat, it then, on cooling, deposits crystals of picrotoxine, especially if a small quantity of acid has been added. The part insol boiling water is then treated with acidulated water, and ppd by an alkalı, a granular pp is thereby formed, from which alcohol extracts a peculiar yellow sub stance, and the residue is finally dissolved in ether, which deposits menispermine in the crystalline form The ether leaves undissolved a viscous substance, which may be dissolved in absolute alcohol and the solution, evaporated at 45°, ultimately yields crystals of parame nispermine

Properties — Prisms, insol water, sol alcohol and ether Is not poisonous Its sulphate

forms prismatic needles, sol water

Paramenispermine [250°] Isomeric with menispermine Insol water, sl sol ether, v sol boiling alcohol Dissolves in dilute acids

sol boiling alcohol Dissolves in dilute acids MENTHENE C₁.H.₁ Mol w 138 (167 4° cor) (Atkinson a Yoshida, C J 41, 53), (163°) (Oppenheim, C J 15, 29) V D 4 94 (calc 4 78) S G 15 814, 2 8226, 20 8073 (A a Y) C E (0°-10°) 000994, (0°-60°) 00100 [a]₃ = +13 25 (A a Y) R₁₀ 74 0 Specific refractive energy, 548 Specific dispersive energy, 0313 (Glad stone, C J 49, 622) Obtained by distilling menthol (1 pt) with ZnCl₂ (2 pts), or with P₂O₃ (Walter, A. 32, 288) Formed also by the action

of cone H,SO, on menthol (Beckmann, 4 250,

Properties — Colourless oil, smelling like cymene, m sol ether and alcohol, v sol benz ene, turpentine, and petroleum Dextrorota torv

Reactrons —1 Combines with fuming HCl, forming a yellow oil $C_{10}H_{10}Cl$ Combines also with HI, forming $C_{10}H_{10}I$, identical with the product obtained by heating terpliene dihydro disolde $C_{10}H_{16}2Hl$ with HI (Bouchardat a Lafont, C R 107, 916) —2 Combines with bromine, forming $C_{10}H_{18}Br_4$, which is split up by heat into HBr and cymene (Beckett a Wright, C J 29, 1) 8 Fuming natric acid oxidises it to glutaric acid

8 Fuming nutric acid oxidises it to glutaric acid

Methylpropyl phenol herahydride Mol w 156 (212°) VD 562 (calc 541) SG SG 15 890 596 (Oppen [a]_j = -59 3 (Morrya), [a]_b = -59 6 (Oppen heim), = -49 4 in a 5 p c alcoholic solution at 22° (Arth, A Ch [6] 7, 438) $R_{\infty} = 77.4$ in a 21 pc benzene solution (Kanonnikoff, J pr [2] 31,348) HC 1,509,100 (Louguinine, A Ch [5] 23, 387) Deposited in crystals when the essential oil of peppermint is kept for a long time or cooled to a low temperature (Dumas, A 6, 252, Blanchet a Sell, A 6, 293, Walter, A 32, 288, Kane, P M 16, 418, Laurent, Rev Scient 14, 341, Oppenheim, C J 15, 24) Menthol is imported from Japan in the solid state as 'peppermint camphor' (Moriya, C J 39, White crystals, smelling of peppermint, il sol water, ve sol alcohol, ether, CS2, HOAc, and fixed and volatile oils Insol aqueous al and fixed and volatile oils kalıs From alcoholic NaOH it crystallises in long needles Sodium dissolves in it with evolu tion of hydrogen Cone acids dissolve menthol, but it is reppd on dilution with water Menthol has the refractive and dispersive energy of a saturated compound (Gladstone, C J 49, 621) The rate of etherification of menthol by acetic acid is that of a secondary alcohol (Menschut kin, J R 13, 569)

Reactions—1 With K₂Cr₂O, and H₂SO₄ in seal.d tubes at 120° gives an inactive oil 'men thone' (205°), C₁₀H₁₈O, S G 15 9032, sol alco hol, ether, and chloroform—2 Fuming HNO, brms an explosive oil, S G 15 1061, which may be reduced to a yellow oil C₁₀H₁₈NH₂(185°-190°) 3 Excess of fuming HNO, forms an acid, probably glutario (q v)—4 Bromine in acetic acid forms C₁₀H₁₈Br Unstable oil—5 Cone HClAq at 100° slowly forms menthyl chloride PCl₃ forms the same body—6 ZnCl₂ or P₂O₃ dehy drate menthol, producing menthene—7 KMnO₄ in acid solution forms (β) pimelic acid C,H₁₀O₄ [87°], of which the amide [191°] crystallises from water in prisms (Arth, A Ch [6] 7, 440, C R 107, 107) Formic, propionic, butyric, and oxymenthylic acids are formed at the same time The oxymenthylic acid C₁₀H₁₈O₄ boils at 174° under 15 mm pressure—8 Boiled with HI (S G 17) for 3 days it forms a mixture of hydrocarbons chiefly consisting of C₁₀H₁₈ (168 6°) V D 67 25, [a]₂=+52 S G 2 8254, 28 111, C E (0°-10°) 000929, (0°-60°) 000694 R₂₀

benzene, less so in alcohol or ether Odour resembles symene (Aktanson a Yoshida, C J 41, 54) —9 Menthol does not react with hydroxylamine (Nageli, B. 16, 499) —10 On heating with sodium and ether on the water bath, and, after cooling, adding CS₂ there is formed menthyl-xanthogenic acid $C_{10}H_{20}$ CS SH, a liquid which undergoes spontaneous decomposition, but forms a yellow crystalline copper salt CuA'_{2} (Bamberger a Lodter, B 23, 213)

Acetyl derivative $C_{10}H_{19}OAc$ Menthyl acetate (223°) [a] = -114° From menthol and HOAc at 120° (Oppenheim, C J 15, 26) Liquid Not decomposed by cold alkalis, but saponfied by alcoholic NaOH at 120°

Butyryl derivative C₁₀H₁₀O CO C₃H₇.

Menthyl butyrate Obtained by heating menthol with butyric acid at 200° for 30 hours (Oppen heim) (230°-240°) [a] = -89°

Benzoy l derivative $C_{10}H_{10}OBz$ [54°] (230°) [a]₀ = -91° In a one p \bar{o} benzene solution, trimetric crystals putially decomposed on distillation into menthene and benzoic acid (Arth, A Ch [6] 7, 479)

Carbamyl derivative $C_{11}H_{21}NO_{2}$ s.e $C_{12}H_{12}OCONH_{2}$ Menthyl carbamate [165°] $[165^{\circ}]$ and 58 pc chloroform solution at 21° Formed by passing dry cyanogen into a solution of sodium menthol in dry toluene. The product is washed with water and the toluene distilled off. The crystalline mass is then recrystallised from alcohol, from which the carbamyl derivative separates in slender prismatic needles (Arth, CR 94, 872, 98, 521, ACh [6] 7, 433) Needles, m sol alcohol and benzene Subhmes at 100° Decomposes at about 200°, yielding cyanuric acid Alcoholic KOH forms menthol and potassium cyanate $Ac_{2}O$ at 130° forms $C_{2}H_{10}OAC$ Benzoic aldehyde and HCl form $(CH_{10}CONH)$ CHP1 [142°]

and HCl form $(C_{10}H_{10}OCO NH_2CHPh [143°] Carbonyl derivative <math>(C_{10}H_{10}O)_2CO Menthyl carbonate [105°] Obtained in the preparation of the carbamyl derivative by eva porating the alcoholic mother liquor and boiling the residue with water as long as menthol and ammonia come off On cooling, the carbonyl derivative is deposited as a crystalline mass, sol boiling alcohol (Arth) Plates (from alcohol) or prisms (from toluene), v sl sol alcohol, v sol ether and benzene Alcoholic KOH at <math>100^\circ$ saponites it

Phenyl-carbamyl derivative
C₁₀H₁₀O CO NHPh Menthyl phenyl urethane
Menthyl phenyl carbamate [111°] From men
thol and phenyl cyanate (Leuckart, B 20, 115)
Silky needles (from hot alcohol)

Succinoxyl derivative $C_{10}H_{10}O$ CO CH_2 CH_2 CO, H [62°] [a]_D = -59 6° in a 1 4 pc benzene solution Formed by heating menthene (1 mol) with succinic anhydride (1 mol) at 110° (Arth) Acicular crystals, vesol alcohol, velecity solutions and K salts are very deliquescent, the Ca and Basalts are white pps $-AgC_{14}H_{22}O_4$ small needles (from hot water)

Succinyl derivative $(C_{10}H_{10})_2C_4H_4O_4$. [62°] (220°) $[a]_D - 81$ 5° in a 1 9 p c benzene so'ution From menthol (1 mol) and succinic acid (2 mols) at 150° Trimetric crystals (from alcohol) Decomposes on distillation into succinic acid and menthene.

204 MENTHOL

Phthaloxyl derivative C18H2,O4 re $C_{10}H_{10} O CO C_6H_4 CO_2H [110°] [a]_D = -105 6°$ in a 16 pc benzene solution Formed by heating menthol (1 mol) with phthalic anhydride (1 mol) at 110° (Arth) Minute needles, insol cold water, y sol alcohol and ether Gives white pps with Ba and Ca salts -Mg(C18H23O4) lamine, almost insol cold water

Phthalyl derivative $C_{28}H_{42}O_4$ s.e $(C_{10}H_{19})_2C_8H_4O_2$ [133°] $[a]_D=-94$ 7° in a 2 pc benzene solution at 20° From phthalic anhydride (1 mol) and menthene (2 mols) at 140° Trimetric crystals (from ether), sl sol

boiling alcohol

Menthyl chlorade C10H19Cl (c 204°) Ob tained by treating menthol with PCl, (Walter, A 82, 292) or with cone HClAq for a week at 100° (Oppenheim) The same body appears to be formed by heating menthene with fuming HClAq at 120° (Arth, C R 97, 323) Light oil, sl sol water, m sol alcohol Not attacked by alcoholic KOH With sodium menthol it gives menthene and menthol

Menthyl bromide C10H19Br From menthol and bromide of phosphorus Non volatile liquid

Gives with bromine $C_{10}H_{14}Br_6$ Menthyl iodide $C_{10}H_{19}I$ From menthol and conc HIAq Liquid, decomposed by alcoholic

K2S into menthene and HI

Tetra menthyl silicate Si(OC10H19)4 (350°) at 155 mm Formed by the action of SiCl, upon menthol, the yield is 75 pc of the theo retical (Hertkorn, B 18, 1695) Colourless prisms, v sol ether, benzene, ligroin, chloroform,

CS₂, and warm alcohol, sl sol cold alcohol
Oxymenthylic acid C₁₀H₁₈O₃ (175°) at 15 mm (280°) A product of the oxidation of menthol by KMnO, (Arth, A Ch [6] 7, 448) Colourless liquid, partially decomposed on boiling at 280°, v sl sol water, v sol alcohol and ether salts of alkalis and alkaline earths are very soluble A solution of the sodium salt is ppd by salts of Pb, Fe", Cu, and Pt It forms no white deli acetyl derivative -AgA' -NaA' quescent crystals

Methyl ether MeA' (137°) at 17 mm

Liquid

Ethyl ether EtA' (145°) at 18 mm

Thick liquid

MENTHONE $C_{10}H_{18}O$ (206 3° cor) [a]₁ = +21° S G $\frac{9}{2}$ 9126, $\frac{49}{12}$ 8972 C E (0°-10°) 000862, (0°-100°) 000923 R $_{\infty}$ 75 3 From menthol (30 g), K₂Cr₂O₇ (10 g), and H₂SO₄ (10 g) at 155° The light oil is subjected several times to the action of the same oxidising mixture (Atkinson a Yoshida, C J 41, 49) Colourless oil, miscible with alcohol, chloroform, benzene, and CS₂ Smells like diluted peppermint Does not combine with NaHSO₃ If a solution in petroleum is treated with Na and CO₂ successively and then shaken with water crystals of menthol are got [42°], but having [a]_j = -39° not -59° Levo-menthone C₁₀H₁₈O : e

 $CHPr < \begin{array}{c} CH_2 \\ CH_2 \\ CO \end{array} > CHMe (?) \quad (207^\circ)$ S.G -8960 $[a]_D = -282^\circ$ Menthone is a mixture of two isomerides-one dextro, the other lævorotatory By using very little acid the lævomenthone may be obtained free from dextromenthone and menthol The best proportions are 60 g. K₂Cr₂O₂, 50 g H₂SO₄, 300 g water, and

45g menthol, the mixture being kept at 30° to 55° (Beckmann, A 250, 325) The menthone is extracted with ether, washed with dilute alkalis, and distilled with steam

Properties - Mobile liquid, smelling faintly of peppermint, sl sol water, miscible with al of peppermint, s. sor warre, cohol, ether, and petroleum ether. The mole cular weight determined by Raoult's method carees with the formula. The molecular re

fraction $\left(\frac{n^2-1}{n^2+2}\right)^{\text{P}}_{\vec{d}}$ is 46.3 Leevo menthone is

converted into a mixture of dextro and lævo menthone by acids, bases, water, heat, or even on keeping

Oxim C_1 H_{18} NOH $[a]_D = -42.5^{\circ}$ Crystall Mol w 169 Crystalline, sol dilute alcohol, ether, and petroleum ether Raoult's method gives, when acetic acid is used, the mol w 169, but when benzene is used it gives 251 With HCl the oxim forms a compound (C₁₀C₁₈NOH)HCl [119°], a white orystalline

powder - × C₁₀H₁₈NONa

Dextro menthone $C_{10}H_{18}O$ Mol w 154 (208°) SG $\frac{20}{20}$ 900 [a]_p = +28 14° Obtained by freezing a mixture of H SO₄ (10 pts) and water (1 pt), adding menthene, (2 pts), and shaking The temperature is slowly raised to 30°, the product poured into ice, and the men-thone extracted by ether (Beckmann, A 250, 334) Colourless mobile oil, sl sol water, miscible with alcohol, ether, and petroleum ether The mol w determined by Raoult's method is 150 The action of acids, bases, water, heat, and time convert dextro menthons into a mixture of dextro and levo menthone Oxim C₁₀H₁₈NOH Thick oil, slightly levo

rotatory The mol w determined by Raoult's method is 165 when acetic acid is used, and 228 when benzene is employed as solvent — (C₁₀H₁₈NOH)HCl [6 97°] Deliquescent —

*C₁₀H₁₈NONa

MENYANTHIN C₉₀H₄₆O₁₄ [60°-115°] A bitter glucoside found in buckbean (menyanthes trifoliata) (Brandes, Kromayer, Ar Ph [2] 108, 257, 124, 37, Fr 1, 15) Prepared by treating the aqueous extract with animal charcoal at 65°, and subsequently extracting the charcoal with alcohol Amorphous yellowish mass, sl sol cold water, v sol hot water and alcohol, insol ether Dissolves in aqueous alkalis Its solutions are not ppd by metallic salts It is ppd by tannin When distilled with dilute H₂SO₄ it gives off volatile menyanthol, while glucose C₆H_{1,O₆} Gaq remains behind

Menyanthol C₈H₄O is an oil smelling like benzoic aldehyde

It reduces ammoniacal

benzoic aldehyde It reduces ammoniacal AgNO₈ By exposure to the air, or by potashfusion, it is converted into a crystalline sub-

limable acid

This name has also been Menyanthin applied to inulin when prepared from buckbean

MERCAPTALS Compounds of the form RCH(SR')2 They may be viewed as thio acetals or as the sulphur compounds corresponding to the alkyl derivatives of ortho aldehydes THIO ALDEHYDES

 (Lousen, A. 264, 71) H.Fp. 14,480. HF.v. 18,271 (Thomsen) R_{∞} 18 62 (Nasını, G 18,

Formation —1 By distilling calcium ethyl sulphate (Zeise, P 31, 369) —2 A mixture of alcohol and H₂SO₄ is neutralised with KOH, decanted from ppd K₂SO₆, mixed with excess of KOH, saturated with H₂S, and distilled (Wohler) —3 A solution of KOH (S G 13) is saturated with H₂S, mixed with an equal volume of a cone solution of KEtSO₄, and distilled from a water bath (Liebig, A 11, 14, 23, 34) The product is freed from Et₂S by fractional distillation (Claesson, J pr [2] 15, 193) —4 From KSH and EtCl (Regnault, A Ch [2] 71, 390) —5 From KSH and LtI (Baudrimont, C R 54, 616) —6 By reducing with HI a'·160° the solid thio aldehyde obtained by passing H₂S into a mixture of aldehyde solution and iodine (Bot tinger, B 11, 2203) —7 Together with HEtSO₄ and ether, by heating alcohol saturated with SO₂ in sealed tubes (Endemann, A 140, 336, Pagliam, B 11, 155)

Preparation —A cold mixture of alcohol (1 litre) and H₂SO₄ (500 c c) is diluted with ice and then added to a solution of crystallised so dium carbonate (4 kilos) —The product is concentrated until Na₂SO₄ separates —The mother liquor is further concentrated, and mixed with KOH (800 g) dissolved in water (1,500 c c) previously saturated with H S. The whole is heated on a water bath, and the gases are passed first through a strong solution of caustic potash (50 g) and then into a solution of KOH (350 g) in water (700 g) —The small amount of H₂S contained in the latter solution is ppd by lead acetate, and the mercaptan liberated by HCl. It is dried with K₂CO₃ and distilled (Klason, B 20, 3407)

Properties - Colourless, very mobile, liquid, having a peculiarly persistent alliaceous odour V sl sol water, miscible with alcohol and ether Very inflammable, and burns with a blue flame A drop of it when briskly agitated on the end of a glass rod becomes solid, possibly through formation of a hydrate Neutral to litmus alcoholic solution forms a yellow pp with lead salts, and white pps with cupric acctate, mer curic salts, and trichloride of gold. The alco holic solution is turned blue by FeCl, (Rathke, A 161,148) Mercaptan is a reducing agent thus it converts nitro benzene into azo benzene Mer captan decomposes salts of phenyl with forma tion of sodium phenylate and a thio ether (R Seiffert, J pr [2] 31, 462) But with phenyl salicylate it acts thus C,H4(OH)CO,Ph+NaSEt = C_sH₄(ONa)CO₂Ph + HSEt A trace of isatin dissolved in sulphuric acid gives, with a trace of mercaptan, a fine green colouration (Berthelot, C R 108, 350)

Reactions—1 Boiling netric acid (S G 14) becomes red, deposits an oil, and ultimately forms ethane sulphonic acid Weaker nitric acid (S G 128) forms EtsO₂SEt.—2 Potassium forms hydrogen and KSEt—8 P₂S₅ forms Et₂PS₄ and Et₂HPS₄ (Carius, A 112, 190)—4 Bromme forms EtBr and S₂Br₂ (Friedel a Ladenburg, A 145, 189)—5 Heated in sealed tubes with diaso-compounds (diazo salicylic acid diazo phenol chloride) it forms di ethyl disulphide, the diaso-compound being reduced exactly as when

boiled with alcohol (R. Schmitt a O. Mittenzwey, J. pr. 126, 192). C₂H₄(OH) N NCl + 2EtSH = Et₁S₂ + N₂ + C₆H₅ OH + HCl — 6. PCl₅ at 100° forms thiophosphorous ether P(SEt)₃, a fetid oil, resolved by distillation into phosphorus and Et₂S₂ — 7. CCl₄, acting on NaSEt, forms C(SEt)₄ a light oil, S. G. 1.01, decomposed on distillation C. Cl₅ with NaSEt gives C₂(SEt)₆, a heavy fetid oil, solidiying at very low temperatures. C₂Cl₄ heated with NaSEt at 100° gives C₂(SEt)₄, crystallising in rhombohedra [54°] — 8. S.Cl₂ forms HCl and Et₂S₄, which is resolved by distillation into Et₂S₂ and S₂ — 9. TCl₄ gives EtSHTiCl₄ and (EtSH)₂TiCl₄ (Demarcay, Bl. [2] 20, 132) — 10. Reacts with ketones forming 'mercaptoles' or thioketates. Thus HCl passed into a mixture of acetone and mercaptan forms (CH₃)₂C(SEt)₂ (Baumann, B. 18, 887) — 11. Mercaptan sus pended in ice water and mixed with diazobenzene sulphonic acid and soda gives explosive yellow needles of SO₂Na C₂H₄, N, SEt. When the alcoholic solution of this salt is boiled SO₂Na C₂H₅, SFt and nitrogen are formed (Stad ler, B. 17, 2075)

Salts — All metallic mercaptides are decom posed by HCl -- KSEt From mercaptan and Dull white granular mass, v sol water, sl sol alcohol Its aqueous solution gives a yellow pp with lead salts - NaSEt From mercaptan and Na or NaOEt Crystalline mass, v sol water and alcohol Its aqueous solution is alkaline in reaction, and gives off all its mercap-tan on boiling. In dry air it oxidises to C2HSO3Na When oxygen is passed through its alcoholic solution Et.S is formed -Zn(SEt)2 white, indistinctly crystalline pp obtained by adding mercaptan to aqueous zinc acetate NH, Aq and reppd on neutralisation - Cd(SEt), -Co(SLt), gummy pp Unlike the other mercaptides it is not attacked by fuming HNO, --Ni(SEt), chocolate brown powder, not decomposed by water—*Fe(SEt), from FeCl, mercaptan, and ammonia Black slimy mass, re solved by heating into mercaptan and ferrous hydrate —LtSFe(NO), [78°] From KSFe(NO), and EtI (Pavel, B 15, 2607)—TISEt yellow curdy pp, sl sol water -Cu(SEt)2 Obtained by adding mercaptan to a solution of CuSO. mixed with NaOAc Pale yellow amorphous powder (klason, B 20, 3407) —Hg(SEt), [77°] S 7 in 85 p c alcohol Formed on shaking HgO with mercaptan or with an alcoholic solution of mercaptan, the action being attended with great evolution of heat It is from this body that mercaptan derives its name (corpus mercurio aptum) White unctuous scales When its alcoholic solution is heated to 190° it is decom posed into mercury and Et S, (Otto, B 13, 1289, 15, 125) The same decomposition appears to occur when it is heated in the dry state. It is not decomposed by aqueous KOH, but aqueous K2S forms some HgS and KSEt H.S forms HgS and mercaptan Nitric acid oxidises it to (C₂H₃SO₃)₂HgHgO When melted with lead the products are mercury, PbS, and Et2S Mercury mercaptide forms with iodoform needles of ((EtS) Hg), CHI, [85 5°] (Jackson a Oppenheim, B 8, 1033)—EtSHgCl White bulky pp obtained on mixing an alcoholic solution of mercaptan with HgČl₂ Changes after some time to crystalline laminæ Sl. sol. water and ether, m sol boiling alcohol (Debus, A 72, 18) -Pb(SEt)₂ Yellow pp, got by mixing alcoholic solutions of lead acetate and mercaptan composed by heating with alcohol at 190° into PbS and Et₂S —B₁(SEt)₂ [79°] Obtained by mixing a solution of a salt of bismuth with mer-Long flexible yellow needles, m sol alcohol and ether Oxidises in the air Resolved by heat into BiS and Et,S -Sn(SEt). Formed by mixing solutions of mercaptan and SnCl, in Also from CS₂, and evaporating the solvent mercaptan and a conc aqueous solution of Oil, remaining liquid at -40° May be distilled in vacuo, but when heated under atmospheric pressure it decomposes yielding Et.S. and metallic tin -Sn(SEt), yellow pp which quickly oxidises in air -EtSSbCl2 formed by evaporating a mixture of mercaptan and SbCl. Decomposed by water with libera tion of mercaptan -As(SEt)3 Obtained by adding NaSEt to an ethereal solution of AsCl. Oil, with unpleasant odour Decomposed on distillation into arsenic and Et₂S. —ClAs(SEt), From AsCl, and mercaptan in the cold —EtSAu White gelatinous pp obtained on mixing dilute alcoholic solutions of auric chloride and mercaptan -Pt(SEt), light yellow pp -Rh2(SEt), yellow pp

Hydrate EtSH 18H2O Solidifies as a crys talline mass when moist vapour of mercaptan is passed through a condenser cooled below 8° (H Muller, Ar Ph [2] 150, 147) Mass of small needles, insol water and mercaptan pound containing 16 p c carbon, crystallising in prisms, is obtained by pouring mercaptan into a solution of H₂S at 0° It perhaps contains

 ${
m H_2S}$ as well as water It melts and decomposes above 3° (Blankie, Pr E 10, 87) **MERCAPTANS** (Sulphydrates) Compounds of the formula RSH where R is a hydrocarbon radicle They may be viewed as acid ethers of sulphydric acid or as alcohols in which O has been displaced by S Just as H₂S is more acid than H₂O, the mercaptans are more acid than the alcohols Thus they readily form salts by reacting with metallic oxides, and they derive their name from the ease with which they form mercuric salts The salts of mercaptans may be called mercaptides The mercaptans boil at a lower temperature than the corresponding alcohols, just as H2S has a lower boiling point than H_0 The mercaptans have an unpleasant odour. They are very readily oxidised, forming disulphides R_2S_2 , and finally sulphonic acids The oxidation to sulphonic acids is best effected by nitric acid, and the chlorides of the sulphonic acids RSO2Cl when reduced by tin and HCl yield the mercaptans again (Vogt, A 119, 152) By heating mercaptans with H₂SO₄ disulphides R₂S₂ are formed (Erlenmeyer

a Lisenko, J 1861, 590)

Preparation—1 Fatty, but not aromatic, mercaptans are formed by heating a solution of KSH with alkyl chlorides or iodides or with potassium alkyl sulphates -2 By heating alco hols or phenols with P_2S_5 (Kekulé, A 90, 311, Z 1867, 193) The yield is small -3 By reducing chlorides of sulphonic soids with zinc or tan and dilute H2SO, or HCl This process is very convenient for the preparation of aromatic mercaptans The product is distilled with steam.

4 Aromatic mercaptans may be prepared by treating diazo compounds with K28 (Klason, B. 20, 350) -5 Aromatic mercaptans may be obtained by reducing the corresponding disulphides with zinc and H2SO, -6 Aromatic mercaptans can be formed, together with the corresponding sulphides, by the action of aluminium chloride on a mixture of hydrocarbon and sulphur at 80° (Friedel a Crafts, Bl [2] 31, 464) -7 When three atoms of hydrogen in the benzene nucleus have been displaced by chlorous radicles, and two of these are NO, and a halogen in ortho position to each other, alcoholic KSH displaces the halogen by SH (Beilstein a Kurbatoff, A 197, 75) -8 By treating aromatic diazo compounds with sodium thiosulphate and reducing the resulting aromatic thiosulphates with zinc and H_2SO_4 (Leuckart, G P 1887, 45,120)

Properties — Oils or crystalline solids with pleasant odour Insol water The salts of unpleasant odour Insol water the heavy metals are sparingly soluble in water The mercuric salts can usually be recrystallised from alcohol When a small quantity of a 1 p c solution of isatin in H2SO4 is mixed with a few c c of the strong acid and a small quantity of a fatty mercaptan, a green colouration is produced Aldehydes and the higher alcohols interfere with the isatin reactions, and in this case the liquid may be shaken with a solution of KOH and then mixed with a little sodium nitro prusside, when a reddish violet colouration is produced (Deniges, C R 108, 350) The alkyl sulphides do not give this reaction sulphides are present they should first be ppd by an alkaline solution of PbO

Reactions -1 The ammoniacal solutions of aromatic mercaptans oxidise in the air with formation of disulphides —2 When HCl is passed into a mixture of a ketone and a mer captan condensation takes place and a thicketate

or 'mercaptole' is formed, eg(CH₃)₂CO + 2HSEt = (CH₃)₂C(SEt)₂ + H₂O
(Baumann, B 18, 887) -3 The alkoyl deriva tives of aromatic o amido mercaptans readily split off H2O, forming anhydro compounds, e g $C_6H_4 < \frac{NH}{SH}COCH_7 = H_2O + C_6H_4 < \frac{N}{S}CCH_8$

These anhydro- compounds may even be formed by boiling the alkoyl derivatives of aromatic amines with sulphur They are also formed by the oxidation (by K,FeCy, of the thio alkoyl They are vola derivatives of aromatic amines tile liquids which exhibit feeble basic characters, and regenerate the amido mercaptans when fused with potash (Hofmann, B 13, 8, 1223, Jacob sen, B 19, 1069) When o amido mercaptans are diazotised they produce characteristic stable compounds of the form $C_6H_4 < N > N$

MERCAPTURIC ACIDS Acids obtained by placing chloro- or bromo benzene in food eaten by dogs V Bromo PHENYL and CHLORO PHENYL-MERCAPTURIO ACIDS

MERCURAMMONIUM COMPOUNDS monro mercury compounds Ammoniacal mercury bases Mercuramines) By the reactions of ammonia, or ammonium salts, on compounds of Hg, compounds are obtained, many of which may be represented by the empirical formulæ xHgX yNH_s and xHgX₂ yNH_s where X = acidic radicle, some of the compounds, however, contain N and H in the ratio N H2, and some are composed of N, Hg, and acidic radicles only The mercurammonium compounds, as a class, do not react as loose compounds of Hg salts with NH, but rather as compounds of Hg, N, H, and acidic radicles

The mercurammonium compounds were regarded by Kane as compounds of NH2Hg Thus, the compound HgO NH, was formulated as NH,Hg OH, and the compound HgSO, 2NH, as NH2Hg O SO,ONH, (A Ch [2] 72, 215) Hirzel (A 84, 258) represented the mercurammonium compounds as compounds of mercuric nitride, N₂Hg₃ Gerhardt suggested that these compounds are derived from NH₃ by replacing H by Hg, and after the ammonium hypothesis had been somewhat developed, Hofmann attempted to derive the compounds in question from different hypothetical mercurammoniums, ve compounds formed by replacing the H of NH, more or less completely by Hg (v Handwörterbuch der Chemic [2nd ed] 2, 751, cf Schmieder, J pr 75, 147, Nessler, J 1856 409) On this view, the compounds HgCl22NH2 and HgSO42NH2

are represented as Hg</r>
NH,Cl and

NH So. The mercurammonium compounds

may be divided, on this view, into classes ac cording to the hypothetical Hg derivative of am monium from which they are supposed to be derived Thus we have the following N2H6Hg = mercurammonium, N.H, Hg2 = mercurosammo nium, $N_2H_1Hg_2 = dimercurammonium$, $N_2H_1Hg_4$ = dimercurosammonium, the mercurammonium compounds are those containing divalent Hg, and the compounds of monovalent Hg are called mercurosammonium derivatives The compound 2HgO NH, obtained by the reaction of HgO with NH, Aq, is represented on the ammonium hypothesis as hydrated mercurammonium hy droxide, NHg,OH H,O

A division is sometimes made between those mercurammonium compounds which contain N and H in the ratio N H, and those which con tain these elements in the ratio N H2, the latter are called mercuramide compounds

Although some compounds readily give off NH, when heated, and others only when heated with alkali, yet it seems simpler to name all the compounds under consideration in accordance with the ammonium hypothesis In this article the mercurammonium compounds are divided into two classes, mercurous and mercuric, the former being called mercuro and the latter mercuri compounds, the name given to each com pound is intended to indicate the number of NH, groups from which the compound is derived, and the number of Hg atoms (mercuro- or mercuri) in the formula Several compounds are known whose reactions beem well expressed by supposing them to contain the group Hg O Hg, such compounds are called mercur oxy ammonium derivatives in this article

The following table presents the classifica tion and nomenclature adopted in the present article --

MERCUROUS COMPOUNDS

Series (1) Mercuro - ammonium com pounds , eg (NH,Hg)Cl.

(11) Dimercuro-ammonium compounds, eg (NH,Hg,)Cl

Class II MERCURIC COMPOUNDS

> Series (1) Mercuri - ammonium pounds, e g (NH₂Hg)Cl

(11) Dimercuri-ammonium compounds, eg (NHg₂)₂O

(111) Mercuri diammonium com pounds, eg (N_iH_iHg) I_i

(1V) Dimercuri - diammonium

compounds, eg
(N,H,Hg,)SO, HO
(v) Trimercuri - diammonium
compounds, eg $(N_2H_2Hg_3)SO_42H_2O$

Class III MERCUROXY AMMONIUM COMPOUNDE, e g (NH Hg₂O)OH, (NH₂Hg₂O)₂SO₄ Dimercuro ammonium chloride (NH₂Hg₂)Cl

18 sometimes called mercuro chloramide or amido mercurous chloride, to express this view of its constitution the formula is written Hg (NH₂)Cl So also mercuro ammonium chloride (NH, Hg)Cl is sometimes called ammo nio mercurous chloride, and the formula is written, empirically, HgCl NH₃, the for mula of this compound is frequently doubled, and the name mercurosammonium chloride-(N2H6Hg2)Cl2-18 given to it The salts called in this article mercuroxy ammonium compounds may be regarded as hydrated dimercuri ammo nsum salts, thus, the chloride (NH₂Hg₂O)Cl may be written (NHg)Cl H.O, and the car be bonate (NH2Hg.O)2CO3 may (NHg)2CO, 2H2O

Class I MERCUROUS COMPOUNDS NH,-xHgxX. The experiments of Barfoed (J pr [2] 39. 201) make it probable that the so called mer curo ammonium compounds are really mixtures of mercuri compounds and Hg B asserts that exactly half the Hg in the black pps formed by NH,Aq in solutions of mercurous salts exists uncombined, that nearly the whole of this Hg disappears as vapour when the pps are freely exposed to air, and that the light coloured com pounds remaining are the same as those pro duced by adding NH, Aq to mercuric salts the pp produced from HgNO, Barfoed gives the composition 3Hg + 2(HgNH, NO₃)HgO, that produced from Hg₂SO₄ is 4Hg + (NH₂Hg)₂SO₄ 2HgO, that from HgCl is Hg + NH₂HgCl, and that from Hg C₂O₄ is 4Hg + (NH₂Hg)₂C₂O₄ 2HgO

Series (1) Mercuro ammonium compounds: NH.HgX

Mercuro-ammonium chloride, (NH,Hg)Cl. (Ammonio mercurous chloride (HgCl NHs) Mer curos ammonium chloride (N2H6Hg2 Cl2)) black powder, obtained by saturating HgCl, pre pared by ppn, with NH, gas, on gently warming all NH, is given off (H. Rose, P. 20, 158) The dissociation of this compound has been studied by Isambert (C R 66, 1259, v Dissociation, vol ii p 397) According to Barfoed (J pr [2] 39, 201) the compound formulated as above is really a mixture of Hg, mercuri-ammonium chloride (NH2HgCl), and NH4Cl.

Series (11) Dimercuro-ammonium com-pounds, NH₂Hg₂X

Dimercuro ammonium chloride, (NH2Hg2)Cl (Mercurochloramide or amido-mercurous chloride (Hg,NH, Cl) Tetramercuro - diammonium chloride (N,H,Hg, Cl₂)) A black solid, obtained by digesting HgCl with NH,Aq (2HgCl + 2NH,Aq = NH,Hg₂Cl + NH,ClAq) Becomes dark grey when dried, heated, gives off NH, and N, and at a higher temperature yields a sublimate of HgCl and Hg, treated with HCl gas, gives HgCl and NH,Cl (Kane, A Ch [2] 72, 215, Ullgren, P 42, 395) According to Barfoed (J pr [2] 39, 201) the black solid obtained as described is a mixture of Hg and NH2HgCl

Mercuro ammonium nitrates Various com pounds of the form xHg₂O yN₂O₃ zNH₃ have been described by Kane (lc) and Mitscherlich (P9,387, 16, 41), but Barfoed's experiments make it very probable that these bodies are mixtures of Hg and mercuri ammonium salts (v supra)

Class II. MERCURIC COMPOUNDS N.H. H. W. Hgy X.

Series (1) Mercuri ammonium compounds, NH₂HgX Obtained by interaction of excess of NHaAq with mercuric salts in solution

Mercuri-ammonium chloride, (NH2Hg)Cl (Mercuri-chloramide, or amido mercuric chloride (Hg NH₂ Cl) Dimercuri diammonium chloride (N₂H₄Hg₂ Cl₂) Infusible white precipitate) Ac cording to Rammelsberg (J pr [2] 38, 558) this salt is a double compound of dimercuri ammo nium chloride-NHg,Cl-and NH,Cl, R assigns to it the formula NHg₂Cl NH₄Cl (v infra)

When excess of NH3Aq is added to HgCl2Aq, or when HgCl2Aq is dropped into NH3Aq, a white pp is obtained, this pp was long considered identical with that obtained by adding Na, CO, Aq to HgCl₂Aq mixed with NH₄ClAq, and known in pharmacy as Mercurius precipitatus albus Wohler (P 26, 203) found that the pp formed by NH3Aq was volatilised without fusion when heated in a Pt dish, but that the pp formed by Na₂CO₃Aq melted before it volatilised by NH, Aq was then called infusible white precipitate, and to that produced by Na, CO, Aq the

name fusible white precipitate was given
Preparation —HgCl₂Aq is added to excess of cold NH, Aq, the pp is collected at once, rapidly washed with a little cold water, and dried at 110° (André, C R 108, 233, 290) André (lc) has examined the compounds obtained by the interaction of NH, Aq with HgCl2Aq, varying the relative masses of the reacting bodies and the time of contact Using equal volumes of HgCl2Aq, containing 33 875 g HgCl₂ per litre, and NH₂Aq containing 4 25 g NH₃ per litre, the pp after drying at 110° was not quite pure NH₂HgCl, but contained a little mercuroxy ammonium chloride (NH₂ Hg₂O)Cl The quantity of (NH₂ Hg₂O)Cl increased by allowing the reacting bodies to remain in contact, and also by increasing the quantity of NH, Aq, when the NH, and HgCl2 were present in the ratio 6NH, HgCl2, the pp contained equal molecular proportions of NH2HgCl and (NH₂ Hg₂O)Cl, and by further increasing the NH₃, only (NH₂ Hg₂O)Cl was obtained André found that NH₄Cl tends to change (NH₂ Hg₂O)Cl into NH. HgCl, by adding 1 vol HgCl, Aq to 5 vols NH, Aq (strength as given above), decanting after 24 hours, and agitating the pp for 2 days with 2 vols NH₄ClAq (containing 13 4 g.

per litre), pure NH2HgCl was obtained André has also examined the pps obtained by adding NH₂Aq, and also NH₄ClAq, to HgCl₂Aq in presence of KOH (C R 108, 1108, 1164) The pps are compounds of NH₂HgCl, NHg₂Cl, and (NH₂ Hg₂O)Cl in varying proportions

Properties -A white solid, which volatilises completely, when strongly heated, without melt-Readily sol in HClAq, not blackened by NH3Aq, dissolved by acids, also by hot solutions

of NH, salts

Reactions -1 When heated, in an open vessel, does not melt but yields a sublimate of HgCl and a mixture of 1 vol N and 2 vols NH, $(6NH_2HgCl = 6HgCl + 4NH_3 + N_2$, Kane, A Ch [2] 72, 215)When slowly heated in a retort to o 340°, HgCl, and NH_s are given off, and a red crystalline compound, 2NHg,Cl HgCl,, re mains —2 Decomposed by water, slowly by cold, more rapidly by hot, eventually with formation of yellow mercuroxy ammonium chloride, $(NH_2 Hg_2O)Cl$, and NH_4Cl $(2NH_2HgCl + H_2O + Aq$ $= (NH_2 Hg_2 O)Cl + NH_1 ClAq) -3$ Potash or soda separates (NH₂ Hg₂O)Cl and evolves NH₃ Only half the N of the original NH2HgCl is evolved as NH, (Kane, lc), but by boiling for some days with KOHAq, renewed from time to time, all the N is removed as NH_3 , and HgO remains (Schmieder, J pr 75, 147) The fact that only half the N is readily evolved as NH₃, by the action of alkalis on NH₂HgCl, has induced Rammelsberg (J pr [2] 38,558) to regard this body as a compound of dimercuri ammonium chlor ide and NH,Cl, and to give it the formula NHg,Cl NH,Cl But it is to be remembered, as pointed out by Kane, that water readily separates NH₂HgCl into (NH₂ Hg₂O)Cl and NH₄Cl. hence the NH, obtained by the action of aqueous alkalı is probably due to the direct decomposi tion of NH Cl by the alkali—4 Boiled with very dilute sulphuric acid till dissolved, the compound HgCl 2NH Cl 2HgSO, forms on cooling (Kosman, A Ch [3] 27, 238) -5Heated in dry hydrogen chloride, HgCl, and NH,Cl are produced (Ullgren, A 26, 203)— 6 Heated with solutions of sodium chloride potassium vodide, barium sulphide, &c, NH3 14 evolved and HgCl₂, HgI₂, HgS, &c, formed, eg NH, HgCl + 2KIAq + H,O

= HgI₂ + KClAq + KOHAq + NH, (Kane, lc, Rammelsberg, P 48, 182) —7 Boiled with am monium chloride solution, mercuri diammonium chloride N.H. Hg Cl. (fusible white precipitate) is produced -8 Decomposed by heating with sulphur, with formation of a yellow sublimate of a chlorosulphide of N —9 Rubbed with soding and a little alcohol, HgI2 is formed and then an explosion occurs, probably from production and decomposition of N iodide (Rice, Ph [3] 6, 765, of Schwarzenbach, B 8, 1231, Flückiger, B 8, 619) -- 10 Bromine and chlorine cause evolution of N and formation of HgBr2 or HgCl2 (Schwarzenbach, B 8, 1231) -11 Decomposed by alcoholic iodides, e g EtI (v Sonnenschein, A 101, 20) -12 For reactin with amylic mercaptan

Wagner, J pr 53, 378

Combinations —1 Forms various compounds with NHg,Cl and (NH, Hg,O)Cl; obtained by adding NH,Aq or NH,ClAq to solutions of HgCl2Aq containing KOH (André, C R 108, 1108, 1164) -2 Combines with HgCl. to form NH, HgCl HgCl2; produced by slowly heating to

o 340° in a retort (Millon, A Ch [3] 18, 392)

Mercuri-ammonium bromide, (NH, Hg)Br
(Mercuri bromamide, or amido-mercuric bromide (Hg NH₂ Br) Dimercuri diammonium bromide (N2H4Hg2 Br2)) A yellow powder, obtained by ppg HgBr,Aq with excess of,NH,Aq (cf Mercuri ammonium chloride, supra) Insol water or alcohol, slowly changed by cold water, more quickly by hot water, to NHg2Br (Pesci, G 19, 509) E sol NH, Aq Heated gives N, NH, and HgBr, when very slowly heated to c 340° gives NH₃, HgBr₂NH₃, and NHg₂Br HgBr₂ (Mitscherlich, *J pr* 19, 455)

Series (11) pounds, NHg₂ X Dimercuri ammonium compounds, NHg₂X According to Pesci (G 19, 509) many and probably all the dimercuri ammonium salts, when digested with NH,Cl, NH,Br, or NH₄I solution, evolve NH₃ in the proportion of 4NH₃ for each NHg₂ group in the dimercuriammonium salt This reaction may be applied to estimate dimercuri ammonium salts, by conducting the digestion in a closed vessel containing a dish with a measured quantity of normal oxalic acid

Dimercuri-ammonium hydroxide, NHg OH (Mercurammonium hydroxide) Prepared by saturating yellow HgO with NH₃ under increased pressure, finely powdering, and again saturating with NH3, or by shaking HgO with alcoholic NH₃ for some hours and drying at ordinary temp in NH3 gas, the product, which is NHg₂OH H₂O, is then heated in dry NH, to 80°-85° The operation should be conducted in the dark (Weyl, P 121, 601, 131, 539) A brown powder, explodes when strongly heated, decomposed by water, with evolution of NH3, absorbs CO, from air, evolving NH3 at the same time, dissolves in warm HClAq or HNO,Aq with formation of salts of Hg and NH,

Heated to 100° in absence of air, gives dimercuri ammonium oxide (NHg)20 dark brown powder which explodes when heated, struck, or rubbed in a mortar, readily combines with water to form NHg₂OH H₂O, soluble in HClAq and HNO₃Aq, reacts with HCl gas to foim HgCl₂ and NH₄Cl. This oxide is also formed by the action of liquid NH, on HgO

hydrate of dimercuri-ammonium hydroxide NHg₂OH H₂O, 18 a yellow powder, obtained as described above appears to be isomeric with mercuroxy ammonium hydroxide (NH₂ Hg₂O)OH (p 211)

Dimercuri - ammonium chloride, NHg, Cl (Mercurammonium chloride) Obtained by treat ing the hydroxide (v supra) with alcoholic solution of HCl, also by treating the oxychloride formed by fusing together HgO and HgCl, in the ratio 3HgO HgCl₂, with liquid NH₃, and removing excess of NH₃ by warming in a stream of dry air at 150° Forms a yellow powder, de composed suddenly at 300° to HgCl, Hg, and N (Weyl, P 121, 601, 131, 529). Not acted on by boiling water, decomposed by hot KOHAq with production of NH, and HgO; slowly dissolved by cold HClAq

Forms a double compound with mer-curic chloride 2NHg. Cl. HgCl. (dimercurs-ammonium-mercurs chloride). A red crystalline solid, resembling HgO, produced by very slowly Vol. III

heating mercuri ammonium chloride, NH, Hg Cl, in a retort until HgCl begins to sublime compound reacts with hot HClAq to form NH,Cl and HgCl₂, it is said to be unchanged by conc HNO,Aq, dilute H₂SO,Aq, H₂O, or boiling alkali solutions (Mitscherlich, *J pr* 19, 453) Heated to 360° it separates into N, HgCl, and Hg

Dimercuri - ammonium bromide, NHg.Br (Mercurammonium bromide) Obtained by ppg HgBr,Aq by excess of NH, Aq and digesting the pp (NH,HgBr) with water, better, by adding excess of NH, carbonate to HgBr,Aq, washing the pp of 4NHg2Br 5NH4Br with NH4 carbonate, warming with KOHAq, and washing with cold water (Pesci, G 19, 509) Also obtained, according to Pesci, by the action of dilute HBrAq on Millon's base (NH₂Hg₂O)OH A yellow powder, insol water, sol HClAq, insol HNO,Aq, decomposed by heat, without melting, yielding NH3 and a sublimate which contains Hg (Pesci, Digested for a short time with boiling NH, BrAq, and filtered, small crystals of NHg, Br 3NH, Br are obtained This compound seems similar to fusible white precipitate, it is described on p 210 as mercuri diam monium bromide. The double compound 4NHg, Br 5NH, Br is obtained, in clear microscopic needles, by adding excess of NH, car bonate to HgBr₂Aq (Pesci, lc)

Dimercuri ammonium iodide, NHg2I, is ob tained by the action of liquid NH, on the oxy iodide formed by fusing together HgO and HgI_2 in the ratio $3HgO HgI_2$ (Weyl, P 121,601, 131, 539)

Dimercuri ammonium selenate,

(NHg₂)₂SeO₄ 2H₂O A white pp which darkens in light and is decomposed by heat; obtained by dissolving the basic selenate HgSeO, 2HgO in cone NH, Aq, and ppg by much water (Cameron a Davy, C N 44, 63)

Series (111)
pounds, N.H. HgX. Mercuri diammonium com

Mercuri-diammonium chloride, N2H6Hg Cl2 (Mercurammonium chloride Fusible white Ammonio mercuric chloride. precipitate $HgCl_2 2NH_1$) Rammelsberg (J pr [2] 38, 558) regards this salt as a double compound of di chloride-NHg2Cl-and mercuri ammonium chloride—NHg₂Cl—and NH₄Cl He formulates it as NHg₄Cl 3NH₄Cl (v infra)

When an alkalı carbonate is added to HgCl₂Aq containing NH₄Cl, a white pp is ob tained, this pp was called in pharmacy mercurius precipitatus albus, and for long was supposed to be the same as that formed by adding NH,Aq to HgCl2Aq Wöhler (P 26, 203) found that the pp formed by alkalı carbonate, in presence of sal ammoniac, melted when heated, before volatilising, but that the pp formed by ammonia volatilised without melting former pp was then called fusible white precipitate, to distinguish it from the latter to which the name infusible white precipitate was given

The researches of Krug (Ar Ph 42, 1) have shown that pure mercuri diammonium chloride cannot be obtained by addition of alkali car bonate to HgCl_Aq containing NH_Cl at the ordinary temperature, the pp consists of a mix-ture of mercuri ammonium chloride (infusible white precipitate, NH.Hg Cl) and mercuri-diammonium chloride (fusible white precipitate, N2H2H2 Cl2), the longer the pp remains in contact with the supernatant liquor, and the higher the temperature, the greater is the amount of fusible white precipitate formed Krug found that almost pure NH, HgCl (infusible white precipitate) was obtained by adding Na₂CO₃Aq to HgCl₂Aq mixed with NH₂Cl at 0°, and filtering at once (about 4Na₂CO₃HgCl₂9NH₂Cl) The first pp formed by the alkalı carbonate therefore probably always consists mostly of mercuri ammonium chloride, NH2Hg Cl, but this is acted on by the NH₄Cl present, and thus more or less N₂H₆Hg Cl₂ is produced, CO₂ is also given off from the alkali carbonate used, and this CO₂, according to Krug's experiments, seems to change some of the NH2HgCl to HgCl, xHgO (with simultaneous formation of NH₄Cl and NH₄HCO₂), which oxychloride then probably reacts with

NH₄Cl to produce N₂H₆Hg Cl₂
Preparation —HgCl₂Aq is dropped into boiling NH ClAq containing NH3, as long as the pp which forms is redissolved, and the liquid is allowed to cool The compound crystallises out ın garnet red dodecahedra Melts at c 300°

with decomposition

Properties and Reactions - Small red dodecahedra, also formed by ppn with Na₂CO, as a white powder Gently heated, gives off half its NH_s , leaving $HgCl_1NH_s$ (v infra), melts at c 300°, evolving N and NH_s and yielding a sublimate which reacts with water to form NH₄Cl, HgCl₂, and HgCl Boilingreacts to form mercuroxy ammonium chloride, (NH₂ Hg₄O)Cl, and NH₄Cl Alkalis evolve NH₃ According to Rammelsberg (J pr [2] 38, 558) three fourths of the N of mercuri diammonium chloride is evolved by the action of hot alkali solution, hence R assigns to this compound the formula NHg,Cl 3NH,Cl, but as the action of boiling water on N2H6Hg Cl2 is to produce (NH₂Hg₂O)Cl and NH₄Cl in the (NH, Hg,O)Cl 3NH,Cl, it is easy to account for the action of boiling alkali without suppos ing fusible white precipitate to be a double compound of NHg₂Cl with NH₄Cl Iodine reacts energetically, according to Fluckiger (B 8, 1619) the reaction is expressed thus $6(N_2H_6Hg Cl_2) + 2I_2$ $= N_2 + 6NH_4Cl + 4NH_3 + 2HgCl_2 + 2HgI_2 + 2HgCl$ Liquid ammonia dissolves N2H2HgCl2, after prolonged action, and evaporation of the excess of NH2, a white crystalline mass remains which has the same composition as the original, ac-

cording to Weyl (P 1, 547)

Combination — The compound HgCl₂ NH₂

may be regarded as a compound of N,H₄Hg Cl₂ with HgCl₂ [N₂H₆Hg Cl₂ HgCl₂ = 2(HgCl₂ NH₃)] This compound is formed by heating HgCl, in dry NH, or by distilling HgO with NH,Cl, it melts when heated and distils without much change, it is decomposed by water, forming NH, Hg Cl and HgCl, NH, Cl (Kane, A Ch [2]

72, 215)

Mercuri-diammonium bromide, N2H4Hg Br2 Small microscopic, rhombohedral, transparent crystals, obtained by adding excess of NH, carbonate to HgBr,Aq, boiling the 4NHg2Br 5NH4Br for a short time with NH4BrAq, filtering, and allowing to cool (Pesci, G 19, 509) Also formed by treating dimercuri ammonium bromide (NHg.Br) with boiling NH.BrAq, by

the action of NH, Aq on solution HgBr, NH, Br; also by adding alcoholic NH, to HgBr, dissolved in alcohol (P, lc) Melts at c 180° with evolution of NH, more strongly heated, yields two distinct sublimates Easily sol HClAq, H_SO,Aq forms HgBr2, alkalıs produce NHg,Br (P, lc) Forms a compound with HgBr. N₂H₈Hg Br₂ HgBr₂(=HgBr₂ NH₃) similar V1Z to the chloro compound already described (H Rose, P 20, 160)

Mercuri-diammonium sulphate,

N₂H₆H_g SO₄ H₂O Lustrous, orthorhombic, crystals Obtained by adding, little by little, yellow HgO to pure, saturated, cold (NH₄), SO₄Aq, each portion of HgO being allowed to dissolve before another portion is added, the liquid being kept cold, addition of HgO is continued till the liquid begins to grow turbid, the clear liquid is decanted and allowed to evaporate in the air or in vacuo This compound is decomposed by the smallest quantity of water with production of a compound of mercuroxy ammonium sulphate and mercuri ammonium sulphate,

$3(NH_2Hg_2O)_2SO_4(NH_2Hg)_2SO_4$

boiling water removes more H2SO4, finally form ing (NH, Hg,0),SO₄ (v Mercuroxy ammonum sulphate, p 211, cf Millon, A Ch [3] 18, 410, Schmieder, J pr 75, 147) It is e sol in (NH4)2SO4Aq, NH4ClAq, HClAq, dilute H2SO4Aq, and HNO, Aq, insol conc HNO, Aq with cone H2SO4 it gives (NH4)2SO4 and HgSO4, decomposed by KOHAq, forming a basic compound, with boiling cone KOHAq, NH, is evolved and HgO formed Heated to 115° water is evolved, and at a higher temperature complete decomposition results

Mercuri-diammonium iodide N₂H₆Hg I₂, Mercuri diammonium fluor ide N₂H₆Hg F₂, and the double compound N₂H₆Hg I₂ HgI₂, have been described (v. H. Rose, P 20, 160, Nessler, C C 1856 530, Finkener, P 110, 147, Rammelsberg, P 48, 170, Caillot a Carriol, J. Ph 9, 381)

Series (1V) Dimercuri diammonium compounds , $N_2H_4Hg_2X_2$

Dimercuri-diammonium sulphate, $N_2H_4Hg_2SO_4H_2O$ (= $SO_22HgO2NH_2$) Obtained, according to Millon (A Ch [3] 18, 410), by saturating 70 c c cold cone NH_2Aq with $HgSO_4$. allowing to stand in an atmosphere of NH₃ over CaO for some months, powdering the crystals which separate, and drying over CaO

Series (v) Trimercuri diammonium com pounds, $N_2H_2Hg_3X_2$

Trimercuri diammonium sulphate $N_2H_2Hg_3SO_42H_2O$ (= $SO_38HgO2NH_2$) pared similarly to preceding salt, but using 90 c o NH, Aq (Millon, lc)

Class III MERCUROXY AMMONIUM COMPOUNDS

(NH₂ Hg₂O)X.

The name mercuroxy- is here given to the group Hg₂O, which s supposed to act as a dyad The salts of this radicle in these compounds series may be regarded as hydrated tetramercuridiammonium compounds, thus the carbonate (NH₂·Hg₂O)₂CO₂ may be written N₂Hg₄ CO₂ 2H₂O, and the chloride (NH₂ Hg₂O)Cl may be written N.Hg, Cl, 2H,O Some of the salts of this series may also be regarded as hydrated dimerouriammonium compounds, thus the chloride (NH₂ Hg₂O)Cl loses water at 200°, and is there fore regarded by Rammelsberg as NHg₂Cl H₂O

Mercuroxy-ammonium hydroxide,

(NH₂ Hg₂O)OH (Millon's base) This is the final product of the reaction of NH, Aq on HgO, the hydroxide contains H₂O Millon gave the formula NH₂ Hg₂O OH H₂O, Gerresheim, the formula 2(NH₂ Hg₂O OH) H₂O (A 195, 373), and Rammelsberg, more recently (J pr [2] 38, 558), assigns the composition 3(NH₂ Hg₂O OH) 2H₂O The empirical formula for the base is 2HgO NH₂xH₂O

Preparation —Yellow HgO is agitated with NH₃Aq, quite free from carbonate, so long as any change occurs, if red HgO is used the change is not completed for some days. The yellow brown product is washed with cold water, crystallised from hot water, and dried (Millon,

A Ch [3] 18, 392)

Properties — Yellow, microscopic crystals, probably rhombic Appears to be isomeric with hydrated dimercuri ammonium hydroxide NHg,0H H,O (p. 209) Insol alcohol or ether, somewhat sol water S 007 at 17°, 06 at 80° Acts as a very strong base, decomposes NH, salts energetically with evolution of NH,, and rapidly combines with CO₂ when exposed to air Several salts may be obtained by dissolving the base in excess of acetic acid, and ppg by alkali permanganate, chromate, &c Over H,SO₄ loses H₂O and becomes brown, heated to 130° further loses ½H₂O, leaving mercuroxy ammonium oxide (NH, H₂O).0

oxide (NH₂ Hg₂O),O

Reactions—1 The hydrated base is very slowly decomposed by boiling alkali solution, the dehydrated base is only decomposed by molten alkali—2 Decomposes ammonium salts rapidly, with evolution of NH₃—3 Combines so rapidly with carbon dioxide that it is almost impossible to obtain the base quite free from carbonate—4 With acids forms salts (NH₂ Hg₂O)X (X = NO₃, ¹SO₃, &o) (v Rammels berg, J pr [2] 38, 558)—5 Decomposed by heat with more or less explosion (Millon, lc, c, fHirzel, J 1852 419, 1853 381)—6 Many salts, e g sulphates and chlorides, are decomposed by shaking with Millon's base, with complete re moval of the acid of the salt used (v Gerres heim, A 195, 373)—7 Heated with ethylic iodide to 100° yields crystals of 2NEt,I 3HgL, ethylic bromide reacts similarly—8 A thic carbonate of the base is obtained by heating with carbon dissulphide (Gerresheim, Ic)

Mercuroxy ammonium chloride,

mercurvy ammonium chloride, (NH₂ Hg₂O)Cl (Hydrated tetramercurammonium chloride N₂Hg₂Cl₂ 2H₂O Hydrated dimercuri ammonium chloride NHg₂Cl H₂O) This compound is formed by the reaction of boiling water with either fusible white pp N₂H₆Hg Cl₂ or infusible white pp NH₂Hg Cl It is also produced by passing dry NH₂ over the oxychloride SHgO HgCl₂ at 150° (Uligren, P 42, 395) A heavy, yellow powder, v s' sol water, e sol HClAq and HNO₂Aq (Kane, P 42, 367) Decomposed by heat, giving NH₃, N, H₂O, HgCl, and Hg Decomposed by excess of solutions of KCl, NaCl, and KI, with evolution of NH₃ Loses water at 200°, and is therefore regarded by Rammelsberg as NHg₂Cl.H₂O (J. pr. [2] 88, 559).

Mercuroxy-ammonium chloride combines with NH₂HgCl and NH₂Cl to form various double compounds, eg $3(NH_2Hg_2O)Cl NH_2HgCl$

3(NH, Hg,O)Cl NH,HgCl and (NH Hg,O)Cl NHg Cl,

these compounds were obtained by André by ppg HgCl₂Aq with NH₃Aq, some of them requiring the presence of KOH for their production (O R 108, 233, 290, 1108, 1164)

Mercuroxy ammonium iodide, (NH, Hg,O)I. (Hydrated tetramercurammonium iodide N,2Hg, I, 2H,O Hydrated dimercura ammonium iodide NHg,I L, 2H,O Hydrated dimercura ammonium iodide NHg,I H,O) This compound is formed by adding NH,3Aq to Nessler's reagent (alkaline solution of HgI, in KIAq), the composition of the pp thus produced is often represented as Hg NH, I+HgO, or as Hg NHg I+HO The compound is best prepared by dissolving HgI, 2KI in KOHAq, adding NH,Aq, washing thoroughly with cold water, and drying at 100°

 $\begin{array}{c} (2K,HgI_4Aq+3KOHAq+NH,Aq\\ = (NH_2Hg_0)I+7kIAq+2HO,\\ v \ \ Rammelsberg,\ P\ 48,\ 170) \ \ (NH\ Hg_2O)I\ is\\ also formed by heating 3HgO\ HgI_1\ to\ 180^\circ\ in\\ NH_1\ (Rammelsberg),\ and\ by\ boiling\ HgI_2\ with\\ excess of cono\ NH_3Aq \end{array}$

Mercuroxy ammonium iodide is a brown powder with a puiple red tint. Begins to give off water at 128°, heated more highly, out of contact with air, it melts to a dark brown liquid, and then decomposes violently, giving HO, Hg, HgI., NH, and N Sol warm KIAq, with formation of K HgI. and KOH and evolution of NH, Sol warm HClAq, HgI. and HgICl are deposited on cooling (R immelsbeig). Decomposed by hot BaSAq, with evolution of all N as NH, Heated in HCl gas, gives a sublimate of HgCl., NH,Cl, NH,I, and (NH,) HgI.

Mercuroxy ammonium nitrates Several nitrates, and some double nitrates, of the mer curoxy ammonium compounds seem to exist

The salt often called Souberran's ammo natcal salt is probably the normal nitrate (NH, Hg O)NO, (Souberran, J Ph 12, 465) This compound is obtained by ppg dilute Hg(NO₄), Aq, containing only a little free acid, with very dilute NH, Aq, boiling with water till the pp becomes compact and curdy, washing, and drying

The loose flocculent pp produced by adding very dilute NH,Aq to dilute Hg(NO₃).Aq, sometimes known as Mischerlich's ammoniacal salt, is probably a double compound of mercuroxy ammonium nitrate and mercuri ammonium nitrate.

and mercuri ammonium ni (NH₂ Hg₂O)NO₃ (NH Hg)NO₄ H₂O

Other compounds are obtained by boiling Mitscherhich's salt with excess of NH₂Aq with addition of NH₂NO₂Aq, and by dissolving Souberran's salt in hot cone NH₂NO₂Aq, the salts thus formed are probably double compounds of mercuroxy ammonium nitrate and ammonium nitrate, but their exact composition and constitution are not yet decided (v Mitscherhich, P 9, 387, 16, 41, Millon, A Ch. [3] 18, 392, Kane, A Ch [2] 72, 215, Nessler, J 1856 409)

Merouroxy-ammonium sulphate, (NH₂ Hg₂O)₃SO₄ (Hydrated tetramercuram-monum sulphate, N₂Hg₄SO₄ 2H₂O₅ Hydrated domercuri-ammonium sulphate,

(NHg.)₈SO₄ 2H₂O Ammoniacal turpethum) Obtained by saturating cone NH₂Aq with HgSO₄, also by digesting the basic sulphate HgSO₄. HgO (mineral turpethum) with NH₂Aq, also by digesting HgO with hot (NH₂)₂SO₄Aq (Millon, A Ch [3] 18, 392, Ullgren, P 42, 395, Hirzel, J 1852 419, 1853 381) Schmieder (J pr 75, 147) obtained the salt by repeatedly treating mercuri-diammonium sulphate, N₂H₂HgSO₃ HO (v p 210), with boiling water, till the filtrate was free from sulphates Forms a heavy yellow white powder, sl sol water, easily sol HClAq or HNO₂Aq Decomposed by heat to H₂O, N, NH₃, and Hg₃SO₄ Treated with KOHAq, gives NH₂ and a basic salt (NH₂Hg₂O)₂SO₄HgO (perhaps NH₂Hg₂O NH₂Hg₃O SO₄), and on further treatment with KOHAq yields NH₃, HgO, and K₂SO₄

Besides the mercuroxy ammonium salts de scribed above, the following have been pre

Mercuroxy ammonium bromate (NH₂Hg₂O)BrO₂ (Rammelsberg, P 55, 82)

Mercuroxy ammonium carbonate (NH₂ Hg₂0),CO₃ (Millon, A Ch [3] 18, 392, Hirzel, J 1852 419, 1853 381)

Mercuroxy ammonium chromate (NH₂ Hg₂O)₂CrO₄, and a double basic salt (NH₂ Hg₂O)₂CrO₄ 3HgCrO₄ HgO (Hirzel, lc)

Acid mercuroxy ammonium fluoride (NH₂ Hg₂O)F HF (Finkener, P 110, 632)

Mercuroxy ammonium - ammonium sodate (NH₂Hg₂O)IO₃ 2NH₄IO₃ (Millon, A Ch [3] 18, 410)

Mercuroxy ammonium - mercuric phosphate (NH₂ Hg₂O) Hg PO₄ (Hirzel, J 1852 419, 1853 381)

Mercuroxy - ammonium - mercuric sulphite (NH₂ Hg₂O)₂SO₃ HgSO₃ (Hirzel, lc) M M P M

MERCURIALINE The volatile base ob tained by distilling the seeds of Mercurialiss annua or M perennis with lime and water, and formerly called 'mercurialine,' is identical with methylamine (E Schmidt, B 10, 2226, A 193, 73. cf Reichardt, J. rr. 104, 301)

73. cf Reichardt, J pr 104, 301

Occurrence—Small quantities of Hg are found as globules disseminated through ores of Hg, or in the rocks in which these ores occur. The chief ore of Hg is cinnabar, HgS, found in limited quantities in Illyria, Spain, Bohemia, Peru, China, California, the Ural, and one or two other localities. An amelgam of Hg and Ag is sometimes found native, iodide, chloride, and minute quantities of selenide, of Hg are also known to occur.

Preparation—1 By distilling cinnabar in a regulated supply of air, condensing the Hg in a suitable apparatus, and allowing the SO₂ to escape—2 By heating cinnabar with lime, CaS and CaSO₄ are formed, and the Hg distils and is condensed—8 By heating cinnabar with iron (smithy scales), Hg, FeS, and SO₂ are produced, the Hg is condensed in long chambers, or by downward distillation in a trough filled with

water To purify Hg from dust, &c, it may be filtered through a paper cone having a minute hole at the apex, or pressed through leather Traces of metals in solution may be removed by leaving the Hg in contact with cold conc H.SO for some weeks, with frequent agitation, and then digesting with very dilute HNO,Aq, or with HgNO₃Aq (Branchi, R P 6, 77, Wittstein, R P 65, 362) Karsten and Ulex (A 60, 210) re commend to rub the Hg in a basin for ten minutes, with 1 60th of its weight of FeCl, Aq, S G 148 diluted with an equal weight of water. to pour off the liquid, which contains the foreign metals and some HgCl₂, to wash with water, and then to dry the Hg by heating it L Meyer (B 12, 437) has described a convenient apparatus for purifying Hg by bringing a fine stream of it into contact with FeCl, Aq Bruhl (B 12, 204) shakes Hg with an equal volume of chromate solution, made by dissolving 5 grams K,Cr,O, in 1 litre water, and adding a few c c of H,SO, the shaking is continued until the red HgCrO at first produced has disappeared, and the liquid is coloured green by $\operatorname{Cr}_2(\operatorname{SO}_4)_2$, the fine greyish powder which is formed, and which consists of oxides of foreign metals, is washed away by a rapid stream of water The process is repeated. and the Hg is then shaken with pure water until no more greyish powder is formed About half pe of Hg is lost Crafts (Bl [2] 49, 856) removes Pb, Zn, Sn, and most other metallic impurities from Hg by placing the Hg in a slightly inclined glass tube, and aspirating a gentle current of air through the apparatus for about forty eight hours. The oxides of the foreign metals collect at the top Ag cannot be be removed by this method

Pure Hg may be obtained by distilling equal parts of cinnabar and burnt lime or Fe filings. Also by boiling pure HgCl.Aq with pure Fe.

Also by heating HgO in a retort, and digesting the residual Hg, which contains a little HgO, with dilute HNO₂Aq or H₂SO₄ Millon (B J 27, 110) prepares HgO (from which to make Hg) by shaking Hg for some time with dilute HNO, Aq to remove foreign metals, washing, dissolving in such a quantity of HNO, Aq that 1 10th of the Hg remains undissolved, evaporating to dryness, and heating

After purifying Hg by one of the foregoing methods it is advisable to distil it A very con venient apparatus for distilling Hg under reduced pressure is described by Wright (Am S [3] 22, 479, v also Weber, Carl Rep 15, 52, Weinhold, Carl Rep 15, 1)

Properties -A very lustrous metal, white, with the slightest tinge of blue Exists as a very mobile liquid at ordinary temperatures, and does not solidify above - 38 5° Hg boils at c 360°, but it is very easy volatilised, even at -13° sufficient Hg is vaporised to produce a daguerrectype by twenty four hours' exposure (Regnault, \hat{C} R 73, 1462) According to Merget (C R 73, 1386) solid Hg at -44° is very slowly Solid Hg is a tin-white, ductile mass of octahedral and needle shaped crystals It may be cut with a knife Hg is a very coherent liquid By trituration with sugar, grease, sulphur, chalk, &c, or by agitation with ether, turpentine, and some other liquids, Hg ap pears as a grey powder, which consists of minute globules of Hg separated by the foreign matter present (extinction or deadening of mer Finely divided Hg is also obtained by mixing about equal parts of SnCl2, dissolved in HClAq, and HgCl2 dissolved in hot water $(\operatorname{SnCl}_2\operatorname{Aq} + \operatorname{HgCl}_2\operatorname{Aq} = \operatorname{SnCl}_4\operatorname{Aq} + \operatorname{Hg})$ In this state of fine division, Hg is slowly oxidised by contact with air Pure Hg adheres very slightly to glass When foreign metals are present the Hg leaves a blackish film on glass A globule of pure Hg should roll down a slightly inclined surface without losing its round form, and with out leaving any streak behind it When shaken in a bottle with dry air it should not form any black powder

Pure Hg is not oxidised by exposure to air at ordinary temperatures, when heated to near its BP, HgO is slowly formed [Berthelot (C R 91, 871) asserts that pure Hg is very slightly Hg obtained in a state of fine oxidised in air] division by trituration, eg with chalk, is slowly oxidised at the ordinary temperature. Ozone oxidises Hg at ordinary temperatures (Volta, G 9, 521, cf Reactions, No 2) Hg combines directly with O, S, and the halogens, it alloys with most of the metals, in some cases forming definite compounds (v Mercury, amalgams of) Hg reacts with hot cone H.SO, to produce HgSO, and SO₂, with HNO, Aq it produces HgNO, Hg(NO₃)₂, or a basic nitrate, according to the temperature and the quantity of acid does not react with Hg

The atomic weight of Hg has been determined (1) by analysing HgO (Sefström, S 22, 328, Turner, A 13, 18, Erdmann a Marchand, J pr 31, 895), (2) by determining Cl in HgCl and HgCl₂ (Turner, Ic, Svanberg, J pr 45, 468, Millon, A Ch [3] 18, 345), (3) by estimating Hg in HgS (Erdmann a Marchand, J. pr 81, 400), (4) by determining S H of Hg.

Hg is distinctly a metallic element. It forms salts by replacing the H of most acids These salts belong to two series, HgX and HgX_2 , where $X = NO_2$, ClO_2 , $\frac{1}{2}SO_4$, $\frac{1}{2}PO_4$, &c Both series are well represented by definite and stable salts HgO dissolves in molten KOH, and crystals of K₂O HgO are obtained on cooling pound Na₂O HgO is said also to exist HgS dissolves in NaHSAq and cone KHSAq The com pound K2S HgS 5H2O has been isolated The existence of these compounds shows that HgO and HgS are slightly acidic towards K.O and KHS

The molecular weight of Hg has been directly determined, the molecule is monatomic atom of Hg is divalent in the gaseous molecules HgCl₂, HgBr₂, and HgI₂ The molecular formula of calomel 1s probably HgCl, if this 1s so, the atom of Hg is monovalent in this molecule

Hg is related to Mg and Zn, and more dis tantly to Be, Ca, Sr, and Ba (v MAGNESIUM GROUP OF ELEMENTS, p 165, and of CLASSIFICA-TION, vol 11 pp 204, 207)

Reactions—1 Heated in air or oxygen, to

near its BP, Hg slowly forms HgO -2 Ozone produces some Hg₂O at ordinary temperatures, perfectly dry ozone does not react with dry Hg (Shenstone a Cundall, C J 51, 619) —3 Hg is oxidised by agitation with solution of potassium permanganate, Hg2O is formed if the solution is cold, and HgO if hot (Kirchmann, Ar Ph [2] 150, 203) -4 Hg does not react with hydro chloric acid -5 Sulphuric acid, when hot and cone, forms HgSO4, or Hg2SO4 if there be an excess of Hg and the acid is not very hot, and SO₂, dilute H₂SO₄Aq scarcely acts on Hg -6 Nitric acid, cold and dilute, forms HgNO, , with hot HNO, Aq and excess of Hg, basic mercurous nitrates, $x Hg_2 O y N_2 O_5$, are formed, excess of hot HNO_3Aq produces $Hg(NO_3)_2$ —7 Warm cone hydrobromic and hydriodic acids produce HgBr. and HgI2, respectively (cf Berthelot, A Ch [5] 16, 433) —8 Hydrogen sulphide, or alkaline polysulphides, produce HgS —9 With nitrogen tetroxide, forms HgNO, and NO (Ramsay, B 18,

Combinations — 1 Hg combines with the halogens, forming Hg X or HgX₂ according to the relative quantities of the reacting bodies -- 2 With oxygen, Hg forms Hg₂O and HgO -3 With sulphur and selenton, HgS and HgSe are produced -4 Hg probably combines with phos-phorus, but no definite compound has been iso

lated with certainty

Detection and Estimation - Solid Hg com pounds are decomposed by drying, mixing well with dry Na, CO,, and heating strongly in a small tube closed at one end, Hg is volatilised, and condenses on the cold part of the tube in minute globules Mercurous salts in solution give a white pp (HgCl) with HClAq, or a soluble chloride, this pp is blackened by NH₄Aq with formation of NH₂Hg₂Cl Mercurous salts are oxidised to mercuric salts by boiling with HNO, Aq. Mercuric salts are not ppd by HClAq H.SAq, or a soluble sulphide, ppts black HgS, addition of a small quantity of the reagent causes the formation of a compound of HgS with the original salt present, this pp is white, yellow, or brown, according to the quantity of reagent

Hg is sometimes estimated by heating its dry compounds with powdered CaO, condensing the Hg under water, transferring to a weighed crucible, drying by blotting paper and then over H₂SO₄, the metal is sometimes ppd by SnCl₂ or H.PO.Aq at c 60°, dried, and weighed is also estimated as HgCl, by adding HClAq, then nearly neutralising with KOHAq, adding K or Na formate, digesting for some days at 60°-70° (Hg is ppd at boiling temperature), collecting the HgCl on a weighed filter, washing, drying at a low temperature and weighing 18 also determined as HgS, by ppn from HgCl₂Aq by H,S, and collection on a weighed filter the pp is formed from solutions containing HNO, Aq or FeCl, Aq &c, free S is ppd with the HgS, the pp may then be heated with CaO and the Hg collected, or heated in Cl, the HgCl2 passed into water, and Hg ppd by SnCl₂ Hg may also be determined by depositing it by electrolysis on a weighed Pt dish A mercurous salt, in presence of mercuric, may be estimated by ppg by HClAq, from a cold very dilute solution, not more than a very small quantity of HNO, being present

There are several methods for the volumetric determination of Hg, that described by Hannay, which is based on the fact that the turbidity produced in mercuric salt solutions by a few drops of NH, Aq is removed by a definite quantity of KCNAq, is said to give satisfactory results (For details of the methods v Manuals of

Analysis)

Mercury, alloys of, v next line Mercury, amalgams of The alloys of Hg are usually called amalgams, the word is supposed to be an alchemist's anagram of μάλαγμα = a soft mass Amalgams are known of most of those metals which have been fairly well studied Amalgams are formed by mixing the other metal with Hg, by ppg the other metal on Hg (or Hg on the other metal), and by placing the other metal in contact with Hg and a dilute acid Many amalgams are definite compounds, others seem to be merely solutions of metals in Hg, and others are probably solutions of definite com pounds in excess of Hg Amalgams of Bi, Pb, Sn, and Zn, for instance, retain Hg at 360° (B P of Hg), but not at 410° Crystalline amalgams of K and Na, K,Hg and Na,Hg, are obtained by heating solutions of K and Na in Hg to 440°

The best known amalgams are those of Al, Ba, Bı, Cd, Cs, Ca, Cr, Co, Cu, Au, Fe, Pb, Mg, Mn, Nı, Os, Pd, Pt, K, Ag, Na, Sr, Tl, Sn, and For brief accounts of these amalgams, with the exception of those of Cu which are described below, v the various metals, Aluminium, BARIUM, &c, the articles, Amalgams, vol 1 p 149, and Alloys, vol 1 p 132, should be consulted An interesting paper on Amalgams, by Dudley, will be found in Proc Amer Ass for Advancement of Science, 1890 145

COPPER AMALGAMS (should have been described under COPPER, ALLOYS OF, vol 11 p 254) Amal gams of Ou are formed by placing Cu foil in HgNO₃Aq, by triturating 3 parts Hg with a mixture of 1 part very finely divided Cu and a few drops of HgNO, Aq, by triturating Hg with NaCl and verdigris, by making Hg the negative elec trode during electrolysis of CuSO₄Aq, by immersing Na-amalgam, or Zn amalgam, in

CuSO, Aq, and in some other ways By dissolving Cu in Hg, and removing excess of Hg by pressure, Joule obtained an amalgam having the composition CuHg (Chem Gazette, 1850 339) By heating amalgams rich in Hg, De Souza obtained Cu₁₆Hg at c 410°, and Cu, Hg at c 360° (B 9, 1050) By ppg Cu from CuSO Aq Ly Fe, washing well, moistening with HgNOsAq, and rubbing with Hg, amalgams are obtained which harden after a time The amalgam with from 25 to 83 pc Cu, may be obtained soft and plastic by heating nearly to 360°, and kneading for some time in a warm mortir, this amalgam slowly hardens without either contracting or expanding, it is used for stopping teeth (v Von Gersheim, A 70, 344)

Mercury, antimonide of A substance of the nature of an amalgam is formed by triturating together Sb and Hg, little is known of its composition and properties, it is very easily decom-

Mercury, arsenates of, v vol 1 p 309

Mercury, arsenide of Bergmann obtained what he thought was a compound of 1 pt As with 5 pts Hg by heating Hg and As together

Mercury, arsenites of, v vol 1 p 306 Mercury, bromides of Two bromides of Hg are known, HgBr and HgBr, Mcrcuric bromide has been vaporised, its mol w is 359 3 = HgBr, Mercurous bromide has also been vaporised, the results indicate the mol w 279 55 = HgBr, but it is not certain whether partial dissociation into HgBr, and Hg occurred during vaporisation (v infra, also Mercurous chloride, p 215) Both HgBr and HgBr, form double compounds with the bromides of metals more positive than Hg

MERCUROUS BROMIDE HgBr (Mercury proto or mono bromide) Mol w 279 55 (?) H F [Hg,Br] = 25,475 (Thomsen, Z P C 2,21)

Preparation -1 By subliming an intimate mixture of 80 pts Br and 200 pts Hg -2 By adding KBrAq to HgNO₃Aq -3 By heating saturated HgNO,Aq, as free as possible from HgO and slightly acidified with HNO, Aq, with Br, decanting, and allowing to cool in the dark (Stroman, B 20, 2818) -4 By adding alcoholic solution of Br to cold cone HgNO, Aq (Stroman,

Properties and Reactions - As prepared by method 3 (supra), forms small, white, nacreous, tetragonal, scales, prepared by method 2, appears as yellow, crystalline, spangles (Stroman, lc) SG 7307 (Karsten, S 65, 394) Sublimes at 340°-550° Melts c 405°(?) (Car Sublimes at 340 -500 Method 227 (1) method 227 (2) solves HgBr with evolution of SO₂, dissolves slowly in hot HNO₂Aq S G 142, decomposed by hot HClAq dil or conc, decomposed by NH,Aq or KOHAq, forming NH,Br or KBr, and leaving a black r sidue which contains Hg (Stroman, lc) Slowly decomposed by boiling KBrAq, giving HgBr, and Hg Soluble in some NH, salt solutions

Combinations -Two compounds with strontrum chloride are described by Löwig (P 14, 485) By dissolving HgBr in boiling SrBr.Aq. allowing

to cool, pouring off from separated HgBr, and evaporating, crystals of 6HgBr SrBr2 separate, by dissolving these crystals in water, filtering from HgBr which separates, and evaporating, a very soluble crystalline compound 2HgBr SrBr, 18 obtained

MERCURIO BROMIDE HgBr₂ (Dibromide of 859 3 H F [Hg,Br²] W Mercury) 859 3 Mol

= 41,880 (Thomsen, Z P C 2, 21)

Preparation — 1 By dissolving HgO in HBrAq, and crystallising -2 By bringing Hg into slight excess of Br, warming to remove un-combined Br, and subliming -3 By heating an intimate mixture of HgSO, with rather more than its own weight of KBr, the HgBr, which sublimes is said to contain HgBr -4 By adding KBrAq to Hg(NO₃)₂Aq, evaporat ng as long as HgBr₂ crystallises out, and crystallising from alcohol -5 By agitating Hg with water, adding Br as long as its colour is removed, boiling, filtering, allowing to crystallise, and drying at c 150° -6 By adding excess of Br to a slightly acid solution (S G 1 197) of Hg(NO₄)₂, HBrOAq is formed in the reaction (Sievers, B 21, 647)

Properties — White rhombic prisms, isomorphous with HgCl_2 , $a\ b\ c=6817\ 1\ 9975$ (Hjord thal, $Z\ K=3$, 362) SG 5 9202 (Karsten, S 55, 304), 5 7298 at 16°, 5 7461 at 18° (Clarke's pecific Gravity Tables, new ed 32) V D 175 5, Mitscherlich (P 29, 193) Melts at 244° (Carnelley a Williams, C J 37, 127) Can be sublimed unchanged S 106 at 9°, 20-25 at 100° (Lassaugue) Very sal in alcohol and other Very sol in alcohol and ether (Lassugne)

HgBr Aq reddens litmus

Heated with phosphorus, Reactions -- 1 arsenic or antimony, forms bromide of P, As, or Sb - 2 Decomposed, yielding HgBr, by sunlight, or contact with copper or mercury, or by mixing with cuprous bromide dissolved in HBrAq -3 HgBr Aq with ammonia gives a white pp of HgBr NH₂ (Mitscherlich, J_pr 19, 455) - 4 HgBi NH, (Mitscherlich, J pr 19, 455) – 4 With sodium hypochlorite, HgBr Aq gives oxy chlorides xHgO yHgCl, (Rammel-berg) — 5 With hypochlorous acid, HgCl₂ and Hg(BrO₃), are formed (Balard) —6 Decomposed by nitric or sulphuric acid, giving off Br —7 Oxybromides, xHgO yHgBr, are obtained by boil ing HgBr Aq with mercuric oxide -8 Mixed with mercuric iodide and crystallised from ether or acetone, HgIBr is obtained, this compound is also formed by the action of an alkyl volide, eg LtI, on HgBr₂ dissolved in acetone (Oppen heim, B 2, 571) (v Mercury, wodobromide of, p 221)

Combinations -1 With hydrobromic acid to form bromomercuric acid HHgBr, (v infra) -2 Combines with many bromides of more positwo metals than Hg, to form salts regarded by Von Bonsdorff as bromomercurates (P 19, 839) These salts are obtained by evaporating solutions of the component bromides, the more important are HgBr, KBr and HgBr, 2KBr, HgBr, MgBr, and 2HgBr, MgBr, HgBr, SrBr, and 2HgBr, SrBr, (Löwig, P 14, 485) Salts containing NaBr, CaBr,, BaBr, and ZnBr, were also obtained by Von Bonsdorff (l.c.) Bromomercuric acid, HHgBr, was obtained by Neumann (M 10, 286), in long transparent needles, by slightly warming excess of HgBr. with HBrAq, filtering through asbestos, and sooling to between 0° and -4° . This acid is

readily decomposed by moisture or heat tion of HgBr2 in HBrAq reacts with alkalis to give HgBr₂ 2MX (M = alkali metal), the heat produced is c 27,200 for 2MOH, the solution of HgBr, in HBrAq probably contains the acid H.HgBr. -3 With mercuric cyanide and potascyanide, forms lustrous tablets of HgBr₂ HgCy₂ 2KCy 4H₂O (Geuther, A 29, 325) With mercuric cyanide and zinc cyanide, forms transparent prisms of HgBr₂ HgCy₂ ZnCy₂ 8H₂O (Varet, C R 109, 809) —4 Heated with mer curic sulphide, forms HgBr₂ 2HgS (Schneider, P 115, 167), this salt is also obtained by boiling HgBr₂Aq with freshly ppd HgS (H Rose, P 13, 59) (v Mercuric sulphide, Combinations, No 4, p 225)

Mercury, bromiodide of , v Mercury, wodo-

bromide of, p 221
Mercury, bromosulphide of, v Mercuric

sulphide, Combinations, No 4, p 225

Mercury, chlorides of Two chlorides are known, HgCl and HgCl₂ The molecular weight of the latter has been determined from the VD of the compound The numbers obtained for the VD of the former agreed with the formula HgCl, but it was shown that the vapour produced by heating mercurous chloride contained Hg and HgCl2, hence the V D could not decide between the possible formulæ HgCl and Hg2Cl2 More recently it has been found that the VD calculated from observations of VD of mer curous chloride vaporised into an atmosphere of HgCl₂ agrees with that required by HgCl (v infra)

MERCUROUS CHLORIDE HgCl (Protochlor-Calomel) Mol w very pro ide of mercury Sublimes at 400°-500° without bably 235 17 melting SG 6 993 (Karsten, S 65, 394), to 7 176 (Hassenfratz, A Ch 28, 3) VD 118 6 at 140° (Deville a Troost, C R 45, 821), 120 8 (Mitscherlich, P 29, 193) VD calculated for Odling showed that gold leaf is HgCl = 117.58amalgamated when exposed to calomel vapour at c 400° , hence he concluded that the vapour contained Hg, and that therefore the observed VD did not prove the formula HgCl (J 1864 Debray found that only a limited portion of the calomel vaporised at 440° is decomposed with separation of Hg (C R 83, 330), hence it appears impossible that calomel should have the molecular formula Hg_2Cl , else the observed V Dat c 440° would be considerably greater than 120 (calc for $Hg_1Cl_2 = 235 16$) In 1881, Fileti showed that when a mixture of mercurous and mercuric chlorides is heated to c 400° in a Pt tube, containing a tube of silver-gilt traversed by a stream of cold water, not a trace of Hg is deposited on the gilt tube He then determined the VD of a mixture of mercurous and mercuric chlorides, and calculated the VD of the mercurous chloride in the mixed vapours, the results were 115 9 and 120 1, hence the molecular formula of calomel is most probably HgCl (G 1881 341) S H at 7°-99°, 05205 (Regnault, A Ch [3] 1, 129) Crystallises in tetragonal forms, a c=1 17414 HF [Hg,Cl] = 32,600 (Thomsen, Z P C 2,21) For T C v. Von Lang, P 135, 29, for heat of vaporisation, w Marignac, C R 67, 877

Occurrence —As horn quicksilver, in tetra-gonal crystals. SG 6482.

Formation.—1 By passing Ol over excess of Hg; action proceeds slowly at ordinary temperatures, rapidly at near BP of Hg—2 By reducing HgCl,Aq, saturated at 50°, by SO₂ (Wohler, 4 90, 124, Sartorius, A 96, 325) —3 By reducing HgCl,Aq by oxalic acid in sunshine (Eder, 5 By ppg a mercurous salt by HClAq -6 By heating HgCl₂ with Hg -7 By heating HgSO₄ with Hg and NaCl -8 By triturating Hg with NaCl, Fe₂(SO₄)₃, and a little water, till the metal has lost its fluidity, and subliming

 $(Fe_2(SO_4)_3 + 6NaCl + 2Hg$ = $3Na_2SO_4 + 2FeCl_2 + 2HgCl)$ = Preparation —1 Anintimate mixture of 4 pts HgCl, with 3 pts Hg is made by moistening with alcohol and triturating until the Hg loses its fluidity, the mixture is gently heated for a few hours, again pulverised, and then slowly sublimed in a flask or retort, not more than a quarter filled with the mixture and placed on a thin layer of sand -2 4 pts Hg, 9 pts dry HgSO4, and 3 pts water are very intimately mixed, a quantity of NaCl equal to the weight of the Hg and HgSO, used is added, and the mixture is slowly heated till HgCl sublimes (Planche, A Ch 66, 168)-3 A well-pulverised mixture of 1 pt MnO₂, 1 pts NaCl, and 2 pts Hg is heated with 21 pts cone H2SO4, until HgCl sublimes 4 A warm dilute solution of HgNO, Aq, mixed with a little HNOs to prevent formation of basic salts, is ppd by excess of dilute NaClAq containing a little HCl, the liquid is heated for some time in contact with the pp which is then thoroughly washed with cold water in the dark (Scheele, of Frantwein, R P 11, 72, 12, 155, Mialle, J Ph 22, 586)—5 Cl is passed into HgNO, Aq, the pp of HgCl mixed with HgCl₂ is washed with hot water till HgCl₂ is all dis solved, the HgCl is then crystallised from warm HgNO, Aq (Sievers, B 21, 647)

Properties - White, semi transparent, tetragonal, prisms, if sublimed quickly, forms a fibrous mass of small crystals When powdered, calomel shows a slight lemon yellow colour Highly refractive and dispersive Tasteless and inodorous Sublimes without melting qute insol water, alcohol, ether, and dilute acids Sl sol cold, more sol hot, HgNO₂Aq (v Debray, O R 70, 995, cf Drechsel, J pr [2] 24, 44) Boiled with HClAq, HgCl₂ goes into solution, and Hg is separated, with conc hot H₂SO₄, HgCl₂ and HgSO₄ are formed HgCl 18 decomposed by solutions of alkalis, alkaline earths, and alkaline carbonates, with ppn of Hg₂O For experiments on V D of calomel, v

Reactions —1 Exposed to sunlight, HgCl darkens with separation of Hg (for action of heat on HgCl v supra) -2 Partly decomposed by aqueous vapour or boiling water, with production of HgCl₂ and Hg —3 Decomposed by many metals when heated with them in presence or absence of water, giving metallic chlorides and Hg —4 Triturated with wodine and water, HgCl₂ and HgL are produced (Planche a Soubeiran, J Ph 12, 651)—5 Heated with a little sulphur, HgS and HgCl, are formed, with excess of S, the products are HgS and S,Cl. -6 Heated in phosphorus vapour, HgCl yields PCl, and Hg phosphite (Davy).—7. By heating an intimate

mixture of 3 pts HgCl with 1 pt arsenic, a sub limate is obtained consisting in part of yellow tetrahedral crystals, according to Capitaine (J pr 18, 422) these crystals are mercuri-arsenic chloride AsHgCl The compound is decomposed by hot water to As Hg amalgam, As2O3 and HCl, it is partly decomposed by heat, giving Hg, As, and AsCl₃-8 Reduced by sulphurous acid, also by hot stannous chloride solu tion, with separation of Hg - 9 Cold sulphuric acid has no action on HgCl, the hot cone acid forms HgCl₂, HgSO₄, and SO -10 Dissolved by hot nitric acid with evolution of NO, the solution contains Hg(NO₂)₂ and HgCl₂ -11 Boiling hydrochloric acid forms HgCl₂ and Hg, boiled in an open vessel with water and a little HCl, no Hg is separated, but HgCl, goes into solution -12 Decomposed by hydrocyanic acid solution, forming HgCy, Hg, and HCl -13 With solution of alkali chlorides forms HgCl, which combines with the excess of alkali chloride to form double salts, some of which are soluble and some insoluble -14 Digested with solutions of alkalı vodides, or vodide of magnesium, or won, HgI is separated, and metallic chloride goes into solution -15 Solutions of alkalis form Hg2O and alkalı chloride, heated with solid alkalıs, Hg, O, and alkalı chloride are produced -16 Ammonia produces black NH Ilg Cl (v MFRCURAMMONIUM COMPOUNDS) —17 Heated with carbonates of calcium, barrim, or magnesium, Hg, Hg,O, and HgO are separated, and CO is evolved (Buchner, R P 3, 31, 4, 289, Vogel, R P [3] 1, 34) -18 With alkali sulphites in solution, Hg separates, and a double sulphite of Hg and alkali metal goes into solution 19 Rubbed with antimony tri or penta sul phide, HgS and SbCl, are formed

Testing calomel for impurities -HgCl some times contains HgCl₂, HgNO₃, or Hg(NO₃), or Hg HgCl₂ is detected by shaking with water, filtering, and adding SnCl.Aq, when a white grey pp is produced Bonnewyn (Bl [2] 4, 201) says that 1 pt of HgCl in HgCl may be detected by immersing a clean knife blade in the calomel moistened with alcohol or ether, if HgCl, is present a black spot is formed on the blade HgNO₃ or Hg(NO₃)₂ is detected by heating, when NO₂ is evolved Hg may be detected by examination under the microscope HgCl may be adulterated with powdered heavy spar, &c , this remains unchanged on sublima tion Adulteration with gum or other organic material is detected by the smell produced on

heating

Combinations -1 With sulphur chloride, to form 2HgCl SCl2, produced by long continued warming HgCl with S2Cl2, also by heating an intimate mixture of 31 pts HgCl₂ and 2 pts S in a dish covered with a funnel, on to which the double compound sublimes, also by heating As2S, with HgCl2

(7HgCl₂ + As₂S₃ = 2AsCl₃ + 3HgS + 2Hg₂SCl₄)Forms rectangular needles, which melt to a brown liquid, and volatilise without decomposi tion, decomposed by water (Capitaine, J pr. 18, 422) —2 With stannous chloride to form 2HgCl SnCl. Produced by heating an amal gam of 8 pts Sn with 1 pt Hg mixed with 24 pts HgCl, and subliming Forms white dendritic crystals, partially decomposed by heat;

Coefficient

wholly decomposed by water, with formation of SnCl₂ which reduces the HgCl (Capitaine, J pr 18, 422) —3 H Rose (P 44, 325) states that

HgCl combines with sulphur dioxide

mercury Corrosive sublimate) Mol w 270 54 [288°] (Carnelley, C J 33, 276) (303°) (Carnelley a Williams, C J 33, 282) S G 6 223 (Playfair a Joule, C S Mem 2, 401), 5 448 (Schroder, P 107, 113) V D 136 3 (Mitscherlich, P 29, 193) S H 12°-45° 064 (Kopp, Tr 155, 71), 138 088 (1890 (Parment) A Ch (131, 139) 13°-98° 06889 (Regnault, A Ch [3] 1, 129) S 5 78 at 0°, 6 57 at 10°, 7 39 at 20°, 8 43 at 30°, 9 62 at 40°, 11 34 at 50°, 13 86 at 60°, 17 29 at 70°, 24 32 at 80°, 37 05 at 90°, 53 96 at 100° (Poggiale, A Ch [3] 8, 463) S cold alcohol 43 5, boiling alcohol 86 2, S ether 33, S glycerin 7 (Fairley, M S [3] 9, 685) Crystallises in two forms belonging to the trimetric system (1) crystals from alcoholic solution, abc = 7254 1 1 0686, (11) crystals by sublimation, a b c = 9347 1 3396(v Mitscherlich, P 28, 118, Von Lang, W A B 45, 119) H F Z P C 2, 21) $[Hg,Cl^2] = 54,490$ (Thomsen,

Occurrence - In a volcanic district on Ternate, one of the Molucca islands (Frenzel, Min

Mittheil 1877 305)

Formation 1 By heating Hg in excess of Cl 2 By dissolving HgO in hot HClAq, and evapor ating 3 By dissolving Hg in hot HClAq con taining some HNO, evaporating, and recrystal lising from hot water -4 By adding excess of Cl to a slightly acid solution of Hg(NO₃) (Sievers, B 21, 617)

Preparation - 1An intimate mixture of equal parts NaCl and HgSO, (obtained by boiling 4 pts Hg with 5 pts cone H SO, till a dry mass is formed), to which a little MnO, has been added (to prevent formation of HgCl from Hg,SO, which may be present), is slowly heated in a long necked flask or retort, HgCl, sublimes on the cooler parts of the apparatus The operation must be conducted in a good draught cupboard because of the very poisonous nature of $HgCl_2$ —2 Boiling cone $HgNO_3Aq$ is mixed with cone HClAq as long as a μp forms, the pp of HgCl is boiled with as much HClAq as was used in its formation $(HgNO_1Aq + 2HCl = HgCl_2Aq + H_1O + NO_2)$, crystals of $HgCl_2$ separate on cooling, they may be recrystallised from hot water

Properties -Translucent crystals, forming a white powder when crushed HgCl2 has a dis agreeable metallic taste, it is extremely poison ous Melts at 288° (v supra) to a colourless liquid; according to Haass, HgCl, does not melt when horted if the pressure is less than 120 mm (B 13, 2203) Easily sol water, sol alcohol, ether, and glycerin (v supra) Schröder (J R 1886 18) gives the following table, showing the S G of aqueous and alcoholic solutions of HgBl, and the percentage of HgCl, in these solutions

HgCl Aq reacts slightly acid to litmus boiling HgCl2Aq some HgCl2 passes off with the HgCl2Aq is decomposed by light with evolution of O and formation of HCl and Hg
oxychloride (cf V Meyer, B 20, 2970)
Reactions —1 Many metals decompose HgCl,

when heated with it, forming HgCl or Hg, such metals are Sb, As, Bi, Cu, Fe, Pb, Ni, Sn Many metals also reduce HgCl₂ in aqueous solution, generally ppg HgCl and Hg, Cd, Fe, and Zn pp Hg only -2 Reducing agents, e.g. SnCl₂Aq, 50 Aq, formic acid, oxalic acid, produce HgCl (cf 1 der, B 13, 166, also Wurt's Dictionnaire, Suppl p 1066) -3 With many carbon com punds, HgCl, forms HgCl and HCl (the H being withdrawn from the C compound) -4 HgCl2 is not decomposed by sulphuric or nitric acid, it dissolves fairly easily in HNO3Aq -5 Dissolves in hot cone hydrochloric acid, on cooling, a white crystalline mass is obtained which has the composition 2HgCl HCl according to Boullay (A Ch 34, 243, cf Combinations, No 1) -6 Ac cording to Fairley (B A 1875 42), hypochlorites reduce HgCl2 to HgCl -7 Albumen is lapidly coagulated and ppd by HgCl Aq, white of egg serves as an antidote to poisoning by corrosive sublimate -8 Boiled with mercuric oxule, oxychlorides are obtained (v MERCURY, OXYCHIORIDES or, p 223) - 9 Alhalis produce HgO and alkalı chloride—10 Normal potassium or sodium carbonate ppts HgO, K(or Na)HCO, is also formed, and this reacts with the rest of the HgCl, to pp oxychlorides -11 Potassium (or sodium) hydrogen carbonate produces various oxychlorides (q v p 223) -12 Phosphorus trihydride produces a black pp when passed into HgCl, dissolved in water or alcohol, on con tinuing the passage of PH₃, the pp becomes yellow, and then has the composition P,Hg, 3HgCl₂3H₂O = 2(PHg₂Cl HgCl₂)3H₂O, the solution contains HCl This compound is known dimercuri phosphonium mercuric chloride, it must be washed quickly with cold water, and dried over H2SO, in vacuo, it is de composed by hot water, giving Hg, HCl, and R₁PO₃, heat produces HCl, Hg, and H₃PO₄ (H Rose, P 40, 75) —13 Arsenic trihydride produces a brown yellow pp in HgCl₂Aq This pp has the composition AsHg₂Cl HgCl₂, it is known as dimercuriarsonium-mercuric chloride The pp is washed with cold water and quickly dried over H₂SO₄ in vacuo, it is decomposed by water to Hg, As₂O₃, and HCl (H Rose, P 51, 123)

Combinations -1 With hydrochloric acid. according to Boullay (A Ch 34, 243) the compound 2HgCl, HCl is obtained by dissolving HgCl, in hot cone. HClAq, and cooling, this compound forms a crystalline lustrous mass which melts by the heat of the hand (v also Ditte, O. R. 92, 853) Neumann (M 10, 236) obtained chloromercuric acid HHgCl₂ by gently warming excess of HgCl2 with HClAq, filtering through asbestos, and cooling to between 0° and -4° This acid is very readily decomposed by heat or moisture Solutions of HgCl in HClAq react with alkalis to form HgCl, 2MX (M = alkalı metal), the heat produced in the reaction is c 27,200 for 2MOH, the solution of HgCl2 in HClAq probably contains the acid H.HgCl. Dry HCl passed over well-cooled $HgCl_2$ has no action (N, lc) —2 With many chlorides and with some other salts The chief compounds with other chlorides are the following (v Von Bonsdorff, P 17, 115) -

(1) With phosphorus pentachloride 3HgCl₂ 2PCl₅ Pearl white needles, sublimes unchanged, decomposed by water, formed by heating the constituents together (Baudrimont,

A Ch [4] 2, 45)
(11) With alkalı chlorides (a) chloride2KCl HgCl, H,O, potassium KCl HgCl₂ H₂O, KCl 2HgCl₂ 2H₂O The first salt is formed by saturating KClAq with HgCl₂ at 30°, adding as much KCl as originally used, and evaporating The second salt is produced by evaporating a solution of equal equivalents of KCl and HgCl₂ (Rammelsberg, P 90, 34) The third salt results by saturating KClAq at 60° with HgCl₂ and allowing to cool The com 60° with HgCl, and allowing to cool pound 6KCl 3HgCl, CuCl, 2H,O was obtained by Von Bonsdorff (P 33, 81) by adding CuCl, 2Aq to a dilute solution of KCl HgCl₂ (b) With sodium chloride 2(NaCl HgCl₂) 3H₂O, 2NaCl HgCl, The first salt is obtained by adding NaCl to NaClAq saturated with HgCl2. The second salt is produced by adding alcohol to saturated NaClAq shaken with powdered $HgCl_2$ (c) With rubidium chloride 2RbCl HgCl₂, RbCl 2HgCl₂, RbCl HgCl₂ Ob tained, respectively, by evaporating a neutral solution of RbCl and HgCl, by evaporating a solution of equal parts of the constituent salts, and by heating the second salt to 50 (Godeffroy, Ar Ph [3] 12, 47) (d) With ammonium chloride 2NH,Cl HgCl₂H₂O (sal alembroth) is obtained by evaporating a solution of 1 pt NH,Cl and 2 pts HgCl2, loses H2O in dry air, isomorphous with the corresponding K salt The other salts obtained are NH, Cl HgCl, 2NH₄Cl 2HgCl₂ 2H₂O (Kane), 2NH₄Cl 9HgCl₂ and 2NH, Cl 3HgCl, 4H,O (Holmes, C N 5,

(iii) With alkaline earth chlorides (a) With calcium chloride CaCl25HgCl28H2O, by saturating warm CaCl2Aq with HgCl2, and cooling, by evaporating the mother liquor the salt CaCl₂ 2HgCl₂ 6H₂O is obtained strontium chloride SrCl, 2HgCl, 2H,O (c) With barium chloride

BaCl₂ 2HgCl₂ 2H₂O (d) With michloride MgCl₂ 3HgCl₂ 5H₂O and (d) With magnesium

MgCl₂ HgCl₂.6H₂O

(1V) With chloride of zinc ZnCl, HgCl, 4H,O, by evaporating a mixed solution of the constituents. Analogous salts with CuCl, CoCl, NiCl, and FeCl, have been obtained

The chief compounds with oxysalts are

the following .-

(1) With ammonium sulphite $3 HgCl_2 2(NH_4)_2SO_3$ By adding hot saturated $HgCl_2Aq$ to cold $(NH_4)_2SO_3Aq$ (P de Saint-Gilles, A 84, 266, 269)

(11) With potassium chromate, and dichrom ate (a) HgCl₂ K₂Cr₂O₇, by cooling a warm solution of equivalents of the two salts (Millon, A Ch [3] 18, 388, Darby, C S Mem 1, 24) (b) 2HgCl₂ K₂CrO₄, by mixing solutions of the constituent salts in the ratio 2HgCl, K,CrO, adding HClAq sufficient to dissolve ppd HgCrO. and evaporating (Darby, lc)

(111) With ammonium dichromate (a) HgCl₂ (NH₄)₂Cr₂O₇ H₂O, by evaporating a solution of the constituents (Abel a Richmond, C J 3, 202, cf Darby, C S Mem 1, 24, Zepharo vich, W A B 39, 17) (b) HgCl, 3(NH,), Cr,O,, by evaporating the mother liquor from the first salt (A a R, Lc; of Clarke a Stern, Am. Ch 3, 351)

(1v) With copper acetate

 $2HgCl_2Cu(C_2H_3O_2)_2CuO$, deposited from a mix ture of cold saturated solutions of HgCl, and $Cu(C_2H_3O)_2$ (Hutteroth a Wöhler, A 53, 142)

(v) With chlorochromtetrammonium chloride 6HgCl, Cl2Cr28NH3 Cl4, by spontaneous evaporation of a mixed solution of the two salts (Cleve,

J 1862 150)

3 Compounds of HgCl2 with PHg Cl and AsHg,Cl areknown (a) Dimercuriphosphonium mercuric chlorule 2(PHg2Cl HgCl) 3H O, ayellow solid formed by passing PH, into HgCl, dissolved in water or alcohol (v Reactions, No 12) Dimercuriarsonium - mercuric chloride AsHg₂Cl HgCl₂, a brown yellow pp by passing AsH₃ into HgCl₂Aq (v Reactions, No 13) -4 A compound of HgCl2 with mercuric sulphocyanide - HgCl₂ Hg(CSN)₂—is obtained by the reaction of SOCI, with Hg(SCN), (McMurtroy, C J 55,

Mercury, ferrocyanides of, v vol 11 p 335 Mercury, fluorides of Two are known, HgF and HgF₂, the VD of neither has been determined. These fluorides are remarkably unstable both as regards the action of water and of heat

MERCUROUS FLUORIDE HgF or Hg2F2 pared by adding freshly ppd Hg₂CO₂ to HFAq so long as the salt is dissolved, and evaporating, also by adding recently prepared HgCl to a solution of Ag.CO, in HFAq, filtering from AgCl, and evaporating on a steam bath (Finkener, A 110, 142) Berzelius obtained HgF, mixed with HgCl. by subliming a mixture of HgCl with NaF HgF is a light yellow, crystal me, powder It is partly dissolved, and partly decomposed to HF and Hg₂O, by water Exposed to light when moist it is blackened HgF may be heated to c 200° without change, above this temperature Hg sublimes and the glass vessel is corroded HgF is decomposed by alkalis with separation of Hg₂O, the action of NH₃Aq is more complex HgF absorbs NH₃ gas forming N₂H₆Hg₅F₂ (v Mercurammonium compounds, p 206) Combines with SiF, to form Mercurbus silicofluoride Hg₂SiF₆ 2H₂O (v Mercury, silicofluorides of, p 224)

MÉRCURIO FLUORÌDE HgF₂ According to Fremy (A Ch [3] 47, 5), crystals of this com pound are obtained by dissolving HgO in excess of Hi Aq, and evaporating the solution slowly over lime Finkener (P 110, 628) obtained an oxyfluoride, HgF₂ HgO H₂O, by this method, by adding cone HFAq (50 p c) to this oxyfluoride, it was suddenly changed to a white crystalline mass of HgF₂ 2H₂O (Finkener, Lc) The hy drated fluoride is decomposed at 30°, giving H₂O, HF, and HgO HgF₂ H₂O (F) HgF₂ is decomposed by water with separation of HgO Addition of slight excess of NH₃Aq to HgF₁ in HFAq ppts NH₂Hg₂OF HF (Finkener, P 110, 632) Mercuric silveofluoride HgSiF₆ 6H₂O probably exists (v Mercury, silveofluorides of, p 224) Berzchus obtained a compound of HgF₂ with NH₄F by treating HgF₂ with NH₄Aq HgF₂ combines with HgS (v Mercuric sulphide, Combinations, No 6, p 225)

Mercury, fluosulphide of, v. Mercuric sul-

phide, Combinations, No 6, p 225.

Mercury, fulminate of, v vol 11 p 317 Mercury, haloid compounds of Two series of these compounds exist, HgX and HgX, molecular weights of HgCl, HbBr, and HgI, are known, the molecular weights of HgCl, HgBr, and HgI are probably as represented by these formulæ The compound HgI HgI also exists, and a periodide of Hg has been isolated mercurous compounds Hgl are insoluble in water, except Hgl, which is partly dissolved, and partly decomposed, by water, the mercuric com pounds Hgl, are soluble in water, with the ex ception of HgF2, which is decomposed by water The Hg haloid compounds combine with many other haloid compounds, and also with oxysalts, to form numerous double salts The double salts of the type HgX2 M1X and HgX2 2M1X are best regarded as salts of the mercur halogen acids HIIgX, and H HgX, respectively, the acids HilgX, have been isolated, and probably also the acids H.HgX, The heats of formation of HgX and HgX₂ decrease as the atomic weight of X increases Thomsen gives the following data (Z P C 2, 21) X [Hg,X

An iodochloride HgICl, and an iodobromide

HgIBr, have been isolated

Mercury, hydrated oxide of According to Carnelley a Walker (C J 53, 80), the hydrate HgO H₂O is obtained by ppg HgCl₂Aq by NaOHAq, and drying in air, it is stable to about 100°, and is completely dehydrated at c 175° According to Schaffner (A 51, 181) the yellow pp formed by adding KOHAq to solution of a

mercuric salt is HgO 3H₂O (v Mercuric oxide, p 222) But according to Millon (B J 27, 112), Marchand (J pr 37, 277), Rammelsberg (J pr [2] 38, 559), and Wallace (Chem Gazette, 1858 345), the pp obtained from Hg salts by KOHAq is HgO

Mercury, lodides of Besides the lodides HgI and HgI₂, corresponding with the chlorides, bromides, and fluorides, of Hg, there is said to exist a definite mercuro increuric lodide, HgI HgI₂, and a hexa lodide HgI₃. Hg and I combine directly with production of heat

HgI HgI₂, and a hexa iodide HgI₄. Hg and I combine directly with production of heat Mercurous former HgI or HgI₂. Mol w not known with certainty Melts at c 290° (with partial decomposition according to Stroman, B 20, 2818) Boils at c 310° with partial decomposition (Yvon, C R 76, 1607) S G 775 (Boullay, A Ch [2] 43, 206) S H 17°-99° 03949 (Regnault, A Ch [3] 1, 129) Crystallises in tetragonal forms, a c = I 1 6726 (Des Cloizeaux, C R 84, 1418) H F [Hg,I] = 15,550 (Thomsen, Z P C 2, 21)

Formation —1 By subbing together Hg and I, in the ratio Hg I, moistened with a few drops of alcohol, and removing the small quantity of HgI, which is always formed by treatment with alcohol, in which HgI. is soluble but HgI is in soluble —2 By rubbing together HgI and Hg in the ratio HgI Hg, and dissolving out unchanged HgI by alcohol—3 By heating 10 parts I with 10½ parts Hg in a retoit, on a sand bath, to not above 200°, HgI sublines in red crystals, be coming yellow when cold (Yvon, C R 76, 1607) 4 By adding KIAq to solution of a mercuric salt, preferably the acetate (v Lefort, Ph [3] 3, 823)

Preparation—A cone solution of HgNO, containing a little HNO, and free from basio mitiate, is heated to boiling with excess of I, when the I is partially dissolved the liquid is carefully decented into a warm basin, on cooling, very lustrous transparent, yellow tablets of HgI separate. The crystals are brought on to a filter (best in the dark), washed with cold water containing a little HNO,, and then with pure cold water, and dried in the dark at ordinary summer temperature by placing them on filter paper which is frequently changed (Stroman, B 20, 2819). HgI is obtained as a flocculent pp by rapidly adding a fairly cone solution of I in alcohol to cold cone HgNO, Aq (S, Ic)

Properties and Reactions -HgI crystallises in yellow tetragonal tablets, isomorphous with HgCl HgI is sometimes described as a green powder Stroman (lc) says that green preparations are impure When heated, the yellow orystals become dark yellow, then orange, and finally garnet red Yvon $(C \ R \ 76, 1607)$ says that the change of colour begins at 70°, and assigns a definite temperature for each change of colour Stroman (B 20, 2818) could not connect the different colours with definite intervals of temperature, he says that the salt prepared by him was pure yellow at 100° Sublimation be gins at c 190° according to Yvon, at c 110°-120° HgI when moist is according to Stroman rapidly blackened by light HgI is very slightly soluble in water, insoluble in alcohol. It is easily decomposed to Hg and HgI_2 , \mathfrak{sg} by HIAq , KIAq , and $\mathrm{similar}$ includes. Heated rapidly HgI gives a sublimate of Hg and HgI HgI, HgI is used in medicine For medicinal purposes it must be quite free from HgI2, which is a violent poison.

MERCURO MERCURIO IODIDE HgI HgI2 compound of Hg and I of this composition was obtained by Boullay (A Ch [2] 34, 845) by adding KIAq containing I, in the ratio KI 1, to HgNO, Aq The same compound is said to be obtained by adding KIAq to HgNO, Aq and digesting the pp for some time in the liquid, also by rubbing together HgI, and I in the ratio 3HgI2 Hg Mercuro mercuric iodide is described as a yellow powder, insol water and alcohol, unchanged in the dark, but becoming dark when exposed to light When heated, it turns red, then melts, and may be sublimed unchanged, yielding crystals which are red when hot but become yellow on cooling HIAq, and various iodides in solution, dissolve HgI₂ leaving HgI, and then decompose the HgI with separation of

MERCURIC TODDE HgI_2 Mol w 452 86 [238°] (Carnelley a Williams, C J 33, 283) (339°-359°) (C a W, l c) S G red variety 6 2941 to 6 3004 at 0°, 6 276 at 126°, yellow variety 6 225 at 126° (Rodwell a Elder, Pr 28, 284), 6 179 at 200° solid, 5 286 at 200° molten (R a E, le). VD 2257 to 2344 (Mitscherlich, P 29, 193) SH 18°-99° 04197 (Regnault, A Ch [3] 1, 129) Crystallises in tetragonal forms (red), ac=1 1 9055, also in rhombic forms (yellow), $pp=114^{\circ}$ 30' H F [Hg,I']=25,640 (Thomsen, Z P C 2, 21) Change of yellow to red crystals is accompanied by production of heat, 3000 gram units (Berthelot, Bl [2] 39, 17, cf Weber, P 100, 127) S 004 at 17 5°, 005 at 22°, S 286 50 pc alcohol at 18°, 1 186 absolute alcohol at 18° (Bourgoin, Bl [2] 42,620)

Formation —1 By the action of I on Hg, Dublanc (Ph C 1849 656) says that pure HgI, is obtained by pouring 1,000 pts alcohol (93 p c) on to 100 pts Hg, and adding 124 pts I in por tions of 10 pts at a time, after each addition of I, the whole is agitated until the alcohol becomes colourless, the addition of the last portion of I should leave the alcohol coloured, the HgI2 13 washed with alcohol -2 By adding KIAq or

FeI2Aq to HgCl2Aq

Preparation —1 8 pts HgCl₂ and 10 pts KI are dissolved, separately, in water, the solutions are mixed, and the pp is thoroughly washed with cold water Any excess of KI dis solves some HgI2, and any excess of HgCl2 pro duces a yellowish pp containing more or less HgCl₂ Williams (Ph [3] 3, 1015) dissolves 8 pts HgCl₂ in 4 pts NH₄Cl in water, and then adds 10 pts KI in water -2 10 pts I are sus pended in water, and Fe filings are added until all the I is changed to FeI, the solution is at once added to a solution of 10? pts HgCl₂ in water, the pp of HgI, is rapidly separated from the liquid (to prevent formation of Fe oxychlor ides) and washed with cold water By crystal lising from hot KIAq, or, better, from hot cone HClAq (Köhler, B 12, 608), HgI, is obtained in very lustrous, red tetragonal prisms, with a greenish reflection

Properties - HgI, obtained by ppn is a pure scarlet coloured, crystalline, heavy powder is sl sol. water, S = 66 (Wurtz) Sol hot alcohol; somewhat sol glycerin (in 340 pts , Fairley,

M. S [3] 9, 685); also in ether, and some oils. Sol KlAq, also in cone hot HClAq, from these solutions HgI₂ separates in well formed crystals HgI₂ is dimorphous Red (tetragonal) HgI₂ is changed to the yellow (rhombic) modification by heat, the change occurs at 126° (Rodwell a Elder, Pr 28, 284), it is accompanied by a sudden, and then by a regular, expansion SG red at 126° = 6 276, yellow at 126° = 6 225 (R a E) HgI, melts at 238° (Carnelley a Williams, C J 33, 283), at 253°-254° according to Kohler (B 12, 608), to a blood red, liquid, melting is attended with considerable expansion At c 339°-359° the liquid boils, and sublimes to yellow rhombic plates The yellow variety passes into the red at the ordinary temperature, this change is hastened by rubbing or scratching the red crystals, heat is produced in the process, 3,000 gram units according to Berthelot (cf Weber, P 100, 127) The HgI₂ obtained by adding cold KIAq to cold HgCl Aq appears at first yellow, but it quickly changes to red, the change of crystalline form in this case may be observed under the microscope Solutions of HgI₂ in alcohol, ether, or KIAq are colourless, if the HgI2 is allowed to form slowly from these solutions, the crystals are red, but if the ppn is made rapid, e g by pouring an alcoholic solu tion into water, the crystals appear yellow for a moment, but they quickly change to red (cf Schiff, A 111, 371, Selmi, J 1855 417)

Reactions—1 HgI₂ dissolves in hydrodic

acid solution with production of heat (v Bei thelot, Bl 38, 369) This solution has about the same heat of neutralisation as HIAq (Thom sen), with alkalis it forms salts HgI, 2MI, the solution very probably contains the acid H2HgI, (cf Combinations, No 2) An iodomercuric acid, HHgI₃, has been obtained by slightly warming excess of HgI, with HIAq, filtering through asbestos, and cooling to between 0° and -4° (Neumann, M 10, 236), this acid is very readily decomposed by moisture and by heat According to Boullay (A Ch [2] 34, 345) a solu tion of HgI₂ in hot HIAq deposits I on cooling, and then crystals of 2HgI₂ 3HI —2 Most heavy metals, eg Zn, Sn, when triturated with HgI, remove I and leave Hg, potassium acts in the same way -3 HgI Aq is decomposed by alkalis, with separation of HgO and formation in solu tion of a double salt xHgI, yMI Baryta and strontia react similarly to alkalis -4 Lime, sodium carbonate, and potassium carbonate do not decompose HgI,Aq, but a solution of HgI, in alcohol is decomposed by these reagents -5 HgI, dissolves in hot calcium hypochlorite solution, on cooling Ca periodate is deposited and HgCl, remains in solution (Rammelsberg) 6 When HgI₂ is boiled with nitric acid, S G 15-14, Hg(IO₃)₂ is formed, with acid S G 13, white leaflets of HgI₂ Hg(NO₃)₂ separate, with acid S G 12, crystals of unchanged HgI₂ are obtained, together with some of the compound HgI, Hg(NO3)2 (Kraut, 7 18, 3461) -7 Chlorine, passed into water containing HgI, in suspension, produces a yellow solution containing HgCl2 and ICl₃ (Filhol)

Combinations -1 With hydriodic acid (v Reactions, No 1) -2 With various metallic iodides to form double salts, regarded by Von Bonsdorff as iodomercurates (P. 17, 265). These salts have been examined chiefly by Boullay (A Ch [2] 34, 345) They are generally obtained by dissolving HgI, in a solution of the other rodide and evaporating The fol

lowing are the most important

(1) With alkali rodides (a) With potassium rodide 2HgI, 2KI 3H, 0, HgI, 2KI The former is produced by saturating boiling KIAq with HgI₂, filtering, separating from HgI₂ which crystallises out, and evaporating Sol alcohol and ether Decomposed by water, with forma tion of HgI₂, and HgI₂ 2KI which separates on evaporation Thes, soluble salts may be pre pared by boiling KIAq with HgO, the solution contains the double salts and also KOH (cf Jehn, Ar Ph [3] 1, 97) (b) With sodium wodide NaIAq reacts with H₆I₂ similarly to KIAq, the compositions of the double salts of NaI with HgI₂ have not been satisfactorily de (c) With ammonium rodide termined 2(NH₄I HgI₂) 3H₂O, obtained, as yellow needles, by dissolving HgI2 in hot NH, IAq, separating from HgI, which forms on cooling, and evapora

(11) With other metallic rodides Bal, Srl, CaI2, and MgI2 solutions react with HgI2 simi larly to kIAq, the double salts are probably MI₂HgI₂ HgI₄ appears to form double compounds with CdI₄ and FeI₄. The compound $2 \mathrm{HgI}_2 \,\mathrm{Cu}_2 \mathrm{I}_2$ was obtained by Hess (D P J 218, 183) -3 HgL combines with mercuric chloride, also with mercuric bromide (v. Mercury, iodo chlorides and iodobromide of, infra) —4. Com bines with mercuric sulphide (v sulphide, Combinations, No 5, p 225) Mercuric

This per-MERCURY, HEXA IODIDE OF Hgl. nodide is said by Jörgensen (J pr [2] 2, 357) to be obtained by adding cold HgCl,Aq, followed by addition of water, to an alcoholic solution of KI, heated to 50° If the solutions are mixed hot, large rhombic crystals of HgI, are formed, but they are always mixed with HgI₂ HgI₈ is decomposed quickly by alcohol, slowly by water, with formation of red HgI2 HgI, possesses most of the optical properties of tourmalin

Mercury, iodobromide of HgIBr Sulphur yellow, translucent, rhombic prisms, a b c = 6443 1 9194 (Groth, B 2, $5\overline{7}4$) Melts at c 229° , and boils at c 360° , crystallisable from ether, may be sublimed unchanged Produced by crystallising a mixture of HgI2 and HgBr2 from ether or acetone, also by the reaction of an alkyl iodide, eg EtI, on HgBr, dissolved in

acetone (Oppenheim, B 2, 571

Mercury, iodochlorides of Two iodochlorides (1) HgL 2HgCl2 of Hg have been isolated $= Hg_3L_2Cl_4$ Obtained by dissolving HgI, in hot HgCl, and cooling (Liebig, S 49, 252), also by boiling HgCl with excess of I and much water until I vapour is no longer given off (Selmi, J 1855 417) (11) HgIČl Prepared by heating, in a closed tube at 140°-160°, HgI, HgCl, and a little water, until no HgI, remains unchanged (Köhler, B 12, 1187) Boullay (P 48, 175) said that HgICl is produced by satura ting hot HgCl₂Aq with HgI₂, but Köhler found that very little was formed in this way HgICl forms a citron-yellow crystalline mass, which becomes red after about 12 hours. The red modification forms tetragonal, the yellow forms rhombic, crystals. HgICl is citron-yellow at

c 125°, it melts at c 158° to a golden coloured liquid which solidifies at c 146°, it is slightly soluble, with partial decomposition, in hot water, more soluble in alcohol HgICl may be sublimed, with only slight decomposition, in a stream of HCl, SO2, or H2S From a solution of HgICl in dilute HClAq, H2S ppts a yellow solid, probably HgICl HgS (Kohler, lc)

Mercury, 10dosulphides of, v Mercuric

sulphide, Combinations, No 5, p 225
Mercury, nitride of Hg, N₂ (Trimercur amine) This compound was first isolated by Plantamour (A 40, 115) Ppd HgO is dried at 40°-50°, and then heated at 100° in a stream of dry NH_2 so long as water is evolved (Hirzel, J1852 419) Plantamour directed to pass NH, over cold HgO, then to heat to 150° in NH,, and finally to remove unchanged HgO by HNO, Aq, Hirzel found that HNO, Aq reacts with Hg, N, Mercury nitride is a brown powder, very explosive, but requires a higher temperature, or a stronger blow, than nitrogen iodide to explode it Hg₃N₂ is not acted on by cold dilute H SO, Aq, the hot acid decomposes it Conc H.SO, reacts energetically and explosively Conc HNO, Aq forms Hg(NO,), and NH, NO, dilute HNO, Aq forms a white powder, HClAq forms HgCl2 and NH,Cl Mixed with KOH and heated, NH, and Hg are formed Moist Hg, N, is slowly decomposed by light, in water it is

changed, after 24 hours, to a white powder
Mercury, oxides of Two oxides of Hg are
known, Hg₂O and HgO, it is doubtful whether Hg₂O has been obtained free from Hg and HgO Neither oxide has been gasified, and the mol w

of neither is known with certainty

MERCUROUS OXIDE Hg.O (Suboxude, or black oxude, of mercury) This oxide is prepared by adding NaOHAq or KOHAq to solution of a mercurous salt, or to HgCl suspended in water The best salt to use seems to be HgNO, it should be dissolved in water with a very little HNO, the solution being made dilute, ppn with KOHAq, and washing with cold water, should be performed in the dark, and the black pp should be dried in the dark without heating Guibourt (A Ch [2] 1, 422) says that Hg₂O cannot be obtained quite free from Hg and HgO, this is confirmed by Bruns a O Pfordten (B 21, 2010), who assert that Hg₂O oxidises to HgO at the ordinary temperature Barfoed (J pr [2] 38, 441) says that the product of the action of NaOHAq on mercurous salts is a mixture of Hg, Hg, O, and HgO in varying proportions The descriptions of Hg2O probably apply to Hg.O mixed with more or less Hg and some HgO

Mercurous oxide is a black powder, S G 10 69 (Herapath, P M 64, 321), 8 95 (Karsten, S 65, 894) H.F [Hg²,O] = 24,860 (Thomsen, Z P C 2, 21) Hg₂O is decomposed very easily by light or heat, giving HgO and Hg, strongly heated gives Hg and O Dilute HClAq produces Hg₂O is soluble in cone acetic acid With dilute acids Hg,O generally yields mercurous salts, with H,PO,Aq it gives H,PO,Aq and Hg Bolled with KIAq, Hg and HgI, 2KIAq are formed (Berthemot, J Ph 14, 189) cone. NH ClAq, NH, is evolved and Hg and HgCl, are produced (Pagenstecher, R. P. 27, 27,

Thompson, P. M [8] 10, 179)

Mercuric oxide HgO. (Red oxide of mercury Red precipitate) Mol w unknown, as compound has not been gasified S G 11 074 at 17 5° (Herapath, P M 64, 321), 11 186 to 11 344 at 4° (Playfair a Joule, C S Mem 3, 84, and C J 1, 137), 11 29 at 4° in vacuo (Le Royer a Dumas, in Bottger's Tabellarische Uebersicht der Spec Gewichte der Körper, Frankturt, 1837) S H 19°-52° = 053 (Kopp, T 155, 71), 5°-98° = 0518 (Regnault, A Ch [3] 1, 129) HF [Hg,O] = 22,000 (Thomsen, Z P C 2, 21) Crystallises in rhombic forms a b c = 6523 1 9456 (Nordenskjold, P 114, 621), in monoclini forms, according to Des Cloiseaux (A Ch [4] 20, 201) CE (0°-100°) 0058 (Playfair a Joule, O J 1, 187)

HgO was known to the Arabians in the eighth century, Geber prepared it by calcining the nitrate, and towards the end of the seventeenth century Boyle obtained it by strongly heating Hg in air

Formation —By heating Hg to near its B P in a loosely covered vessel for a long time

Preparation -1 Hg is dissolved in HNO, Aq, the solution is evaporated to dryness, the residue is powdered and then heated on a sand tray so long as N oxides are evolved, the temperature being slowly raised, and the heating continued till a porcelain plate held over the vessel shows a slight deposit of Hg HgO thus prepared a slight deposit of Hg HgO thus prepared forms red lustrous scales —2 One of the oxy chlorides 2HgO HgCl2, and the oxychloride 4HgO HgCl2, when treated with KOHAq, give red HgO, another oxychloride 2HgO HgCl2, and also the oxychloride 3HgO HgCl,, give yellow HgO by treatment with KOHAq The compound 2HgO HgCl, which yields rcd HgO is prepared by mixing 1 vol KHCO₃Aq, free from K₂CO₃, saturated at 15°, with 3 vols HgCl,Aq, also saturated at 15°, stirring with a glass rod till black streaks appear where the rod rubs the glass, pouring off, adding a fresh quantity of the The com mixed solution, and again stirring pound 2HgO HgCl₂ which gives the yellow HgO is prepared by stirring a mixture of 1 vol KHCO₂Aq, saturated at 15°, with 6 to 10 vols HgCl₂Aq, also saturated at 15° The compound 4HgO HgCl₂ is prepared by mixing 1 vol HgCl2Aq (saturated at 15°) with a large excess (4 to 6 vols) KHCO, Aq (saturated at 15°), and allowing to stand for some time (cf Mercury, oxychlorides of, p. 223)—3 Hg(NO,), Aq, or HgCl₂Aq, is poured into KOHAq, the pp is thoroughly washed and dried at 100°-120° HgO thus prepared forms a yellow compact solid

Properties.—HgO exhibits allotropy, it forms heavy, red, crystalline scales, or a somewhat more bulky, amorphous, yellow powder (v supra) HgO is a violent irritant poison HgO is very slightly soluble in water, 1 pt dissolves in 200,000 cold water, or in 125,000 pts if the water is boiled with HgO and then allowed to cool (Wallace, Chem Gazette, 1858, 345) The solution has a metallic taste Heated to redness, Hg is separated into Hg and O Heated below the temperature of decomposition, HgO turns black, but recovers its original colour on cooling. HgO is slowly blackened and decomposed to Hg and O by the action of light There are differences in the reactions of Ol, HgOl, in

| alcoholic solution, and oxalic acid, with the two
varieties of HgO (v. Reactions, Nos. 8, 9, 10)
Reactions — 1 Decomposed by heating to

redness, giving Hg and O, Pelouze (C R 16, 50) said that yellow HgO is decomposed at a lower temperature than the red variety, but this was not confirmed by Gay Lussac (C R 16,309), nor by Millon (B J 27, 112) Carnelley a Walker (C J 53, 80) found that HgO, ppd by NaOHAq from HgCl2Aq, began to give off O at a little above 175°, and that evolution of O became rapid at c 415°, at which temperature red HgO was formed and decomposed. Myers's results (obtained by measuring vapour pressures of O from HgO, B 6, 11) agree with those of C a Debray (C R 77, 123) found that when a tube containing HgO was sealed, and the whole tube was heated to 440°, the O evolved was almost wholly again absorbed -2 A mixture of HgO with such easily oxidised bodies as P, S, Sb, detonates when heated more or less violently Some organic compounds are oxidised by boiling in solution with HgO SO2Aq boiled with HgO produces SO,Aq and Hg SnCl,Aq forms SnCl,Aq and Hg — 3 HgO is decomposed, rapidly and somewhat violently, by heating with magnesium, in the ratio HgO Mg, with formation of MgO and Hg (Winkler, B 23, 128) —4 Heated with sodium, Na amalgam and the compound Na₂O HgO are formed (Beketoff, B 13, 2392), the compound Na₂O HgO is not decomposed by heat, but very quickly by water -5 HgO dis solves in molten potash If the KOH is nearly saturated with HgO, allowed to cool slowly, and lixiviated with a little cold water, a heavy violet crystalline powder and a lighter greyish green powder are obtained The violet powder is said to consist of KO HgO, and the greyish powder to contain from 2 to 5 pc K,O, the SG of K₂O HgO is 1031, it is decomposed at high temperatures, also by continued washing with water, but less completely by alcohol (St Meunier, C R 60, 557) —6 According to Fouberg (A Ch [4] 1, 300), saturated solutions of the alkali and alkaline earth haloid compounds are decom posed, with separation of alkali or alkaline oxides, by boiling with HgO (cf Melsens, A Ch [3] 26, 220, and H Rose, P 107, 298) André, however, says that boiling saturated solutions of alkaline earth chlorides react with HgO to form either oxychlorides xHgCl, yHgO, or compounds of HgO with the alkaline chloride (C R 104, 431, v Mercury oxychlorades of, p 223, and also unfra, Combinations, No 1) According to Jehn (Ar Ph [3] 1, 97), HgO boiled with KIAq produces KOHAq and the double iodide HgI2KI -7 HgO reacts with most acids to form mercuric salts HgX_2 (X = NO_3 , $\frac{1}{2}SO_4$, $\frac{1}{3}PO_4$, &c) -8 The reaction of chlorine with HgO differs according to the conditions, and the variety of HgO used Cl scarcely reacts with red crystalline HgO, with yellow HgO, prepared by ppn and dried at c 100°, Cl reacts energetically forming HgCl₂ and O, with the yellow oxide, dried at 300° and cooled, Ol reacts more slowly, forming Cl₂O and HgCl₂, or, if water be present, forming HClOAq and HgO HgCl₂ (of vol 11 pp 12,16) -9 An alcoholic solution of mercuric chloride heated with yellow HgO at once produces black oxychloride HgO HgOl2, the same oxychloride is formed from the red variety of HgO only after prolonged action of boiling alcoholic HgCl₂ solution—10 Oxalic acid solution reacts with yellow HgO, to form oxalate, in the cold, but the red variety is unchanged when

boiled with H2C2O4Aq

Combinations — 1 With alkaline earth chlorides, obtained by the reaction of HgO with solutions of CaCl₂, BaCl₂, and SrCl₂ The compounds 2HgO CaCl₂4H₂O, HgO BaCl₂6H₂O, and HgO SrCl₂6H₂O, are described by André (C R 104, 431) — 2 With ammonia, to form 2HgO NH₂ H₂O = NHg₂OH 2H₂O, this compound reacts with soids as a base forming dimercuri ammonium salts (v Mercuram Montum compounds, p 206)

Mercury, oxybromide of 8HgO HgBr₂
= Hg₄O₃Br₂ (Basic mercuric bromide) A
yellow, crystalline, powder, obtained by boiling
HgBr₄A with HgO, filtering, and allowing to
crystallise, or by partial ppn of HgBr₂Aq by
KOHAq, and boiling the liquid in contact with
the pp (Lowig, P 14, 485, cf Rammelsberg,
P 55, 248)

For H F of oxybromides of Hg v André, Bl

[2] 41, 274

Mercury, oxychlorides of Hg.O_yCl. (Basic mercury chlorides) Several oxychlorides of Hg are known, they are produced by the reaction of HgO with HgCl,Aq, by partial ppn of HgCl,Aq by KOHAq or NaOHAq, by mixing KHCO₃Aq and HgCl,Aq in different proportions, and by the reaction of Cl with yellow HgO

and by the reaction of Cl with yellow HgO

Millon (A Ch [3] 27, 253) described oxychlorides obtained by mixing solutions of KHCO, (free from K,CO,) and HgCl, both saturated at 15° (1) 2HgO HgCl, by adding 1 vol KHCO,Aq to 6-10 vols HgCl,Aq, also by adding 1 vol KHCO,Aq to 3 vols HgCl,Aq, stirring till ppn begins on the sides of the vessel, pouring off the liquid, adding a fresh quantity of the same mixture, and stirring again The compound obtained by the first process forms a red non crystalline powder, and yields yellow HgO when acted on by KOHAq, as obtained by the second process, the compound is a heavy, black, lustrous solid, which yields red HgO with KOHAq (ii) 3HgO HgCl, by mixing equal volumes of the solutions of KHCO, and HgCl, and allowing to stand, a golden yellow crystalline pp, yielding yellow HgO with KOHAq (iii) 4HgO HgCl, by mixing 1 vol HgCl,Aq with 4-6 vols KHCO,Aq, and allowing to stand, a brown crystalline solid, which yields red HgO with KOHAq

Roucher (A Ch [3] 18, 372) described seven oxychlorides, containing HgCl₂ and HgO in the ratios 1, \frac{1}{2}, 2, 3, 4, 5, and 6, each oxychloride exists, according to Roucher, in two varieties, one derived from and giving red HgO, the other derived from and giving yellow HgO, some of the oxychlorides also exhibit other differences Roucher described 15 different oxychlorides. A tabular statement showing the other differences between the oxychlorides is given by Roucher

André (O R 104, 431) described two oxychlorides, HgCl, 8HgO and 2HgCl, 8HgO, obtained by dissolving HgO in boiling CaCl,Aq and MgCl,Aq, respectively, and pouring the solutions into large quantities of cold water.

The oxychlorides of Hg have been examined more recently by Thümmell (Ar. Ph. 27, 589, v.

abstract in C J 56, 1050) f. says that only 5 definite compounds exist, viz, HgO 2HgCl₂, HgO HgCl₂, 2HgO HgCl₂, 3HgO HgCl₂, and HgO HgCl., 2HgO HgCl., 3HgO.HgCl., and 4HgO HgCl., (1) HgO 2HgCl. is formed in all solutions prepared by dissolving HgO in HgCl.Aq, but it is readily decomposed, it is HgO HgCl₂, 4HgO HgCl₂ best prepared by heating at 100° 1 pt HgO (red or yellow), with 10 pts HgCl₂, and 60 pts water, stirring till no further separation of a yellow powder occurs, washing, drying, and then washing with ether (free from alcohol) to remove HgCl₂ Walm water separates 2HgO HgCl₂, NaOHAq ppts rcd HgO (11) HgO HgCl₂ has NaOHAq ppts rcd HgO not yet been obtained pure (iii) 2HgO HgCl₂ exists in two varieties, (a) red variety, obtained by mixing solutions of NuHCO, and HgCl₂ in the ratio 2NaHCO, HgCl, (b) black variety, obtained by heating the red variety when dry, or by adding HgO to hot HgCl, Aq, or by mixing equivalent quantities of red HgO and HgCl, in cold water, or by treating 3HgO HgCl, with cold HgCl₂Aq (iv) 3HgO HgCl₂ is a yellow pp obtained by adding alkaline carbonate (normal or acid) to HgCl,Aq, avoiding excess of the carbonate, also by treating freshly ppd yellow HgO with HgCl Aq (this preparation is yellow and yields yellow HoO with KOHAq), also by treating washed red HgO with HgCl Aq (this preparation is reddish yellow and yields red HgO by KOHAq) (v) 4HgO HgCl, is obtained as a brown amorphous powder, by adding KHCO₃Aq to HgCl₂Aq, in the ratio 30 to 35 KHCO, HgCl, it is also obtained, as reddishbrown crystalline plates, by shaking HgCl Aq with red HgO in the ratio HgCl, 6HgO, both varieties give yellow HgO by KOHAq All these oxychlorides yield sublimates containing HgCl and HgCl when heated

For H F of oxychlorides of Hg v André, Bl

[2] 41, 274

Mercury, oxycyanides of, v. Cyanides, vol.

n p 342

Mercury, oxyfluoride of HgO HgF₂H₂O. (Basic mercuric fluoride) A yellow crystalline solid, obtained by dissolving freshly ppd HgO in HFAq, and digesting the solution with HgO, or evaporating the solution (Finkener, P 110, 628) The oxyfluoride is also obtained by heating HgF₂2H₂O (q v p 210) to 30° (F) Heated above 100°, the oxyfluoride gives off HO and HF, it is decomposed by water with separation of HgO

Mercury, oxynodide of 3HgO HgL. (Basic mercuric vodule) A yellowish brown solid, obtained by melting together HgO and HgL. in the ratio 3HgO HgL., also by digesting HgL, with dilute KOHAq (Rammelsberg, P 48, 182)

Mercury, oxysulphides of Oxysulphides of Hg have been described, but according to Polleck (B 22, 2859) none has been isolated, and the existence of any is very improbable Mercury, phosphide of No phosphide of

Mercury, phosphide of No phosphide of Hg has been isolated with certainty By passing P hydride, prepared by boiling amorphous P with KOHAq, into HgCl₂Aq, several compounds have been obtained Aschan (Chem Zeitung, 10, 82, 102) describes a yellow compound 3Hg₂P₂,7HgCl₂, a red compound 4Hg₃P₂,5HgCl₂, and a black compound Hg₂P₂HgCl₂. A compound probably 2PH, 6Hg₂O is said by Aschan (Le) to be formed by passing P hydride over Hg₂CO₂. The pra-

when P hydride is passed into Hg(NO₂),Aq are probably mixtures of different compounds of Hg, P, and HNO_s (A) Most of the foregoing compounds are readily decomposed,

some explosively, by warming

Mercury, salts of Hg forms two series of salts, mercurous salts corresponding with Hg2O, and mercuric salts corresponding with HgO The former are obtained sometimes by dissolving Hg₂O in acids, sometimes by dissolving Hg in acids and digesting with excess of Hg, and in some cases by double decomposition from the nitrate, the mercuric salts are obtained by dia solving HgO or HgCO, in acids, or by double decomposition from the nitrate. The mercurous salts have the composition HgX, where X = NO₃, 2SO, &c , the mercuric salts have the composition HgX2 The mercuric salts are more stable, as a class, than the mercurous salts mal mercurous salts are generally decomposed by water into a basic salt, which separates, and an acid salt, which goes into solution Many basic salts and a large number of double salts are known The salts of Hg, as a class, act as violent and irritating poisons The principal salts of Hg are the following (v Carbonates, Ni The principal TRATES, SULPHATES, &c) antimonates, arsenates and -ites, bromates, carbonates, chlorates and perchlorates, chromates, rodates and periodates, molybdates, nitrates and ites, phosphates, selen ates and -ites, sulphates and -ites, tantalates,

throsulphates, tungstates, vanadates
Mercury, selenide of HgSe Small quan tities of more or less pure HgSe occur native in the Harz, accompanying PbSe HgSe 18 produced by strongly heating together Hg and Se, and subliming at a higher temperature, forms grey, metal like, lustrous laminæ, dis solved by aqua regia with formation of Hg selenite, slowly changed to the same compound by boiling cone nitric acid (Uelsmann, A 116, 126, cf Little, A 112, 211) HgSe is also formed by passing H2Se for a long time into HgCl2Aq, the white pp of 2HgSe HgCl, at first produced is changed to black HgSe S G of natural HgSe 18 7 1 to 74, SG of artificially prepared HgSe

IS 8 877

Combinations -1 With mercuric chloride, to form 2HgSe HgCl₂, a white pp formed by adding H₂Se, or K₂Se, to excess of HgCl₂Aq -2 With mercuric oxide, to form 2HgSe HgO, a black powder formed by treating 2HgSe HgCl₂ with NaOHAq Decomposed by heat, yielding sublimates of HgSe and Hg (Uelsmann, A 116,

Mercury, selenosulphide of A mineral approaching the composition HgSe 4HgS is found near San Onofre in Mexico, it is known as onofrite

Mercury, selenocyanides of. HgSeCy and Hg(SeCy)2, v vol n p 348

Mercury, silicofluorides of Two are known, Hg₂S₁F₄ 2H₂O and HgS₁F₆ 6H₂O

MERCUBOUS SILICOFLUORIDE, Hg2S1F4 2H2O Olear prismatic crystals, obtained by dissolving Hg.CO. in H.SiF.Aq, evaporating, washing with a little water, and pressing between paper (Finkener, P. 111, 246, of Berzelius, P. 1, 200).

MERCURIC SILICOFLUORIDE, ? HgS:F, 6H,O. Obtained by dissolving HgO in H₂SiF₆Aq, eva porating till yellow needles (HgSiF₆ HgO 3H₂O) begin to separate, and then allowing to stand at a temperature not above 15° Forms clear, colourless, rhombohedral crystals, very un stable, deliquescent in air, and efflorescent over H,SO,, composition doubtful (Finkener, P 111, 246) The compound HgSiF, HgO 3H,O (Finkener) was described by Berzelius (P 1, 200) as the normal salt

Mercury, sulphides of Two are known, Hg2S and HgS, the latter reacts towards the alkalı sulphides as an acidic sulphide, it also combines with many Hg compounds to form

double compounds

MERCUROUS SULPHIDE, Hg,S This sulphide is best prepared, according to Berzelius, by dropping mercurous acetate solution into Na or NH, sulphide solution (cf Brande, Q J S 18, 292) HgNO₈Aq should not be used, as the HNO₃ produced oxidises the Hg₂S Hg₂S is a black powder, easily decomposed by heat to HgS and Hg According to Barfoed (Bl [2] 3, 183) the substance described as Hg₂S always contains some Hg, however it may be prepared

MERCURIC SULPHIDE, HgS Mol w uncertain H F [Hg,S] = 8,220 (Thomsen, Z P C 2, 21) This compound exists in two forms a black amorphous pp, and a red crystalline body

known as vermilion or cinnabar

Occurrence - In Illyria, Spain, Bohemia, Ural mountains, China, Japan, Mexico, California, Chili, and Peru

Formation —1 By rubbing or heating to gether 1 pt S and 61 pts Hg -2 By adding H₂S, or an alkaline sulphide, to solution of a mercuric salt -3 By digesting Hg with an al kaline polysulphide -4 By subliming a mixture

of S and HgO or HgSO.

Preparation -1 Amorphous black mer curic sulphide is prepared by passing excess of H,8 into slightly acidined HgCl,Aq or Hg(NO_s),Aq, washing the pp thoroughly with dilute HNO_sAq and then with water, and drying at a low temperature -2 Red crystalline mercuric sulphide (vermilion) is prepared in different ways (a) A mixture of 6 pts Hg and 1 pt S is heated till combination occurs (attended generally with production of heat and light and partial projection of the mass), the product is powdered, mixed with a small quantity of S, and heated for some hours in a hard glass flask, sunk in sand in a wind-furnace, the flask is loosely closed by a charcoal stopper and is arranged so that the upper part is kept com paratively cold, red HgS sublimes on to the neck of the flask The HgS is purified by grind ing, boiling with KOHAq, and washing with water (b) Black amorphous HgS is heated with an alkaline persulphide This may be done by triturating 100 pts Hg with 38 pts 8 for some hours, till black HgS is produced, heating with 25 pts KOH in 130-150 pts water to 45°-50° for several hours (the water being replaced as it evaporates, and the mass being stirred from time to time) until reddening begins, after which the temperature is maintained at 45° till the whole is bright red The red HgS is washed, and any Hg present is removed by levigation (Brunner, P. 15, 598, of. Doberemer, S 61, 380; Firmenich, D P J 172, 370, Liebig, A 5, 289, 7, 49, Raab, N R P 24, 39) (c) HgCl₂Aq is poured into excess of dilute NH₂Aq, to the pp of NH₂HgCl thus produced is added conc Na₂S₂O₂Aq in quantity rather more than sufficient to dissolve the pp, and the whole is heated for some time to 70°-80° (Hausmann, B 7, 1746) For details of the manufacture of Vermilion v Dictionary of Applied Hermistry—8 Colloidal mercuric "ulphide, soluble in water, is obtained by ppg a dilute solution of a mercuric salt by H₂S, and washing with water of dilute H₂SAq for a long time (Winssinger, Bl [2] 49, 452)

Properties -The black sulphide is an amorphous, heavy powder, heated in a closed vessel, it yields a sublimate of red HgS, heated in air, Hg sublimes and SO₂ is formed, it is not acted on by dilute acids. The red sulphide crystallises in hexagonal forms, $a c = 1 \ 1 \ 145$, SG 81 to 899, polarises light, blackens by exposure to light (v Heumann, B 7, 750), heated to the sublimation temperature, red HgS is changed to the black variety (Fuchs, P 31, 581) Mitscherlich (A 12, 168) found V D of HgS at 670° to be 85 3, V and C Meyer found VD at 1560° to be 78, the formula HgS requires V D 116, a mixture of Hg+Hg+2S requires V D 773 The red sulphide reacts with acids The colmore slowly than the black variety loidal sulphide is soluble in water, forming a solution which is black and opaque when cone, but brown, with a greenish tint by reflected light, when dilute, a very dilute solution may be boiled till all H2S is expelled, or kept for some time, without change

Reactions -1 Heated in a closed vessel, HgS sublimes -2 Heated in air, SO2 is formed, and Hg sublimes -3 Heated with solid alkahs or alkaline carbonates, Hg sublimes and alkaline sulphide remains—4 Heated with eron, tin, antimony, copper, sinc (and some other metals), a metallic sulphide and Hg are produced, HgS is decomposed by heating with finely divided Cu and water (v Heumann, B 7, 1388, 1486) -5 Digested for some time with sodine in KIAq, HgS is decomposed with formation of HgI, 2KI and separation of S (Wagner, J pr 98, 23) -6 HgS is decomposed to Hg and SO, by heating with lead monoxide, Pb being separated .- 7 HgS is scarcely attacked by dilute acids, conc nitric acid produces Hg(NO₃) mixed with HgSO₄, HNO, Aq S G o 12 produces a white compound 2HgS Hg(NO,)2 -- 8 According to Bolley (A 75, 239) HgS is at once decomposed by an ammoniacal solution of silver nitrate, with forms tion of a mercurammonium salt and Ag.S -9 HgS is insoluble in caustic soda or sodium monosulphide solution, but it dissolves in a mixture of the two, ie in sodium hydrosulphide solution This solution contains a sulpho-salt (sulpho-hydrargyrate of sodium) The solution is readily obtained by adding KOHAq to ppd HgS, and passing in H₂S (excess of H₂S causes reppn of HgS) On evaporation, white crystals HgS K₂S 5H₂O separate, mixed with KOH, these crystals are decomposed by water (Weber, P 97, 76, of Brunner, P 15, 596) By ppg HgCl_Aq with NH, sulphide, and adding KOHAq, a solution is obtained, which, on evaporation, yields KCl, and then a sulpho- salt mixed with KOH. Vol. III.

According to Schneider (P 127, 488) the crystals of the sulpho-salt, when kept for some years in KOHAq, form six sided, lustrous, olive green tablets having the composition 2Hg8 K₂S

Combinations—1 With alkah sulphides, v

supra, Reactions No 9—2 Forms a compound with hydrogen sulphide, 31HgS H₂S Produced in solution by passing H₂S into HgS suspended in boiled water (Linder a Picton, C J Proc 1890 49) -3 With cuprous chloride to form 2HgS Cu2Cl2, a yellow solid, obtained by boiling HgS with CuCl.Aq and HClAq, and removing S by $_{1}$ CS. $_{2}$ (?3HgS + $_{2}$ CuCl. $_{2}$ = 2HgS Cu. $_{2}$ Cl. $_{2}$ + HgCl. $_{2}$ + S) This compound is decomposed by boiling cone HClAq with evolution of a little H₂S and forms tion of Cu₂Cl₂ and HgCl₂ in solution, dilute hot H2SO4Aq has no action, but with boiling cone H₂SO₄, HCl and SO₂ are evolved and a compound of HgSO, and HgS is formed NaOHAq produces NaCl, HgS, and Cu_2O (v Heumann, B 7, 1390) 4 With mercuric chloride, and also with mercuric bromide, to form compounds 2HgS.HgX₂ (X = Cl or Br) These sulphohaloid compounds are formed (a) by passing H2S into excess of HgCl₂Aq or HgBr Aq, (b) by digesting freshly ppd HgS with boiling HgCl₂Aq or HgBr₂Aq (H Rose, P 13, 59), (c) by adding HCl (or HBr), or solution of a metallic chloride (or bromide), to HgS dissolved in mercuric acetate solution (Palm, C C 1863 120), (d) by heating HgS with 8-10 parts HgCl₂ or HgBr₂, till the whole melts, and washing the cold mass with boiling water (Schneider, P 115, 167) The compounds are yellow white crystalline powders, decomposed by slow heating to HgS and HgX, decomposed by alkalı solutions, but not by HNO.Aq or H.SO.Aq (of Barfoed, J pr 93, 230) -5 With mercuric sodule to form the sulpho nodide HgS HgI,, a yellow solid ob tained by digesting HgI, with less H,SAq than suffices for complete decomposition (H. Rose, P. 13, 59), also by ppg HgO and Hgl, in HClAq by a small quantity of H₂S (Rammelsberg, P 48, 175), also by saturating HgI₂ in HIAq with H₂S, and diluting (Kekulé) Palm (C C 1863 121) says that the yellow red pp obtained by adding HIAq, or a solution of an alkalı iodide, to HgS dissolved in mercuric acetate solution, has the composition 2HgS HgI,-6 With mercuric fluoride, to form the sulphofluoride 2HgS HgF₂, obtained by passing a little H₂S into HgF₂ dissolved in HFAq (H Rose, P 13, 59) —7 With mercure sulphate, to form several the chief of which are compounds, (2) HgSO, 2HgS, and (3) These compounds are obtained, HgSO, HgS, HgSO, 3HgS (1) by treating red HgS with warm H2SO.Aq Palm, J 1862 220), (2) by treating 2HgS HgNO. (obtained by passing a little H₂S into Hg(NO₃)₄Aq) with H₂SO₄Aq (Barfoed, J 1864 282, Kessler, A Ch [2] 6, 61ō), (3) by adding H₂S₄O₈Aq to Hg(NO₂)₂Aq and removing S by washing with CS₂ (Spring, A 199, 116, Wacken roder, A 60, 190) -8 With mercuric nutrate, to form 2HgS Hg(NO₃)₂, a white solid, obtained by passing a little H₂S into Hg(NO₃)₂Aq, or by digesting freshly ppd HgS with Hg(NO₃)₂Aq. by HNO.Aq or alkalı nitrate solution (H Rose, Barfoed, Palm, Le)

By heating HgS with HNO.Aq, S.G. 1 2, to 120° in a closed tube, Gramp (J pr [2] 14, 299) obtained a white crystalline mass of 6HgS HgO 2Hg(NO_s)₂ 1.2H₂O

MMP MERCURY COMPOUNDS, ORGANIC Mercury forms compounds with two identical alcohol radicles, or with one alcohol radicle and one acid residue Compounds of mercury with two different alcohol radicles appear to split up at the moment of their formation, eg 2HgEtMe = HgMe₂ + HgEt₂ (Frankland, A 111, 57)

Mercury dimethide Hg(CH₃), Mercury dimethyl Mol w 230 V D 8 29 (cale 7 97) (93°-96°)

Formation —1 When mercury is exposed with MeI to sunlight for a week, crystalline CH₂HgI is formed (Frankland, A 85, 361) When this body is distilled with KOH, hime, or KOy, mercury dimethide passes over as a heavy liquid which may be purified by washing with water and rectifying over CaCl₂ (Buckton, Pr 9, 91, A 108, 103) —2 By the action of sodium-amalgam on MeI (10 pts) in presence of acetic ether (1 pt) (Frankland a Duppa, C J 17,415,

A 130, 105)

Properties — Colourless oil, with faint but mawkish taste Insol water, v sol alcohol and ether Dissolves phosphorus, resins, and caout chouc Very inflammable, burning with a bright flame

Reactions - 1 Iodine forms CH₃HgI and methane Bromine acts in like manner -2 SnCl, forms a crystalline compound which is decomposed by water with formation of CH₂HgCl -8 Conc HClAq gives methane and CH₂HgCl -4 Conc H₂SO₄ gives methane and (CH₂Hg)₂SO₄ -5 PCl₃ gives CH₂HgCl -6. KMnO₄ oxidises it to CH₂Hg OH (Seidel)

Mercuric chloro-methide CH, HgCl [1709] (Seidel, J pr [2] 29, 135) S G 4 063 (Schröder, B 12, 563) Formed from HgMe, by the action of HCl Lamins

Mercuric codomethide CH, HgI [143°] From MeI and Hg in sunlight (Frankland) Formed also by heating HgMe2 with HgI2 Small nacreous lamins (from ether), insol water, m sol alcohol, v sol ether and MeI Slightly volatile, emitting an unpleasant odour, and leaving a persistent nauseous taste May be sublimed.

Mercuric nitromethide CH₂ HgNO₂ [1007] From an alcoholic solution of CH₂ HgI and AgNO₂ Nacreous lamine, v sol water, sl sol alcohol Its solution is not ppd by KOH or baryts water, but HCl and soluble chlorides ppt CH₂HgCl (Strecker, A 92, 79)

Mercuric acetomethide CH, Hg.OAc [143°] Obtained by heating HgMe, with acetic acid at 180° (Otto, Z. [2] 6, 25) Thin tables,

with very offensive odour, nearly insol boiling water and cold HOAc

Mercurse chloro-methylo rodide CH₂Cl HgI [129°] Obtained by boiling CH₂I HgI with alcoholic HgCl₂ (Sakurai, C J 41, 360) Silky plates (from alcohol) Decomposed by rodine into methylene chloro rodide and HgCl₂

Mercuric todo methylo-todide CH₂I HgI [109°] Formed by leaving mercury and a little mercurous rodide in contact with methylene rodide in a sealed tube for several days (Wanklyn a Von Than, C J 12, 258, Sakurai, C J 37, 658) White crystals (from CH₂I₂), insol water, cold alcohol, ether, chloro form, EtI, and benzene, sl sol boiling alcohol, v sol methylene rodide When heated with rodine dissolved in aqueous KI it is decomposed into CH₂I₂ and HgI₂ Chlorine and bromine act in like manner When heated with HClAq it is reduced to CH₂ HgI

D1-mercuric methyleno-ds-sodide CH₁(HgI)₂: [c 230°] Obtained by exposing a mixture of an ethereal solution of methylene iodide with a little HgI, and an excess of mercury to sunlight (Sakurai, C J 39, 487) I ormed also by the action of mercury on CH I HgI Yellowish crystalline powder, insol all ordinary solvents, sl sol hot methylene iodide When heated with dilute HClAq or with KIAqit yields CH₂ HgI Iodine forms HgI₂ and methylene iodide

Mercuric methenylo-trs-todide CH(HgI), From iodoform, mercury, and alco hol, by exposure to sunlight (Sakurai, C J 39, 488) Yellow mass, insol ordinary solvents and in CH₂I₂. Gives iodoform when treated with iodine

Mercurie diethide HgEt. Mol w 258 (159°) SG 246 VD 997 (cale 94) Strecker (C R 39, 57, A 92, 97) by acting on I tI with mercury obtained the compound EtHgI Dun haupt (Chem Gaz 1854, 263, A 92, 879) obtained the corresponding EtHgCl and LtHgBr by decomposing bismuth triethide with HgCl, or HgBr. Buckton (A 109, 218, C J 16, 17) obtained HgEt, by the action of ZnEt, on HgCl, and, lastly, Frankland and Duppa showed that mercuric diethide can be more easily obtained by the action of sodium amalgam on EtI in presence of acetic ether. The acetic ether remains in undiminished quantity at the end of the process, but nevertheless its presence is essential

Preparation — Ethyl nodide (10 pts) is mixed with EtOAc (1 pt) and poured upon pc sodium amalgam, the flask being shaken and cooled in water. When separation of NaI has rendered the liquid pasty it is distilled off from a water bath and shaken with fresh amalgam Finally it is mixed with water, and the oil dried over CaCl, and rectified.

Properties - Transparent colourless liquid, with faint ethereal odour, insol water, sl sol, alcohol and ether Very poisonous Burns with smoky flame Takes fire in chlorine.

Reactions.—1 Acts violently on bromine and todine, forming EtHgBr and EtHgI (Buckton, A 112, 220)—2 Alcoholic HgCl₂ forms EtHgCl. 3 Cone HClAq forms ethane and EtHgCl—4 H₂SO₄ gives ethane and (EtH_C)₂SO₄—5. Sedium forms a bulky grey spongy mass, which

takes fire in air and violently decomposes when | heated -6 Heated with finely granulated zinc it yields ZnEt, and mercury (Franklanda Duppa, C J 17, 29) Cadmium forms CdEt, Bismuth gives BiEt, -7 Mercuric ethide is decomposed when heated at 150° with copper, iron, silver, or gold, but ethides of these metals are not formed 8 KMnO, forms EtHgOH - 9 When heated with PCl_s it forms PEtČl₂—10 Iodoform at 90° gives acetylene and ethylene (Suida, M 1, 716)

Mercuric chloro-ethide EtHgCl [190°] (Seidel) SG 348 Formed by the action of HgCl2 on BiEt2, by 'reating HgEt2 with alcoholic HgCl₂, and by the action of HgCl₂ on ZnEt₂ Ppd by adding NaCl to an aqueous solution of EtHgNO, with HCl Obtained also by treating EtHgOH Light iridescent laminæ (from al cohol) Nearly insol water, sl sol ether, v sol boiling alcohol Sublimes at 40° With Ag CO. it gives (EtHg)₂CO₃, which crystallises with difficulty and is easily decomposed by heat and by acids Ag₃PO₄ gives a very soluble phosphate (Dunhaupt)

Mercuric iodomethide EtHgI Formed by the action of mercury on EtI in diffused daylight Decomposed by direct sunlight (Strecker, A 92, 75) Shining laminæ, insol water, sol alcohol and ether Sublimes at 100° Dissolves without change in aqueous NH₃ or KOH

ZnEt, it yields ZnI, and HgLt,

Mercuric ethylo hydroxide EtHgOH Obtained by adding moist Ag O to a boiling al coholic solution of EtHgCl, filtering, and evapo rating in vacuo Strongly alkaline liquid, which V sol water blisters the skin Decomposes ammonium salts with expulsion of NH3 It does not liberate KOH or MgO from their salts, but it ppts salts of Al, Zn, Sn, Cu, Au, and Pt a large excess of H2S it forms a white pp turning through orange to black With metallic zinc it forms ZnEt, With acids it forms crystalline salts, eg HCl yields EtHgCl

Mercuric bromo ethide EtHgBr Mercuric ethylo bromide Formed from BiEt, and HgBr2, or by treating EtHgOH with HBr (Dun-

haupt, A 92, 379) Resembles EtHgCl

Mercuric ethylo cyanide EtHgCy Formed by saturating an alcoholic solution of EtHgOH with HCy Crystallises readily, v sol alcohol and ether Very volatile Gives off a repulsive odour when heated

Mercuric ethylo nitrate EtHgNO, Mercuric nitro ethide From EtHgI and AgNO. Colourless prisms, v e sol water, m sol alcohol

(Strecker)

Mercuric ethylo sulphate (EtHg), SO. Formed from EtHgCl and Ag2SO, Shining

laminæ (from alcohol)

Mercuric ethylo sulphide (EtHg)28 Obtained by adding ammonium sulphide to an alcoholic solution of EtHgCl Yellowish white powder, v sol alcohol, ether, and CS₂ The al coholic solution is decomposed by evaporation, leaving HgS

EtHgOAc Mercurio ethylu-acetate Obtained by dissolving HgEt, in HOAc [178°]

(Otto, Z 1870, 25)

Mercuric dipropyl HgPr, (190°) (0); (180°) (Schtscherbakoff, J R 13, 353) S G 12 2 214 Formed by the action of propyl iodide on sodiumamalgam in presence of acetic ether (Cahours,

C. R 76, 133, 1383) Oil, sl sol alcohol, v sol. With iodine and bromine it forms proether ducts which may be crystallised from alcohol The effect of small additions of HgPr2, of $Hg(C_4H_9)_2$, of $Hg(C_5H_{11})_2$, and of $HgPh_2$ on the freezing point of ethylene bromide has been

studied by Louise and Roux (C R 107, 600) Mercuric di isobutyl Hg(CH₂Pr)₂. (206°) Obtained by treating a mixture SG 1-1835 of isobutyl iodide and acetic ether with 2 pc sodium amalgam (Cahours) Colourless liquid Iodine forms CH, Pr HgI, whence Ag, O forms CH. Pr HgOH Bromine acts in like manner

Mercuric di isoamyl $Hg(C_5H_{11})_2$ SG \circ 1 666 From isoamyl iodide (5 pts), acetic ether (1 pt), and sodium amalgam (Frankland a Duppa, A 130, 110) Colourless oil, decomposed on distillation even in vacuo May be distilled with steam Insol water, v sl sol alcohol, v sol ether With chlorine it forms dense fumes of $C_aH_{11}HgCl$ It reacts with great violence with bromine and iodine With an alcoholic solution of HgCl₂ it readily forms C₃H₁₁HgCl [86°], which crystallises from alcohol in hair like needles An ethereal solution of $Hg(C_5H_{11})_2$ treated first with an alcoholic solution of iodine and then with solid iodine forms isoamyl iodide and C,H,,HgI [122°], which crystallises from alcohol in pearly scales With zine at 130° C₃H₁₁HgI forms zine isoamyl and zinc amalgam

Mercuric di octyl $H_g(C_gH_{17})_2$ S G 17 1 342 Prepared by the action of sodium amalgam on octyl iodide in presence of a little acetic ether (Eighler, B 12, 1880) Liquid Insol water, sol alcohol, ether, and C_bH_b Decomposes at 200° into Hg and hexadecane (dioctyl)

Mercuric octylo rodide C,H,HgI white Prepared by the action of an alco holic solution of iodine on mercury dioctyl

Mercuric octylo chloride C_sH₁₇HgCl White pp Prepared by the action of mercuric

chloride on mercury dioctyl

Mercuric octylo-hydroxide C.H.,HgOH [75°] Prepared by the action of silver oxide on an alcoholic solution of mercury dioctyl (Eichler, B 12, 1881) Yellow leaflets Insol cold, sl sol hot, water, v sol alcohol Alkalıne

Mercurio allylo-todide C,H,HgI [135°] 8 (CS₂) 187 at 49° Formed by shaking allyl nodide with mercury, and extracting the resulting vellow mass with hot alcohol or ether (Zinin, A It is best 96, 363, cf Linnemann, A 140, 180) to mix the allyl iodide with an equal volume of alcohol (Oppenheim, B 4 670) Silvery scales, which turn yellow on exposure to light, especially on arying It even turns yellow in the dark Sublimes at 100° Sl sol cold alcohol, nearly insol water Decomposes above its melting point AgNO₃ added to its alcoholic solution ppts all the iodine as AgI Moist Ag₂O ppts AgI, and the filtrate on evaporation leaves a strongly alkaline syrupy mass which forms salts with acids HI easily decomposes it, forming HgI, and propylene Icdine forms HgI, and allyl iodide (Linnemann, A 133, 133, Suppl 3, 262) PBr, acetyl chloride, and BzCl have no action on mercury allyl iodide On shaking it with a solution of ZnEt, in ether an energetic reaction sets in, the products being mercury, ZnI2, diallyl, and HgEt2. A solution

of KCy acts quickly in the cold, forming diallyl, mercury, HgCy2, and KI, if in distilling off the diallyl the distillation is not stopped in time an explosion occurs Aqueous KI at 100° forms mercury, diallyl, and KHgI_s The mercury allyl compounds attack the skin, producing blisters which appear after the lapse of 7 hours The compound C₃H₅HgCl obtained by the action of HCl on the hydroxide is sparingly soluble (Krasowsky, Z 6, 527)

Mercuric propargyl iodide CaHaHgI From propargyl 10dide and mercury (Henry, B 17, 1132) Small yellowish crystalline masses

diphenyl $Hg(C_6H_5)_2$ Mercuric SG 2318 Formed by heating a (above 300°) mixture of bromo benzene, benzene, HgCl₂, and sodium (Michaelis a Reese, B 15, 2876) Presodium (Michaelis a Reese, B 15, 2876) Prepared by boiling for some time a solution of bromo-benzene (10 pts) in an equal volume of xylene with 2 7 p o sodium amalgam and a little acetic ether (1 pt) The product is recrystallised from benzene (Dreher a Otto, Z [2] 4, 685, 6, Small white needles or prisms, 9, A 154, 93) turning yellow in daylight Insol water, v sol chloroform, CS,, and benzene, m sol ether and boiling alcohol May be sublimed Partly decomposed on distillation into mercury, diphenyl, benzene, and charcoal

Reactions -1 Dry HCl gives benzene and HgCl₂. HI, nitric acid, HBr, and H₂SO₄ act in like manner—2 When melted with sulphur (2 at) the products are HgS and phenyl mercaptan —3 Iodine (2 at) in alcoholic or CS₂ solution forms PhHgI and iodobenzene Excess of nodine forms HgI, and nodo benzene -4 Chlorine forms PhHgCl and chloro benzene. Br acts in like manner -5 Glacial acetic acid yields benzene and PhHgOAc -6 Aluminium forl at 130° forms AlEt, [230°] (Friedel a Crafts, A Ch [6] 14, 460) —7 Alcoholic HgCl₂ at 100° gives PhHgCl -8 When boiled with sodium, benzene and sodium amalgam are formed -9 SO₃ gives mercuric benzene sulphonate (Otto, Jpr [2] 1, 179) -10 Allyl wodide forms diallyl, diphenyl and PhHgI (Suida, *M I 715*) -11 C.H.SO.cl at 160° forms C.H.SO.c.H. and PhHgCl (Otto, *B* 18, 246) -12 COCI CO.Et forms phenylglyoxylic ether (Claisen a Morley, B 11, 1596) 18 When oxidised by KMnO₄ the hydroxide PhHgOH is probably first formed, but on adding HCl this is changed to PhHgCl (Seidel, J pr [2] 29, 134, Otto, J pr [2] 29, 136)

Mercuric phenylo chloride CaH, HgCl Mercuric chlorophenylide [250°] Obtained by slowly passing chlorine over HgPh2 or into its solution in CS, Prepared by heating HgPh, with HgCl, in alcoholic solution at 110° metric tables (from benzene) May be sublimed. SI sol alcohol and benzene, insol water

Mercuric phenylo-bromide C.H.HgBr [275°] Resembles the preceding in preparation and properties Br forms HgBr, and bromobenzene When heated with an alcoholic solution of K.S the products are KBr, HgS, and HgPh.

Mercuric phenylo-rodide C.H.HgL. [266°] From HgPh, and I in alcohol Satiny tables (from alcohol benzene) Insol water, nearly insol. cold alcohol, ether, and benzene, m. sol. hot benzene and chloroform, v. sol. CS.

May be partially sublimed Sodium amalgam reduces it in alcoholic solution to HgPh,

Mercuric phenylo hydroxide C.H.HgOH. From PhHgCl by boiling with alcohol and moist Ag₂O White trimetric prisms (from alcohol), sol boiling water, alcohol, and benzene, sl sol cold water Softens at 160°, but is not melted at 200° The aqueous solution is alkaline in reaction Expels NH, from its salts, ppts alumina from alum, and absorbs CO₂ from the air

Mercuric phenylo cyanide PhHgCy. [204°] From HgPh, and HgCy, in alcoholic solution at 128° Long slender trimetric prisms, v sl sol boiling water, m sol boiling alcohol and benzene Cone HClAq at 120° forms HgCl, formic acid, benzene, and NH₃ Alcoholic KOH forms mercury, benzene, and potassium cyanate Iodine forms PhHgI and ICy H2S forms HgS, benzene, and HCy

Mercuric phenylo-sulphocyanide PhHgSCy [227°] From HgPh and Hg(SCy). Silky plates, sol boiling alcohol

Mercuric phenylo-nitrate PhHgNO. [c 167°] From PhHgCl and AgNO, in alcohol Trimetric silky plates, v sl sol boiling water Conc HClAq gives benzene and mercuric nıtrate

Mercuric phenylo carbonate (PhHg)2CO3 From PhHgCl and Ag2CO3 Small white needles, sl sol boiling water, m sol boiling alcohol and benzene Not decomposed on fusion

Mercuric phenylo-formate
PhHgO CHO [171°] From HgPh, and concentrated formic acid Small tables

Mercuric phenylo acetate PhHgOAc. [149°] Obtained by boiling HgPh, with excess of HOAc, ppg with water, and crystallising from hot water Radiate groups of prisms, sl sol cold, m sol hot, water, m sol alcohol and benzene. Decomposed by distillation yielding diphenyl, benzene, Ao₂O, HOAo, carbon, and mercury Boiling aqueous HCl forms benzene, HgCl2, and HOAc Other mineral acids act in like manner Sodium amalgam reduces it in alcoholic solution to benzene Iodine, acting on its aqueous solution, forms HgI2, iodo benzene and HOAc H2S forms HgS, benzene, and HOAc

Mercuric phenylo-propionate PhHgOC, H,O [c 166°] From HgPh, and boil ing propionic acid Crystals, sol hot water, alcohol, and benzene

Mercuric phenylo-myristate
PhHgOC₁₄H₂₇O From HgPh₂, myristic acid, and alcohol at 120° Small scales, sol boiling alcohol and benzene Boiling HClAq splits it up into HgCl2, benzene, and myristic acid (Otto, J pr [2] 1, 179).

Mercuric tetra-methyl-di-amido-di-phenyl (NMe, C.H.), Hg [169°] Formed by the action of sodium amalgam in presence of EtOAc on p-bromo-di-methyl-aniline dissolved in xylene (Schenk a Michaelis, B. 21, 1501) Colourless orystalls, turning green in air Crystallises from benzene with C.H. (1 mol.) V e sol chloroform, and benzene, v si sol. alcohol and ether Mercuric di-o-tolyl Hg(C.H.Me), [107°].

From o bromo toluene sodium-amalgam, and

acetic ether (Ladenburg, A 178, 162). Large | or CS2) Not affected by air or light Insol. triclinic tables (from benzene)

Mercuric o-tolylo-chloride
[2 1]C₆H₄Me HgCl o Tolyl-mercuric chloride
[146°] Formed by treating mercuric di o tolyl with HgCl, in ethereal solution (Michaelis a Genzken, A 242, 180) Needles, v sol chloroform, m sol alcohol and benzene, sl sol ether and petroleum ether Sublimes with partial de composition

Mercuric m-tolylo-chloride

[3 1]C₆H₄Me HgCl [160°] Obtained by boiling (C₆H₄Me)₃SbHgCl₂ with alcohol (M a G) Needles (from alcohol), v sol chloroform and benzene, m sol alcohol H₂S passed into its

alcoholic solution ppts HgS

Mercuric di-p tolyl Hg(C,H,Me), [238°] Formed from p bromo toluene, sodium amalgam, and EtOAc (Dreher a Otto, A 154, 171, Ladenburg, A 173, 163) Needles or tables, insol water, sl sol cold alcohol, m sol hot benzene, CS2, and CHCl3 May be distilled Boiling conc HClAq gives toluene and HgCl₂

Mercuric p tolylo chloride

C.H.Me HgCl [187°] Small tables (Otto, J pr

[2] 1, 185)

Mercuric p tolylo rodide C.H.Me HgI [220°] From mercuric di p tolyl and iodine Trimetric satiny tables, insol water, sl sol boiling alcohol, m sol hot benzene May be May be sublimed

Mercuric p tolylo-acetate

C.H.Me HgOAc [153°] Small trimetric prisms, nearly insol cold water, al sol boiling water, m sol alcohol Behaves like the corresponding phenyl compound

Mercuric di-p xylyl (C₆H₃Me₂)₂Hg Prepared by the action of sodium amalgam on bromo p xylene (Jacobsen, B 14, 2112) prisms, sol CS2, chloroform, and benzene, sl sol.

alcohol and ether

Mercuric di-m-xylyl [1 3 4] (C₆H₅Me₂)₂Hg [170°] From bromo m xylene and 2 p c sodium amalgam by heating at 145° for 12 hours (Weller, B 20,1718) Slender felted needles, sl sol ether, alcohol, and cold benzene, v sol hot benzene Boiling HClAq gives HgCl2 and m xylene forms CaHaMeaPCl, (257°) and CaHaMeaHgCl

Mercuric di n-propyl-di phenyl Hg(C,H,Pr)2. [110°] From Br C.H. Pr [14] and sodium-amalgam (R Meyer, J pr [2] 34, 103) Long

ncedles

Mercuric di cymyl Hg(C10H13), Formed by heating a mixture of bromo cymene with xylene and sodium amalgam with addition of a little acetic ether (Paternò a. Colombo, B10, 1749) Long slender needles, m sol boiling alcohol, benzene, and xylene

Mercuric di pentamethyl-phenyl Hg(C_eMe₅)₂. From bromo - pentamethyl - benzene, chloroformic ether, and sodium-amalgam (Jacobsen, B 22, 1220) Prisms (from xylene), v sl sol alcohol and ether, v sol hot xylene

Mercuric di-naphthyl $\operatorname{Hg}(C_{10}H_7)_2$ Mol w [243°] SG 193 (Schröder, B 12, 564) Formed by boiling (a) brome naphthalene with several times its volume of crude xylene, pasty sodium-amalgam, and a little acetic ether for 19 hours, and filtering while hot (Otto a. Möries, A 147, 164, Z [2] 3, 877, 4, 162). Small minute, trimetric prisms (from benzene

water, sl. sol boiling alcohol, cold benzene or ether, m sol hot CS, chloroform, and benzene Decomposed by heat Cone HIAq forms HgI, and naphthalene HCl and HBr act in a similar Iodine forms HgI2, C10H, HgI, and ultimately CleH.I It does not react with HgOl.

Mercuric naphthylo-bronide

 $C_{10}H,HgBr$ [196°] From $Hg(O_{10}H,)_2$ and bromine Formed also by heating $Hg(O_{10}H,)_2$ with $HgBr_2$ Needles, insol water, sol hot alco-

Mercuric naphthylo iodide C19H,HgI [185°] From mercuric di naphthyl and iodine (1 mol) in CS2 Soft sating needles or dendritie Not altered by light, insol water, al sol hot alcohol and benzene Sodium-amalgam converts it into mercuric di naphthyl

Mercuric naphthylo acetate C_{1e}H,HgOAc [154⁵] Formed, together with naphthalene, by heating mercuric di naphthyl with excess of HOAc Small needles (from alcohol), insol water, v sol hot HOAc, alcohol, CS₂, benzene, and chloroform, m sol ether Hot HClAq gives naphthalene and HOAc Sodium amalgam acting on its alcoholic solution forms naphthalene and HOAc Water at 140° has no action

Mercuric naphthylo butyrate C₁₀H, Hg OC₄H,O [200°] Very slender needles, sol hot water

MESACONIC ACID C.H.O. s.c. CH, C(CO.H) CH CO.H Mol w 130 [202°] CH₁ C(CO₂H) CH CO₁H Mol w 130 [202³] 2 6 at 14°, 3 4 at 22° (Baup, A 81, 97) S (90 p c alcohol) 30 6 at 17°, 95 7 at 78° (P), (88 p c alcohol) 38 at 22° (B) R_∞ 46 9 in a 3 69 p c aqueous solution (Kanonnikoff, J pr [2] 31, 349) Heat of solution -5493 Heat of combustion 27,334 (Gal a Werner, Bl [2] 47,159) H C 479,063 (Louguinine, C R 106, 1291)

Formation -1 By boiling a dilute solution of citraconic acid for half an hour with onesixth of its volume of nitric acid Mesaconic acid is deposited on cooling (Gottlieb, A 77, 268, Pebal, A 78, 129, Baup, A 81, 96) -2 By boiling citric acid with cone HIAq or HBrAq (Kekulé, A Suppl 2, 94, Fittig, A 188, 77, 80). 8 By heating a conc aqueous solution of itacome or citracome acid at 180° to 200°, CO, and an empyreumatic oil being also formed (Swarts, Bull Acad. Royale Belgique, [2] 36, No 7) 4 From citra- and mesa di bromo pyrotartario acids by heating with KI and copper at 150° (Swarts, Z 1868, 259)—5 The mono-anilde is heated with (3 mol of) KOH and a little water for 11 hours in the water bath The aniline separates out and is removed by means of ether, the acid being ppd by means of SO_4H_2 (Anschütz, A 254, 136)—6 'Oxy-tetric acid,' which is formed from methyl aceto aceto acid by succes sive treatment with bromine and alcoholic potash (Demarcay, A Ch [5] 20, 473), is identical with mesaconic acid (Gorboff, J R 1887, 605, Cloez,

Bl [3] 3, 598, 602)
Preparation —By evaporating a mixture of citraconic anhydride (10 pts), water (22 pts), and cone HNO_s (8 pts), until red fumes begin to appear The product is crystallised from water (Fittig, A. 188, 73)

Properties - Slender needles (from water) or

prisms (from alcohol), sl sol cold, v sol hot, V sol alcohol and ether May be sublimed without decomposition Its molecular weight, determined by Raoult's method, is identical with that of citraconic and of itaconic acid (Paternò, B 21, 2157) Mesaconic acid is slightly coloured by FeCl₃, and the solution when boiled yields a brown gelatinous pp which re dissolves on cooling The addition of more FeCl, prevents its re dissolving Neutral solutions of mesaconates give a brown pp with FeCl_s, insoluble in excess of the reagent or when

Reactions -1 Conc HIAq at 160° forms pyrotartaric acid —2 Sodium amalgam also re duces it to pyrotartaric acid The same reduc tion may be effected by zinc dust (Bottinger, B 9, 1821) -8 Bromine has no action in the cold (difference from citraconic acid) but above 60° it combines, forming mesa di bromo pyrotartario acid [170°] (Kekulé, A Suppl 2, 85)—4 Chlorme passed into water in which mesaconic acid is suspended forms a solution which when eva porated leaves chloro cutramalic acid C₅H,ClO, (chloro oxy pyrotartaric acid) The same acid is formed, together with tri chloro acetone, by passing chlorine into an aqueous solution of sodium mesaconate -5 Does not combine with HBr in the cold, but by prolonged heating with HBrAq at 100° or 140° it is converted into citra bromo pyrotartaric acid, an acid that is formed also by the union of HBr with citraconic acid in the cold -6 When repeatedly heated with fuming HClAq at 160° it is converted into citra chloro pyrotartaric acid [130°], which is decomposed by boiling water into HCl and mesaconic acid (Swarts) —7 The electrolysis of potassium mesaconate yields, at the positive pole, CO, and allylene (Aarland, J pr [2] 6, 256, 7, 142) – anhydride has not been obtained (Petri, B 14, 1636) - 9 On evaporating a solution of the andine salt water is not eliminated from the molecule (difference from citraconic acid)

Salts -NH,HA" S 125 at 15° Very small prisms -BaA" 4aq monoclinic crystals more sol water than barium citraconate and ıtaconate (Petri, B 14, 1634) —BaH₂A"₂2aq pearly hexagonal plates —CaA"aq S 6 at 20° Very small needles, insol alcohol —PbA" 1 aq deposited in the cold as a crystalline pp, v sl sol water - PbA"aq deposited from a hot solu tion as an amorphous pp —PbH₂A"₂ (dried at 100°) Small needles — (HO Pb)₂A"₂ ppd by adding lead subacetate to a solution of sodium mesaconate (Otto, A 127, 182) — CuA" 2aq — Ag₂A" crystalline pp, sl sol water —AgHA" needles, m sol hot water

Methyl ether Me.A" (205° 1 V) S 8 at $^{\circ}$ S G $^{15}_{1}$ 1 1254, $^{\circ}_{3}$ 1 1138 MM 1 154 at $^{\circ}$ $^{\circ}$ $^{\circ}$ $^{\circ}$ $^{\circ}$ $^{\circ}$ $^{\circ}$ $^{\circ}$ (Gladstone), 1 4570 at 17° (Knops, A 248, 195), $\mu_{\rm H}$ 14813 at 16° (Gladstone) From the acid, MeOH, and HCl (Perkin, C J 39, 556)

Ethyl ether (229° 1 V) SG 15 1051, 20 1089 (Perkin), 20 10468 (Knops, A 248, 196) MM 1168 at 25° μ_D 14483, μ_R 14727 at 16° (Gladstone, cf Knops) Formed by the action of alcohol and HCl on mesaconic and on sitraconic acids

Chloride C₂H₄(COCl)₂ (80° at 17 mm).

Prepared by the action of PCl, on mesaconic acid or citraconic anhydride (Petri, B 14, 1634). Colourless liquid

 $Amide C_3H_4O_2(NH_2)_2$: [177°], colourless

flat crystals, sol water

Anilide C,H,O,(NHPh)₂ [186°], flat white
sliky needles, sol alcohol and ether, sl sol Heated to 268° it decomposes into aniline and citraconenil (the phenylimide of citraconic acid) (O Strecker, B 15, 1639)

Mono anilide C₃H₄(CO₂H)(CONHPh). [158°] Formed by heating citraconic anhydride with aniline at 170°, rectifying in vacuo the re sulting phenylimide (172° at 12 mm), dissolving it in baryta water, ppg excess of barium by CO, and then adding HCl (Anschutz, A 254, 133). Identical with the product which separates from an aqueous solution of acid aniline citraconate White powder on standing Converted by heating in a sealed tube with KOH into mesaconic acid

Constitution - Mesaconic acid stands to citra conic acid in the same relation that fumaric stands to maleic acid This is shown by their behaviour towards Br, HBr, and aniline, and by the physical constants of their ethers Hence mesaconic acid is methyl fumaric acid, while citraconic acid is methyl makic acid The constitution of mesaconic acid will there fore be known as soon as that of fumaric acid has been satisfactorily determined (v Maleic

MESA-DI BROMO PYROTARTARIC ACID v. DI BROMO PYROTARTARIC ACID

TRIMESIC ACID C,H,O, 1 e

 $C_bH_3(CO_2H)_3[1\ 3\ 5]$ Benzene s tri carboxylic 0 [c 325°] HCv 768,500 HF 285,400 (Stohmann, acid Mol w 210 HCp 767,600 Kleber & Langbein, J pr [2] 40, 140)

Formation -1 By the oxidation of mesi tylene or mesitylenic acid by chromic acid mix ture (Fittig, A 141, 153) -2 By the oxidation of uvitic acid (Baeyer, Z 1868, 119, Fittig, A 147, 301), and of s tri ethyl benzene (Jacobsen, B 7, 1435, Friedel a Balsohn, Bl [2] 34, 636) by chromic acid mixture -3 One of the pro ducts obtained by heating hydromellitic or iso hydromellitic acid with cone H2SO4 (Baeyer, A Suppl 7, 40, 48) —4 By heating mellitic acid with glycerin (Baeyer, A 166, 340) —5 In very small quantity by fusing the corresponding bromo benzene sulphonic acid with sodium formate (Bottinger, B 7, 1781) -6 By fusing benzene s trisulphonic acid with KCy, and sa ponifying the resulting nitrile with KOH (Jack son a Wing, Am 9, 347) -7 From di sodium salicylate C,H,(ONa) CO,Na by heating in a cur rent of carbonic acid, converting the resulting C_bH₂(OH)(CO₂H)₃ into C_sH₂Cl(CO₂H)₃, and re ducing with zinc and dilute acids —8 By the polymerisation of propiolic acid, which takes place to some extent when it is exposed for some weeks to sunlight, air being excluded (Baeyer, B 19, 2185) -9 Trimesic ether is formed by the action of sodium upon a mixture of ethyl formate and ethyl acetate, formyl acetic ether HCO CH2 CO2Et is probably first formed and subsequently condensed (Piutti, B 20, 537) When mixtures of methyl formate and ethyl acetate. or of ethyl formate with methyl acetate

are used a mixture of ethyl and methyl trime sates is obtained

Properties - Colourless prisms (from water) partially sublimes before melting M sol cold water and ether, v sol hot water, v e sol When distilled with lime it yields benzene

Salts —NaH,A" plates, sl sol cold water —Na,A" —KH₂A'" needles, sl sol cold water — Ca,A",2q nodules — Ba,A",aq (dried at 150°) needles, almost insol cold, v sl sol boiling (difference from mesitylenic acid) -BaH₄A'''₂4aq slenuer hair like needles, sl sol cold water — Zn₃A'''₂2aq glittering prisms, almost insol cold water — Cu₃A'''₂aq (dried over H₂SO₄) Pale blue pp —Ag₂A''

Methyl ether Me₃A''' [143'] Small silky

needles HF 249,500 (Stohmann, J pr [2] 40,

Ethyl ether Et,A" [133°] Prepared by adding a mixture of formic and acetic ethers by drops to twice the amount of ether, in which sodium is placed. On adding dilute H SO, an oil is obtained, which gives a blue violet colour with FcCl3, and on standing in a desiccator de posits crystals of trimesic ether (Wislicenus, B 20, 2930) Long glistening prisms A mixture of this ether and the preceding in equal propor tions melts at 105° to 110°

Sulpho trimesic acid Amide

CoH2(SO NH2)(CO2H)3 Formed by oxidising the amide of either of the sulpho mesitylenic acids with KMnO, (Jacobsen, A 206, kH₂A''' 2aq crystalline mass, m sol water Conc HClAq at 210° gives trimesic acid, NH₃, and $\rm H_2SO_4$ Potash fusion gives oxy trimesic **sc**id

Occurs in coal tar oil (Fittig a Wackenroder, A 151, 292, Jacobsen, A 184, 179, B 9, 256, 10, 855) It is also one of the products of the manufacture of oil gas (Armstrong, C J 49, 74) Occurs in all kinds of petroleum (American, Russian, &c) (Engler, B 18, 2234)

Formation -1 By distilling acetone with H,SO₄ (Kane, P 44, 474, Hofmann, C J 2, 101, Cahours, C R 24, 255, C J 3, 17) — 2 By the action of H_2SO_4 on allylene (Fittig a Schrohe, B 8, 17) -3 By treating toluene with MeCl in presence of AlCl, y cumene being also formed (Friedel a Crafts, A Ch [6] 1, 461,

Ador a Rilliet, B 12, 329)

Preparation -1 By mixing 180 g acetone with 300 g sulphuric acid, allowing to stand for an hour, then distilling gently, using a current of steam at the end of the operation The yield is 40 g (Varenne, Bl [2] 40, 266) -2 H₂SO₄ (2 vols) diluted with water (1 vol) is slowly added to a mixture of crude acetone (2 vols) and sand After 24 hours the mixture is distilled The oil thus obtained is washed with aqueous NaOH and rectified (Fittig a Bruckner, A 147, 42) -8 The fraction of coal tar oil boiling between 160° and 168° is agitated with H2SO4 and the resulting sulphonic acids converted first into Ba salts and then into Na salts The Na salts are then treated with PCls, and the resulting chlorides converted into amides by NH₃Aq . On crystallising from alcohol, the v cumene sulphonamide separates first, and then mesitylene sulphonamide The mesitylene sulphonamide is then heated with cone HClAq at 160° (Jacob sen) -4 The sulphonic acids of ψ cumene and of mesitylene may also be separated by heating

with HClAq at 100° for 1 hour, when mesitylene sulphonic acid is decomposed into mesitylene and H,SO, while ψ cumene sulphonic acid is not affected (Armstrong, B 11, 1697) -5 When steam is passed through a heated solution of mesitylene sulphonic acid in dilute H2SO4, hydrolysis into mesitylene and H,SO, begins as soon as the temperature reaches 100° (Armstrong a Miller, \hat{C} J 45, 148)

Properties —Light oil
Reactions —1 Br and Cl form crystalline substitution products -2 Fuming HNO3 mixed with fuming H₂SO, forms 4ri nitro mesitylene. 3 Boiling dilute HNO₃ oxidises it to mesitylenic acid and uvitic acid (Fittig, A 141, 142) — 4 K₂Cr₂O, and H₂SO₄ yield acetic acid (Fittig) 5 KMnO, oxidises it to uvitic and trimesic acids (Jacobsen, A 184, 191) -6 When heated with AlCl, in a current of HCl it yields MeCl and m xylene, toluene, and benzene (Jacobsen, B 18, m xylene, toluene, and behinden (Jacobsen, B 13, 342) -7 MeI in presence of AlCl, yields (1, 2, 4, 5) tetra-methyl benzene (durene) (Barbier a Roux, Bl [3] 2, 4) -8 Benzyl chloride and AlCl, at 100° form benzyl mesitylene (q v) 9 Benzoyl chloride in presence of aluminium chloride forms phenyl tri methyl phenyl ketone C_sH₃ CO C_sH Me, [36°] and the compounds (C_sH₃ CO)₂C_sHMe, [117°] and (C_sH₃CO)₃C_sMe, [215°] (Louise, A Ch [6] 6, 200) —10 PCl, at 180° gives a small quantity of C_sH₃(CH₂Cl)₃ (Colson a Gautier, Bi [2] 45, 6) —11 Mestylene is very readily attacked by halogens In the dark, mono- di- or tr. (eso) bromo mesitylene (C₆H₂Me₃Br, C₆HMe₃Br, and C₆Me₃Br₃) are formed according as 1, 2, or 3 mols of bromine are em ployed Chlorine acts similarly The presence of iodine, though not required, does not effect At the boiling point the bromine, the reaction as usual, enters the side chains, 1 mol Br forming ω bromo mesitylene (mesityl bromide) C_e(CH_s)₂CH₂Br melting at [38°] Direct sun shine, which usually acts like heat, in the case of mesitylene, owing to the great tendency to dis placement of the nucleal hydrogen, produces a different result, (eso) mono brome mesitylene is first produced but is partly attacked by the rest of the bromine forming the liquid $p \propto di$ bromo mesitylene (p bromo mesityl bromide) C₆H₂(CH₃),Br(CH₂Br) [5 3 4 1] If eso bromo mesitylene be exposed to further bromination in sunshine, the reaction proceeds normally, pioducing $p \omega$ di bromo mesitylene (as above), and, on further action, $p \omega_1 - \omega_2$ tri bromo mesitylene $C_0H_2(CH_3)Br(CH_2Br)$, [5 4 3 1] melting at [122°] (Schramm, B 19, 212) —12 When a 10 pc solution of mesitylene in CS2 is mixed with a similar solution of chromyl chloride CrO, Cl, a pp (C,H3Me2)(CrO2Cl2) is obtained which when decomposed by water yields dimethyl benzoic aldehyde (221°), which is oxidised by air to mesitylenic acid (Etard, C R 97, 909) —13 The diacetyl derivative of ortho formic aldehyde (1 pt) mixed with mesitylene (1 pt) and HOAc (10 pts) condenses on adding a mixture of HOAc (10 pts) with an equal volume of H₂SO₄, and after 24 hours crystals of (O₆H₂Me_{s/2}CH₂ [130°] separate The formation of this body may be used as a test for mesitylene, a mixture of methyl alcohol and CrO, in HOAc being used instead of CH₂(OAc)₂ (Baeyer, B 5, 1094, 6, 220)

Constitution.—The explanation of the for.

mation of mesitylene by condensation of acetone was first given by Baeyer (A 140, 306) That the three methyls are symmetrically situated in the benzene nucleus would appear from the existence of only one mono-derivative derived by displacing an atom of hydrogen in the nucleus, eg there is only one nitro mesitylene A systematic proof of the symmetry of mesitylene has been given by Ladenburg (A 179, 163) He prepares in succession C₆Me₂(NO₂)(NO₂)H, C₆Me₃(NO₃)(NH₂)H, C₆Me₃(NO₃)(NH₂)(NO₂), and C₆Me₃(NO₂)H(NO₂) Since the last dinitromesitylene is identical with the first, the second and third hydrogen atoms are similarly situated in the nucleus Again, from the above nitro in the nucleus Again, from the above nuro mesidine $C_8Me_s(NO_s)(NH_s)H$ Ladenburg obtained $C_8Me_s(NO_s)HH$ and, by reducing this, mesidine $C_8Me_s(NH_s)HH$ Nitro mesidine, obtained by nitrating $C_8Me_s(NH_s)HH$, must be either $C_8Me_s(NH_s)(NO_s)H$ or $C_8Me_s(NH_s)H(NO_s)$ But since it has been shown that the second and third storms of hydrogen are similarly situated third atoms of hydrogen are similarly situated, these two formulæ are identical And since the nitro mesidine is found to be identical with the C₈Me₃(NO₂)(NH₂)H prepared from the dintro mostylene C₈Me₃(NO₂)(NO₂)H, it follows that the first and recond atoms of hydrogen are similarly situated Hence all three atoms of hydrogen are similarly situated, and the formula will be C.Me.H. [1 3 5]

Mesitylene hexahydride C,H18 2 C C6Me1H Obtained by heating mesitylene with PH I at 280° (Baeyer, Z [2] 5, 320, A 155, 273) Oil, smelling like petroleum Converted by pro longed heating with fuming HNO, into tri nitro

mesitylene

Formation —1 Together with urea, by ing alloxan or alloxanic acid with baryta -1 Together with urea, by boil resulting Ba salt is recrystallised and decom posed by H.SO, (Liebig a Wohler, A 26, 298, Svanberg, B J 27, 165, Deichsel, B B 1864, 587) -2 By treating amido malonic acid with iodine and water (Baeyer, A 131, 298) -3 By boiling di bromo malonamide CBi (CO NH2), with precipitated Ag₂O (Freund, B 17, 782) —4 By boiling di bromo malonic acid with baryta water (Petrieff, J. R. 10, 72) -5 By heating caffuric acid with concentrated aqueous lead subacetate (E. Fischer, A. 215, 283)

Properties - Very deliquescent prisms, melt ing without loss of aq M sol alcohol and ether, v e sol water Its concentrated aqueous solution decomposes above 80° into CO2, gly collic, oxalic, and glyoxylic acid (Bottinger, A 203, 138) With acetates of Ba and Pb it gives flocculent pps gradually becoming crys talline In neutral solutions CaCl, and BaCl, give pps It reduces hot ammoniacal AgNO,

Reactions -1 H.S passed into an aqueous solution to which silver oxide has been added forms thio glycollio acid CH2(SH) CO2H and thio di glycollic acid (sulphido diacetic acid) S(CH₂ CO₂H)₂ (Bottinger) -2 Sodrum amalgam acting on its dilute aqueous solution forms tar tronic acid CO₂H CH(OH) CO₂H - 3 Silver mes oxalate boiled with water yields CO₂, oxalio and, and silver —4 Urea at 100° gives allantom C₄H₆N₄O₃ —5 Hydroxylamine yields the oxim which is identical with nitroso malonic acid

Salts — [A" = C,O,] — (NH,),A" granular crystals turning red in air (Deichsel, cf Engel, C R 98, 628) -(NH,), A"aq Obtained by evaporation in vacuo over H₂SO₄—Needles (Petrieff)—Na₂A"aq thin laminæ, v sol water—CaA"aq white pp insol dilute acetic acid—CaA"4aq (dried at 100°) (Petrieff)—BaA"aq (dried at 110°). White crystalline powder, v sl sol water—BaA"1½aq—BaA" (dried at 180°)—(HO Pb)₂A" nearly insol water —Ag₂A"aq amorphous pp changing to minute needles Explodes when heated

Ethyl ether Et. A"aq. From the silversalt and EtI. Oil.

D: acetyl derivative of the ethyl ether (CO₂Et)₂C(OAo)₂ [145°] From the ether (1 mol) and AcOl (2 mols) at 100° (P) Long needles Partially decomposed by fusion and by solution in water

Dr acetyl derivative C(OAc),(CO₂H)₂ [180°] From (CO₂Et)₂C(OAc)₂ and dilute alcoholo KOH Needles Its alkaline salts are v sol water, its silver salt Ag₂C,H₈O₈ is an insoluble powder

Amide C(OH)2(CONH2)2. Deliquescent

tables, which turn red in the air

Phenyl-hydrasıds PhHN₂C(CO₂H)₂ [158°-164°] From mesoxalıo acıd and phenyl hydrazıne hydrochloride in dilute acid solution (Elbers, **A** 227, 355)

Phenyl hydraside of the Nitrile
PhHN₂ C(CN)₂ [135°] May be formed from
the oxim phenyl hydrazide of glyoxylyl cyanide
HO N CH C(N₂HPh) CN by dissolving in POCl₃,
heating with PCl₃, pouring into ice, and treating
the crystals with ether and alkali (Von Pech
mann a Wehsarg, B 21, 3001) Yellow needles
(from ether ligroin) Turns brown at 126°
Sol hot water, alkalis, and the usual menstrus
Conc H₂SO₄ forms a blood red solution net
changed by FeCl₂ On warming with conc
HClAq it forms yellow needles of C₅H₈N₄O
[215°.

MESOXALIC ALDEHYDE CHO CO CHO
Oxim HON CH CO CH NOH or

ON CH CO CH₂ NO v DI NITROSO ACETONE

Mesoxalic semi aldehyde *CHO CO CO₂H Glyoxylyl carboxylic acid

Diphenyl hydraside

CH(N,HPh) C(N,HPh) CO,H [203°] From dibromo pyruvic acid in aqueous solution and phenyl hydrazine hydrochloride (Nastvogel, A 248, 87) Reddish yellow needles (from hot alcohol), almost insol water, sl sol ether and chloroform, v sol hot alcohol, acetone, benzene and HOAc Dyes wool and silk yellow Cold cone H₂SO₄ forms a dark red solution from which it is ppd by water unaltered

Dip tolyl hydrazide CH(N₂HC₆H₄Me) C(N₂HC₆H₄Me) CO₂H [188°] Formed in like manner Golden needles (from benzene) Its alkaline salts are v sol hot, sl sol cold, water

Nitrile *CHO CO CN v Glyoxylyl

cyanide

Mesoxalic bromo semi aldehyde

™CBrO CO CO₂H

Methyl ether of the oxim
CBiO C(NOH) CO₂Me [c 170°] From dimethyl di bromo pyrrole di carboxylate and
HNO, at -18° (Ciamician a Silber, B 20,
2601) Crystalline, sol alcohol, m sol cold
water, insol petroleum ether Decomposed by
fusion and by boiling with water

MESOXALYL-UREA IS ALLOXAN See also its compounds with METHYL ANILINE, NAPHTHYL

AMINE, and PYRROLE

META Use of this prefix applied to mor game compounds, for Meta-acids and Meta salts with a solds or salts to the name of which Meta-is prefixed. Thus Meta-phosphoruc acid will be found under Phosphoruc acids, and Meta stannates under stannates, a subdivision of the artials Tre.

Names of organic bodies beginning with 'meta' will be found under the word to which 'meta' is prefixed

METACETONE The mixture obtained by distilling sugar with quicklime, called metacetone by Fremy (A Ch [2] 59,6), is composed according to E Fischer a Laycock (B 22, 101) of propionic aldehyde, di methyl-furfurane, and hydrocarbons

METACETONIC ACID An old name for

Propionic acid

METALBUMIN v PROTEIDS, Appendix C METALDEHYDE v Aldehyde

METALLIC ACIDS In the article Acids (vol 1 p 47, cf Classification, vol 11 pp 201, 202), it is shown that compounds of H with certain negative elements or groups of elements react with metallic oxides, hydroxides, and car bonates, in presence of water, to produce sub stances composed of metal, and the elements of the hydrogen compound excepting the H or a part of the H Such hydrogen compounds are The negative elements which are called acids found intimately combined with H in acids are fluorine, chlorine, bromine, iodine, oxygen, sul phur, selenion, tellurium, carbon always enters into the composition of those negative groups of elements which combine with H or with H and other elements to form acids Only a few acids are binary compounds, the greater number are compounds of H with two or three other elements, among which are always found at least one of the eight negative elements enumerated above, or at least one of the negative carbon containing groups of elements By far the greater number of the more stable and definite acids are com posed of H combined with non metallicelements, but some acids have been isolated which are composed of H combined with metals and one or more of the eight strongly negative elements already enumerated, or one or more of the car bon containing negative groups of elements The following table gives the composition of most of those acids which contain metallic elements -

Metallic acids H,AsO, (?H₂T₁O₂) (?H₄T₁O₄) H_PtCy_Cl_ H,PtBr. HAsO, H.Pt.S. H2SnO H,As,O, H2Sn2O. H₄OsCy₄ (?H_sAsS₄) H,SnS, H.RuCy. H,IrCy, H,SbO. (?H,PbO.) H PbI, HaNgOs,O HSbO, H,Sb,O, H,CrO H,SbO, (?H,Cr(SCy),) HVO. H2MoO4 (?H,V,O,) H,V,O, H,Ta,O, H,WO, $(?H M O_7, M = Mo, W, U)$ $(?H_2M_3O_{10}, M = Mo, W, U)$ (?H,Nb,O,s) HAuCy, (?H₂ZnO₂) (°HMnO,) HAuCl, HHgCl, H₂MnCl₆ HHgBr, HAuBr. H,MnCy. H,PtCl H FeCv. HHgI. H_sFeCy₆ H2PtCl H,HgCl, H.PtI. H.Pt(NO.). H.Pt(NO.).Cl. H.FeCy, NO H2HgBr4 H,CoCy_e H,CoCy_e H,HgI, (?HZnCl,) H.Pt(SCy). (?H,AlO,) (?HZn,Cl,) H.PtOy,

The isolation of some of the acids in the fore-

going list is doubtfut, these acids are placed in brackets. The compounds H_{*}AlO_{*} and H_{*}ZnO_{*} are also bracketed, because the reactions of these bodies show that they may be classed as feeble acids and at the same time as basic hydroxides

An examination of the composition of the metallic acids shows that the reacting atomic aggregates of these compounds all contain a number of atoms of a negative element, or group of elements, which is large relatively to the number of atoms of metal present The accumulation of negative atoms so modifies the functions of the H atoms that these are replaceable by metals, and this notwithstanding the presence of the positive metallic atoms. The H of the of the positive metallic atoms metallic hydrogen - containing compounds $H_2Cr_2O_4(=Cr_2O_3H_2O)$ and $H_2CrO_2(=CrOH_2O)$ is not replaced by metals when these compounds react with metallic hydroxides or carbonates, but when 4 atoms of the negative O are associated with one atom of Cr and 2 atoms of H, the H of this compound (H,CrO4) is distinctly acidic The negative character, or acid forming character, of the groups CN and SCN is rendered evident by the number of acids which are formed by the union of these groups with H and metals

If attention is paid to the general chemical characters of the inetals which form acids it is seen that most of these metals occur in groups (using this term as it is used in the nomenclature of the periodic law) which also contain several distinctly non metallic elements—thus Ti, Sn, and Pb belong to Group IV, which group contains C and Si, Cr, Mo, W, and U belong to Group VI, in which group also occur the negative elements O, S, Se, and Te, As, Sb, V, Nb, and Ta form part of Group V, which is distinctly negative in its general chemical character, and includes the markedly non metallic elements N and P, I'e, Co, Ni, Au, and the Pt metals occupy a peculiar position in Group VIII (cf. Classification, vol in pp 203-210, also Iron Elements, this vol p 65)

Several salts exist which, on account of their methods of formation and general stability, are probably best regarded as derivatives of metallic acids that have not yet been isolated, among such salts may be mentioned the stanno- and zircono fluorides Mr₂Sn(Zr)F₂. Some chemists would class most, if not all, the double metallic haloid compounds as salts of metallic acids, e g BiF, 3KF as the K salt of the acid H₂BiF₆, ZnCl₂BaCl₂ as the Ba salt of the acid H₂ZnCl₄, and MgI₂KI as the K salt of the acid HMgI₃ (v. especially Remsen, Am 11, No 5)

The consideration of those metal-containing compounds which are acids brings out the in adequacy of that classification which would divide the elements into two classes only, metals and non-metals, it also well illustrates the difficulties of chemical classification, as shown by the way in which the chemical properties of an element are modified according to both the nature and the number of other elementary atems with which that element is combined (cf the article Metals in this yol and Classification in yol ii)

METALLOIDS This name was at one time applied, most mistakenly, to the non-metallic elements. It is sometimes used to denote those slements which on the whole are non-metallic,

but yet closely approach the metals in some of their properties, As, Sb, Ti, V, Nb, Ta, for instance, are sometimes called metalloids. The term cannot be defined. There are certain elements which one chemist would class among metals, another would place with the non metals, and a third would prefer to put into neither class, but call them metalloids

M M P M
METALLURGICAL CHEMISTRY The
chemical reactions utilised in metallurgy are divisible into two distinct classes, viz 'wet,' those
which take place in aqueous solutions, and 'dry,'
those which take place in furnaces, or their
equivalent, at a relatively high temperature
The present tendency is more and more in the
direction of combining these two methods, metals
being now frequently extracted from their ores
partly by wet processes and partly by dry processes

The ore of any metal may be defined as a collection of mineral substances containing that particular metal in sufficient quantity to pay for its extraction on a commercial scale. Although each metallic element exists in nature in a great number of combinations, yet very few of these compounds occur in sufficient quantity to be of direct importance to the metallurgist, except in so far as they may tend to introduce impurities into the metal to be extracted.

Chemically, ores may be broadly divided into three classes, containing respectively—I NATIVE METALS, i.e. metals uncombined with any non metallic element II SULPHIDES and ARSENIDES III Oxides, including carbonates and silicates

Class I NATIVE METALS A native metal may be separated from its ores in one of four ways (a) By Liquation In order that this may be done it is essential that the metal be fusible at a temperature insufficient to cause the earthy portions of the ore to frit or agglomerate, eg B: (b) By fusing the ore, when the metal will sink to the bottom by reason of its high SG, eg Bi, Cu (c) By dissolving the metal out by means of another metal, eg Au, Ag, Pt These metals may be dissolved out of their ores by Pb, which is then removed by cupellation, or, in the case of Ag, the separation of the Ag from the Pb may be effected by Zn, which does not alloy with Pb, and being specifically lighter rises to the surface, The Zn carrying the Ag and some lead with it is subsequently distilled off, and the residual Ag and Pb cupelled Similarly, Au and Ag may be dissolved out by Hg, which may then be distilled off (d) By dissolving the metal by means of an acid or a gas in solution, eg Au extracted by a solution of Cl, and Pt, Pd, Ir, Rh, and Ru by aqua regia The Au and Pt may be refined by wet processes, taking advantage of the fact that Au and Pt are insoluble in sulphuric. hydrochloric, and nitric acid, when these acids are used separately, but are soluble in aqua regia, while the Ag, Cu, Pb, and Fe are freely soluble in one or other of the three acids named In 'parting' Au, sufficient Ag must be present to allow the acid free access to the impurities, which would otherwise be protected by the insoluble gold Pt, when present in Au only in small quantity, may be separated by 'parting' with Ag, as under these conditions the Pt is

soted on by the 'parting acid' If present in larger quantity, it must be ppd from a solution. Ir may be separated from Au by difference of SG, and from Pt it may be removed to a certain extent by using aqua regia of medium concentration, in which it is not freely soluble Pt is ppd from its solutions as a double salt of Pt and NH, by adding NH,Cl Pd, if present, may be ppd before the Pt by neutralising with Na,CO,Aq and adding HgCy, Ir, if it has gone into solution, will not be ppd with the Pt, but its double salt is difficult to wash out Pd. Rh. Ru, and Os will also be found with the Ir in solution after the Pt has been ppd Rh may be removed completely by fusing the platinum double chloride with KHSO, and a small quantity of NH HSO. Ir may be ppd at the same time as platinum by KCl, and the pp fused with K CO, which will oxidise the Ir and not the Pt Remove the potassium salt by boiling water, and then dissolve out the platinum with aqua regia, in which the oxide of Ir is insoluble Ir may also be separated from the pp by KCy, the Ir salt being soluble while the Pt salt is insoluble Pt is obtained in the metallic state by carefully heating the double chloride, which then breaks Au is ppd from its solutions as metal by FeSO, Aq, SO, Aq, or H2C, O, Aq For dental purposes, Au is frequently deposited by electrical means Ag is first thrown down as chloride, which is afterwards reduced by Cu, Zn, or Fe Au, containing not more than 10 p c Ag, is also refined by Miller's process, at the Australian Mint, in the dry way, by passing Cl into the molten gold The impurities As, Sb, Bi, Pb, and Zn are converted into chlorides, which volatilise, and the Ag becomes AgCl, which forms a fused layer on the surface of the gold

Class II Sulphides and Arsenides Dry methods Sulphides and arsenides are either (a) infusible, at such temperatures as can be obtained in furnaces on the large scale, (b) fusible,

or (c) volatile without fusion

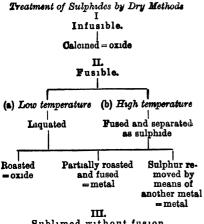

(a) Infusible sulphides In these cases the S must be replaced by O, as an infusible sulphide cannot be properly reduced to the metallic state. This is done by calcining or reasting the ore, so that air has free access to it. The sulphide is exided to a sulphide at low temperatures, and at higher temperatures the sulphide breaks up into SO₂ and an exide of the metal. Practically there is only one sulphide under this head, viz ZnS, sinc blende. For the subsequent treatment of the exide v 'exide class'

(b) Fusible sulphides Sulphides and arsenides of this class may be subdivided as follows—(i) those which are fusible at a very low temperature, insufficient to produce fritting, is incipient fusion causing agglomeration of the constituents of the ore, (ii) those requiring a higher temperature, at which fritting would take place A sulphide in division (i) may be liquated out, e.g. Sb₂S₂. The sulphides and arsenides belonging to (ii) may be separated by fusing the ore, when the sulphide or arsenide would collect together beneath the slag, e.g. sulphide of copper (copper pyrites), arsenides of nickel and cobalt (if sufficient arsenic is not present in the ore more is added), the arsenide separates in a distinct layer from the sulphides of other metals during the

fusion, sulphide of nickel obtained by fusing nickel ores, or products, free from arsenic, with iron pyrites The sulphides and arsenides thus separated from the gangue would next be treated in one of the following ways —1 Converted into oxide by roasting, e.g. Sb.S., copper matte, arsenides of nickel and cobalt (the arsenious and being condensed in coke towers), sulphides of nickel and cobalt free from arsenic, the oxides of nickel and cobalt are subsequently treated in the wetway 2 Partially roasted to form a certain amount of oxide and sulphate, and then fused, the oxygen of the oxides combines with the sulphur of the sulphides and arsenides, forming SO, and liberating the metal, eg Sb₂S, and PbS In the case of the double sulphide of Cu In the case of the double sulphide of Cu and Fe, the Fe is first removed by a series of calcinations and fusions, S passing to the Cu and O to the Fe, the oxide of iron thus formed uniting at the same tune with silica to form slag This process goes on so long as any iron As soon as the iron is all removed, remains the reaction between Cu₂S, CuO, and Cu₂O takes place, liberating metallic copper principal impurities in copper ores likely to pass into the Cu are As, Sb, Zn, Pb, Bi, Sn, Ni, Co, Au, and Ag The greater proportion of these present either volatilises or becomes oxidised and removed in the slags Au and Ag, being neither appreciably volatile under the conditions nor oxidisable, become concentrated in the copper It is particularly difficult to get rid of the last The use of a basic lining traces of As and Bı to the furnace—say, dolomite—greatly facilitates the removal of As in the slag The elimination the removal of As in the slag of As is also assisted by the use of 'soda nitre' in refining Bi can most readily be removed by what is known as the best selecting process, in which advantage is taken of the circumstance that copper has a greater affinity than bismuth for sulphur This process comes in just before the copper is first reduced from the sulphide little copper is made to separate by the reaction between sulphide and oxide, this throws out and collects as 'bottoms' the bismuth, tin, lead, and antimony -3 Fused in the presence of another metal which combines with, and so removes, the sulphur, eg sulphides of Bi, Pb, and Sb treated with Fe, Ag separated by metallic Pb from sulphide of Ph containing sulphide of Ag Copper can only be partially separated from sulphur in this way, a double sulphide forming which cannot be reduced by iron

The operations described under (1) and (11) are in some cases applied directly to the ore without first separating the sulphide by liquation or

(c) Sulphides volatile without fusion Amongst the metallic sulphides there is only one which sublimes without fusion, viz HgS When heated in presence of air HgS yields SO₂ and Hg As the Hg has no tendency to combine with oxygen under these conditions, and is vilatile at a very low temperature, it distils ever, and may readily be condensed For these reasons advantage is not taken of the fact that the sulphide is itself volatile, it being simpler to distil the metallic mercury direct from the ore The sulphur is sometimes removed by roasting the mercury ore with lime or oxide of iron.

Sublimed without fusion 1 Sulphur separated by calcination alone = metal

2 Sulphur separated by lime, oxide of iron, or iron = metal

Wet processes for sulphides and arsenides The sulphide and arsenide ores of Ni, Cu, and Co are partially, and those of Cu and Ag partially or wholly, treated by wet methods In these processes the metal is first made to form a soluble compound This may be done by roasting the ore with, or in some cases only mixing it with, some compound, which by double decomposition will convert the metal to be extracted into a soluble compound In other cases it is done by roasting the ore alone at a low temperature, or even by simply exposing it to the action of the atmosphere without using artificially produced heat, in either case the sulphide will be con verted into a sulphate, eg copper pyrites and silver ores

Thus, soluble sulphate of copper may be formed by roasting copper pyrites or more slowly at the ordinary temperature of the atmosphere About one third of the copper extracted in this country is obtained from Spanish pyrites, averaging only 3-4 pc of copper, by roasting the burnt ore received from the sulphuric acid works-with common salt, which reacts with the CuSO, produced during the burning, to form CuCl2, which is then dissolved out, together with the chlorides of Ag, Pb, and Au, these metals being present to a small extent The Ag is thrown down, along with Au and Pb, by a soluble iodide, KI or ZnI2 The iodine is removed from the AgI by Zn Finally the Cu is ppd by addition of iron

The reactions which take place in the wet treatment of silver ores are of special interest They are divisible into three and importance classes

I The insoluble silver compound is decomposed and the Ag amalgamated while still in the ere ('free milling ore'), without the aid of any furnace-operation whatever If there is much S or As present the ore, where practicable, is first roasted with salt Under this head are included all the amalgamation-processes

II. The mealuble silver compound is converted

unto sulphate by roasting alone and washed out with water, or the Ag is converted into chloride by roasting with common salt, and washed out by a solvent for chloride of silver Under this head are included the Augustin, Ziervogel, Von Patera, and Russell processes

III The insoluble silver compound is converted into a soluble compound by the action of certain salts in solution without roasting the ore or employing any furnace-operation whatever This class includes the Von Patera process when applied to 'amalgamation tailings,' and the Russell process applied to both ores and tailings

The amalgamation methods without roasting have been of great service where fuel is scarce, as in Mexico These methods depend on the power of Gortain salts, such as the chlorides of Cu, to decompose Ag₂S If mercury is present at the same time, the AgCl will be reduced and the Ag taken up by the excess of Hg, from which it can be separated by squeezing and distillation Iron or Cu may be employed to decompose the AgCl, Hg being used only to collect the Ag This reduces the loss of Hg, but to bring about suffi cient contact, more power, and consequently more fuel, is required Where fuel is available there is often great advantage in roasting the ore with salt before amalgamation

Where possible the amalgamation methods have been superseded by the other wet processes included under heads II and III, viz the Augustin, Ziervogel, Von Patera, and Russell methods

The Augustin process Ore or regulus is first partially roasted, and then undergoes further roasting with common salt, the AgCl thus formed being washed out with NaClAq and ppd The Ag is usually first concentrated in by Cu copper mattes

The Ziervogel process This method depends on the difference between the temperatures re quired to break up the sulphates of different Thus by suitably regulating the tempe metals rature, the sulphates of Fe, Cu, &c, formed by roasting mattes at a low temperature, may be de composed into oxides and SO2, while the sulphate of Ag will be unaltered, and can therefore be ex tracted by warm water, and then ppd as in the previous method The regulation of the tempe rature throughout a large furnace is obviously a point requiring considerable skill reason, in practice, matter are usually first worked by the Ziervogel process, and the residue ex tracted by the Augustin method

Von Patera process The soluble salts pro duced by roasting the matte are first dissolved out with water, after which the matte is further roasted with NaCl, and the AgCl washed out with Na₂S₂O₃Aq or CaS₂O₃Aq, from which solu tion the Ag is ppd by a soluble sulphide or The silver is reduced from the Ag₂S, either SH, by roasting or by boiling with freshly slaked lime, forming calcium polysulphide When there is much of the base metals present, more particularly lead, the Von Patera process is not so suitable The lead is mostly present as sulphate after roasting, and this is soluble in Na₂S₂O₂Aq Some of the most important objections to the Von Patera process, as applied to poor ores containing base metal, are obviated in the process mext described.

The Russell process In this process what is known as the 'extra solution' is used, in addition to or in substitution for that ordinarily employed in the Von Patera process The 'extra solution' is prepared by making solutions of Na₂S₂O, and CuSO, containing respectively 18 parts of the former and 10 parts of the latter salt, and mixing them together The pp after washing is dissolved in a solution containing 1-21 p.c Na₂S₂O₃ Although this 'extra solution' is not so good a solvent for AgCl as Na,S,O,Aq, yet it acts energetically on native silver and the compounds of silver with S, As, and Sb Owing to the want of permanence special precautions have to be taken in using this solution. To get the best effect the solutions should be used warm In order to obtain finer bullion by this process, ad vantage is taken of the fact that PbCO, is not soluble in the solution, although other salts of lead are soluble Na₂CO₃, free from NaOH and Na2S, is added to the solution containing the silver and lead which have been washed out It is stated that the whole of the Pb may thus be Carbonate and sulphate of Cu are the only compounds of Cu likely to occur which are soluble in the 'extra solution'

It is probable that this process in the near future will supersede very largely the fusion and amalgamation piocesses, besides which it is applicable to cres which cannot profitably be treated by either of the other methods. The cost of the necessary chemicals is much less than that due to loss of mercury, in addition to which, lead and copper are lost in the older processes and saved in the Russell process.

In some cases the ores may be treated direct by the Russell process without previous reasting, and both the Von Patera and Russell methods are largely used in the treatment of 'tailings' from amalgamation

Nuckel and cobalt It has been seen that these metals may be separated from others as arsenide In practice, however, the separation is not so complete, some of the nickel and cobalt passing into the regulus, and some of the other metals into the spesse. The following are the reactions usually employed to separate the va rious metals from one another The calcined speise is treated with HClAq The resulting so lution, which will contain Ni, Co, Fe, Cu, Pb, Bi, and As, is diluted, and oxidised by bleachingpowder, the proportion added being adjusted by a rough analysis Milk of lime is added to the requisite extent to throw the iron down as ses quioxide, any arsenic present at the same time ppg as basic arsenate of iron The solution is next treated with SH, to ppt Cu, Pb, and Bi, after which the Co can be thrown down as ses quioxide by a further addition of bleachingpowder, and subsequently the Ni ppd as hydrated oxide by the addition of milk of lime

Class III Oxides, including carbonates and bilicates Ores of this class are reduced to the metalic state by means of carbonaceous matter such as charcoal, coal, or co'e, or by means of the gaseous product of the incomplete oxidation of carbonaceous matter, vis carbon monoxide

The only exceptions among the oxides of the commoner metals are Al₂O₂ and MgO These oxides cannot be reduced to the metallic state in this way; they have to be converted into

double chlorides, from which, while in a state of fusion, the metals are liberated by metallic The metals, the sodium, or by electrolysis oxides of which are in practice reduced by car bon or CO, are Sn, Fe, Ni, Co, Mn, Cr, W, and Zn Of these Sn and Zn present the simplest The reactions in the other cases are complicated by the fact that all these metals combine more or less freely with carbon When it is desired to obtain the metals in the most malleable condition, se free from carbon, the fact that the oxides and the carburised metals react with one another eliminating both the carbon and the oxygen, as CO and CO₂, is utilised Every iron- and steel making process is dependent on this reaction. According as the conditions are made more or less favourable to carburisation, or decarburisation, so will the resultant metal be either cast iron, hard steel, mild steel, or malleable iron. It is possible to reduce the oxides under consideration to the metallic state, and also to carburise the metals, by the action of CO, without the metals becom ing fused The oxides are first reduced, and then carburised by the dissociation of some of the CO The liberated oxygen combines with CO and is thus removed Nickel is thus reduced to the metallic state, more or less combined with car bon, and bars of metallic iron are carburised to produce 'cementation' steel In a similar way a carburised metal may be decarburised by O or CO2, in this way 'malleable cast iron' is made Whether the action consists of carburising or decarburising is entirely dependent on which agent preponderates at the time in the atmosphere surrounding the body

Reactions for removal of 'impurities' from metals of oxide class The refining of Ni and Co, as we have seen, precedes the reduction to the metallic state The refining of Sn is effected after reduction, partly by liquation and partly by oxidation, by which means the principal im purities, Fe, As, and W, are removed Mn and Cr are reduced directly from their ores, in the form of alloys with iron, only pure ores being used Tungsten is either reduced directly from the ore, alloyed with iron, or undergoes a preliminary purification and ppn as oxide in the wet way The impurities which it is important to remove from iron are S and P The latter can only be passed into the slag when the slag is basic, and the conditions tend to oxidation Thus, P is removed in the primitive iron making processes, also when iron is made by the 'finery' and the 'puddling' processes, also in making 'ingot-iron' by the Siemens and Bessemer processes, when a basic lining to the furnace or converter is used P is not removed in processes in which pig iron or high carbon steel is made, nor in the Siemens or the Bessemer processes when the furnace or converter is lined with siliceous material, and malleable metal is being produced In the Bessemer process, with an acid hning,' the necessary heat for the process is obtained mainly by the oxidation of silicon in the pig-iron, when a phosphoriferous pig iron is used, and a 'basic lining,' most of the heat is obtained by the oxidation of the phosphorus and less silicon is required in the pig-iron In both pro cesses a portion of the heat is obtained from the exidation of C Sulphur can be removed economically only in the blast furnace, because when treating pig-iron for the production of malleable iron the sulphur is one of the last substances to oxidise out, and its removal would result in a great waste of iron. To remove S in the blast-furnace the temperature must be high, and the conditions must be strongly reducing and carburising: *e the charge must contain plenty of charcoal, coal, or coke, and lime must be added to the charge in considerable quantity. Under these conditions the S combines with the Ca, and passes into the slag as sulphide

SLAG REACTIONS Slags consist of the normetallic constituents of an ore or furnace pro duct, and of the useless or objectionable metallic They are produced by simply fusing the ore alone, if it is in itself sufficiently fusible, or by fusing it with such materials-fluxes-as will bring about the requisite fusibility Except in a few special cases, eg the reduction of aluminium or magnesium, slags consist of more or less complex silicates In processes for making more or less malleable iron, the slags are com posed mainly of silicates of Fe, Ca, Al, and Mg, with smaller proportions of silicates of Mn, alkalis, and alkaline earths In pig iron slags, the iron is comparatively small in quantity, or is even entirely absent when much lime is used In other slags, excepting those produced in treating the 'noble metals,' iron will generally be

present in large proportion

ELECTRO METALLURGY Electro metallurgical processes are divisible into two distinct classes one class includes processes for the extraction of metals from their ores, the other includes processes for refining metals already extracted Although a great many processes have been devised for the electrical extraction of metals, except for the extraction of aluminium and magnesium-in which cases the metals are first got into the condition of double chlorides, or, in the case of aluminium, sometimes of fluoride -there is not much prospect of such processes being successfully and economically worked, even when power can be obtained from water-falls By the Cowles process, according to Sterry Hunt, nearly pure Al is produced in small buttons, but up to the present it has been necessary to reduce some other metal with the Al to collect it together In this process the Al₂O₃ and the oxide of the metal to be alloyed with the Al are mixed with carbon, and the mixture is placed round two carbon poles between which an electric discharge is made to pass

The second class of processes has been advantageously applied to the refining of Cu, more particularly Cu containing small quantities of Au and Ag In refining Cu electrically, the electrolyte is usually CuSO₄Aq, kept at as uniform a temperature and concentration as possible, the anode being formed of the copper to be refined, pure copperdepositing on the cathode. The silver and gold collect at the bottom of the tank as a smiddy deposit.

muddy deposit.

METALS. An element is a definite and distinct kind of matter which has resisted all attempts to separate it into unlike portions. The classification of the elements, in accordance with their chemical properties, necessarily carries with it the classification of many compounds, insamuch as the chemical properties of an elements.

ment cannot even be stated without considering the composition, general chemical behaviour, and conditions of formation, of compounds of that element. For instance, certain elements are placed in the same class because they all form hydroxides which are alkalis this state ment implies an acquaintance with the composition, methods of production, and chemical properties, of the alkalis, but one of the chemical properties of an alkali is that it neutralises acids, and in so doing forms salts, hence it is necessary to know something about acids and salts, in order to understand what is meant by an alkali, or by an alkali forming element.

The elements may be classified in accordance with their physical properties If a binary compound is electrolysed, one of its elements separates at the positive electrode, and the other at the negative electrode (secondary reactions which may occur are supposed to be overlooked) That element which separates at the positive electrode is said to be electro negative to the other element By studying the electrolysis of binary compounds, the elements may be arranged This series may be in an electrical series divided into two parts all the elements on one side of any chosen element are electro positive to all the elements on the other side of the chosen element Taking hydrogen as the central element we are able to subdivide the elements into two classes, all the elements on one side of H are electro positive to the elements on the other side of H Thus we arrive at a classi fication of the elements founded on one chemicophysical property Now we find that the electropositive elements, on the whole, more resemble one another in certain physical properties, and also in their general chemical character, than they resemble the electro negative elements Those elements which are electro positive to H as a class are greyish white in colour, lustrous, fairly malleable and ductile, comparatively good conductors of heat and electricity, those ele ments which are electro negative to H vary much in colour and appearance, they are not usually lustrous, they are generally brittle, and they do not conduct heat or electricity well to the chemical characters of the two classes of elements, we find that those placed in the elec tro-positive class generally combine with O to form basic oxides their compounds with O and H are also usually basic, they do not, as a rule, enter into the composition of acids, very few of them form hydrides, their haloid compounds, as a whole, are tolerably stable as regards the action of heat, and they are not readily decom posed by water, if they are thus decomposed they generally produce oxyhaloid compounds, speaking broadly, these elements do not exist in allotropic forms. On the other hand, we find that most of the elements which are placed in the electro negative class combine with O to form acidic oxides, their compounds with H and O are usually acids All acids contain one or more of these elements, they generally form hydrides, many of their haloid compounds are decomposed by heat, and many of them are also decomposed by reacting with water, thereby producing haloid acids and either oxides or oxyacids of the electro negative elements; speakMETALS. 241

ing broadly, these elements exhibit the phenomena of allotropy

Hence, it would appear that the division of elements into two classes, those which are electro positive to H, and those which are elec tro negative to H, is a good classification, because with this one class mark many other properties, both physical and chemical, are associated

The electro positive elements are called metals, the electro negative elements are called non metals

A further examination of metals and nonmetals shows that the classification implied in these terms is very far from being sufficient for chemical purposes We cannot define the term metal, just as we cannot define any of the chemical names which are given to classes of bodies We can sketch the ideal metal Considered physically, the ideal metal is a hard, fairly heavy, greyish-white, lustrous, malleable, ductile, and tenacious solid, which melts only at a high temperature, it is a good conductor of heat and electricity, it crystallises in forms be longing to the regular system, its emission spectrum consists of lines, and is comparatively simple in character Considered chemically, the ideal metal is hardly, if at all, changed in the air, it combines with O at fairly high tem peratures, and forms one or more oxides which are basic, te which react with acids to form salts, it reacts with water or steam to produce an oxide or hydroxide and evolve H, no hydride of the ideal metal is known, it does not enter into the composition of acids, but it reacts with acids to form salts, its sulphides react with acids to produce salts and evolve H2S, they combine with the sulphides of decidedly electronegative elements, the salts of the ideal metal are numerous and stable, it forms but few acid salts, but the number of double salts into which it enters is large, it combines directly with the halogens, producing compounds which are vola tilised without decomposition at rather high temperatures, and which dissolve in water without change, the ideal metal forms alloys with elements of its own class, which alloys be long rather to the group of physical, than to that of chemical, compounds, lastly, the ideal metal exists in only one modification, se it does not show allotropy The ideal non-metal is the opposite, chemically and physically, of the metal

No element exhibits all the properties which we have placed in the category 'metal', nor is there any element which possesses even some of these properties without at the same time also possessing some of the properties which belong to the typical non metal

The elements sodium and potassium possess most of the chemical properties enumerated as characteristic of metals, but these elements are instantly oxidised by exposure to air, they pro-bably form unstable hydrides, they are very soft, lighter than water, and melt at moderately low temperatures.

The element gold possesses most of the physi cal properties characteristic of metals, but its hydroxide reacts with alkalis to form salts, eg KAuO,; Au also forms the acids HAuBr, and exhibits any acidic functions, they are electro-HAuOl4; Au₂S combines with the sulphides of positive to all the other elements. The metals Vor. III.

the very metallic elements K and Na to form The element chromium exhibits many of the characteristic physical properties of metals, it also decomposes steam with evolution of H, it combines with the halogens to form stable compounds, some of which have been gasified at high temperatures, chromium does not form a hydride, the oxides CrO and Cr.O. are basic, the element reacts with many acids to form salts, which are well marked, stable compounds, it does not exist in allotropic forms. On the other hand, CrO, is a distinctly acidio oxide, reacting with water to form the acid H₂CrO₄, from which is obtained a large number of salts In other words, chromium belongs to the class metals, and also to the class nonmetals In an even more marked way than Cr, manganese combines in itself both metallic and non metallic properties

The chemical properties of an element depend on the properties of the other elements with which it combines, and on the relative quantities of these other elements entering into combination It is this fact which makes it impossible to apply the definition of metal or non metal, in its entirety, to any element The classification of elements into metals and non metals is nevertheless a useful one, provided it is employed with judgment and knowledge If we find that a certain element is hard, lustrous, unchanged or only slowly changed in the air, and is a good conductor of electricity, or if we find that the oxide of a certain element is basic, and that the chloride is not decomposed by water, or if decomposed produces an oxychloride, we have at once a guide to lead us in our further examina-tion of the element. We shall probably find that the element in question possesses several of the other physical characteristics of metals, and we shall also probably find that it reacts with acids to form salts, decomposes steam with evolution of H, produces at least one sulphide which combines with sulphides of some of the negative or non metallic elements, and so on

The following division of the elements usually placed in the class metals is that arising from the application of the periodic law

```
CLASS I division 1, Li Na K Rb Ca
  CLASS II davision 1, Be Ca Sr Ba
                    2, Mg Zn Cd Hg
 CLASS III division 1, Se Yt La Yb
 ,, 2, Al Ga In Tl.
CLASS IV division 1, Ti Zr Ce Th
  ", 2, Ge Sn Pb
Class V division 1, V Nb Di Ta
 CLASS VI dursion 1, Cr Mo W U
                    2, none isolated.
 CLASS VII division 1, Mn
                    2, none isolated.
CLASS VIII division 1, Fe Ni Co (Cu)
                    8, Os Ir Pt (Au)
```

The metals in division 1 of Class L are generally known as the alkalı metals They possess in the most marked way the chemical characters of the ideal metal; none of their compounds exhibits any acidic functions, they are electro-

R

METALS. 249

in division 2 of Class I are very distinctly metallic in their physical properties, chemically considered they show considerable differences among themselves, several compounds of gold are almost non metallic in their reactions, the chemical and physical analogies of this element are best represented by placing it both with Cu and Ag, and also with Os, Ir, and Pt, in division 8 of Class VIII

The alkaline earth metals which form divi sion 1 of Class II are more metallic in their physical properties than the metals placed in division 1 of Class I , chemically they are also distinctly metallic Coming to Mg, Zn, Cd, and Hg, which form division 2 of Class II, we have four elements whose properties closely approach those of the ideal metal, Cd may be taken as on the whole the best actual representative of the class metal As we pass to the higher classes we find many metals exhibiting properties characteristic of non metals, until in Class VII we arrive at Mn, an element which is at once distinctly metallic and decidedly non-metallic in its chemical properties

In connexion with the subject of this article, reference should be made to the following articles wherein the different classes of metals are described - Alkaline earths, metals of the, vol 1 p 112, Alkalis, metals of the, vol 1 p 114, CHROMIUM GROUP OF ELEMFNIE, vol 11 p 168, COPPER GROUP, Vol 11 p 250, LARTHS, METALS OF THE, Vol 11 p 424, IRON GROUP, Vol III p 65, MAGNESIUM GROUP, vol III p 163, NITROGEN GROUP (for Class V, V to Bi), vol III infra, Noble metals, vol 111 infra, Titanium

GROUP, in vol iv , Tin GROUP, in vol iv

M M P M METALS, RARE Under this name are in cluded a number of presumed elementary bodies concerning which our knowledge is at present very imperfect. We see that in their general properties they approximate more or less closely to cerium, yttrium, and lanthanum, but we are not sure how far we have yet obtained them in a state of purity Consequently we are in doubt not merely as to their at w and SG, but even as to their number and their rank as elements, compounds, or mere mixtures Our ignorance is due to the great rarity of these bodies, to the high complexity of the minerals in which they are found, but most of all to the fact that they differ among themselves merely by very minute shades

The principal sources of the rare metals are gadolinite, keilhauite, fergusonite, euxenite, cerite, and thorite, which are Norwegian minerals, and further, samarskite, which was first obtained from the Urals, but has since been found in relatively large quantities in North Carolina It is to be noticed that specimens of any one of these minerals, if from different localities, are not identical in the earths they contain Hence if it is desired to isolate any particular earth it is best to select as the first material that mineral in which nature has, so to speak, commenced the task of separation (This method was proposed by the writer in his address to the chemi-cal section of the British Association, Birmingham Meeting (C N 54, 128, abid 54, 157, Pr 40, 505) Nilson a Krüss have since adopted and recommended the same method (B 20,

2134, C N 56, 74, 85, 135, 145, 154, 165,

The recognition of the various rare earths is a matter of no little delicacy Here spectroscopy in its several modifications renders the greatest service In endeavouring to ascertain by this means what substances are present in a mineral containing rare earths, chemists may employ either the spark spectrum, the absorption spec trum, or the incandescence or the phosphores cence spectrum They may further apply any of these tests either at once to the original matter, or to some of its portions after a partial separation has been effected by chemical treatment question of course arises, how are we to know when we have obtained any one earth separated from all other bodies, and absolutely pure? In the case of those earths and their solutions which present an absorption spectrum, e g didymia, samarıa, holmıa, erbıa, &c , the writer has shown that as an element approaches simplicity the absorption spectrum of its solutions will become less and less complicated, hence it would appear that when absolutely free from its associates, each element would have an absorption spectrum of great simplicity, in many cases consisting of one band only (the 'one band, one element' hypothesis) But as certain earths, e g lanthana, mosandra, philippia, scandia, terbia, &c , give no absorption spectra, this test is not applicable in all cases

Great caution is required in drawing conclusions from the examination of spectra. Concerning the influence of one body upon another little is yet known, but that little is of sufficient importance to make us very careful how we in terpret absorption-spectra when not corroborated by chemical results Lecoq de Boisbaudran a J Lawrence Smith have pointed out some im portant modifications produced in absorption spectra by the presence of an excess of acid in the solution (C R 88, 1167) Soret subsequently verified these observations Brauner and others have put on record experiments on mixing solu They find tions of didymium and samarium in the case of a didymium solution showing the group of three bands, 476, 469, 428 $[1/\lambda^2]$ 430 4, 441 3, 454 6], that, by adding a dilute solution of samarium, these three bands vanish, without the appearance of any of the samarium bands, until a certain proportion is reached, when the samarium bands gradually come into their places (Brauner, C J 48, 286)

Many of the earths that do not yield solutions giving absorption spectra can be made to give characteristic spectra by phosphorescence This is known as the 'radiant matter' test When the spark from a good induction coil traverses a tube having a flat aluminium pole at each end, the appearance of the spark changes according to the degree of exhaustion If atmospheric air is the gas under exhaustion, at a pressure of about 7 mm a narrow black space is seen to separate the luminous glow and the aluminium plate connected with the negative pole of the induction coil As the exhaustion proceeds this dark space increases, until at a pressure of about 002 mm the dark space nearly fills the tube; the luminous cloud showing the presence of residual gas has almost disappeared, and the molecular discharge from the negative pole begins to excite phosphorescence on the glass where it strikes the side There is a very wide difference in the degree of exhaustion at which various substances begin to phosphoresce Under the influence of this discharge of ' radiant matter,' a great many substances emit, more or less intensely, a phosphorescent light examining this light in the spectroscope, most of these bodies give a faint, continuous, spectrum with a more or less decided concentration in some one part, the superficial colour of the phosphorescing substance depending on this preponderating emission in one or other part of the spectrum Sometimes, but less commonly, the spectrum of the phosphorescent light is discontinuous

If we examine the rare earths by this 'radiant matter' test we find they present phenomena of a striking character Some of them remain unaffected, and are thus at once referred to a distinct group Others, such as thoria, do not phosphoresce and offer great ob struction to the passage of the spark Other earths become very phosphorescent and vary greatly in their power of retaining a residual phosphorescence On examining phosphor escent earths glowing in a vacuum tube, the writer found remarkable differences in the dura tion of this residual glow. Some of the earths remain luminous for many minutes after the cessation of the current, while others cease to phosphoresce immediately on the stoppage of the current Take the case of yttria This Take the case of yttria earth, the writer finds, can be resolved by chemical treatment into a series of simpler bodies of unequal basicity, to which he has given the provisional designations of $G\alpha$, $G\beta$, $G\delta$, $G\zeta$, $G\eta$, and $S\gamma$ The after glow of these bodies differs somewhat in colour from that which the earth exhibits while the current is still passing The spectrum of the after glow also shows that some of the lines are missing In the electrical phosphoroscope—an instrument similar to Bec querel's phosphoroscope, but having the substance acted on electrically instead of by direct lightthe different bands of the new constituents of yttria (v infra) do not all appear at the same speed of rotation At the lowest speed the double greenish blue band of GB is first seen, followed next by the dark-blue band of Ga As the velocity increases there follows the bright citron yellow band of Go, and as the utmost speed approaches the red band of G(is seen, but not without difficulty As another instance, if lanthanum sulphate, with traces of Sm as impurity, along with a little lime is examined in the phosphoroscope, the band of Ge is visible at the lowest speed, Go follows at an interval of 0035 second, and the Ga band immediately afterwards All the earths of the yttrum and samarium groups yield discontinuous spectra when submitted to the induction discharge in vacuo

A modification of phosphorescence spectroscopy is produced by the previous addition of other earths to the specially phosphorescent earths. Lime exerts a remarkable action. By itself, it phosphoresces with a continuous spectrum, while yttria phosphoresces with a discontinuous spectrum. But if these two bodies are mixed together, the phosphorescing energy of the lime does not extend over the whole spectrum.

but concentrates itself in strengthening the yttria These bands become broader, but at the same time less sharply defined, in proportion as the lime is increased in quantity. Lime also the lime is increased in quantity. Lime also brings out the phosphorescent bands of samaria It also suppresses the sharp line So, the most striking feature in the phosphorescent spectrum shown by pure samarium sulphate On the other hand an addition of 'old' yttria deadens the other lines of samaria, but brings out the line 88 more Lanthanum sulphate in the 'radiant matter' tube phosphoresces with a reddish colour If lime is added to lanthanum sulphate the phosphorescence changes its colour from red to yellow Lime also brings out the bands of yttrium and samarium if these are present as impurities sensitive is this test that it will show the presence of one part of yttria or samaria in more than a million parts of lime When Go, Ga, and GB are present in small proportions with lime the bands of Go and Ga become intensified. but a dark space appears instead of the green band of $G\beta$ Hence if only a small trace of $G\beta$ is present in lime the green band is not only obliterated, but the quenching action suppresses that part of the continuous lime spectrum which has the same refrangibility as the GB line, and thus gives a black space in the spectrum

There are many instances of the modifica tions induced in the normal spectrum of one earth by the admixture of others when treated as anhydrous sulphates One of the most striking instances is that of a mixture of samaria with yttria, since the presence of even 40 pc of yttria practically obliterates the spectrum of samarıa The most minute proportion of lime added to samarıa causes the sharp line at $1/\lambda^2$ 269 to vanish, while at the same time it much intensifies the other bands (Tr, pt ii 1885, C R, June 15, 1885) The action of lime upon yttria is of great use in detecting very minute traces of this earth when in admixture with elements which would otherwise prevent its phosphorescence

Alumna is also active in inducing new spectra when mixed with the rare earths. A moderate amount of fractionation has enabled the writer to penetrate beneath the veil of red phosphorescence observed in crude alumina and to see a complicated sharp line spectrum (O N, 56, 62, 72). The new body of which glimpses have been obtained is probably one of the unknown earths in decipia, since the new spectrum may be fairly reproduced by adding one of the fractionations of decipia to alumina. Hence, it will be seen that the performance of a long series of check and counter-check experiments often becomes necessary before the presence or the absence of any particular earth can be inferred

The quantitative separation of the rare metals is much more difficult than their mere recognition. These substances are not linked to one another, or to other elements with which they are associated, by any strong affinities, but they are nearly identical in their behaviour and properties. Hence we have so far been unable to find any reagent or any mode of treatment which at once quantitatively separates one of these substances from all the others. We are therefore obliged to have recourse to tedious processes of fractionation.

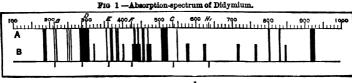

In attempting to enumerate or describe the rare metals, we meet with the additional difficulty that the unitary character of many of them is still a matter of extreme doubt

Several of the rare metals will be found described in their proper alphabetical order in this Dictionary, e.g. beryllium, cerium, didymium Many of these, as will be seen below, are probably capable of being further split up, but as they are frequently mentioned in chemical treatises and memoirs their description as at present, or lately, known has been found necessary

There are certain other metals which are still under discussion, eg decipium, philippium, holmium (Soret's X), and dysprosium Roscoe has indeed proved that philippium is a mixture of terbium and trinium, and the experiments of the writer have confirmed his results, but until we know more about the constitution of terbium and of yttrium, both of which are undoubtedly compound bodies, these experiments do not carry us much further Samarium is also identical

separate a mixture of two bodies into two parts, just as the addition of a reagent only divides a mixture into two portions, a precipitate and a solution These divisions will be effected on different lines according to the reagent employed Thus, if we add ammonia to a mixture we may get a separation into two parts, but if we add oxalic acid to the same original solution we split up the mixture differently and obtain two other parts Thus, if we erystallise a solution of old didymium, as was done by Auer von Welsbach, we divide its components into neodymium and praseodymium But by fusing didymium nitrate we divide its components in a different way and obtain different products Now, it is clear that so long as by different modes of attack we ob tain different products, we have not yet reduced the original substance to its ultimate elements, we have not yet reached bed rock

We find that a compound molecule may behave as an element, as has been shown in the case of old didymium Chemists have a certain

The scale is $\frac{1}{\lambda^2}$

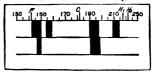

with a body which other chemists have named

It has been mentioned elsewhere that the old didymium, after the elimination of Delafontaine's decipium, was found by Lecoq de Boisbaudran to contain another body, which he named samarium, characterised by the bands of Delafontaine's decipium, together with two additional bands (cf figs 1 and 2) After the removal of these bodies the residual didymium was split up by Auer von Welsbach into the two bodies, neodymium and praseodymium, the absorption spectra of which are shown respectively in figs 3 and 4 It will be observed, however, that two of the bands of old didymium are not to be found in the neodymium and praseodymium spectra taken conjointly Hence it becomes extremely probable that there exists a third body distinct from neodymium and praseodymium to which one of these extra bands, or possibly both, This probable metal the writer has provisionally named Da But we still encounter the question whether neodymium, praseodymium, and Da are ultimate elements, or are capable of still further scission The researches of several investigators point very decidedly in the latter Thus Nilson a Kruss in 1887 appear direction to have obtained from didymium no fewer than nine bodies, each of which may possibly prove to be an element These bodies have been provisionally named by the discoverers $D_{1\alpha}$, $D_{1\beta}$, $D_{1\gamma}$, Dis, Die, Din, Die, Die, and Die

It seems to the writer that neodymium and praseodymium are simply the products into which the original didymium is split up by one particular mode of attack. Any single chemical operation, whether it be crystallisation, presipitation, fusion, partial solution, &c, can only

number of reagents, operations, or processes in regular use, and if a substance resusts all these and otherwise behaves as a simple body, they call it an element But for all this it may prove to be a compound Hence, we may legitimately pause before conceding to neodymium and praseo dymium the rank of elements We need some criterion for an element which shall appeal to our reason more clearly than the old untrust worthy characteristic of having not as yet been decomposed, and to this point chemists would do well to turn their most serious attention

Fig 2—Absorption spectrum of Samarium and Decipium (De Boisbaudran).

In samarium the writer, by means of the 'radiant matter' test, has recognised four bodies, named provisionally $S\delta$, $G\epsilon$, $G\gamma$, and $G\theta$ Very similar observations seem to prove that, like didymium and samarium, erbium, holmium, thulium, dysprosium, &c., are compounds or mixtures of a number of closely allied bodies

In order to ascertain the existence of supposed new elements chemists have proposed as a test that certain absorption-bands seen in different solutions follow the same variations of intensity. If this is the case we may infer that they are all characteristic of one and the same substance. But if one of the bands dies out while others remain unaltered we may judge that two or more distinct bodies are present.

In erbium the writer has detected two bodies, which he has characterised by their absorption bands \$550 and \$493 Kruss a Nilson apply apparently to the same bodies the names Era and Ers To obviate all confusion it must be remembered that the name 'erbia' has been given to two bodies which are not identical The substance which ten years ago was called erbia, and which was then supposed to be the oxide of a simple metal, has been resolved by the investigations of Delafontaine, Marignac, Soret, Nilson, Clève, Brauner, and others into at least six distinct earths. Three of these scandia, ytterbia, and terbia—give no absorption spectra, while three others - erbia (new), holmia, and thulia-give absorption spectra The first to question the elementary character of old erbium was Delafontaine (C R 87,559, C N38, 202) He obtained from it and described philippia, a yellow oxide having a strong band in the violet (\$\text{\$\lambda\$400 to \$405}), a broad black absorp tion band in the indigo blue (about \$\alpha450\), two rather fine bands in the green, and one in the red

The history of philippium is very instructive Soon after Delafontaine's discovery, Soret (C R 89, 521, C N 40, 221) stated that he was unable to identify 'Soret's X' with Delafontaine's philippia, the latter being characterised by an absorption band in the blue occupying the same place as one of the erbia bands In 1880 Delafontaine (C R 90, 221, C N 41, 72) described ten new earths as present in gadolinite and samarskite, viz, mosandra, philippia, ytterbia, decipia, scandia, holmia, thulia, samaria, and two others to which he did not assign names He concluded that the properties of philippia were identical with those of Soret's X and of Clève's holmia, and proposed that the name hol mia should be set aside in favour of philippia In C R 91, 328 (also C N 42, 185), Clève re peated his earlier assertion that philippia was not identical with Soret's X or holmia fontaine then withdrew all he had said about the absorption spectrum of philippium and decided that it had no absorption spectrum at all (Archives de Genève [3] 999, 15) Lastly Roscoe (C J 41, 277) gave an elaborate account of the earth metals in samarskite, proving philip pia to be a mixture of yttria and terbia present writer, after prolonged chemical exami nation of these earths, has come to a similar conclusion, but a spectroscopic examination of the earth left on igniting some very carefully purified crystals of philippium formate, tested in the radiant matter tube, has shown that in the separation of Delafontaine's 'philippium' the yttria undergoes a partial fractionation

Shortly after the announcement of philippium, Soret (C R 86, 1062) described an earth which he provisionally named X It was subsequently found to be identical with Clève's holmia (C R 89, 479, C N 40, 125) The absorption spectrum of this earth is marked by a very strong band in the extreme red (λ 804), two characteristic bands in the orange and green (λ 640 and 536), with fainter lines in the more refrangible part of the spectrum, and a number of bands in the ultra violet (see fig 7) The claim of holmium to rank as an element has been disputed by Nilson and Kruss, who assert that it consists of, or at least contains, four distinct

bodies, provisionally named $Xa, X\beta, X\gamma, X\delta$ By submitting Soret's X to fractional precipitation, and examining the fractions spectroscopically, Lecoq de Boisbaudran found that this X, otherwise holmium, consisted of at least two elements one of these he has named dysprosium, reserving the name holmium for the residue left after the elimination of the dysprosium. The absorption spectrum of dysprosium shows four bands, λ 4515, 475, 7565, and 4275. The absorption spectrum of what may be called new holmium is shown in fig. 8. What relation this new holmium bears to any of the components observed in the original spectrum of holmium by Krüss and Nilson is not as yet determined.

The writer (Pr~40,502) obtained an earth by repeated fractionation, in which one of the bands ascribed to dysprosium, that namely at $\lambda~451~5$, was very strong, though the others were absent As de Boisbandran regards the bands $\lambda~475$ and 451~5 as both belonging to dysprosium, and as the earth obtained gives $\lambda~451~5$ strong but with scarcely a trace of $\lambda~475$, dysprosium consists of at least two simpler bodies. Kruss and Nilson in fact resolve it into three bodies to which they have given the provisional names $X\zeta$, Xe, $X\eta$, and de Boisbaudran gives the absorption spectrum of

dysprosium as shown in fig 9

Simultaneously with the discovery of holmia, Clève announced the separation of a second earth from erbia, which he called thulia Its absorption spectrum consists of a very strong band in the red \(\lambda \) 680 to 707, and one in the blue \(\lambda \) 464 5 (fig 10) The ultimate character of thulium is by no means established Kruss and Nilson resolve it into two bodies, Tma and Tm3 Nevertheless the atomic weight of thulium has been determined as 170 7, and the composition Tm30, has been assigned to its oxide, determinations which for the present must be regarded as premature

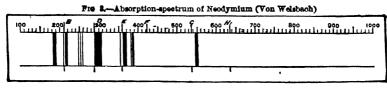

Further, it must be mentioned that the spec trum of old erbium has two faint bands, one at \$550 and a second broader one at \$493 (fig 11). These bands are not to be found in the spectrum of holmium, thulium, dysprosium, or the new erbium (fig 12). In a long continued fractionation of the erbia group of earths, conducted with an ample supply of the old erbia, the writer finds an earth giving these two bands concentrated at one end, the bands becoming stronger, while at the same time two other bands make their appearance. This phenomenon indicates the existence of another earth as yet unknown, belonging to the erbium group

We next come to the yttrium group, comprising the metals yttrium, terbium, gadolinium, ytterbium, scandium, mosandrium, columbium, and rogerium Of these yttrium, terbium, ytterbium, and scandium form the subject of distinct

articles in this Dictionary

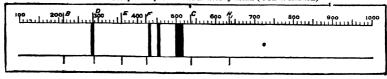

Columbium and rogerium were discovered in the samarskite of North Carolina by J Lawrence Smith in 1879, but nothing further has been published concerning them. This columbium is perfectly distinct from an element sometimes called columbium, but better known as tantalum.

Mosandrum was also discovered by J L. Smith, and has been the subject of a little controversy. Delafontaine pronounced it a mixture

of terbium, yttrium, erbium, didymium, and philippium In November 1878 and in September 1879 Smith reasserted the elementary character of mosandrum He states that its compounds are of a deep orange colour, that its double potassium sulphate is not easily soluble, and that its equivalent weight is 512 No recent and conclusive investigations on this alleged metal have appeared, and its existence must in the meantime be regarded as exceedingly doubt ful

Decipium has been considered as holding an intermediate position between the didymium and the yttrium groups of rare metals, but its elementary character is very questionable. It has not formed the subject of any recent researches. It is said to show a characteristic absorption band about \$\lambda\$ 416

Gadolinium, otherwise known as the Ya of Marignao, gives no absorption-spectrum. In the writer's investigations its phosphorescence spectrum was found to consist of those of two of the constituents of yttrium, which will be mentioned

below

Yttrium proves to be an exceedingly complex substance The body to which all chemists would have applied the name yttria as recently as four years ago may be split up into possibly six, but certainly five, bodies, $G\alpha$, $G\beta$, $G\delta$, $G\zeta$, and $G\eta$, two of which, $G\beta$ and $G\zeta$, are also met with as the components of gadolinium Hence it is con venient to speak of the original substance as 'old yttria' and to remember that such is the substance to which everything written concerning yttra prior to 1885 will be found to refer Fig 13 shows the simple phosphorescence spectra of the several components into which yttria may be split up by fractionation If these com ponents are taken in the order of their apparent basicity—the chemical analogue of refrangibihty-the lowest of these constituents gives the deep-blue band Ga then follows a strong citron band, Go, which increases in sharpness as it becomes more separated from its associates un til it may be called a line, then a red band, G(, then a crimson band, $G\eta$, and, lastly, very close together a pair of greenish-blue bands, $G\mathcal{B}$

The diagram, fig 14, shows a series of nine teen phosphorescence spectra obtained from a prolonged examination of 'old yttria' The central spectrum, s, is approximately that given by crude old yttria, though this differs slightly according to the mineral from which the old yttria is extracted After a time fractionation splits up the earth J into two earths here marked I and K, giving slightly different spectra tionating I gives H and J, while K on fractionation yields J and L. It must not be thought that there is so great a difference between any two adjacent spectra as is here shown To make the diagram accurately represent what is actually seen in the laboratory it would be necessary to place between each of these nineteen spectra about 1,000 intermediate spectra. Beginning at the extreme red it will be seen that a strong band at $\lambda 647$ [1/ λ^2 289] is at its maximum intensity from 6 to E, when it rapidly disappears and is not seen beyond c and w. The component giving this band the writer names provisionally Gn The next band in the red $\lambda 689$ [1/ λ^2 245] reaches its maximum at A or even higher, and fades out be-

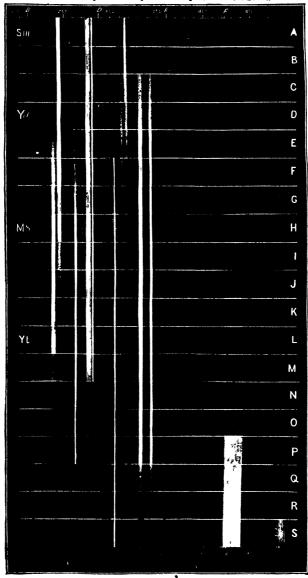

tween κ and κ . The band at $\lambda 619 \left[1/\lambda^2 261\right]$ has its maximum between I and o, dying out rapidly below but being more persistent above It is called G. Then comes an extremely sharp band $\lambda 609$ [1/ λ^2 269] which appears to belong to an earth absent in gadolinite but present in samarskite and a few other minerals greatest brilliancy is between E and K, and on either side it dies rapidly away. For this the writer proposes the name So. Then follows a double orange band, and its two components, though very closely united, are probably capable The maximum brightness of the of separation first component $\lambda 603$ [1/ λ^2 275] extends from o to the top of the figure The second component $\lambda 597 \left[\frac{1}{\lambda^2} 280 \right]$ begins to fade about q, and is at its greatest brilliancy at the highest spectrum shown on the figure. This band occurs almost isolated in a specimen of crude lanthana, and may be provisionally called Ge Next follows the citron, or G5 band, $\lambda 574$ [1/ λ^2 305 5] which is the most prominent feature in the spectrum of This band extends with scarcely old yttrium diminished sharpness from a to s, above a it fades rapidly and disappears above D follows a double green band separable into two components The first of these, $\lambda 568 \left[\frac{1}{\lambda^2} \right]$ is nearly absent in A, reaches a maximum at D, and disappears at κ The second member of this green pair, $\lambda 563 [1/\lambda^2 315]$ has its maximum at A and extends only to H The substance pro ducing this pair of bands may be called for the present Gy Then follows a pair of bright green bands which so far show no signs of dividing They begin at B, reach a maximum at E, and continue with scarcely diminished brightness to The body giving this double green band is remarkably persistent and may provisionally be called GB Next comes a dark interval followed by a broad, hazy, double blue band, with its centre at $\lambda 482 [1/\lambda^2 430 5]$, this band appears at r and grows brighter to the last fraction at s The substance to which it is due is called Ga Lastly, at $\lambda 456$ [1/ λ^2 481] appears a deep violet band beginning at about o and brightening as we proceed lower down. In some samples of ytterbia, supposed to be pure, this band is in tensely brilliant, but it is absent in a specimen received from Nilson and considered by him to be perfectly pure Hence it is probably due to another new body which may be provisionally named Sy

It must be remarked that the writer's fractionations have been carried far beyond the limits shown in the diagram Fractions above a and below s afford evidence that the process of differentiation has not yet reached its utmost limit.

On the left side of the diagram will be seen chemical symbols attached to some of the spectra. Thus the top spectrum, A, is the one shown by samarium. At D is the spectrum of Marignac's Ya, or gadolinium. It shows the spectrum of mosandrum, and L that which is generally pronounced to be pure yttrium. A careful study of this diagram will lead the observer to conclude that samarium, gadolinium, mosandrum, and yttrium are not true chemical elements but compounds, or perhaps very intimate mixtures, of certain simpler bodies. For these bodies the name 'meta-elements' is proposed (W. Crookes,

B A Birmingham Meeting, C. N 54, 155, Krüss a Nilson, B 20, 2134 and C N 54, 71, 85, distinct substances which he names Za, $Z\beta$, and 135, 142, 154, 165, 172, Marignac, Archives des 'new yttria' (C R 103, 627) It is possible

FIG 14.—Phosphorescence-spectra of components of 'Old Yttria.'

The scale is $\frac{1}{\lambda^2}$

Sciences Physiques, 16, No 5 and C N 57, W. | that Zα is G8, and that Gβ and Zβ are identical, though de Boisbaudran now regards the latter De Boisbaudran likewise finds yttrium to | body as terbia (C R 102, 395, 902)

The right of the 'new yttma' to bear this name is in the highest degree questionable Boisbaudran assigns to it an atomic weight close upon 89, and states that it has a characteristic spark-spectrum but gives no phosphorescence spectrum either in the radiant matter tube or by his reversion-process It evidently cannot be regarded as the old yttrium freed from impurities, since the purest specimens of such yttrium give a phosphorescence spectrum in vacuo of such remarkable intensity that it cannot be due to mere traces of impurities Ga, GB, &c, can no more be spoken of as impurities in old yttrium than can neodymium and praseodymium (as suming them to be elementary) be viewed as im purities in old didymium

Marignac's Yais probably a compound writer recognises in it two at least of the con-

stituents of yttrium, GB and GC

A E Nordenskjöld gives the name oxide of gadolinium (a totally different body from Marignac's Ya or gadolinium) to the mixture of earths in gadolinite which are precipitated by ammonia and oxalic acid, but not by sulphate of potash This mixture consists of yttria, erbia, and ytterbia A very interesting point is that however different the minerals from which it has been obtained, and however the percentage of the rare earths varies, the equivalent weight of the mixture is always approximately the same, viz 261 9 This value is determined by transforming a weighed quantity of the oxide into sulphate by digestion with dilute sulphuric acid, and driving off excess of water and acid by heating to incipient redness (Nordenskjöld, Ö R 102, 795, W Crookes, C N 54, 239)

On the other hand, commenting on this, De Marignac shows that there is sometimes a varia tion of 15 pc in the equivalent weights of these natural mixtures of rare earths (De Marignac,

Arch des Sci Phys 17, No 5)

We have therefore some thirty bodies of which the so called rare metals are composed, or, at least, which they contain, and a variety of facts points to the conclusion that we have by no means come to the end Several even of the new bodies give signs of a capability of further splitting up, if they are examined with sufficient nicety and persistence It is far from unlikely that when the various methods of research known as fractionation have been more generally applied we may have to deal, not with thirty, but with nearer sixty, unknown bodies

But whatever may be the number of these bodies the question must be raised, What are they? Are they each and all independent elements? We have certainly no good a priori grounds for asserting that the number of ele ments now recognised is not capable of consider But before any body can be able extension accepted as simple it should certainly undergo a very severe scrutiny, more severe than any of these newly-discovered bodies has yet undergone The case of didymium is here a warning had been closely examined by some of the ablest chemists in Europe, it had been freed from several foreign bodies, its atomic weight had been established, when a novel mode of examination proved its compound nature

Pending therefore the completion of a series of investigations, chemical and optical, which

will probably occupy several generations of chemists, it may be safest to call these recently observed bodies not, as yet, elements, but quasi or meta elements Our notions of a chemical element have been enlarged, hitherto the ele mental molecule has been regarded as an aggre gate of two or more atoms, and no account has been taken of the manner in which these atoms have been agglomerated. The structure of a chemical element s certainly more complicated than has hitherto been supposed reasonably suspect that between the molecules which we are accustomed to deal with in chemical reactions, and the component or ultimate atoms, there may intervene sub molecules, sub aggregates of atoms, or meta elements, differing from each other according to the positions which they occupy in the very complex structures commonly known as didymium, yttrium, and the

METAMERISM This term is generally applied to those cases of isomerism wherein compounds show identity of elementary composition, but belong to different types or classes (v Iso-

METEORITES As

As regards composition, meteorites have been divided into two classes, those which consist for the most part of metals only, and those which are chiefly composed of silicates, sometimes accompanied by unoxidised iron and nickel Iron and nickel are the principal constituents of those meteorites which are mainly metallic The quantity of Fe varies from 80 to 95 pc, and of Ni from 6 to 10 pc Co occurs in many meteorites, varying from a mere trace to 2 or 3 pc, the other metals found in small quantities are Sn, Mn, Cr, and Cu, small quantities of Fe Ni phosphide, and also carbide, phosphide, silicide, and sulphide of Fe are also frequently found in metallic meteorites The silicates which form the chief constituents of meteorites of the second class are silicate of Al, Ca, and Na (labradorite), silicate of Ca and Mg (augite), and silicate of Fe and Mg (olivine) These silicates are often accompanied by nickel and iron, also by iron pyrites, and sometimes by chrome iron, and magnetic oxide of iron

METHACRYLIC ACID C.H.O. 1 e CH₂ CMe CO₂H a Methyl acrylic acrd [16°], (160 5° 1 \forall) S G 20 1 0153 (Bruhl, B 14, 2800) $\mu_{\rm D} = 1\,4314$ R_{∞} = 35 07 Occurrence - In small quantity in Roman oil

of chamomile (Kopp, A 195, 82)

Formation — I Obtained as ethyl ether by the action of PCl₃ on oxy isobutyric ('dimethoxalic') ether CMe₂(OH) CO₂Et (Frankland a Duppa, C J 18, 133, A 136, 12, Paul, A 188, 52) -2 By the action of fuming HBr on citraconic acid, mesaconic acid, or citraconic anhy dride, the resulting brome pyretartaric acid being boiled with cone NaOHAq (Fittig, A 188, 95, B 10, 517) -3 By boiling citra and mesa chloro pyrotartaric acid with alkalis (Prehn, A 188, 42) -4 Together with oxy-isobutyric acid, by boiling a brome isobutyric acid (1 pt) with water (25 pts.) (Thomson, A 200, 86)

Preparation - Citraconic anhydride is mixed with a saturated solution of HBr (2 vols) at 0°. In a few days a mass of crystals of citra-bromo-pyrotartaric acid is got These are collected, boiled with Na₂CO₃, acidified with HCl, and dis-The distillate is neutralised by CaCO, filtered, evaporated to dryness, and mixed with HCl Methacrylic acid separates as a light oil

(Fittig a C Kolbe, J pr [2] 25, 372)
Properties —Long prisms (from water), with strong but not unpleasant odour V sol water,

v e. sol alcohol and ether

Reactions—1 Bromine forms di-bromo iso-butyric acid—2 Potash fu uon gives hydrogen, formic acid, and propionic acid (F a D) 8 Sodium-amalgam reduces it to isobutyric acid—4 Cone HIAq forms, in the cold, iodoisobutyric acid crystallising in tufts of prisms -5 Methacrylic acid dissolves easily in fuming HBr even at 0°, the solution, after some time, depositing a crystalline addition product and a thick oil (Paul, B 9, 122) -6 Bromins forms CH,Br CBrMe CO,H -7 On contact with cold conc HClAq or by heating at 130°, it is con verted into an amorphous (? polymeric) modifi cation The ammoniacal solution of this sub stance gives white pps with Ba and Ca salts is not altered by conc H₂SO₄ and HNO₃ (Fitting a Engelhorn, A 200, 70)—8 Hypochlorous acid forms chloro oxy isobutyric acid [107°] (c 235°) (Melikoff, Bl [2] 41, 311)

Salts - CaA'₂ tufts of long needles, v sol Appears to change on keeping to a salt water of the polymeric acid (v Reaction 7) -AgA' needles (from boiling water), scarcely affected by light Suddenly decomposes at 100°

Constitution -Inasmuch as the di bromo iso butyric acid, formed by the addition of bromine, is converted by boiling water into a bromo oxy butyric acid that can be reduced to a oxy isobutyric acid, (CH₃)₂C(OH) CO₂H, it is clear that methaci ylic acid is not CH CHMe CO,H but CH, CMe CO H

Occurrence - The bubbles of gas given off by decaying vegetable matter in stagnant pools con sist of marsh gas, CO2, and nitrogen escapes into coal mines, where it is known as fire damp, since it forms an explosive mixture It escapes from the earth in various places, as in Italy, North America, and especially at Baku on the Caspian It occurs among the products of distillation of wood, peat, coal, and bituminous shale, constituting 35 to 40 pc of coal gas Methane occurs also in the intestinal gases It occurs also among the products of the passage of ethylene (Norton a Noyes, Am 8,

362) and other gases through a red hot tube. The gaseous product obtained by heating ethylene at 400° contains 36 p c methane and 40 p c.

ethane (Day, Am 8, 153)

Formation —1 By the action of potassium. amalgam on CCl4 in presence of water (Regnault) 2 By passing a mixture of CHCl, or CCl, and hydrogen through a red-hot tube (Berthelot) -By the action of powdered zinc on chloroform dissolved in aqueous alcohol (Sabanejeff, B 9, 1810) -4 By exposing a mixture of CO and hydrogen to the action of electricity in an induction tube (Brodie, Pr 21, 245) -5 By the action of water on zinc methide (Frankland) -6 By the action of sodium on MeI in presence of ether (Wanklyn a. Buckersen) —7 In small quantity by passing a mixture of CS₂ and H₂S over red hot copper (Berthelot, A Ch [3] 53, 69) 8 By heating \tilde{CS}_2 with PH I at 130° (Jahn, \dot{B} 13, 127) -9 Among the products of the dry distillation of barium formate (Berthelot, J 1857, 426) -10 By distilling crystallised sodium acetate (2 pts) with KOH (2 pts) and quicklime (3 pts) (Dumas, A Ch [2] 73, 92) Von Schlegel (A 226, 140) recommends 1 pt of sodium acetate and 2 pts of soda lime (cf Schorlemmer, C N 29, 7) -11 When river mud is added to a solu tion of calcium acetate a slow evolution of a mixture of methane (2 vols) and CO2 (1 vol) occurs, calcium carbonate being left Calcium lactate undergoes a similar fermentation, the gases being evolved in the same proportion (Hoppe Seyler, H 11, 561)

Preparation -By the action of the copperzinc couple on an alcoholic solution of Mel, the escaping gas being well washed by a scrubber containing a further quantity of copper zine (Gladstone a Tribe, C J 45, 154)

Properties — Colourless gas V sl sol. ter Much less soluble in alcohol than water ethane Its illuminating power is slight (cf L T Wright, C J 47, 200) May be liquefied by combined cold and pressure (Cailletet, J 1877, 221) Methane is not absorbed by aqueous KOH or by ammoniacal cuprous chloride When compressed with water below 0° under a pressure of 30 atmospheres it forms a crystalline hydrate, the critical temperature of which is 21 5° (Villard, C R 106, 1602, 107, 395)

Reactions —1 When passed through a red-

hot tube it is for the most part unaffected, buta little naphthalene is formed Electric sparks partially convert it into carbon, hydrogen, and acetylene (Berthelot, C R 67, 1188) When passed over a red hot palladium spiral it is decomposed, if dry, into carbon and hydrogen, and, if moist, into CO and hydrogen (Coquillon, C = R = 86, 1197) —2 It is not attacked by sulphuric acid, by nitric acid, by a mixture of hot cone H.SO, and HNO, by POl, or by chlorine in the dark -- 3 A mixture of chlorine (2 vols) with methane (1 vol) when exposed to sunlight presently explodes The explosion may also be brought about by an electric spark If the mixture be first diluted with CO, and then exposed to sunlight, quiet chlorination takes place, and if excess of chlorine is present chloroform and CCl, are formed A mixture of methane (1 vol) and chlorine (1 vol) exposed to diffused daylight gives methyl chloride In presence of moisture, chlorine forms HCl, CO2, and CO.-

4 A mixture of aur and methane passed over a red-hot platinum spiral yields formic acid (Coquillon, C R 77, 444) -5 When mixed with nitric oxide and fired by an electric spark CO₂ and oxygen are among the products (Cooke, C N 58, 130)

Constitution —That the four atoms of hy drogen in methane are of equal value may be inferred from the existence of only one set of methyl compounds The same thing may be

shown thus

From CHHHI we may obtain, by treatment with KCy, an acetonitrile CHHHCy which we may call 'a' From this we can obtain CHHH CO₂H, CHHCl CO₂H, CHHCly CO₂H, and 'β' acetonitrile CHHCyH successively But from CHHCy CO H we can obtain malonic ether CHH(CO₂Et)(CO₂Et), and thence we can get CHCl(CO₂Et)(CO₂Et), CHCy(CO₂H)(CO₂H), and '\gamma' acetomtrile CHCyHH successively The three acetomtriles '\alpha' '\beta', and '\gamma' are then found to be identical, hence three at least of the atoms of hydrogen in methane are of equal value The fourth acetonitrile might probably be obtained from CH(CO,Et), via CCl(CO,Et), and CCy(CO,H), (Henry, C R 104, 1106) Since co Coc, H, the product of the action of

 $co<_{OEt}^{Cl}$ on isobutyl alcohol, is the same as

 $CO < {OEt \atop OC_4H_9}$, obtained from $CO < {Cl \atop OC_4H_9}$ ethyl alcohol, the carbonyl group is united to two atoms of hydrogen of equal value Now from aldehyde CO CH. we may obtain

Cl > 0 < H whence silver propionate forms $^{C_3H_5O}_{AcO}>^{C}<^{H}_{CH_3}$ But from aldehyde we

may also obtain $_{C_3H_3O}$ $\overset{Cl}{O}$ > $C < \overset{H}{CH_1}$ whence silver acetate yields $_{C_3H_3O}$ > $C < \overset{H}{CH_1}$

These two acetyl propionyl derivatives of ortho aldehyde are found to be identical, hence the two atoms of hydrogen in methane which are displaced by oxygen in forming carbonyl are of equal value It follows that there are two pairs of equivalent atoms of hydrogen in methane (Geuther, A 205, 203, 225, 290) And since Henry has shown that three of the atoms of hydrogen in methane are equivalent, it follows that the fourth 18 so also

NO CH₂)₂O? [c 60°] The sodium salt is formed by acting on nitro methane with alcoholic NaOH, the resulting crystalline pulp being heated on the water bath The upper (alcoholic) layer is poured off, and the lower layer deposits sodium methaconate on cooling I is dissolved in water and reppd by alcohol (Friese, B 9, 804) Ac cording to Lecco (B 9, 705) it is best to add dilute H,80, and shake with ether If the ether is deied with Na SQ and shake with ether if the ether is dried with Na₂SO₄ and evaporated over H₂SO₄, it leaves methazonic acid as large crystals, which may be recrystallised from benzene. It is v. sol

water, alcohol, and ether, m sol benzene, insol petroleum naphtha The Na salt crystallises from alcohol in long prisms METHENYL-AMIDINE v Formamidine

METHENYL-AMIDOXIM v FORMAMIDOXIM METHENYL-AMIDO-o-CRESOL CaH, NO + 6. $C_sH_s(CH_s) < N > CH [3]$ [89°] (200°) **Co**lourless crystals Prepared by the action of formic acid on amido-o cresol (Hofmanna Miller,

B 14, 570)

Methenyl-amido p-cresol CaH, NO : 6.

 $G_0H_3(CH_3) < N > CH [5] [46^\circ]$ Formed from amido p cresol by distillation with formic acid (H a M) Crystals

METHENYL (α) AMIDO NAPHTHYL MER-CAPTAN C₁₀H₄<^NSCH [46°] Formed by heating formyl (a) naphthylamine with sulphur Colourless oily fluid Insol water Volatile Base -B'2H2Cl2PtCl4 steam yellow needles (Hofmann, B 20, 1799, 2265)

METHENYL-AMIDO-PHENOL C,H,NO .. $C_{\bullet}H_{\bullet} < N > CH [30.5^{\circ}] (182.5^{\circ}) V D (H=1)$ 112 5 (cale 119) Obtained by boiling formic acid with o amido phenol (Ladenburg, B 10, 1123) Prisms Hot cone HClAq decomposes it, forming o amido phenol

METHENYL-AMIDO-PHENYL MERCAP. TAN C_7H_4NS 4.6 [1 2] $C_6H_4 < N > CH$ (230°) Colourless fluid Sparingly soluble in water, easily in alcohol and CS₂. Has decided basic properties Heavier than water Volatile with steam Isomeric with phenyl mustard oil

Preparation -1 By reduction of the chloro derivative (vol 11 p 78) with tin and HCl or with HI -2 By the action of formic acid on amido phenyl mercaptan (Hofmann, B 13, 14) 3 Formed together with aniline, methyl aniline, and a base C₈H₇NS₂, by boiling di methyl aniline with sulphur (Mohlau a Krohn, B 21, 59)

Properties -Oil, smelling like quinoline and having a bitter taste It is related to thiszole as quinoline is to pyridine The sulphur cannot be displaced by the action of lead hydrate or even by heating with copper to 250° On fusion with KOH it gives formic acid and amido phenylmercaptan PCl, at 180° forms the chloro deri vative CeHe(NS)CCl

Salts—(B'HCl),PtCl, sparingly soluble tables, or needles—(B'HCl)AuCl,—B',H,FeCy, Methylo-sodide C,H,NSMeI [210°]; needles, si sol cold alcohol, v sol hot water

General character -This base stands in the same relation to quinoline as thiophene stands to benzene In consequence of this analogy the base and its derivatives exhibit great similarity in properties with the corresponding quinoline compounds thus the boiling-points of the methenyl- and ethenyl-o amido phenyl mercaptan do not differ much from those of quinoline and methyl-quinoline, and they form crystalline picrates and uncrystallisable chromates They also form colouring-matters analogous to the cyanines (obtained by the action of alkalis upon a mixture of the alkylo-iodides of quinoline and methyl quinoline) Thus by boiling an aqueous solution of the amylo-iodides of methenyl- and ethenyl amido-phenyl mercaptans with NH₃, a red colouring matter C₂₃H₃₁N₂S₂I is obtained which crystallises in four sided violet red plates with green reflex, sol hot alcohol, sl sol cold al cohol, insol water Neither of the amylo iodides when treated separately, in the same way, gives any colouring matter In a similar manner to the amylo rodides, the mixed methylo rodides give a compound crystallising in reddish-golden plates, sol alcohol with a scarlet red colour Similar colouring matters are also obtained from the corresponding derivatives of amido naphthyl mercaptan, or from the latter derivatives cor. jointly with those of amido phenyl mercaptan, or from those of amido phenyl-mercaptan conjointly with those of quinoline and methylquinoline All the above products are stronger colouring matters than the cyanines (Hofmann, B 20, 2262)

Derivatives v Amido-, Chioro, and Nitro-METHENYL-AMIDO PHENYL-MERCAPTAN

METHENYL-0-AMIDO-PHENYL-MERCAP-TAN ω -CARBOXYLIC ACID $C_{\bullet}H_{\bullet} < N \\ S > C CO_{\bullet}H$

Formation -1 By the action of cold alco holic caustic potash upon amido imido ethenylo-amido phenyl mercaptan

 $C_{\bullet}H_{\bullet} < N > C(NH_2)NH$, ammonia being eliminated -2 In small quantity by oxidation of ethenyl-o-amido phenyl mercaptan

C.H. N C CH3 with cold aqueous KMnO. Properties - White needles Sol water and alcohol It very readily splits off CO2 giving methenyl amido-phenyl mercaptan (Hofmann,

H C 170,600 (Stohmann). M.M. 1 640 at 18.7°. Compressibility. 00010879 at 15° (Dupré, Pr 20, 386) Methyl hydroxide Wood spirit methane

Occurrence.—Free in the juices of plants (Guthseit, J. 1879, 905, Maquenne, O R 101, 1067) and in the aqueous distillate in the fruits ed Heracleum (Guthzeit, A. 177, 844; 240, 248).

Methyl alcohol occurs also in the product of the distillation of wood (Taylor [a.D. 1812], Telloch's Phil Mag 60, 315, Dumas a Peligot, A 15, 1; A Ck 58, 5, 61, 193) and of colophony (Kelbe a. Lwow, B 16, 851) It occurs as methyl salicylate in oil of winter-green (Gautheria procum-

Formation. 1 From methane by chlorinating, and heating the resulting methyl chloride with aqueous KOH for 7 days at 100° Berthelot, 105, 241) The MeCl may also be treated with HOAc and NaOAc at 200°, and the result-ing MeOAc saponified McCl treated with Ag. 80, and H₂SO, at 100° gives HMeSO, whence methyl alcohol can be readily obtained —2 From hydrogen cyanide by reduction with zinc and H2SO4, and treating the resulting methylamine with nitrous soid (Linnemann, Z [2] 4, 284) – 8 By distilling calcium formate (Lieben a. Paterno, G 3, 290, A. 167, 293, Friedel a Silva, C R 76, 1545)

Preparation -The crude watery liquid obtained by the distillation of wood contains methyl alcohol, acetone, acetic acid, methyl acetate, and ammonium acetate It is separated from the tarry products and redistilled, the first tenth of the distillate is mixed with slaked lime and redistilled, a little sulphurio acid is then added, and the liquid redistilled and rectified over quicklime The crude wood spirit thus obtained has a strong aromatic odour and turns brown on keeping. It contains methyl acetate, acetone, di-methyl acetic orthaldehyde CH, CH(OMe), (Dancer, C J 17, 222), allyl alcohol, methyl ethyl ketone, and other ketones (Grodzky a Krämer, B. 9, Methyl alcohol may be obtained from wood spirit by saturating with fused CaCl, and heating on a water bath The residue is a compound of methyl alcohol with CaCl, which when distilled with water is decomposed, giving off the methyl alcohol The distillate is then rectified over quick-lime (Kane, A 19, 164) According to Gould (C J 7, 811) it is best to distil the wood spirit with cone NaOHAq (to saponify MeOAc) and then to dehydrate with K2COs before saturating with CaCl. A better method for obtaining methyl alcohol from wood spirit is to distil the spirit (1 pt) with H2SO4 (1 pt) and potassium oxalate (2 pts), the crystalline di-methyl oxalate is then decomposed by distillation with water, and the MeOH dried over lime (Wöhler, A 81, 376) The oxalate may also be obtained by dissolving oxalic acid, dehydrated at 100°, in boiling MeOH, leaving the solution to cool, and washing the crystals with cold water as long as the filtrate exhibits the iodoform reaction (Erlenmeyer, N Rep Pharm. 28, 624). An alternative method consists in passing HCl into a solution of benzoic soid in wood spirit, distilling, ppg with water the portion collected above 100°, decomposing by boiling for several hours with aqueous NaOH, distilling, and rectifying over quick-lime (Carius, A. 110, 210). The following modification of Wohler's process is recommended by Dittmar a. Fawsitt (Tr. E 38, 509) 100 c.c of wood spirit are digested with 150 g of powdered NaOH, and then distilled on a water-bath, 500 g. of oxalic acid crystals are mixed with 200 c.c. of sulphuric acid, and then 400 c.c. of the alsohol, purified as above, is added, and the whole cautiously heated on a

The methyl exalate thus obtained ' water-bath is thoroughly dried by pressure, and the alcohol regenerated by digestion with water at 70° To dehydrate the alcohol thus obtained, digestion with baryta, lime, and dried copper sulphate is necessary Even when prepared from the oxalate methyl alcohol is not quite pure, as it contains bodies which exhibit Lieben's iodoform reaction It may be freed from these by dissolving in it one tenth of its weight of iodine, gradually adding NaOH until the liquid is distinctly alkaline, and distilling The product, rectified over CaO, has a specific gravity of 81 at 15° (Reg nault a Villejean, A Ch [6] 4, 430, C R 99, Methyl alcohol may also be prepared by saponifying methyl formate (\$\beta\$ pts) with NaOH (2 pts) and water (6 pts) (Grodsk, a Kramer, B 9, 1928, Baidy a Bordet, A Ch [5] 16, 564) Methyl alcohol may be obtained very nearly pure by distilling oil of winter green with potash, and rectifying the distillate over lime

Properties—Colourless mobile liquid, with purely spirituous odour Burns with a pale flame Mixes with water, alcohol, and ether, dissolves fixed and volatile oils and most resins Hence it is much used as a solvent. In aqueous solution it produces intoxication, in concentrated solution it is poisonous. When perfectly dry it dissolves a little CuSO, acquiring a bluish green colour, but it does not dissolve crystallised CuSO, 7aq (Klepl, J. pr. [2] 25, 526). Methyl alcohol is etherined by acetic acid more rapidly and completely than any other alcohol (Men schutkin, Z. P. C. 1, 611). Dittimar a Fawsitt give the specific gravity of mixtures of methyl is specific gravity.

alcohol and water as follows

Estimation —Pure methyl alcohol does not give Lieben's iodoform reaction with iodine and notash

The amount of methyl alcohol in commercial wood spirit may be estimated by adding 5 c o of the spirit, drop by drop, to 30 g of PI₂ in a flask provided with inverted condenser. The flask is then heated for 5 minutes in boiling water, and the MeI then distilled off by inclining the condenser. The volume of MeI is read off in a graduated receiver 5 c c of methyl alcohol yield 7 19 c c of methyl include (Krell, B 6, 1310, cf Grodzky a Kramer, B 7, 1495, 9, 1928). If it is desired to determine how much of the methyl alcohol is in the form of MeOAc, the spirit may be boiled with standard alkali, and the amount used up in the saponification determined

Bardy and Bordet (A Ch [5] 16,565) modify Krell's process, using only 15 g of PI to 5 cc of wood spirit, but adding 5 cc of aqueous HI subsequently They distil the liquid at %0°-90°, and at the end of the distillation add 5 cc of water and quickly distil The methyl iodide is washed once or twice with water and measured

Di methyl ortho acetic aldehyde or methyl acetal CH₁ CH(OMe), boils at 64° and gives MeI on treatment with PI₂, but it does not react with aniline, so that when the wood spirit is to be used in preparing di methyl aniline, by heating with aniline hydrochloride, the estimation by

PI, will give too high results

The presence of acetone is objectionable in methyl alcohol that is to be used for preparing di methyl aniline. Its amount can be determined by shaking 1 or 2 cc of the alcohol with 20 or 30 cc of normal aqueous KOH, adding 20 or 30 cc of a decinormal solution of iodine, until the solution is clear. The liquid is then acidited with HCl (S G 1025), excess of decinormal sodium thiosulphate added, and the excess determined by titrating back with iodine solution If 1 cc of methyl alcohol be taken, the weight of acetone in 100 cc will be found by multiplying the amount of iodine used up by 7612 (Messinger, B 21, 3366, cf kramer, B 13, 1002, Hintz, Fr 27, 182)

The estimation of methyl alcohol in ethyl alcohol can be effected by oxidation with a standard solution of h₂Cr₂O₂, for 1 pt of ethyl alcohol reduces 4 278 pts of the dichromate in becoming oxidised to acetic acid, while 1 pt of methyl alcohol, in being oxidised to CO₂ and water, reduces 9 224 pts of K₂Cr₂O₂. A solution of 80 g K₂Cr₂O₂ and 150 c c H₂SO₄ per litre is employed, and the unreduced chromate estimated volumetrically (O Hehner, An 12, 25)

When 10 cc of pure ethyl alcohol are shaken with 1 cc of a 1 pc solution of KMnO, at 20°, no reduction takes place for 20 minutes, but if the ethyl alcohol contains crude wood

spirit, decolourisation takes place at once (Haber mann, Fr 27, 663)

Reactions - 1 Passage through a red hot tube yields acetylene and other products (Berthelot, O R 50, 805) -2 In contact with platinum black and air it is oxidised to formic aldehyde and formic acid -8 Heated with ammonium chloride in a sealed tube at 300° it yields mono-, di-, and tri methylamine (Berthelot) 4 Bleaching powder does not yield chloroform (Goldberg, J pr [2] 24, 115) - 5 Potassium gives off hydrogen, forming KOMe -6 When its vapour is passed over heated potash, hydrogen is given off, and potassium formate, oxalate, and carbonate are successively formed -7 Conc H SO4 forms HMeSO4, which, when heated with excess of methyl alcohol, yields di When distilled with excess of methyl oxide H₂SO₄ di methyl sulphate passes over —8 Con verted into methyl chloride by treatment with HCl, with PCl₈, or with S₂Cl₂ The joint action of H2SO4 and HBr gives rise to methyl bromide and ethyl bromide (Niemilovitch, M 10, 820) — 9 SOCl₂ forms MeSH, Me₂SO₄, MeCl, and other products (Carius, A 111, 93) —10 SO₅ forms CH(OH)(SO₂H)₂ (Max Muller, B 6, 1031) — 11 When acidulated with 5 pc sulphuric acid and submitted to electrolysis it forms CO2, CO, methyl formate, methyl sulphate, and methylal (Renard, C R 80, 236) -12 Distillation over heated zinc dust splits it up into CO and hydrogen, a very little methane being also formed (Jahn, B 13, 983, M 1, 378) — 13 Zinc chloride forms CH4, water, Me2O, hexa methylbenzene, and traces of propylene, butylene, and other hydrocarbons (Le Bel a Greene, C R 87, 260, 89, 413) -14 Aldehyde (1 vol.), MeOH (2 vols), and HCl form CH3 CH(OMe)2 (Claus a Trainer, B 19,3004) -15 Not affected by B aceti growing in solutions containing it (Brown, C J 49, 177) -16 Converts m and p diazo benzoic acid into C6H4(OMe) CO2H, while o diazo benzoic acid only gives benzoic acid (Griess, B 21, 978) -17 When heated with hydrochlorides of aro matic bases (e.g. aniline, xylidine, piperidine) it often displaces hydrogen in the nucleus by methyl (Hofmann, B 15, 2895, Ladenburg, B16, 2057) -18 Unlike EtOH, it hardly reacts when heated with phenol and ZnCl₂ (Auer, B 17, 669) -19 Unlike butyl and amyl alcohols, it does not form a homologue of benzene when heated with benzene and ZnCl₂ at 270° (Gold schmidt, B 15, 1066) — 20 ClCONH, forms methyl allophanate NH2.CO NH CO2Me [208°] (Gattermann, A 244, 40)

Metallic derivatives - KOMe tained by dissolving K in methyl alcohol-(KOH)_s(MeOH)_s or (KOMe)_s(MeOH)₂ 3aq [c 110°] Obtained by evaporating a solution of KOH in methyl alcohol (Göttig, B 21, 1882) Large elastic plates, somewhat heavier than water, on which they move about rapidly, decomposed - $-(NaOH)_{s}(MeOH)_{s}$ Obtained by dissolving (NaOMe), MeOH aq NaOH in dry MeOH and evaporating Crystalline mass, which moves about on the surface of water while decomposing and dissolving — NaOMe 1 aq Obtained by evaporating a solution of NaOH in not quite dry methyl alcohol (Gottig, B 21, 561) -NaOMe(MeOH), (Fröhlich, A 202, 295) CO passed over NaOMe at 160°

forms acetic acid CO passed into a hot mixture of NaOMe and NaOAc forms propionic acid (Geuther a Fröhlich, A 202, 312) When dostilled with the Ba salt of a carboxylic acid it displaces the carboxyl by hydrogen Thus succinic acid may be converted into propionic acid (Mai, B 22, 2135) — TIOMe From TIOEt and excess of MeOH (Lamy, J 1864, 466) — (Ba(OMe)₂)₂BaO₂H₂ aq White nacreous plates, obtained by evaporating at 135° a solution of BaO in MeOH (De Forcrand, C R 102, 1397. Perhaps identical with Ba(OMe) aq de scribed by Dumas and Peligot (A Ch 58, 17) 1 litre of MeOH dissolves 200 g of BaO The heat of formation of the compound from solid 3BaO and liquid 4MeOH is 62,500 If a considerable quantity of water is added to the solution of BaO in MeOH the hydrate BaO 10aq is precipitated The compound BaO2Ba(OMe), 2aq is readily formed, even if as much as 3 p c water be present in the methyl alcohol, but by evaporating in the cold over H.SO, crystals of Ba(OMe) dag are formed These are sol water and alcohol By passing HCN into a solution of baryta in methyl alcohol there is formed barium cyano methylate Ba(OMe)CN,MeOH This is a crys talline powder, sol water, less sol methyl alcohol It loses at 100° the methyl alcohol of crystallisation

Combinations — CaCl₂VieOH Methyl alcohol dissolves CaCl₂ with great rise of tem perature, and on cooling this compound sepa rates in large six sided tables (Kane, A 19, 168) It is not decomposed at 100°, but water readily liberates the MeOH — LiCl3MeOH — MgCl₂6MeOH (Simon, J pr [2] 20, 377)—SbCl₃MeOH [81°] Slightly yellow crystals (from hot alcohol), decomposes at 130°, giving off MeCl and HCl (W C Williams, C J 30, 463) — CuSO₄2MeOH Minute bluish green crystals, obtained by shaking anhydrous CuSO₄ with methyl alcohol (Forerand, C R 102, 551)

METHYL ALDEHYDE 18 FORMIC ALDEHYDE METHYL - ALIZARIN v DI OX1 METHYL ANTHRAQUINONE

METHYL-ALLANTOIN C, H, N, O, [225°] Formed by oxidising methyl uric acid with cold aqueous KMnO, (Hill, B, 9, 1090) Monoclinic prisms, decomposed by fusion V sol hot water, sl sol alcohol, insol ether Conc HIAq splits it up into urea and methyl hydantom—AgC, H, N, O, prisms, sl sol cold water

METHYL-ÂLLOXAN C₃H₁N₂O₄ te CO NH CO CO Formed by oxidising methyl uric acid with HNO₃ or with KClO₃ and HCl (Hill, B 9, 1092) Formed also by treating theobromine (2 pts) with KClO₄ (9 pts) and HCl (S G 1 06) at 50° (Maly a Andriasch, M 3, 108, of Fischer, A 215, 304) It is converted by alkalis into methyl alloxanic acid, and by boiling HNO₃ into methyl parabanic acid, and by forms di methyl alloxanin KHSO₄ forms a compound B'KHSO₅ aq, which crystallises in large monoclinic prisms

D1 methyl alloxan C_eH_eN₂O₄ a e

CO \ NMe CO \ CO A product of the action of

KClO₄ and HCl on cafferne at 50° It is ex

tracted by ether (E Fischer, A 215, 257, Maly

a Andreasch, M 3, 92) Colourless six sided

tables (containing 2aq), which slowly turn red V sol water, almost insol alcohol, insol in air With FeSO, and Dyes the skin red ammonia it gives a characteristic indigo coloura After drying over H2SO4 it is left as an amorphous powder (containing aq), sol alcohol and ether Di methyl alloxan decomposes at 100° It prevents the ppn of cupric and ferric salts by potash Hydrogen sulphide converts it into amalic acid KHSOs forms the compound C.H.N2O4KHSO, which crystallises in long tablets, S 72 at 20°, almost insol alcohol, insol ether This compound may be crystallised from warm water, and does not give the indigo

colouration with FeSO, and ammonia METHYL ALLOXANIC ACID C,H,N,O Formed by the action of alkalis on methyl-When the product of the action of HNOs on methyl uric acid is neutralised with CaCO₃, and then mixed with alcohol and am monia the salt CaC₃H₄N₂O₃ is ppd (Hill, B 9, 1092) This salt is gelatinous, and when boiled with water it gives off methylamine

METHYL-ALLOXANTIN C,H,N,O, tained by mixing solutions of disluric acid and methyl alloxan (Andreasch, M 3, 431) Ciys tallises from water in minute thin tables (containing 3aq)

s Di methyl alloxantin C10H10N4O8 ve CO < NH CO > C(OH) C(OH) < CO NH CO NH > CO

Formed by passing H S into an aqueous solution of methyl allovan (Maly a Andieasch, M 3, Thin plates (containing 4aq), almost insol alcohol and ether, sl sol cold water Turns 1ed in air Gives a red colouration with ammonia, and a violet colouration with potash or baryta (Andreasch, M 3, 109)

u Di-methyl alloxantin

 $co \stackrel{VMe}{<_{VM}} \stackrel{CO}{<_{VM}} co$

Formed by reducing di methyl alloxan to di methyl dialuric acid, and ppg the aqueous solu tion of this acid with allovan (Andreasch, M 3, Crystallises from hot water in minute four sided pyramids (containing aq), insol alcohol and ether

Tetra methyl alloxantin v AMALIC ACID METHYL ALLYL v BUTYLENE

METHYL-ALLYL ACETO ACETIC ACID • ACFTO ACFTIC ACID

DI METHYL-ALLYL-AMINE Methylo todide C.H.NMe,I From allylamine and MeI (Bono, B 20, Ref 137) When distilled with KOH it yields NMe, and an aldehyde CaHieO (130°-135°)

p METHYL-ALLYL BENZENE C10H12 26 CH₃ C₆H₄ C₃H₅ p Allyl toluene (192°) Formed from cymene by chlorinating and heating the resulting CH₃ C₆H₄ C₃H₆Cl with alcoholic KOH (Errera, G 14, 283, 505) Liquid Combines with bromine KMnO₄ oxidises it to p toluic scid HBrAq (S G 159) at 200° forms a polymeride (C₁₀H₁₂)_x (850°), and this on keeping changes to an amorphous solid, which by distil lation is reconverted into p methyl-allylbenzene

ALCOROL

METHYL - ALLYL - CHLORACETOL v DiCHLORO HEXYLENE

METHYL ALLYL ETHER v METHYL ALLYL

METHYL ALLYL DIKETONE C.H.O. 1 6. CH, CO CO C,H, (c 130°) Acetyl crotonyl Obtained by distilling its mono oxim with dilute H SO₄ (Otte a Von Pechmann, B 22, 2124) Yellow oil with irritating odour Not obtained

Mono oxim CH₃ CO C(NOH) C₃H₃ Nitroso-placetone Methyl nitroso butenyl ketone llulacetone [46°] From allyl aceto acetic acid and nitrous White plates (from ligroin), v sol usual acid menstrua Its solution in NaOHAq is yellow

Di oxim CH, C(NOH) C(NOH) C,H, [135°] Formed from the mono oxim by warming with hydroxylamine Small plates Phenyl hydrazide oxim

CH₃ C(N₂HPh) C(NOH) C₃H₅ [137°] Brownishred needles (from benzene and ligroin)

C4H₂O re (46°) SG 11 METHYL ALLYL OXIDE CH, O C,H, Allyl methyl ether 77 H F p 34,080 H F v 32,050 From allyl bromide and NaOMe (Henry, B 5, 455) bromine it forms CH, O CH2 CHBr CH2Br (185°) ICl gives CH, O C,H, ClI (196°) (Silva, B 8, 1469

METHYL ALLYL PROPYL CARBINOL v

OCTENAL ALCOHOL

METHYL ALLYL SULPHIDE C.H.S t.e CH, SC,H, (c 92°) VD 43 36 Formed by heating lead methyl mercaptide (CH,S),Pb with allyl biomide and ether at 100° (Obermeyer, B 20, 2925

METHYL ALLYL THIO-UREA

[50 5°] CH, NH CS NH C,H, Formed from allylamine and methyl thio carbimide or from methylamine and allyl thio carbimide (O Hecht, White mass B 23, 286)

METHYL AMIDO ACETIC ACID C.H NO. Le CH,NH CH, CO,H Methyl glycocoll Sarcos ine Mol w 89 [210°-215°] Formed by the action of boiling baryta water on creatine or caffeine (Liebig, A 62, 310, Rosengarten a. Stiecker, A 157, 1, Schilling, C C 1884, 811) Formed also by heating chloro acetic ether with aqueous methylamine at 125° (Volhard, A 123, 261)

Properties —Trimetric prisms, v e sol water, sl sol alcohol Has a somewhat sweet taste Heated to 210°-220° the greater part evolves HO giving the anhydride C₆H₁₀N₂O₂, whilst a smaller portion splits up into di methyl amine and CO₂ (Mylius, B 17, 286) Chloride of cyanogen passed into the fused substance gives methyl hydantoin and saicosine anhydride (Traube, B 15, 2110) When taken internally, the greater part passes as such into the urine (Baumann a Mering, B 8, 587, Salkowski, H. 4, 107, Schiffer, H 5, 266) Nitrous and passed into its hot aqueous solution forms a nitrosoderivative CH, N(NO) CH, CO,H, which is a thick liquid, forming the salt $\operatorname{CaA'}_2$ aq crystallis ing in needles (Schultzen, Z 1867, 616) Gives methyl uric acid when heated with urea (Hor baczewski, M 6, 356

Salts—(C.H.NO.),Cu 2aq ultramarıne bluc orystals (E Schmidt, A 217,273) — C.H.NO.HCl needles (from alcohol) —(C.H.NO.),ZnH.Cl, S. (alcohol) 038 V e. sol water (Bulgınsky, J.

1867, 495) — (C₂H₂NO₃) H₂PtCl₂ 2aq monoclinic tables, a b c = 10381 1 6747, $\beta = 75^{\circ}27'$ tables, a b c = 10381 1 6/47, B=75°27' — C₃H₁NO₂HAuCl₄ yellow needles, sl sol cold water—C₄H₂NO₁HNO₃ [c 70°] Very hygroscopic, v sol cold alcohol (Franchimont, R T C 2,839)—(C₃H₁NO₂)₂H₂SO₂ aq four sided tables, v e sol water S (boiling alcohol) 10 Guanidine hydrochloride C₄H₂NO₂HClCH₃N₃ Formed by heating methylamido acetic acid with guanidine hydrochloride (Reumen, R 7, 1151) Tables (from alcohol)

(Baumann, B 7, 1151) Tables (from alcohol)

Anhydride C.H. N.O. 1e

CH, N CH, CO

anhydride Sarcosine OCCH, NCH,

[150°] Formed by the action of cyanogen chloride on melted sarcosine Prepared by heating sarcosine to 210°-220° and distilling the residue (Traube, B 15, 2112, Mylius, B 17, V sol water, al Colourless prisms Weak base cohol, and ether Bitter taste By boiling with water it again gives sarcosine On oxidation with KMnO, it yields s di methyl oxamide

prisms -Salts - B'2H2Cl2PtCl 2aq B'.H.Cl.PtCl.4aq large six sided tables -

B'aHClAuCla 2aq prisms

Sarcosine-uric acid C₈H₂O₄N₃ Obtained by heating a mixture of sarcosine (3 pts) and uric acid (2 pts) at 210°, a good yield is obtained

Properties - Colourless prismatic crystals (containing 2aq) Sol hot water It shows the murexide reaction It slowly reduces alkaline solutions of copper It has weak acid and basic properties, dissolving in aqueous acids and alkalis By fusion with KOH at 110° it is resolved into uric acid and sarcosine Heated with bromine water it is converted into bromo sarcosinemesouric acid C₈H₇N₄O₅Br

Salts -The acetate forms microscopic crystals, sl sol hot acetic acid, insol cold HOAc, v sol water The formate is very analogous to the acetate The ammonium salt is crystalline -A"Ag, insol white amorphous pp (My lius, B 17, 518)

Bromo-sarcosine mesouric acid C.H.N.O.Br Formed by digesting a warm aqueous solution of sarcosine uric acid with bromine, which gives a nearly theoretical yield (Mylius, B 17, 521) Heavy colourless tables Sl sol water By H2S it is reduced to sarcosine mesouric acid It is readily decomposed by alkalis, but is stable towards acids

Sarcosine-mesouric acid CaHaOaN. Obtained by reducing a hot aqueous solution of bromo sarcosine mesouric acid with H.S (Mylius, B 17, 524) Trimetric tables or needles V sol water, insol alcohol It is a strong acid, but also possesses weak basic properties By bromine water it is reconverted into the bromo derivative, similarly chlorine water gives the chloroderivative It is very oxidisable, reducing AuCl, alkaline, copper solution, KMnO4, &c, very

Salts-The acetate forms an unstable crystalline pp, sl sol acetic acid -A"HNH, fine needles, v sol water -A"Ag, white amor

phous pp

Tri-methyl-amido acetic acid internal anhydride v BETAINE.

DI-METHYL-AMIDO ACETIC ORTHAUDE Methylo-hydroxide C,H,,NO, se HYDE CH (NMe₃OH) ČH(OH)₂. Muscarine Occurs, together with neurine, in the fly agaric (Schmie deberg a Koppe, J 1870, 875) Formed from neurine by oxidation with conc HNO, (Schmie deberg a Harnack, J 1876, 804) Deliquescent crystalline mass, sol alcohol Alkaline in reaction Active narcotic poison Separated from neurine by placing the mixed hydrochlorides on filter paper, when the muscarine salt deli quesces and is absorbed by the paper (Harnack, J 1876, 803) —B'(C₅H₁₁NO₂Cl)₂PtCl, 2aa --C₅H₁₁NO₂AuCl, Dr-ethyl derevative of the methylo

hydroxide C.H., NO, ie CH, (NMe, OH) CH(OEt), Hydroxide of tri When chloro acetal methyl - amido - acetal CH2Cl CH(OEt)2 is treated with tri-methyl amine there is formed CH, (NMe, Cl) CH(OEt), and C₃H₁₂NOCl, which is probably CH₂(NMe₃Cl) CHO The two salts are separated by fractional ppn by platinic chloride -(C,H22NO2Cl)2PtCl, orange crystals, sl sol cold water — C. H. NO, AuCl, lemon yellow needles

Di methyl amido acetic aldehyde Methylo hydroxide C₅H₁₈NO, ie CH₂(NMe₃OH) CHO Formed by saponifying CH₂(NMe₂OH) CH(OEt), with baryta (Berlinerblau, B 17, 1142) hydrochloride C₅H₁₂NOCl is also formed as above Gives the aldehyde reactions -Platinochloride (C₃H₁₂NOCl), PtCl, octahedra (from dilute

alcohol)

DI METHYL-AMIDO-ACETONE Methylochloride C₀H₁₄NOCl ie CH₂CO CH₂NMe₂Cl Caprine chloride Formed by the action of dry NMe, upon chloro acetone in the cold (Niemitovitch, M 7, 241) Very deliquescent shining needles, sol alcohol Gives the alkaloidal re actions Acts physiologically like curare — C₆H₁₄NOClAuCl, [139°]

DI-METHYL-AMIDO-ACETOPHENONE C₆H₄(NMe₂) CO CH₃ [59°] Formed by methylation of p amido acetophenone (Klingel, B 18, 2694) Yellowish plates (from hot water) ∇ sol alcohol, ether, and hot water

DI - METHYL - AMIDO - BENZENE PHOS PHINIC ACID NMe2 C6H4 P(OH)2 [162] Formed by decomposing its chloride with water (Schenk a Michaelis, B 21, 1498) needles, v sol hot water and alcohol On boiling its aqueous solution it is split up into di-methyl aniline and phosphorous acid When heated alone it gives phosphorus, PH2, and di methyl aniline

Salt -NaHA" 2aq large crystals (from alcohol)

(250° at Chloride NMe2 C.H. PCl2 [66°] 120 mm) Formed by the action of PCl, (100 g) on di methyl aniline (70 g) in presence of AlCl, (20 g) The mixture is boiled for eight hours with inverted condenser, and the product ex tracted with petroleum ether and distilled in vacuo. Thin plates, v sol benzene, m sol ether, sl sol petroleum ether. Converted by the action of chloro benzene and sodium into

DI-METHYL AMIDO BENZENE PHOS [133°] PHONIC ACID NMe C₆H₄ PO(OH) Formed by oxidising NMe.C.H. P(OH), with HgCl₂ (Schenk a Michaelis, B 21, 1500)

Crystals, v e sol water and alcohol

dı methyl amıdo trı phenyl phosphine

METHYL AMIDO BENZENE SULPHONIC ACID C, H, NSO, te NHMe C, H, SO, H Formed, together with methane disulphonic acid, by heating the acetyl derivative of methyl aniline with H₂SO₄ at 145° (Smyth, B 7, 1240) Crystals, which decompose at 182° without previous fusion -BaA'aq crystalline powder

Methyl-amido-benzene sulphonic acid NHMe C.H. SO3H Formed by heating methylaniline ethyl sulphate at 210° (Mundelius B 7, 1350) Plates (containing aq), insol alcohol and ether — BaA'₂3'₁aq small prisms
CaA' 4aq —PbA'₂8aq
D1-methyl-amido-benzene p-sulphonic acid small prisms -

NMe C.H. SO.H [150°] (S), [257°] (M a G)

Formation -1 By heating di methyl aniline with rather more than the equivalent quantity of sulphuric acid at 185° (Smyth, B 6, 344, 7, 1237, Armstrong, B 6, 663, Vignon, C R 107, 263) -2 From di methyl aniline and ClSO, Et (Wenghoffer, J pr [2] 16, 448) —3 From bromodi methyl-aniline and H SO, at 180° (Michler a. Walder, B 14,2177) -4 From di methyl aniline and SOCl, followed by water (Michaelis a God-chaux, B 23, 555)

Properties -8 sided prisms (containing aq).

Decomposes at 230°

efflorescent aqueous NaOH, insol water (M a G.)

Chlorede C.H. (NMe.)SO.Cl.

Ethyl ether EtA' [85°] Formed from alcohol and the chloride

Di-methyl-amido-benzene p-sulphonic acid Anhydride of the methylo hydroxide $C_0H_{13}NSO_3$ re $C_0H_4 < \frac{NMe_3}{SO_2} > 0$ Formed allowing a mixture of amido benzene p-sulphonic acid, MeI, cone KOHAq, and MeOH to stand for some time in the cold (Griess, B 12, 2116) Four sided plates, v sol cold water, almost insol alcohol, insol ether Decomposes before fusion Ppd as periodide by a solution of rodine in HIAq (SO3H.C4H4 NMe3Cl) PtCl4 8aq orange tables, v e sol cold water

METHYL-o-AMIDO-BENZOIC ACID

Amide NHMe C.H. CONH2. [160°] Formed by heating o amido benzamide with MeI at 100° (Weddige, J pr [2] 36, 152) Plates, v sol hot alcohol, sol water In dilute solutions it shows blue fluorescence

Acetyl derivative NHMe C₈H, CO NHAc [155°] Long needles, v sol hot alcohol, sl sol benzene and ether When heated above 155° it forms the anhydro derivative $C_{\bullet}H_{\bullet} < \stackrel{CO \ N}{\sim} NMe > CMe [199^{\circ}]$ which is

an oxy di methyl quinazoline

Nitroso derivative of the amide NO NMe C₆H₄ CO NH₂ [149°] Pale yellow prisms (from hot alcohol) (Finger, J pr [2] 37,

Methyl-m-amido-benzoic acid C₈H₂NO₂ a.e NHMe C.H. CO.H Formed by boiling (a)-benzcreatin NH C(NH) NMe C.H. CO.H with baryta water (Griess, B 8, 325) Nodular groups of plates, v sol hot water Nitrous acid ppts a nitroso- derivative Salt -C,H,NO,HCl sixsided plates

Di methyl-m-amido-benzoic acid C.H., NO. s.e NMe₂C₆H₄CO₂H [151°] Obtained by saponifying its methyl ether Needles, sl sol hot

Methyl ether NMe, C,H, CO,Me uncor) Obtained by fusing the isomeric anhydride of the methylo hydroxide (v. infra) (Griess, B 6, 587) Heavy yellowish oil, sol acids -C,H10MeNO2H2SO, very small prisms, sl sol dilute sulphuric acid, v sol water -(C.H. MeNO).H.PtCl, spindle shaped laminæ, ▼ sl sol cold water

Anhydride of the methylo-hydroxide C10H13NO, 16 C6H4< NMe3>0 Formed by allowing a mixture of m amido benzoic acid with MeOH (1 mol.), aqueous KOH (3 mols), and MeI (3 mols) to stand in the cold, the product, after freeing from MeOH by distillation, being saturated with HI, whereupon the rodide NMe, I CoH, CO2H is ppd This rodide is then boiled with water and lead hydroxide (Griess) Small deliquescent needles (contain ing aq), which give up their water of crystallisa-tion at 105° V e sol cold alcohol, insol ether Tastes bitter and is neutral in reaction Forms (NMe,Cl C,H, CO,H),PtCl, 4aq crystallising in large prisms, sl sol hot water_____

Methylo rodide NMe, I CoH, CO2H Formed Small short pusms (containing aq), as above al sol cold water

NMe,Cl C,H, CO,H. Methylo-chloride

D1-methyl-p-amido-benzoic acid NMe₂ C₆H₄ CO₂H [235°] Forme Formed by boiling its chloride with water Prepared by boiling for three hours a mixture of p amido benzoic acid (1 mol), MeI (2 mols), and aqueous KOH (3 mols) dissolved in methyl alcohol (Michler, B 9, 400) Obtained also by heating tetra methyldi amido benzophenone with soda lime at 340°, extracting the product with hot water, and ppg by acetic acid (E. Bischoff, B. 22, 341) Short needles (from alcohol), sol aqueous KOH and HClAq, insol dilute acetic acid Nitrous acid forms NMe C₆H₃(NO) CO₂H [224°] The Ca salt forms yellowish plates

Methyl ether NMe_CeH, CO2Me [102°] Silvery plates (from alcohol), v sol benzene, ether, and chloroform, m sol dilute alcohol Nitrous acid forms NMe₂ C₆H₃(NO) CO Me 6 aq

[101°]

Chloride NMe, C,H, COCl Obtained by heating di methyl aniline with COCl₂ at 50° in a

sealed tube (Michler) Crystalline
Nitrile NMe C₈H₄ CN From di methyl p phenylene diamine by Sandmeyer's reaction

(Ahrens, B 20, 2958)

Anhydride of the methylo hydroxide $C_{10}H_{13}NO_2$ i.e $C_8H_4 < \frac{NMe_3}{CO} > O$ [c 255°] When p amido benzoic acid is mixed with MeI, KOH, and methyl alcohol, there is formed, even in the cold, di methyl p amido benzoic acid and the iodide NMe₃I C₀H₄CO H which crystallises in short yellow plates [233°] (Michael a Wing, Am 7, 195) The corresponding anhydrida srystallises from alcohol in colourless plates (containing aq), v sol water It loses its water of crystallisation at 100° The periodide forms long dark prisms [200°] (NMe₂Cl C₆H₄ CO₂H)₂PtCl₄ The platinochloride torms large prisms

Tetra-methyl-di-amido-benzoic acid Da.

methylo di-hydroxide (HO NMe₃)₂C₆H₃CO₂H [1 3 5] The iodide (INMe₃)₂C₆H₃ CO₂H aq is formed when di amidobenzoic acid (1 pt) is mixed with MeI (6 pts), methyl alcohol (10 pts), and twice as much of a concentrated solution of KOH as is required to neutralise the acid The mixture should stand for some time, being kept alkaline by further additions of potash The alcohol is then dis tilled off, and the iodide ppd by HIAq (Griess, This iodide crystallises from hot B 7, 39) water in six sided tables or plates, v sol hot With moist Ag₂O it yields a caustic alkaline liquid which, on evaporation, leaves the hydroxide as a hygroscopic mass of soft white plates It rapidly absorbs CO, and ppts metallic oxides from their salts. The corresponding chloride (NMe3Cl)2C6H3CO2H4aq, obtained by neutralising the hydroxide by HCl, crystallises in small six sided plates, v sol water, sl sol hot alcohol The periodide forms brownish yellow needles The carronate

CO NMe₃ C₈H₂ CO₂H 3aq, obtained from the iodide and Ag₂CO₂, crystallises from water in very small soluble plates, having an alkaline reaction. The platinochloride (CiNMe₃)₂C₆H₁ CO₂HPtCl₁aq is a pp composed

Monoclinic crystals, a b c=1 939 1 0 876, of very small pale yellow plates, usually grouped $\beta=88^\circ$ 49' (Zingel, Z K 10, 414) in stars

Derivative v CHLORO METHYL AMIDO BEN ZOIS ACID

DI - METHYL-p-AMIDO - BENZOIC ALDE-HYDE, C₂H₁₁NO i e NMe C₄H₄CHO [73°] Formed, together with CHCl₃, by heating NMe₂ C₈H₄ CH(OH) CCl₃ with alcoholic KOH (Bossneck, B 18, 1520, 19, 366) With di methyl aniline and hydrochloric acid it forms

(NMe₂ C₆H₄),CH Oxim NMe₂ C₆H₄ CH NOH [144°] Yellow ish brown plates (Knöfler a Bossneck, B 20,

Phenyl hydrazide NMe C.H.CH N.HPh [148°] Needles (from alcohol)

DÍMETHYL AMIDO BENZOPHENONE

C,H, CO C,H, NMe Benzodimethylaniline Benzoyl di methyl aniline Benzoyl phenyl di methyl amine [90°] Formed by heating the methylo iodide to 181° Formed also by heat ing malachite green (NMe C_sH₄)₂C(OH) C_sH₄ with conc HClAq at 180° Colourless plates (from alcohol) Insol water, sl sol cold alcohol, v e sol hot alcohol or ether It is a feeble base, its solution in concentrated acids being ppd by water

C,H, CO C,H, NMe,I Methylo rodide Large tables, sl sol cold water Formed by heating p amido benzophenone with MeI at 100° It decomposes at 181° (Doebner a Weiss,

B 14, 1836, A 210, 270, 217, 257)

Di methyl-amido-benzophenone C.H. CO C.H. NMe. [39°] (330°-340°) Ob tained by heating benzoic acid with di methyl aniline and P2Os at 185° (O Fischer, A 200, Needles (from ligroin) Forms unstable With nitrous acid it yields the oily salts nitroso derivative C₆H₅ CO C₆H₃(NO)NMe₂ (E Bischoff, B 22, 340)

D1-methyl-d1-p-amido-benzophenone

benzoyl derivative C., H., NO, ie (NMeBz C.H., 200 [102°] Formed by heating tetra methyl di amido benzophenone with BzCl at 190° (Nathansohn a Muller, B 22, 1877) Small light brown plates, sl sol cold, v sol hot, alcohol, sl sol benzene, almost msol water and ether Acids and alkalis at 100° do not saponify it

Tri-methyl-di-amido-benzophenone

NHMe C₆H₄ CO C₆H₄ NMe₂ [156°] Formed, together with di methyl aniline, by boiling penta methyl-tri-amido tri phenyl-carbinol HClAq (Wichelhaus, B 19, 109) Nodular groups of needles (from alcohol)

Tetra-methyl-di-amido-benzophenone $NMe_2 C_6H_4 CO C_6H_4 NMe_2 [172°]$ (above 360°)

(Græbe, B 20, 3262)

Formation -1 By passing COCl, into di methyl anılıne (Michlei, B 9, 716, 1900) -2 By boiling hexa methyl tri amido tri phenol carbi nol with HClAq (Wichelhaus, B 19, 109) — 3 From CCl₂ SO₂Cl and di methyl amline (Mich-

ler a Moro, B 12, 1168)

Preparation — By boiling auramine with aqueous HCl till decolourised, and ppg with

NH,

Properties - White plates (from dilute alcohol), insol water, m sol alcohol, v e sol warm benzene, v sl sol ether

Reactions -1 Heating with ZnCl, and

NH₄Cl at 160° produces auramine (Fehrmann, B 20, 2844) —2 Boiling HNO₅ (S G 148) gives insoluble yellow crystals of tetra nitro di methyldi nitramido benzophenone and tri nitro phenylmethyl nitramine [127°], soluble in alcohol (Romburgh, R T C 6, 867)—3 Excess of bromine added to a solution of the base in glacial acetic acid gives the tetra-bromo derivative (C_eH₂B₁,NMe₂),CO [172°] which crystallises in slender yellow needles from alcohol (Nathansohn a Muller, B 22, 1883) -4 Heating with amline hydrochloride yields phenyl auramine -5 Combines with tri nitro benzens (2 mols) forming a compound which crystallises in long reddish violet needles [c 100°] With half the quantity of tri nitro benzene (1 mol) it forms small deep violet plates [123°] 6 Combines with m di-nitro benzene (2 mols) forming a red crystalline compound —7 Nitrous acid in the cold forms the nitroso- derivative NMe C₆H₄ CO C₆H₂(NOH) NMe [159°] crystal lising from alcohol in golden plates This sub stance is a weak base, its solution in HClAq being ppd by water It gives Liebermann's reaction Stannous chloride reduces it to the original tetra methyl di amido benzophenone The nitroso derivative forms the following salts B"H2Cl2 Obtained by passing HCl into a solution of the nitroso ketone in benzene -B"C, H (NO₂), OH [152°] Orange needles (from alcohol) The nitroso ketone gives also a phenyl hydrazide $C_2H_2N_3O_3$ [148°] (L. Bischoff, B. 21, 2452, 22, 337) —8. In presence of dehydrating agents, such as PCl, or AlCl, it condenses with secondary and tertiary bases. Thus with di methyl aniline it yields 'crystal violet' C(OH)(C₆H₄NMe)

Salts -B"H Cl, small radially grouped prisms (from alcohol) Decomposed by water, with separation of the base (Fehrmann, B 20, 2844) -B"H PtCl_e yellow granules, insol water, v sl sol alcohol -Picrate B"C,H (NO2),OH [157°] Small, purple, 1ad1 ally grouped, prisms (from alcohol), insol cold,

v sl sol hot, water, m sol alcohol

Di methyl di rodide B"Me,L₂ [105°]

Light yellow plates (from alcohol), sl sol cold, v sol hot, water and alcohol Split up at 150° into MeI and the base (Nathansohn a Muller, B 22, 1876)

Dr methylo-dr-hydroxide B"Me2(OH) From the preceding and moist Ag O yellow plates (from alcohol), quickly becoming

dark and resinous (N a M)

Oxim HON C(C_cH, NMe₂)₂ [233°], colourless crystals (Munchmeyer, B 19, 1852, 20,

Phenyl-hydraside C2H2N, 16 (NMe₂,C₄H₄),C N HPh [175°] Needles (from benzene-alcohol), m sol warm alcohol, v sol ether Coloured green by acid oxidising agents (Ziegler, B 20, 1111) Conc H₂SO, gives a red colouration

Imide (NMerC.H.)2C NH Auramine base [136°] Formed by heating tetra-methyl-di-amido benzophenone with NH₄Cl and ZnCl₂ at 150° to 160° Formed also by treating a solution of tetra methyl-di-amido benzophenone in CS, with PCl, and subsequently adding ammonia (Caro a. Kern) (cf AURAMINE in THORPE'S DIC-TIONARY OF APPLIED CHEMISTRY). Lemon-yellow

plates, insol water and ether, m sol alcohol Dilute HClAq readily converts it, even in the cold, into tetra methyl di amido benzophenone

Reactions -1 Sodium amalgam reduces it (in alcoholic solution) to leucauramine $C_0H_1NMe_2$), CH NH₂ [135°] This substance forms colourless crystals which when treated with HOAc yield an intense blue solution (Græbe, B 20, 3265) —2 H₂S in alcoholic solu tion at 60° forms tetra methyl di amido thio benzophenone [164°] —3 CS₂ also forms (NMe₂C₈H₄)₂CS together with thiocyanic acid

(Fehrmann, B 20, 2847) Salts—B'HCl aq Auramine Yellow six sided tables (from water at 70°) After expulsion of the water it melts (G) or decomposes (F) at 267° M sol cold water, m sol alcohol Boiling water converts it into tetra methyl di-amido benzophenone Dyes wool and silk greenish yellow Cotton prepared with tannin is also dyed yellow by auramine —B'₂H₂PtCl₆ granules, insol water, sl sol alcohol —B'HI [268°] Minute columns -B'HSCy aq [200°-210°] -B'H,C2O4 [194°] Orange needles, sl sol water, m sol warm alcohol—B'C₆H (NO₂)₃OH [230°-236°] Plates, msol cold, v sl sol hot, water, m sol hot alcohol

Phenyl imide (NMe₂ C₈H₄)₂C NPh Formed by heating the hydrochloride of the imide (auramine) with aniline at 180° (F), Small greyish-yellow radially grouped needles (from alcohol), decomposing at 80° Insol water and ether —B'HCl reddish crystalline mass, sol water and alcohol Its aqueous solution gradually decomposes, yielding aniline and tetra methyl di-amido benzophenone -B',H2PtCl, -B'C₆H (NO₂),OH

p Tolyl imide (NMe, C, H,)2C NC, H,Me Resembles the phenyl imide -B'.H.PtCl. Ethylene-dr-amide C19H28N4 1.e

NH CH2 $(NMe_2 C_6H_4)_2C <$ Formed by heating NH CH,

auramine (hydrochloride) with ethylene diamine at 100°-110° (Fehrmann, B 20, 2855) Yellowish plates (from alcohol), insol water, m sol warm alcohol On treatment with HOAc or dilute HClAq it decomposes into ethylene diamine and (NMe2 C8H4)2CO In alcoholic solution it is de composed by H.S into ethylene diamine and (NMe₂ C₆H₄)₂CS -B"H₂Cl₂ yellow needles -B"H₂PtCl_s amorphous flakes, insol water and ether, v sol warm alcohol—B"2C_gH₂(NO₂)₃OH flakes, v sl sol water, v sol alcohol.

Tolylene di amide (NMe, CeH4), C<NH>CeH2Me Formed by heating the hydrochloride of the imide (auramine) with (1, 2, 4) tolylene diamine at 160°, and treating the product with ammonia brown scales In dilute acetic acid solution it dyes cotton, mordanted with tannin, reddishbrown Dilute HClAq regenerates the original ketone —B"H.PtCl, —B"2C.H.(NO.), OH
Tewa-methyl-tri-amido-bensophenone

C₁,H₂₁N₂O se NMe₂,C₂H₄ CO C₂H₃(NH₂)(NMe₂) [82°] Obtained by reducing nitro-tetra methyldi amido benzophenone (Nathansohn a Müller, B 22, 1884) Amorphous yellow powder, v sol hot, sl sol cold, alcohol and benzene, insol ether —B'C₂H₂(NO₂)₂OH minute plates, v sol. creatinine

hot alcohol, insoluble in benzene and ether -B'2H.PtCl, light red crystalline pp, v sol warm alcohol, sl sol benzene, insol water and

METHYL-g-AMIDO-n-BUTYRIC ACID C₅H₁₁NO₂ is CH₂CH₂CH(NHMe) UU₂H.
Formed by heating a bromo-butyric acid with a concentrated solution of methylamine in sealed tubes at 100°. The product is boiled with baryta to expel NH2Me, the Ba exactly ppd by H2SO4, and the HBr by Ag₂CO₃ (Duvillier, A Ch [5] 20, 188, C R 88, 425) Glistening leaflets (from alcohol), subliming above 120° without V e sol water, m sol hot alcohol, insol Has a sweet taste Feebly acid in re ether action By the prolonged action (several months) of cyanamide (1 mol) in concentrated and slightly ammoniacal solution it is converted into but yro-CH, CH, CH CO NH N(CH,) C NH

which crystallises from alcohol in slender silky needles composed of small rectangular plates

CDuvillier, C R 95, 456, Bl [2] 39, 539)

Salts -HA'HCl [150°] Badly defined crystals, sol alcohol, insol ether Gives off HCl on fusion -H₂A'₂H₂PtCl₅ orange red crystals, v sol water and alcohol, insol ether -H₂A'₂H₂PtCl₆5aq Formed at 0'—HA'HAuCl₄aq transparent yellow prisms, sol water, alcohol, and ether - The nitrate and sulphate crystallise with difficulty in long needles - CuA', 2aq light-blue prisms, sol alcohol

Di methyl a amido-butyric acid Anhudride of the methylo-hydroxide C,H, NO.

CH, CH, CH—CO Tri - methyl - a amido-(CH₂)₂N — O

butyro - betaine Prepared by the action of bromo butyric ether on an excess of tri methylamine in alcoholic solution (Duvillier, C R 104, 1520) Large transparent crystals, containing aq, which they lose at 120°, becoming opaque, v sol. water and alcohol, insol ether Has a bitter taste - B'HCl Uncrystallisable B'2H2PtCl8 orange prisms, sl sol alcohol The aurochloride forms yellowish white

METHYL AMIDO-CAPROIC ACID v METHYL-AMIDO HEXOIC ACID

METHYL - AMIDO - CHLORO- v CHLORO-METHYL-AMIDO

METHYL - AMIDO - CYANURIC ACID v CYANIC ACID.

METHYL-AMIDO - ETHANE SULPHONIC ACID C₂H₄NSO₂ r.e. CH₂NH.CH₂CH₂SO₃H Methyl-taurine [242°].

Formation — From methyl-ethylene-\psi thiourea and bromine-water (Gabriel, B 22, 1148)

Preparation — Silver chloro - ethane sul-phonate is heated with 8 times its weight of a solution of methylamine, saturated at 0°, for 5 hours at 120° The product is boiled with baryta to expel excess of methylamine, freed from excess of baryta by H.SO., and evaporated to crystallisation The crystals are washed with alcohol and recrystallised from water The yield 18 25 p.e (E. Dittrich, J. pr. [2] 18, 68)
Properties—Transparent triclinic crystals

Sol water, insol alcohol and ether Its aqueous solution is acid to litmus Crystallises un-

altered from strong HCl Does not form salts with acids and alkalis

Reactions —1 N₂O₃ forms isethionic acid, (HO)CH₂ CH₂ SO₃H —2 With cyanamide it combines to methyl taurocyamine or methyl guanidoethane sulphonic acid

Di methyl amido ethane sulphonic acid

NMe₂.CH₂ CH₂ SO₃H Formed by heating di methylamine β chloro ethane sulphonate (20 g) with aqueous (33 pc) dimethylamine (5 g) at 160° for 10 hours (James, J pr [2] 31, 416, C J 47, 370) Large tables (from water), v e sol water, insol ether Decomposes at 270°-280° without fusion Does not combine with HCl

Anhydride of the methylo hydroxide $CH_2 NMe_3 > O$ Formed by heating β chloro-CH_SO, ethane sulphonic acid with aqueous tri methyl amine Slender prisms (from water), v sol water, insol alcohol and ether Neutral in re action Tastes sweet Not decomposed at 300° Not acted upon by cyanamide Baiyta gives NMe_3 and isethionic acid (James, C J 49, 489)

DI-METHYL-AMIDO-ETHYL ALCOHOL v

DI METHYL-OXYETHYL AMINE

DI METHYL AMIDO ETHYL BENZENE DI METHYL AMIDO PHENYL ETHANE

METHYL-AMIDO-ETHYL KETONE

CH, CO CH(NH2) CH, Perhaps formed by re ducing methyl nitroso ethyl ketone, but if so it quickly changes to s-tetra METHYL PARAZINE

METHYL-AMIDO-FORMIC ACID v MFTHYL-CARBAMIC ACID METHYL-a-AMIDO n HEXOIC ACID

C,H,NO, 26 $\mathbf{CH_3}\,\mathbf{CH_2}\,\mathbf{CH_2}\,\mathbf{CH_2}\,\mathbf{CH}(\mathbf{NHMe})\,\mathbf{CO_2H}$ amido caproic acid 8 10 2 at 11° Formed by heating a-bromo-hexoic acid (1 mol) with aqueous methylamine (2 or 3 mols) at 100° for several hours (Duvillier, C R 90, 822, A Ch [5] 29, 165) Silky needles (from water) or pearly plates (from alcohol) Sl sol cold alcohol, insol Neutral in reaction Volatilises above ether 100° Does not reduce silver or mercurous nıtrate Gives with ferric chloride an intense red colouration and a yellowish brown pp An equivalent quantity of cyanamide in cold concentrated solution containing a few drops of

NH, forms in a few weeks crystals of 'hexoic creatinine' C,H, CH CO NH NMe C ŇH

cold water, v sol alcohol (Duvillier, C R 96, 1583, Bl [2] 40, 307) -HA'HCl transparent plates, v sol water and alcohol, insol ether -H₂A'₂H₁PtCl₈ orange crystals, v e sol water, v sol alcohol, v sl sol ether—The aurochloride forms golden needles, the sulphate forms very indistinct crystals -CuA' 22aq blue scales, S 1

Di methyl amido-hexoic acid Methylohydroxide HO NMe, C.H., CO.H. Formed by heating leucine (1 mol) derived from casein with aqueous KOH (3 mols), and MeI (3 mols) The resulting INMe, C₂H₁₆ CO₂K, which crystallises from alcohol in needles, being decomposed by moist Ag₂O (Korner a Menozzi, G 13, 353) Strongly alkaline Decomposes at 120°-130° into trimethylamine, an acid, CsH10O2, and oxyhexore and Forms the platinoch oride

(ClNMe, C_aH_{10} CO₂H). PtCl, aq, a urochloride Cl, AuNMe, C_aH_{10} CO₂H [163°], and periodide The periodide forms lustrous green crystals, decomposed by H₂S, yielding INMe, C₃H₁₀ CO₂H [191°], crystallising in small prisms

DI-METHYL-AMIDO-HYDROQUINONE C₆H₃(NMe₂)(OH)₂[241] Di mathyl derivative C₆H₄(NMe₂)(OMe)

Methylo rodide B'MeI [202°] Formed by heating the di methyl derivative of amido hydroquinone with methyl iodide (Bæssler, B 17, 2122) White needles, v sol water, sl sol absolute alcohol, nearly insol benzene, chloro form, and ligroine

Methylo hydroxids B'MeOH

needles

Methylo chloride B'MeCl white easily soluble needles [172°] -(B'MeCl)2PtCl, yellow crystalline pp

TRI METHYL-AMIDO IMIDO IMIDO DI-PHENYL SULPHIDE Methylo chloride C16H16N2SCl 2 e N C2H2(NMe) S Methylene

NMe₂Cl blue Chloride of tetra methyl thionine

Formation -1 By the action of H.S on an acid solution of nitroso di methyl aniline and oxidation of the resulting leuco methylene blue In this reaction di methyl p phenylene diamine is an intermediate product (Caro, E P 1877, 3751, Koch, B 12, 593, Bernthsen, A 230, 137) - 2 By dissolving nitroso di methyl aniline in H.SO4 (S G 14), treating with sulphide of zinc, and oxidising the resulting leuco methyleneblue (Oehler, G P 1882, 24,125, Muhlhauser, D P J 262, 371) -3 By exidation of di methylp phenylene diamine in presence of Na2S2O3, and further oxidation of the resulting C_nH₃(NMe₂)(NH₂)S SO₃H by chromic acid (Bernthsen) —4 By reducing the compound C_sH₃(NMe₂)(NH₂)S SO₃H to C_sH₃(NMe₂)(NH₂)S H and oxidising a mixture of this mercaptan with di methyl aniline with HCl and K2Cr O,, the 'soluble green' resulting C₁₆H₁₉N₂S $N < C_6H_4(NMe_2) > S$ slowly changing in aqueous

solution to methylene blue (Bernthsen, A 251,

Properties -Minute dark blue laminæ (con taining 3aq), v sol water and alcohol mordanted cotton blue Its aqueous solution is blue and not affected by HCl or ammonia NaOH gives a violet colour and, when added in large quantity, a dirty violet pp H.SO, gives a yellowish green solution, becoming blue on dilution. The aqueous solution is decolourised by H₂S or Na₂S₂O₃, the colour is restored even by feeble oxidising agents Sodium hyposulphite Na, S,O, reduces it to the leuco base Fuming HClAq at 260° decomposes it, giving off H2S Boiling dilute HNO. oxidises it, forming H.80. Boiling aqueous KOH forms 'thionol,' the anhydride of di-oxy-

mido-di phenyl sulphide NC₀H₂(OH)>8

Salt -- (C1.H1.N.SCI), ZnCl, aq.

Formed by treating methylene blue with moist Ag.O Amorphous, dark blue mass, v e sol. water and alcohol, insol ether

Methylo rodide C₁₆H₁₈N₂SI bronzy dles (from hot water) The di chloro derineedles (from hot water) vative of this iodide $C_{1s}H_{1s}Cl_sN_sSI$ is formed by successive treatment of di chloro di methyl p phenylene diamine C_sH $Cl_s(NMe_s)(NH_s)$ with H₂S, FeCl₃, and KI (Mohlau, B 19, 2012)

TRI METHYL-AMIDO IMIDO-IMIDO-DI-PHENYL-SULPHONE Methylo-rodide $C_{16}H_{18}N_3SO_2I$ i.e. $N < C_6H_3(NMe_2) > SO_2$. Methy l-NMe₂I

Formed, together with methylene ene azure violet, by boiling methylene blue with Ag2O and a large quantity of water (Bernthsen, A 230, Slender needles with green lustre, sol water, forming a violet solution from which it is ppd by KI Alkalis destroy the colour of the solution The corresponding C₁₆H₁₈N₂SO₂Cl crystallises in needles, v e sol water It dyes silk like methylene blue

TETRA METHYL-DI AMIDO-IMIDO DI-PHENYL METHANE v Imide of Tetra-METHYL-DI AMIDO-BENZOPHENONE

METHYL-DI-AMIDO IMIDO DI-PHENYL SULPHIDE $C_{13}H_{13}N_2S$ s.e $NMe < C_0H_2(NH_2) > S$

Methyl di amido thio diphenylamine Formed by reduction of di nitro methyl imido-di phenyl sulphide with tin and HCl (Bernthsen, A 230, 130) Insol water, sol ether The dilute solu tion of its hydrochloride is coloured blue by FeCl, —B"H,Cl. Needles, v sol water, almost insol HClAq

Tetra methyl-di-amido-imido-di phenyl sul- $NH < \stackrel{C_0H_3(NMe_2)}{C_0H_2(NMe_2)} > S$ phide C, H, N,S .c Leuco methylene blue methylene blue with Formed by treating hyposulphite sodium Na₂S₂O₄ (Bernthsen, A 230, 147) Needles (from alcohol), sl sol water, m sol cold alcohol Gives an acetyl derivative, v sol alcohol, ether and benzene With MeI it forms NMe C.H.(NMe,I)>8 crystallising in plates, v sl sol water and alcohol, insol ether Oxidised by air to methylene blue—B'H₂ZnCl₄ prisms Di-methyl amido imido phenyl disulphide

Methylo chlorede C.H.N.S.Clas C,H, NMe₂Cl $\langle | N-S \rangle$ S Methylene red A by pro-

duct in the manufacture of methylene-blue from dı methyl p phenylene diamine and H₂S followed by FeCl₂ (Bernthsen, A 230, 165, 251, 22, Koch, B 12, 594) Small green glittering prisms (from alcohol), v e. sol. water, insol ether Its aqueous and alcoholic solutions are purple Not affected by HCl Alkalıs decompose it -Zinc salt (Č,H,N,S,Cl),ZnCl, aq

DI-METHYL-AMIDO-JUGLONE v. JUGLONE. METHYL-AMIDO-MESITYLENE v. METHYL-MESIDINE.

METHYL AMIDO METHYL-BENZENES v. METHYL-PHENYL METHYL AMINES

DI - METHYL - AMIDO - METHYL - PHEN-

elimination of the NH. group from 'tolylene red' by means of nitrous acid and alcohol (Bernthsen a Schweitzer, B 19, 2605) Red greenish glistening needles or flat prisms Has basic properties Dissolves in dilute acids with a violet colour, in cone H₂SO₄ with a reddish brown, which on dilution first becomes green, then blue, and finally violet Soluble in ether with a yel lowish-red colour and yellow fluorescence Sublımable

Di methyl di-amido methyl phenazine

$$C_{15}H_{16}N_4$$
 re $C_6H_3(NMe)$
 $\downarrow N$
 $C_6H_2Me(NH_2)$

Formed by oxidation of nitroso-Tolylene red oramido dimethyl aniline together with tolylene m diamine The leuco base has the formula $C_6H_s(NMe_2) < NH > C_8H_2Me(NH.)$ (Bernthsen a

Schweitzer, B 19, 2604)

DI METHYL AMIDO METHYL-QUINOLINE TETRAHYDRIDE Di-methylo di-iodide C₉H₉MeN NMe, Me₂I₂ [171°] Formed by heating $(\dot{P}y\ 1)$ amido quinoline tetrahydride with methyl alcohol and MeI (Ziegler, $B\ 21,862$) Crystals

METHYL-AMIDO METHYL-THIAZOLE

amine [42°] Formed by the action of chloroacetone on methyl thio urea (Traumann, A 249, 44) Crystalline but extremely hygroscopic, m sol ether Strongly alkaline in reaction When heated with HClAq in a sealed tube it yields methylamine Br completely decomposes it

Salts-B'HI small white needles, melts, when anhydrous, at 136° (T) —Platinochlor-ide orange yellow plates [167°]

Acetyl derivative C.H.AcN.S. [110°] White needles

Methyl-amido-methyl thiazole

SC(NH) >NMe Imido di methyl thiazole CH CMe

Formed from chloro acetone by treatment with ammonium sulpho cyanide (Tcherniak a Norton, B 16, 345) and heating with MeI the resulting amido methyl thiazole (socalled propinine sulphocyanide) (Hantzsch a Weber, B 20, 3122, 3336) Crystalline, but very hygroscopic Strongly alkaline When heated with HClAq in sealed tubes it yields ammonia Conc KOHAq has no action

Salts -B'HIaq Tables [164°] -Platinochloride orange tables [193°]

Acetyl derivative C,H,AcN,S [113°] White needles (containing 6 aq)

D1-methyl-amido-methyl-thiazole CH10N2S

S . C(NMe) NMe Methyl ımıdo dımethylthrazole [96°] Formed by adding conc KOHAq to its hydro-iodide (Hantzsch a Weber, B. 20, 8123) White needles, sol alcohol, water, and

ether Bromine reacts with formation of C₃MeBr(NMe₂)SN [114°]

Salts -B'HIaq [54°] From MeI and C₂MeH(NHMe)SN Melts at 155° when an hydrous

Methylo-rodide B'MeI

needles, v e sol water and alcohol
DI-METHYL AMIDO-NAPHTHOIC ACID C₁₀H_a(NMe₂)(CO₂H) [14] [165°] Formed by heating di methyl 'a) naphthylamine with COCl Formed by at 70° for 4 hours (Friedlander, B 21, 3126) Needles (from dilute alcohol), sol dilute acids and alkalis When acted upon by diazo com pounds the azo- group displaces the CO H — (HA'),H PtCl_s yellow needles

DI METHYL AMIDO-NAPHTHO-PHEN

AZINE C10H6 C₆H₂ NMe₂ $D_l methul$

[205°] Formed from ni naphth eurhodine troso di methyl aniline hydrochloride, (\$) naph thylamine, and AcHO (Witt, B 21, 720) Rhombic tables (from toluene or xylene), red by transmitted, and red or green, according to the faces, by reflected light, sol alcohol, ether and benzene, forming yellow solutions with yel low fluorescence Is volatile with slight decom position, and sublimes readily in woolly flocks. The violet red solution in conc. H SO₄ becomes successively black, green, grey, and blue vielet on dilution. The salts crystallise readily, have a bronzy lustre, and are dissociated by water AcHO dissolves it with red violet colour Conc HNO, with violet, soon becoming bright yellow and depositing the nitro compound

METHYL-AMIDO NAPHTHOQUINONE

 $\mathbf{C}_{11}\mathbf{H}_{0}\mathbf{NO}_{2}$ i e $\mathbf{C}_{10}\mathbf{H}_{5}\mathbf{O}_{2}(\mathbf{NHMe})$ [232°] Formed by adding a solution of methylamine acctate to an alcoholic solution of (a) naphthoquinone, evaporating nearly to dryness, adding water, and crystallising the pp from alcohol (Plimpton, C J 37, 639) Glittering red needles, v sol al Aqueous SO₂ at 150° forms an unstable cohol colourless reduction product

Di-methyl-amido-naphthoquinone

C₁₀H₅O₂(NMe₂) [118°] From (a) naphthoquinone and di methyl amine in alcoholic solution (Plimp Red needles

DI-METHYL AMIDO-NAPHTHYLAMINE vNAPHTHYLENE DI METHYL DIAMINE

TETRA-METHYL-DI-AMIDO-DI NAPH. THYL PHENYL-METHANE

Ph CH(C₁₀H₆NMe₂)₂ [189°] Formed by the action of benzoic aldehyde on di methyl (a) naphthylamine in presence of ZnCl2 (Friedlander, B 21, 3128) Colourless crystals, v sol HOAc, benzene, CS₂, and dilute mineral acids, sl sol alcohol, ether Does not yield a colour on oxi dation

Hexa methyl tri amido-di-naphthyl phenyl methane $HC(C_{10}H_6NMe_3)_2C_6H_4NMe_2$ [179°] Formed by condensing di-methyl p amido ben zoic aldehyde with di methyl (a) naphthylamine in presence of ZnCl₂ (Friedlander, B 21, 3129) White needles Does not yield a colour on oxidation

METHYL-AMIDO-NITRO- compounds v NI TRO-METHYL-AMIDO- compounds

METHYL-AMIDO-OXY- compounds v Oxy METHYL-AMIDO- compounds

METHYL-AMIDO PEREZONE v. METHYL-AMIDO PIPITZAHOIC ACID

METHYL o AMIDO-PHENOL Methylde rivative C₆H₁₁NO is C₆H₄(NHMe)(OMe) [1 2] Methyl anisidine (219°) Formed by mixing the methyl derivative of o amido phenol with MeI at 0° (Muhlhauser, A 207, 247) Oil -B', H PtCl, short yellow prisms, m sol water

Methyl-p amido phenol Ethylderivative C.H., NO ve C.H. (NHMe) (OEt) [14] (251°) Formed by heating the ethyl derivative of p oxy phenyl amido acetic acid at 260° (Bischoff a Nastvogel, B 22, 1789) SI sol water, v sol alcohol and ether -B'HCl needles

Di methyl o amido phenol C,HiNO ie Obtained, to $C_oH_1(NMe_2)(OH)$ [1 2] $[45^{\circ}]$ gether with McCl, by the dry distillation of the methylo chloride (Griess, B 13, 248) white prisms, v sl sol hot water, v sol alcohol, ether, HOAc, and aqueous KOH FeCl₃ gives a reddish violet colour Its hydrochloride is

Methylo hydroxide C,H,(NMe,OH)(OH)

aq Prepared by the action of

MeI and kOH on a solution of o amido phenol in methyl alcohol (Griess, B 13, 246) Prisms,

at 105° which become CoH. NMe, sol.

water and alcohol, insol ether Has an intensely bitter taste. On distillation it is converted into C,H,(NMe)(OMe) With acids it forms the -C,H,(NIe₃I)(OH) aq following salts Its solution, neutralised by soluble prisms ammonia, deposits sparingly soluble needles or

prisms of C,H4(NMe,I)(OH)C,H4< NMe₃

C_bH₄(NMe₃Cl)(OH) 2aq long soluble prisms — (C_bH₄(NMe₃Cl) OH) PtCl₄ yellowish red needles, sl sol cold water - The periodide forms brown insoluble leaflets - The nitroprusside (C H₁₃NO) H FeCy, NO forms crystals, sl sol cold

Methyl derivative C9H13NO 1e CH₄(NMe)(OMe) [12] (211°) SG 23 1 016 Formed by an isomeric change by distilling

(Griess, B 13, 248) Formed also NMe,

from MeI and the methyl derivative of o amidophenol (Muhlhauser, A 207, 248) Colourless liquid, with burning taste -B'2H2PtCl sparingly

soluble golden yellow prisms

Methylo rodide of the methyl derivative C.H.(NMe,I)(OMe) From the preceding and MeI Long white needles (G) or tables (M), sol hot water and hot alcohol With moist Ag2O it yields a strongly alkaline hy-It also yields a platinochloride (C, H, (NMe, Cl) OMe) 2PtCl,, which crystallises in sparingly soluble yellow plates or tables

C.H.(OH)NMe2 Di-methyl-m-amido-phenol Prepared by fusing di methyl amido benzene m sulphonic acid with KOH Also by heating resorcin with di methyl amine under pressure

EthyletherCoH4(OEt)(NMe2) [13] (247°) Obtained by boiling a solution of mamidophenetol and methyl iodide and slowly running

in the calculated quantity of potash is distilled over with steam (P Wagner, J pr [2] 32, 77, Baur a Stadel, B 16, 32) Converted by HCl and amyl nitrite into the nitroso compound C₆H₃(NO)(OEt)(NMe)

 $\hat{\mathbf{D}}_1$ -methyl-p-amido-phenol Methylo-

The anhydride CoH, hydroxide

is formed by the action of MeI and conc KOHAq upon p amido phenol in the cold (Griess, B 13, 250) Prisms or plates Changes on distillation into the isomeric C_eH₄(NMe₂)(OMe)[48°] Methyl derivative

C_sH₄(NMe)(OMe) [14] [49°] Formed as above (Griess, B 13, 249) Prisms or plates (from

C,H,(NMe,I)(OMe) Methylo rodide Formed by the action of MeI on either the methyl derivative or the methylo hydroxide Tables or plates With moist Ag O it yields the methylo hydroxide as a strongly alkaline mass. The platinochloride

(C₆H₄(NMe₃Cl) OMe).PtCl₄ forms small yellow

prisms, sl sol water

Di-methyl-di-amido-phenol Anhydride of methylo hydroxide CoH, NoO 16

∕0 $\sum_{\substack{\text{NMe},\\\text{by}}} \begin{bmatrix} 4 & 1\\ 2 \end{bmatrix}$ C6H3(NH2) Prepared by reduction

of the methylo hydroxide of nitro di methyl amido phenol with tin and HCl (Griess, B 13, 648) —B"H₂Cl₂4aq very soluble white plates —
B"H,PtCl₆2aq small prisms, sl sol water
TETRA-METHYL-DI-p-AMIDO-DIPHENYL
NMc, C₆H₄C₆H₄NMc₂ Tetra methyl benzidine

[195°] (above 360°)

Formation -1 By heating di methyl aniline (1 pt) with HSO, (4 pts) at 200° Formed also in small quantity by oxidising di methyl aniline by boiling with PbO, and dilute H SO, (Michlei a Pattinson, B 14, 2161, 17, 115) -2 By heating di methyl aniline with AlCl, in presence of air (Gnaud, Bl [3] 1, 692) -3 By methylation of benzidine

Properties - Colourless needles, sol hot, sl sol cold, alcohol Not volatile with steam Gives a green colouration with FeCl, or CrO, -B"H Cl. sparingly soluble needles -B"H.Br. ncedles -B"H I. white needles -B'H PtCl

Methylo vodide B"MeI [263°] Needles, sl sol water and alcohol Loses MeI when dis tilled with soda lime

[228°] B"MeCl Methylo caloride Crystals, very soluble in water and alcohol -B'MeClHPtCl, yellow pp Tetra methyl op di amido diphenyl

[2 1] NMe, C,H, C,H, NMe [1 4] Tetra methyl diphenyline [52°] (333°-345°) Formed by heating diphenyline hydrochloride with MeOH in sealed tubes at 180° (Reuland, B 22, 3015) Prisms Gives with platinic chloride an unstable pp Chloranil pr tion —B"C₂H (NO₂)₃OH Chloranil produces a blue coloura-H (NO₂)₃OH [200°] Red needles

Methylo iodide B"MeI [184°] Needles, v sol water, alcohol, and ether

Di methylo di-rodide B"Me,I, [196°]. Crystalline, v sol water and alcohol

Tetra-methyl tetra-amido diphenyl NMe, C,H,(NH,) C,H,(NH,) NMe, Tetra-methylbenzidine [1680] Prepared by reduction of dinitro tetra methyl diphenyl (Michler a Pattin son, B 14, 2165, 17, 118) White silvery plates, v sol hot alcohol, sl sol cold alcohol, insol water FeCl, gives a violet colouration K2Cr2O, and H₂SO, produce a brownish red colour-B"H₂Cl₂ (dried at 110°) sparingly solubl sparingly soluble colourless needles -B"H2I2 sparingly soluble needles -B"H2PtCl, yellow pp

Methyl α amido phenyl acetic acid C₉H₁₁NO₂ se C6H3 CH(NHMe) CO2H Formed from the nitrile of mandelic acid CoH, CH(OH) CN by digesting with alcoholic NH.Me at 70°, and de composing the resulting nitiile with HCl (Tiemann a Piest, B 14, 1982) Slende (from hot water) Sublimes at 274° Slender needles Sl sol cold water, insol alcohol and ether

Amide CeH, CH(NHMe) CO NH2 [155° Slender needles -B HCl Needles, sol alcohol,

msol ether

DI-METHYL-AMIDO-PHENYL-ω-AMIDO-CRESOL Methyl derivative [4 1] NMe, C,H, NH CH, C,H, OMe [1 4] [104°] Formed by reducing NMe, C,H, N CH C,H, OMe with sodium (Steinhart, A 241, 343) Light green plates, v sol acids, forming red solutions Its alcoholic solution decomposes rapidly

DI METHYL-AMIDO-DI PHENYL AMINE Me₂N C₆H₄ NHPh [130°] One of the products formed by the action of phenyl hydrazine on nitroso dimethylamine in an alcoholic solution (O Fischer, B 21, 2612) White needles (from petroleum-ether), v sol dilute HCl, m sol dilute SO,H, Gives a blue colouration with FeCl₃ Dissolves with a red colour in nitric acid

Nitrosamine C₁₄H₁₅N₃O [116°] Yellow

needles (from alcohol)

Tetra-methyl-di-amido-diphenyl-amine (NMe₂ C₆H₄)₂NH [119°] Obtained by oxidising a mixture of di methyl aniline (1 mol) and di methyl p phenylene diamine (1 mol) and reducing the resulting 'dimethyl-phenylene green' (Bindscheidler, B 16, 864) Yellowish dimetric tables

Hexa-methyl-tri amido triphenylamine Tri-methylo trichloride (NMe₃Cl C₆H₃),N Obtained by heating tri amido tri phenyl amine hydrochloride with MeOH at 190° (Heydrich, B White needles -19, 758)

(NMe,Cl C,H,),N 3PtCl

DÍ-MĚTHÝL AMÍDO-PHENYL-BENZYL-AMINE NMe₂ C₆H₄ NH CH₂Ph [48°] Obtained by reducing benzylidene di-methyl phenylene diamine [101°] with sodium amalgam (Kohler, A 241, 861) Yellowish plates, v sol dilute mineral acids, alcohol, ether, benzene, and petroleum ether

Nitrosamine NMe₂ C₆H₄ N(NO) CH₂Ph Slender yellow needles, sol alcohol

DI-METHYL - AMIDO - DI-PHENYL CAR. BINOL NMe2.C6H, CH(OH) C6H, Dr methyl-[70°] amido di-phenyl carbinol Formed by reducing di methyl amido benzophenone with sodium amalgam, or by the action of benzoic aldehyde on di methyl aniline (Albrecht, B 21, Thin white needles, insol water, v e sol ordinary solvents, sl sol petroleum ether

Di-methyl-di-amido di-phenyl-carbinol NMe₂ C₆H₄ CH(OH) C₆H₄ NH₂ [165°] Formed by carefully reducing p nitro di methyl amido di-phenyl-carbinol with zinc dust and HCl (Al-

brecht, B 21, 3295) Dissolves in HOAc with blue colouration Crystallises from benzene in needles containing benzene and melting at 142° Gives off water (1 mol) when heated above its melting point Boiling with zinc dust and HCl reduces it to di methyl diamido di phenyl methane [93°]

Tetra methyl di amido-di phenyl carbinol $C_{17}H_{22}N_2O$ te (NMe₂ C_6H_4)₂CH(OH) [96°] Ob tained by reducing tetra methyl di amido benzophenone in hot alcoholic solution with sodium amalgam (Michler a Dypertuis, B 9, 1899, Nathansohn a Muller, B 22, 1879) Colourless Nathansohn a Muller, B 22, 1879) triclinic prisms, v sol alcohol, HOAc, benzene, and ether Its solution in HOAc is blue, the benzene solution is colourless

Formed by passing HCl Salts -B"HCl into a solution of the base in ether Small colourless slender radially grouped needles air it turns blue and deliquesces It is dissociated by water —B"H₂PtCl_s minute yellow needles, v sol hot alcohol —B"C_sH₂(NO), OH minute yellow dank green crystalline mass, v sol hot alcohol, sl sol benzene, insol ether

Di methylo di-rodide B"Me₂I₂ [195°] Small plates (from alcohol), sl sol cold, v sol Dr methylo dr-rodide B"Me₂I₂ hot, alcohol and water, insol benzene and ether

Tetra-methyl di amido-tri-phenyl-carbinol C₂₂H₂₈N₁O is C₆H₅C(OH)(C₆H₄NMe₂)₂ [132°]
Malachite green Benzaldehyde green
Formation—1 By the action of dimethyl

aniline on benzotrichloride in presence of a metallic chloride (Doebner, B 11, 1238, 13, 2222) -2 By the oxidation of a slightly acid solution of tetra methyl di amido tri phenyl-methane with MnO or PbO_2 (E a O Fischer, B12,796), or with tetra chloro quinone (O I ischer, A 206, 130) -3 By heating di methyl aniline (4 pts) with BzCl (2 pts) and ZnCl₂ (3 pts) (Fischer)

From di methyl aniline Preparation - 1(2 mols), ZnCl₂ (half its weight), sand, and benzo trichloride at 100° The product is dis tilled with steam and the dye ppd from the aqueous residue by NaCl The pp is the zinc double chloride, which may be converted by KOH into the base This is conveited into the oxalate which may be purified by crystallisation from water and then decomposed by ammonia (Doebner, A 217, 250)-2 By heating benzoic aldehyde (40g) with dimethylaniline (100g) and 93 pc alcohol (40 g) over a water bath POCl (65 g) is then added gradually, and when cool the mass is extracted with warm water and the base ppd with NaOH The yield is nearly theoretical (Nencki, M 9, 1148) —3 By heating benzoic aldehyde with ZnCl₂ and di methylaniline, and oxidising the resulting leuco base with PbO₂ (Muhlhauser, D P J 263, 249)

Properties - Nearly colourless cubes V sol alcohol forming a green solution When freshly ppd it is v sol ether, but when crystalline it is sl sol ether, m sol CS, ace

tone, benzene or light petroleum

Reactions -1 HClAq at 250° splits it into dimethylaniline and di methyl p amido benzo phenone — 2 On reduction it yields leuco malachite green (tetra methyl di amido tri phenyl-methane) [101°] —8 Fuming HNO, in HOAc forms an amorphoushe xa nitro derivative

Salts-The salts of organic acids and

neutral salts of mineral acids are green and dye emerald-green They are v sol water, the oxalate being m sol water and the picrate sl sol water Concentrated mineral acids turn the solutions orange, forming acid salts Diluting with water restores the green colour In the cold, dilute acids dissolve the base, forming a nearly colourless solution, which turns deep green when heated, a molecule of water being probably split off. Thus the hydrochloride be-

comes C₆H₆ C_CC₆H₄NMe₂C₁

(C₂₃H₂₄N₂HCl)₁(ZnCl₂)₂2aq [c 130°] Malachite green Thick, dark green prisms, sol water (I'ischer, B 14, 2520) — C₂₃H₂₄N₂ZnCl₂aq — C₂₃H₂₄N₂H₂SO₄ — C₂₃H₂₄N₂H₂SO₄aq lustrous green prisms — (C₂₃H₂₄N₂)₂JH₂C₂O₄ Malachite Large green tables, sol water and — Picrates C₂₃H₂₄N₂C₆H₂(NO₂)₈OH water and alcohol - Picrates Golden needles (from benzene), insol water - $C_{23}H_{24}N_22C_6H_2(NO_2)_3OH$ golden needles

Di-methylo-di-iodide C₂₃H₂₄N₂Me₂I.aq [172°] Formed by heating the base with MeI and MeOH at 100° (Doebner) Green plates, sl sol alcohol, ether, benzene, CS2, and cold water, v sol hot water The same compound is ob tained by heating di p amido tri phenyl carbinol with MeI and alcohol at 120° (Doebner, B 15,

Ethyl dermative

C₆H₅ C(OEt)(C₆H₄NMe₂)₂ [162°] From the base by heating with alcohol at 110° (O Fischer, From the B 12, 1686)

Sulphonic acid C2, H2, (SO, H)N2O Green needles with reddish brown lustre, v e sol hot water, forming a green solution - NaA' MgA'2 4aq —CaA'2 3aq

Dernatues v Bromo, Chloro, Nitro, and ()X1 FETRA METHYL-DI AMIDO TRI-PHENYL-CAR

Tetra-methyl-ppo-tri-amido-tri phenyl-

carbinol C., H. N.O i e

 $NH_2 C_6H_4 C(OH)(C_8H_4NMe_8)_2$ [191°] Formed by oxidation of the acetyl derivative of the leuco base (tetra methyl di p amido o amido tri phenyl methane) with lead perovide and dilute H SO₄ (Fischer a Schmidt, B 17, 1892) (rlistening prisms (from ether) The salts are soluble in water with a bluish green colour

Tetra methyl tri p amido-tri phenyl carbinol $NH_2 C_8H_4 CH(OH)(C_8H_4NMe_2)_2$ Tetra methyl pararosaniline Obtained by oxidising the acetyl derivative of tetra methyl tri p amido tri phenyl methane with PbO, and boiling the resulting acetyl derivative with HCl (O Fischer a G Körner, B 16, 2904) Small crystals (from ether)

Penta-methyl tri amido tri phenyl carbinol C₄H₂₈N₄O₄e (NMe₂ C₆H₄)₂C(OH) C₆H₄NH Me Methyl violet [130°] Prepared by oxidising dimethylaniline with SnCl,, with ICl, with HgCl, and KClO, with KClO, and CuSO, or with NaCl and Cu(NO₃) (Lauth, Rep Chim app 1861, 345, Poirrier a Chappat, Bi [2] 6, 502, Hofmann, B 6, 357) Formed also by heating dimethyl aniline with CaH, SO, Cl at 100° (Hassencamp, B 12, 1275), and, together with formic aldehyde, by shaking hexa methyl tri amido tri phenyl carbinol with MnO, and dilute H,SO, (E a O

Fischer, B 11, 2097) Commercial methylviolet may be freed from admixed hexa methyltrı amıdo trı phenyl carbinol by boiling with ligroïn (Wichelhaus, B 16, 2006, 19, 108). Methyl violet occurs in Hofmann's violet

Properties - Brown powder, melting under water Insol water, ether, and ligroin Its alcoholic solution is violet Its solution in HCl is reddish violet, and is ppd by NaOH, but not by ammonia Reduced by ammonium sulphide to its leuco base Tin and HCl reduce it, form. ing a substance melting at 155° Boiling HClAq splits it up into di methyl aniline and tri-methyldi amido benzophenone

 $\begin{array}{c} {\rm Salts-Chloride} \ C_{24}H_{28}N_sCl \ \imath \ e \\ {\rm (NMe_2\ C_6H_4)_2C\ C_6H_4\ NMeHCl} \ \ Amorphous \ mass, \end{array}$

with green metallic lustre Its aqueous solution is violet, but on adding HCl it becomes first green, then deep yellowish brown It dissolves in alcohol Conc H SO, forms a yellow solution, which on dilution changes through greenish blue to violet It dve silk, wool, and mordanted cotton violet —C.,H.,N,I minute needles
Picrate C.,H.,N,C,H (NO.),(OH) Bronzed

needles (from alcohol)

Acetyl derivative Acetate (NMe₂ C₆H₄)₂C C₆H₄ NMeAc OAc [225°] From

methyl violet, Ac O, and NaOAc (O Fischer a. G Körner, B 16, 2905)

Hexa-methyl tri amido-tri phenyl carbinol C.3H31N3O1e (NMe, C6H4)3COH Crystal violet.

Hexa methyl para rosaniline [195°]
Formation —1 Together with its methylo

iodide, by heating methyl violet with MeI and MeOH at 120° (Hofmann, B 6, 363) -2 By the action of dimethylaniline on tetra methyl-diamido benzophenone in presence of dehydrating agents (Kern a Caro) In this reaction tetra methyl di amido thio benzophenone may aiso be used -3 By the action of COCl., of ClCO Et. or of ClCO CCl_s, in presence of ZnCl on di methylaniline - 4 By condensation of tetramethyl di amido-di phenyl carbinol with di-methylaniline and oxidation of the resulting leuco base -5 By gradually adding tetra chloroquinone (1 pt) to dimethylaniline (2 pts), and heating the product to 65° (Meister, Lucius, a. Bruning, B 13, 212, 2100, Wichelhaus, B 16, 2005) Perhaps the substance formed in this case is wholly or partially the penta methyl compound -6 By the action of COCl₂ or of ClCO, Et on dimethylaniline in presence of AlCl, (Hofmann, B 18, 767, Wichelhaus, B 19, 109)

Properties - Dark reddish violet monoclinis Needles containing benzene (from benzene) Insol water, sol ether, acetone, and ligroin, sl sol alcohol, v e sol chloroform and benzene. Boiling HClAq splits it up into dimethylaniline and tetra methyl di amido benzophenone Aqueous ammonium sulphide reduces it to hexamethyl tri amido tri phenyl methane

Salts - Chloride C25H30N3Cl 1e

(NMerC_eH₄)₂C C_eH₄ Hexagonal crystals, with greenish brown lustre (Wada, B 18, 768. Sol alcohol Forms a violet solution in water, which on adding HCl becomes first blue, then green, and finally yellow NaOH gives a violet Conc H.SO, forms a yellow solution,

changed on dilution through green and blue to violet Dyes silk, wool, and mordanted cotton bluish-violet —C₂₂H₃₀N₃Cl 8aq crystals, with bronze lustre —(C₂₂H₃₀N₃Cl)₂8PtCl₄ brickred crystalline pp, decomposed by water -C₂₅H₃₁N₃OH₂I₂ green crystals At 100° it gives off MeI, becoming the iodide of pentamethyl-tri amido tri phenyl-carbinol - Picrate $\mathbf{C}_{23}\mathbf{H}_{22}\mathbf{N}_{3}\mathbf{2C}_{6}\mathbf{H}_{2}(\mathbf{NO})_{3}\mathbf{OH}$ yellowish prisms, with coppery lustre

 $Methylo-rodide \quad C_{25}H_{81}N_8I_2MeI$ pararosaniline, MeI, and MeOH at 115° (Hof

mann, B 6, 365)

TETRA-METHYL-DIAMIDO-DIPHENYL-

CUMYL-METHANE C₂₆H₂₂N₂ ie (NMe₂ C₆H₄)₂CH C₆H₄C₃H₇, Prepared by heating cuminic aldehyde with dimethylaniline and ZnCl₂ to 120°, the yield is about 80 pc oxidation it gives a dye stuff closely resembling malachite green

Salts—B"H₂Cl₂ white crystalfine powder—B"(C₆H₂(NO₂)₃ÔH)₂ green crystals, [156°], explodes at 220°—B"H₂Cl₂PtCl₄ yellow crystals green crystals, [156°],

phenyl-diketone C₂₆H₂₉N₃O₂ 1 e $\mathrm{NMe_2C_oH_3(CO\ C_oH_1\ NMe_2)_2}$ [122°] From boiling di methyl aniline and $\mathrm{COCl_2}$ (Michler, B 9, 716, Michler a Dupertuis, B 9, 1899) Monochinic crystals, a b c = 587 1 714, β = 125° 18′ METHYL - AMIDO - PHENYL - ETHANE Nitroso derivative [41]Et C.H. NMe NO [162°] Formed from di methyl amido phenyl ethane, HCl, and NaNO2 (Heumann a Wiernik, **B** 20, 2423) Needles, insol water, sl sol ether and cold alcohol Zinc and HOAc reduce it to ethylphenyl-methyl hydrazine, the acetyl deriva tive of which melts at 68°

Di-methyl-amido-phenyl-ethane

[4 1]Et C₆H₄ NMe₂ [89°] Formed, together with hexa methyl tri amido tri phenyl methane, by heating glycol (1 mol) with dimethylaniline (2 mols) and ZnCl₂ at 100°-120° (H a W) Needles or prisms (from alcohol), v sol ether, warm alcohol, and benzene, insol water Its salts are deliquescent, and its platinochloride is unstable

stable Oxidising agents colour it blue Methylo-rodrde Et CaH, NMe3I p amido phenyl ethane and MeI (Hofmann, B 7, 527)

Tetra-methyl-d1-amido-d1-phenyl-ethane $C_{18}H_{24}N_2$ 2 c NMe₂ C_8H_4 $C\dot{H}_2$ $C\dot{H}_2$ C_8H_4 NMe₂ [50°] (over 300°) Prepared by heating ethylene bromide with dimethylaniline at 100° (Schoop, B 13, 2196) Slender needles, sol ether. ligroin, hot wood spirit, and alcohol, insol water With FeCl, it gives a green colouration, and finally quinone But it does not yield a and many quinone but it does not plead a dye on oxidation—B"H₂I₂ Sol water and alcohol — Oxalate B"2H₂C₂O₄ — Picrate B"C₂H₂(NO₂)₂OH yellow pp, sol hot alcohol Methylo sodide C₁₈H₂₄N₂MeI From diamido-di-phenyl-ethane, MeI, and a little KOH

at 150°-180° (Heumann a Wiernik, B 20, 909)

Tetra-methyl-di-amido-tri-phenyi-ethane C.H. CMe(C.H. NMez), This is the chief pro duct of the action of acetophenone on dimethyl aniline in presence of ZnCl2 (Doebner a Petschoff, A 242, 339) Yellow oil, v sol ether, benzene, petroleum ether, and hot alcohol It boils above 360° with partial decomposition It is not vola tile with steam

Hexa-methyl-tri-amido-tri-phenyl-ethane NMe₂ C₆H₄ CH₂ CH₂ CH₄ NMe₂)₂ [125°] Formed by heating CH₂Cl CHCl, with dimethylaniline and ZnCl₂ at 110°-120° (Heumann a Wiernik, B 20, 2424) White needles, insol water, v sl sol cold, sl sol hot, alcohol, v sol ether With PbO₂ and HOAc it gives a greenish blue colour

Octo methyl-tetra amido-tetra-phenyl ethane C₃₄H₄₂N, 16 (NMe₂C₆H₄)₂CH CH(C₆H₄NMe₂)₂ [90°] (300°) Formed by heating acctylene tetra bromide with dimethylaniline at 100° (Schoop, B 13, 2199) Prisms, sol alcohol, ether, and benzene, insol water With FeCl, or CrO, it produces quinone —B"2H,PtCl, yellow amorphous pp - Picrate B"C₆H₂(NO₂)₃OH yellow plates, sol hot water

Deca-methyl-penta amido-penta-phenylethane C₂H(C₈H₄ NMe₂)₅ [184°] Formed by heating a mixture of dimethylaniline (50 g), chloral hydrate (20 g), and ZnCl (10 g) at 100°, the yield being 10 g (O Fischer, B 11, 951, A 206, 120, Boessneck, B 18, 1516) Colourless needles (containing aq) (from alcohol), v sol chloroform Sol benzene, v sl sol alcohol and ether On oxidation it gives a green ish blue dyestuff

DI-METHYL - a - AMIDO - wa DI-PHENYL ETHYL ALCOHOL NMe CHPh CHPh OH [110°1 From NH, CHPh CHPh OH, MeI, and EtOH (Goldschmidt a Polonowska, B 20, 494) White needles —B'2H2PtCl3 2aq

DI METHYL AMIDO PHENYL ETHYL DI THIO CARBONATE EtO CS SC₆H₄NMe₂ [54°] Formed from di methyl p phenylene diamine by diazotising and heating the product with aqueous potassium xanthate at 70° (Leuckhart, J pr [2] 41, 206) Light yellow crystals, insol water, sol ordinary menstrua With alcoholic potash it gives S(C,H,NMe,)2

TETRA-METHYL DI AMIDO-DI PHENYL FURFURYL METHANE C.4H.3O CH(C,H N Me)2 [83°] Prepared by the action of furfuraldehyde on dimethylaniline (O Fischer, B 11, 950)

DI-METHYL-AMIDO PHENYL GLYOXYLIC ACID C10H11NO, te NMe2 C6H4 CO CO H [187°] Obtained by saponifying its ethyl ether which is produced by adding Cl CO CO2Et to dimethylaniline at 100° (Michael a Hanhardt, B 10, 2081) Small plates or needles Sol water and alcohol -NaA' (dried at 150°) Small needles. -BaA'₂ (dried at 150°) Plates

Ethyl ether EtA' [95°] Yellow plates (from alcohol) Cannot be distilled

TETRA METHYL DI-AMIDO DI PHENYL-HEPTANE (NMe₂ C₆H₄)₂CH C₆H₁₅ [59 5°]. mm) Formed from dimethyl-(275° at 15 mm) aniline, heptoic aldehyde (cenanthol) and ZnCl, (Krafft, B 19, 2987) Crystalline solid, not readily oxidised -B"H_PtCl, yellow crystalline pp, v sl sol water and ether alcohol

D) METHYL - AMIDO - PHENYL - IMIDO - | QUINOLINE TETRAHYDRIDE THIOSUL-PHONIC ACID

 $N C_4H_3(NMe_2) S SO_3H$ Formed

by oxidising a mixture of quinoline tetrahydride (1 mol) with di methyl p phenylene diamine thio sulphonic acid (1 mol) by K₂Cr₂O₇ (Lell mann a Boye, B 23, 1374) Small lustrous green needles, sl sol water Changes after some time to a brown powder Zinc dust and HCl reduce it, and the product yields a blue dye on oxidation

DI METHYL AMIDO PHENYL HEXYL KE TONE C15H 3NO 1 e NMe C6H4 CO C6H13 [49°] (190° at 20 mm) Formed, together with the leuco base C. H_{3.}N, by adding heptoyl chloride to a mixture of ZnCl₂ and dimethylaniline (Krafft, B 19, 2987, Auger, Bl [2] 47, 44) Colourless needles Gives with conc HNO, a compound C_6H_{13} CO $C_6H_3(NO_2)(NMe_2)$ nıtro [65°]

Oxim NMe. C.H. C(NOH) C.H.12. [99°]. Colourless leaflets

DI METHYL DI AMIDO DI PHENYL KE-TONE v DI METHYL DI AMIDO BENZOPHENONE

MERCAP DI METHYL AMIDO PHENYL (260°) TAN NMe, C,H, SH [28°] Obtained by reducing tetra methyl di amido di phenyl sulphide with tin and HCl (Merz a Weith, B19, 1575, Leuckart, *J. pr.* [2] 41, 207). Old Dissolves in NaOHAq. Re oxidised by air to (NMe, C₆H₄) S. [118°]—Pb(SC₈H₁₀N). plates

Di methyl di amido phenyl mercaptan C_8H_1 N.S i.e. C_8H_2 (NMe)(NH.)(SH) [4 1 2] Formed by reducing methylene red (Jacobsen, B 21, 3104, Bernthsen, A 251, 1) Gives a diazo sulphide $C_6H_3(NMe) < \frac{N}{S} > N$ [78°] LeCl, gives a blue colouration With AcCl in benzene it gives the hydrochloride of ethenylamido dimethylamido phenyl mercaptan

 $NMe_2 C_6H_3 < N > CMe - Zn(C_8H_{11}N.S)_2$

DI-METHYL AMIDO DI PHENYL ME-THANE NMe, C,H, CH, C,H, This is perhaps the base, boiling at 335°, produced by heating di methyl aniline benzylo chloride in a sealed tube at 230° (Michler, B 10, 2079)

Dı methyl dı amıdo-dı phenyl methane NMe, C₆H₄CH₂C₆H₄NH₂ [93°] Formed by boiling p nitro di methyl amido di phenyl carbinol with zinc dust and HCl (Albrecht, B 21, 3296) Colourless needles, coloured bluish violet by PbO, or by tetra chloro quinone

Tetra methyl-di p amido di phenyl methane

Formation — 1 By heating methylene iodide, CHCl, of CO, Dochner, B 12, 810, cf Hanniman, B 10, 1235) -2 By heat ing methylal $CH_2(OMe)_2$ (1 mol) with dimethylar land (2 mol) with dimethylaniline (2 mols) in presence of ZnCl, to 120° (O Fischer, B 12, 1689, A 206, 117), or by acting on a mixture of methylal and dimethyl aniline with cone HClAq (Tröger, J pr [2] 36, 237) —8 One of the products of the action of acetophenone or of di ethyl ketone on dimethylaniline in presence of ZnCl₂ (Doebner a Pet-schoff, A 242, 888) —4 By heating dimethyl-

aniline with CCl, SO, Cl at 100° (Michler a Moro, B 12, 1170) -5 One of the products of the action of (a) naphthylamine sulphonic chloride on dimethylaniline (Michler a Salathé, B 12, 1789) -6 From C₂Cl₈, dimethylaniline and ZnCl₂ (Heumann a Wiernik, B 20, 2426) -7 One of the products of the action of zinc and HCl on a mixture of dimethylamline and CS₂ (Wiernik, B 21, 3204, cf Truger, J pr [2] 36, 241) —8 By distilling tetra methyl di amido benzophenone (1 pt) with zinc dust (10 pts) (Nathansohn a Muller, B 22, 1882) -9 A pro duct of the action of Ac O on dimethylaniline (Reverdin a De la Harpe, B 22, 1006) -10 The chief product of the action of methyl hexvl ketone on dimethylaniline (Doebner a Petschoff, A 242, 342) -11 By distilling tetra methyldi amido thio benzophenone with zinc dust (Baither, B 20, 1737)

Properties - Four sided tables or glistening leaflets (from alcohol) Insol water, sl sol cold, m sol hot, alcohol, v sol benzene, ether, Not volatile with steam On oxida and CS tion with HOAc and MnO₂ it gives a fugitive blue colour When boiled with MnO and H SO, it yields quinone Its alcoholic solution is turned blue by boiling with tetra chloroquinone It may be oxidised to tetra methyl diamido benzophenone (N a M) Conc HNO, in HOAc forms a tetra-nitro derivative which de composes at 218° With tri nitro benzene it forms a compound C₁ H N C₆H₂(NO), [114° and with m di nitro benzene a compound (C₁ H₂N) C₅H₄(NO₂)₂ [74°] (Van Romburgh, R T C 7, 226)

Salts -B"H.L. B".C.H.(NO),OH [178°], sparingly soluble tables

Methylo rodide B"Me.I. [214°] Yellow plates, v sol hot water and alcohol, insol ether (D a P)

Tetra - methyl - ero - pp - tri - amido - diphenyl methane (NMe, C,H,),CHNH, [135°] Obtained by reducing the imide of tetra methyldi amido benzophenone (auiamine) with sodium amalgam (Græbe, B 20, 3265) Colourless crystals, v sl sol water, m sol alcohol Gives an intense blue colouration with HOAc

Methyl cao amido tri phenyl methane CooHis N & C (CoH.) C NHMe [73°] Obtained by passing methylamine into a hot solution of Ph,CBr in benzene (Hemilian a Silberstein, B 17, 745) Prisms (from ligroin) Insol water, v sol alcohol -B.H.PtCl, 6aq -B',I Ppd as lustrous blue black needles by adding iodine to its solution in CS

Di methyl-cxo amido tri phenyl-methane C. H. N & C (C. H.s), C\Mez [97°] From erobromo tri phenyl methane and NHMe, in benzene (H & S) Insol water, v. sol alcohol -B'.H.PtCl

Di-methyl amido tra-phenyl-methane C21H21N

s.e (C₆H₅)₂CH C₆H₄NMe₂ [132°]
Formation -1 By heating di phenyl car binol with di methyl aniline and P2O, at 150° (O Fischer, B 11, 951 12, 1690, A 206, 114) 2 By heating benzophenone chloride Ph.CCl. with dimethylaniline and ZnCl, (F., cf Pauly, A. 187, 209)

Preparation — Benzophenone (10 g), dimethylaniline (13 g), and zinc chloride (10 g) are heated in sealed tubes for ten hours to 190° After driving over excess of dimethylaniline and benzophenone the residue is extracted with ether, and after distilling this off the base is recrystallised from alcohol (Doebner a Petschow,

Properties - Colourless needles, sl sol alcohol, v sol ether and benzene Does not give Is a weak a colouring matter on oxidation base, and does not combine with HOAc

Salts -B'HCl -B',H,PtCl needles, sl sol hot water

Methylo - rodide C, H, NMeI [186°]

Large white plates

Tetra-methyl-di-amido-tri-phenyl methane

C₂₁H₂₂N₂ • e (NMe, C₂H₄), CH C₂H₃, Leuco base of malachite green [102°] and [94°]

Formation — 1 By heating a mixture of benzoic aldehyde (10 pts) and dimethylaniline (23 pts) with ZnCl₂ The yield is 90 pc (O (23 pts) with ZnCl, The yield is 90 pc (O Fischer, B 10, 799, 1624, 11, 950, 2274, 12, 1685, A 206, 122) — 2 From benzylidene chloride, dimethylaniline, and ZnCl. -- 3 By heating di-amido tri phenyl methane with MeI and MeOH at 130° (F) -4 By heating its carboxylic acid (di methyl - aniline phthalin) (NMe₂ C₆H₄)₂CH C₆H₄ CO₂H with barium hydroxide -5 From tetra - methyl di amido tri phenyl-carbinol (malachite green) by reduction with zinc-dust and HCl (Doebner, B 11, 1239, A 217, 256) -6 A by-product in the action of phthalyl chloride and in that of benzoyl chloride on dimethylaniline — 7 By heating phenylglyoxylic acid with dimethylamiline and ZnCl, (Peter, B 18, 539)—8 A by product in the action of ZnCl, on a mixture of dimethylamiline and acetophenone (Doebner a. Petschoff, A 242,

Preparation —A mixture of benzoic aldehyde (40 g), dimethylaniline (100 g), and 93 pc alcohol (40 g) is heated on a water bath, and POCl_s (65 g) added slowly The product is ex tracted with water, the filtrate ppd by soda and the pp recrystallised from alcohol (Nencki, M 9, 1148)

Properties - Crystallises from benzene in (apparently triclinic) needles, melting at 102°, and from alcohol in triclinic leaflets, melting at 94° (E a O Fischer, B 12, 796) Insol water, v sol ether and benzene, sl sol petroleum In small quantities it can be distilled. Its salts are oxidised by MnO2 or PbO2 to malachite green Nitric acid forms a hexa nitro derivative [200°] When distilled with zinc dust it is reduced to aniline, dimethylaniline, and p amido di-phenylmethane (Manns, C C 1888, 1363)

Salts -B"H2Cl2 colourless hygroscopic needles, v sol water Gives off HCl at 100°, becoming B"HCl -B"H2PtCl, white pp, soon becoming yellowish green -The aurochloride is a golden-yellow floculent pp—Picrate B"2C₆H₂(NO₂)₃OH [220°] Aggregations of Aggregations of needles, m sol water

[218°-Di-methylo-di-rodide B"Me2I2 222°] (F), [231°] (Doebner, B 13, 2228) Plates, tables, or leaflets, v sol water Decomposed on fusion into MeI and the base

Tetra - methyl - ppo tri - amido-tri - phenyl-methane ([4 1]NMe₂ C₅H₄)₂CH C₅H₄NH₂ [1 2] [185°] o-Amido-leuco-malachite green Formed by reducing, by means of zinc-dust and HCl, the

product of the condensation of o nitro benzois aldehyde with dimethylaniline (Fischer a Schmidt, B 15, 683, 17, 1891) Colourless crystals (containing C₂H₆) Gives a reddish Colourless brown dye stuff on oxidation

Acetyl derivative C₁₉H₁₈(NMe₂)₂(NHAo).
[186°] Ghistening crystals Gives on oxidation (NMe₂ C₂H₄)₂ C(OH) C₂H, NHAc
Tetra-methyl-tri-amido-tri phenyl-methane

 $C_{23}H_{-7}N_3$ to $(NMe_2C_6H_4)_2CHC_6H_4NH$ Prepared by dissolving tetra methyl di pp amido di phenyl carbinol (20 pts) in HClAq (12 pts of S G 1 18) and water (100 pts), heating to 100°, and adding aniline hydrochloride (10 pts) (Nathansohn a Muller, B 22, 1886) Small needles (from warm alcohol), v sol alcohol, ether, and benzene, unsol water According to analogy it should be identical with the prece ding body With MeI it gives CH(C,H, NMe,I), [1720]

Salts -B"H2Cl2 yellowish green crystalline pp, got by adding HCl to an ethereal solu tion of the base V sol hot alcohol, sl sol ether, insol benzene -B"H,PtCl, light yellow flocculent pp, v sl sol water and alcohol—Picrate B"C₆H₂(NO₂)₃OH light green flocculent pp , v sol hot alcohol, insol benzene and ether

Benzoul derivative

(NMe, C,H,),CH C,H, NHBz [128°] Small, slender blue plates (from warm alcohol), v sol hot alcohol and benzene, sl sol ether, insol water

Tetra - methyl - ppm - tri amido tri phenyl methane ([4 1] NMe₂, C₆H₄) CH C₆H₄ NH [1 3] [130°] Prepared by reducing m nitro tetra methyl-di amido tri phenyl carbinol (E a O Fischer, B 12, 803) Colourless prisms or Gives a green dye on oxidation needles

Tetra-methyl tri p amido tri phenyl methane C₂₈H₂₇N₃te ([4 1] NMe₂ C₆H₄) CH C₈H₄ NH [1 4] [152⁵] Prepared by reducing the hydrochloride of p nitro tetra methyl di-p amido tii phenyl methane with zinc dust (Fischer, B 14, 2527) Colourless plates, sl sol alcohol Gives on oxi dation tetra methyl pararosaniline, a reddish violet dye

Acetyl derivative [108°] Needles Yields on oxidation the corresponding carbinol, a splendid green dye (Fischer a German, B 16, 708

Penta methyl tri p amido tri phenyl methane C24H29N, ie (NMe C4H4), CH C6H4 NMeH [116°] Obtained by heating penta methyl para rosaniline with alcoholic ammonium sulphide at 100° (Hofmann, B 6, 360, E a O Fischer, B 12, 799, Fischer a Körner, B 16, 2906) Large colourless needles (from alcohol) Sl sol hot water, v sol alcohol and ether - B",3H,PtCl,

Acetyl derivative [143°] Hexa-methyl-tri-amido-tri phenyl methane C₂₂H₃₁N₃ re HC(C₃H₁NMe₂), Hexa methyl-paraleucannine [178°] Formation —1 By treating chloral with di-

methylaniline and ZnCl₂ (E a O Fischer, B 11, 2097) The base so prepared melted, however, at 250°—2 From orthoformic ether (1 pt) and di methylaniline (31 pts.) at 100° (Fischer a Knorr, B 17, 98) —3 By condensation of p di methyl-amido benzaldehyde with di methyl aniline in presence of dry HOl gas or ZnOl, (Boessneck, B 19, 366)—4 From glycol, dimethylaniline, and ZnCl, at 100°-120° (Heumann a Wiernik, B 20, 2421) Needles or prisms When oxidised with MnO2 and H2SO4 it gives formic aldehyde and methyl violet (Fischer)

Tri methylo-tri rodide O2 H. N.I. 16. CH(C.H. NMe.I): [185°] From tetra- and hexa methyl-tri-p-amido-tri-phenyl methane, MeI, and MeOH at 100° (Hofmann a Girard, B 2, 448, Fischer, B 12, 2344) Yellow needles (containing aq), decomposes and becomes dark blue on fusion Gives (C₂₂H₄₂N₂Cl₂),3PtCl₂2aq Hexa methyl opp (?)-tri-amido-tri pnenyl-

Tri methylo tri-odide CH(C,H,NMe,I), [172°] Cotained by heating the corresponding tetra methyl tri am. c tri phenyl methane with MeI (Nathansohn a Muller, B 22, 1987) Small brown needles (from warm alcohol), v sol alcohol and hot water, almost

insol ether and benzene

Hexa-methyl mpp tri-amido-tri-phenyl-thane Tri methylo tri-iodids methane [3 1] NMe₃I C₆H₄ CH(C₆H₄ NMe₃I[1 4])₂. Formed by heating the base C23H27N2 or the corresponding CH(C.H. NH.), with Mel and MeOH at 120° (Fischer, B 12, 802, 13, 673) Crystallises with

difficulty, and is v e sol water Gives rise to 8PtCl,2CH(C,H,NMe,Cl), CHLORO NITBO-, and References - CHLORO-,

NITRO-, METHYL AMIDO PHENYL METHANES

TETRA METHYL DI AMIDO TRI PHENYL-METHANE CARBOXYLIC ACID C24H20N2O2 16 (NMe, C,H,),CH C,H, CO,H Di methyl aniline phthalin [200°] Obtained by treating di methyl amido phthalide with zinc-dust and HCl (Fischer, A 206, 101) Formed also by treating p aldehydo benzoic acid with dimethylaniline and ZnCl₂ (Low, 4 231, 367) Plates (from al cohol), v sol ether sl sol ligroin, m sol Conc H₂SO, forms a bluish violet Its zinc salt melts at 147° (L) alcohol solution C2.H2.N2O2H.PtCl2. -- Platinochloride

Piciate C,H,N O,C,H (NO,),OH
TETRA METHYL DI AMIDO TRI PHENYL METHANE CARBOXYLIC ALDEHYDE

C,H,N,O te (NMe, C,H,)2CH C,H, CHO From terephthalic aldehvde, dimethylaniline, alcohol, and ZnCl, (Löw, A 231, 381) Needles (from chloroform) Si sol alcohol, m sol benzene, v sol chloroform Its phenylhydrazide melts at

DI METHYL AMIDO PHENYL (a) - NAPH-

THYL SULPHONE CiaH, NSO, we Formed, together with NMe, CoH, SO, CoH, tetra methyl di amido di phenyl methane, by heating dimethylaniline (2 mols) with the oblor ide of naphthalene (a) sulphonic acid (Michler a Salathé, B 12, 1789) Crystals, v sol alco-Cone HClAq at 180° splits it hol and ether up into naphthalene, H₂SO₄, aniline, and MeCl Zinc and H₂SO₄ give dimethylaniline and naphthyl mercaptan Fuming HNO, gives tetra nitro methyl aniline and nitro naphthalene sul phonic acid

Di-methyl-amido-phenyl (3)-naphthyl sul-Resembles the preceding body in its mode of preparation, properties, and decompo

sitions (M a. S)

DI-METRYL p-AMIDO - PHENYL - OXAMIC mann, B 9, 845) Formed also as a by product, ACID C₁₁H₁₁N₂O₁ • • NMe₂C₂H₄ NH CO CO₂H. in the action of PCl₂ on dimethylaniline in [192°]. The ethyl ether is formed by boiling di-presence of AlCl₂ (S a M.) Colourless needles. Vol. III

methyl-p-phenylene diamine with oxalic other. and separated by solution in alcohol from the accompanying tetra methyl di amido-di phenyl oxamide (Sendtner, B 12, 530) The ether is then saponified by alcoholic KOH. Needles

(from water) or plates (from alcohol)

Ethyl ether EtA' [117°] Ye [117°] Yellow plates

or needles, v sol warm alcohol

DI-METHYL-AMIDO-PHENYL-OXAMIDE C₁₀H₁₂N₂O₂ 16 NMe₂ C₆H₄ NH CO CO NH₂ [259°] Formed by treating di-methyl amidophenyl-oxamic ether with alcoholic NH, (Sendt ner, B 12, 532) Nodules (from alcohol) --B'2H2SO, crystals

Tetra-methyl-dı amıdo-dı phenyl oxamıde NMe₂ C₄H, NH CO CO NH C₄H₄ NMe₂ Formed as described under di methyl amido phenyl oxamic acid (Sendtner) Small yellow needles, insol water, sl sol boiling alcohol Does not melt at 270° Diacid base, forming salts soluble

in water

TETRA-METHYL-DI-AMIDO-DI-PHENYL OXIDE C1.4H20N2O s.e (NMe2 C4H4)2O [119°] Formed by boiling the corresponding sulphide ('thiodimethylaniline') with an ammoniacal alcoholic solution of AgNO, (Holzmann, B 21, 2056) Stellate groups of colourless needles, insol water, sl sol cold alcohol, ether, and benz-Readily soluble in acids Conc HClAq at 200° gives MeCl and aniline -B"H2PtCl4 minute bright yellow plates, sl sol hot alcohol Picrate B"2C_eH₂(NO₂)_eOH [150°] Sma [150°] Small yellow needles, al sol cold alcohol and benz-

Tetra methyl di amido di phenyl-di-oxide NMe C₆H₄) O... Di oxy di methyl aniline [91°] Obtained by adding (4 mols of) silver nitrate to an alcoholic solution of tetra methyl di amido di phenyl di-sulphide (NMe2-CaH4)2S. (1 mol) treated with conc NH, It is also formed by the action of Fe,Cl, upon the conc HCl solution of the same base Thin silky needles, or plates V e sol alcohol, ether, and benzene, sol hot water It dissolves in acids, but its salts are not crystalline (Merz a Weith, B 19, 1573)

TETRA METHYL DI-AMIDO DI PHENYL-OXINDOLE C24H23N4O 1 6

 $C_6H_4-C(C_6H_4NMe_2)_2$

Di methyl aniline-NH - CO

[234°] Formed by heating isatin with isatin dimethylaniline and ZnCl, (Baeyer a Lazarus, B 18, 2642) Glistening colourless prisms SI sol ether, alcohol, and ligroin, insol water Dissolves in soids On oxidation it gives a splendid bluish green dye stuff

DI METHYL AMIDO TRI PHENYL-PHOS-PHINE C, H, NP 16. NMe. C.H. P(C.H.) [152°] Formed by the action of sodium on a mixture of chloro benzene and NMe, C, H, PCl, (Schenk a Michaelis, B 21, 1502) Colourless crystals, v e sol benzene, sl sol alcohol and ether Weak base, being almost entirely ppd by wate, from its solution in HClAq

Hexa methyl tri-amido tri phenyl-phosphine (NMe, C,H,),P [273°] Formed by heating dimethylaniline with PCl, in a sealed tube (Haniwhich turn blue on exposure to air V e sol chloroform, v sol dilute HClAq, m sol hot alcohol

DI . METHYL - AMIDO - PHENYL PHOS -PHINOUS ACID v DI METHYL AMIDO BENZENE PHOSPHINIC ACID

TETRA-METHYL-DI-AMIDO-DI-PHENYL-

PHTHALIDE C24H24N2O2 t. 6

 $(NMe_2, O_0H_4)_2C < \overset{O_0H_4}{O} > CO$ Dimethylanilinephthalein [191°] Prepared by heating dimethylaniline with ZnCl, and phthalyl chloride or phthalic anhydride (O Fischer, B 9, 1753, 10, 952, 12, 1691, A 206, 92) Colourless pointed crystals, insol water, v sol benzene, v sl sol Reduced by zinc dust and HOAc to tetra methyl di amido tri phenyl methane carboxylic acid (dimethylaniline phthalin) Potashfusion gives dimethylaniline, HOBz, and phthalic acid HNO, gives a hexa-nitro-derivative which decomposes at 230°

Salts -B"HCl small needles, m sol water -B"H2Cl2 hygroscopic crystalline mass, got by passing HCl into the ethereal solution Gives off HCl (1 mol) at 100° —B"₂H₂PtCl₆ crystal line pp —B"H₂PtCl₆ aq prisms — Picrate line pp B"H2PtCl_s aq B"2C_sH₂(NO₂)₂OH

Methylo-rodide B"Me₂I₂ [c 185°] Phthal green C₂₄H₂₄N₂O₂. This substance, isomeric with the preceding, is also formed in the action of phthalyl chloride on di methylaniline in presence of ZnCl₂ (Fischer) Îts hydrochloride, B"HCl, forms greenish yellow needles, m sol water Its zinc double salt crystallises in brass yellow needles which form a green solution in water Zinc and HCl reduce it to a leuco- base $C_{24}H_{24}N_2O$ which crystallises in small prisms [286°], and is easily re-oxidised to phthal green

TETRA METHYL-DI-AMIDO PHENYL-DI-PHENYLENE-OXIDE-CARBINYL CHLORIDE

C₆H₅ O C₆H₂NMe₂ O Tetra methyl-rosam-

Formed from benzotrichloride and dimethyl-m amidophenol at 50°-60° (Heumann a Rey, B 22, 3002) Dark red flocculent pp, strongly fluorescent in acid or neutral solution H₂SO₄ dissolves it giving an orange yellow colour, becoming dark-red on addition of water Silk and wool are dyed in feebly acid bath rose to bluish red

Salts -B'HCl dark red needles with steelblue reflex, v sol water and EtOH forming solu tions with a splendid blue red colour, and yellow fluorescence — (C₂H₂N₂OCl)₂PtCl₄ dark-red pp DI-METHYL-AMIDO-PHENYL-PROPANE

C₁₁H₁₇N i e NMe₂ C₆H₄ CH₂ CH₂ CH₃ methyl amido propyl benzene (230°) From p bromo-di methyl-aniline, propyl bromide, and sodium (Claus a Howitz, B 17, 1327) Oil

Methylo-rodide NMe I C.H. Pr [168°] Tetra-methyl-di-amido-di-phenyl-propane (NMe₂C₆H₄)₂CMe₂ [88°] From acetone (1 mol), dimethylaniline (2 mols), and ZnCl₂ (Doebner, B 12, 813) Long needles
DI-METHYL - AMIDO - PHENYL - QUINON -

IMIDE C, H, N,O 66

imide to a solution of di methyl aniline in concentrated aqueous oxalic acid (Fogh, B 21, 889). Formed also by the action of NaOH on di methyl phenylene green (Möhlau, B 18, 2914) Black crystals (containing $\frac{1}{3}$ aq) Yields, when treated with hot dilute HClAq, quinone and dimethyl phenylene p diamine May be reduced to a leuco- base

Sulphonic acid

o. SO,H C,H, Formed by passing M C.H.NMe2"

chlorine into amido phenol sulphonic acid suspended in water, and then adding di methylannline (F) Slender needles, v sl sol hot alcohol, in ol cold water and ether Its alka line solutions are blue Conc H₂SO₄ forms a cherry red solution

TĚTRA-METHYL DI-AMIDO DI PHENYL SULPHIDE (NMe₂.C₆H₄)₂S Thiodimethylan: line [126°] Formed by heating dimethyl aniline with persulphocyanic acid or SCl, (Tursini, B 17, 584, Holzmann, B 20, 1640, 21 2056, Michaelis a Godchaux, B 23, 554) Light-yellow needles, sl sol alcohol and benzene

Reactions -1 Silver nitrate converts it into (NMe₂ C₆H₄)₂O -2 On heating with reduced

copper (10 pts) at 300° it yields NPhMe Salts—B"H₂Cl₂ [176°] White mass becoming coloured in the air, extremely sol water - B"H, PtCl, 2aq - B"H, FeCy, 6aq white owder, m sol water -B"C, H₂(NO₂), OH powder, m sol water — B"C₆H₂(NO₂)₃OH [142°] Yellow needles (from hot alcohol) — B"2C,H₂(NO₂₎₂OH Amorphous [146°] — B'HNCS [168°], pearly plates Tetra-methyl-di-amido di-phenyl di-sulphide

 $(NMe_2C_6H_4)_2S_2$ Di sulphido- or di thio di [118°] Formed by adding methyl anılıne S₂Cl₂, diluted with petroleum ether, to a dilute solution of dimethylaniline in the same solvent (Merz a Weith, B 19, 1570) Formed also by heating di methyl p amido phenyl ethyl di thio carbonate with an alcoholic solution of aniline at 200° (Leuckart, J pr [2] 41, 208) Small yellow needles, e sol CS_2 , more sparingly in hot benzene, alcohol, and petroleum ether, nearly insol water Copper powder removes the sulphur at c 230° forming dimethylaniline and other products By the action of Fe₂Cl₆, or of alcoholic NH, and silver nitrate, it is con verted into tetra methyl di amido di phenyl di oxide (NMe₂C₆H₄)₂O₂ By tin and HCl, or by sodium amalgam, it is reduced to di methylamido phenyl mercaptan, which is readily reoxidised to the di sulphide Its salts are gummy and amorphous, they are decomposed by water

Tetra-methyl-tetra-amido-di phenyl-disulphide (NMe₂C₆H₃(NH₂))₂S₂ Formed by atmo spheric oxidation from di methyl-di-amido phenyl mercaptan NMe₂C₆H₃(NH₂)SH (Bernthsen, A 251, 1) Thick oil, sol ether, alcohol, and benzene Dissolves in acids, but reppt by alkalis In benzene solution it combines with sulphur forming a persulphide [97°], apparently

C₂₂H₄₄N₄S₃ DI-METHYL AMIDO-DI-PHENYL PHONE C.H. SO.O.H. NMe. [78°] (R), [82°) (M a M) Formed by heating dimethyla niline with benzene sulphonic chloride (Michler, B 10. Phenol-blue. Formed by adding quinone chlor
N. C.H., NMe. 1742, Van Romburgh, R. T. C. 2, 305, Michler a. Meyer, B. 12, 1791, Hassencamp, B. 1275) Needles (from alcohol), insol water, ve sol alcohol, ether, and benzene HClAq at 180° splits it up into MeCl, aniline, and benzene Zinc and H₂SO₄ reduce it to phenyl mercaptan and dimethylaniline HNO₂ gives yellow crystals of tetra nitro-methyl aniline [127°]

METHYL-AMIDO-PHENYL-THIAZOLE

 $C_{10}H_{10}N_2S$ to S-C(NHMe) N [138°] From CH CPh

w bromo acetophenore and methyl thio urea (Traumann, A 249, 46) Yellow plates (from ether), insol water, m sol alcohol With HClAq at 220° it yields methylamine

TETRA METHYL DI AMIDO-D' PHENYL-

THIENYL METHANE C₂₁H₂₄N₂S 1 e (NMe₂ C₆H₄)₂CH C₄H₄S Throphene leuco-mala-chite green [98°] Formed by heating thiophenic aldehyde with dimethylaniline, ZnCl. and a little alcohol (Peter, B 18, 538, Levi, B Formed also by heating dimethyl ani-20, 514) line with thienyl glyoxylic acid C,H,S CO CO2H and ZnCl₂ (P) Needles, insol water, v sol alcohol and ether The alcoholic solution turns green in the air MnO2 and dilute H2SO4 oxidise it to the carbinol (NMe, C,H,),C(OH) C,H,S, which is a dark brown oil, sol alcohol and ether, and forming salts which dye a splendid yel-Throphene green -Platino-C₂₁H₂₁N₂SH₂PtCl - Picrate $(Th \iota o p h \cdot n e$ lowish green chloride C, H₂₄N S2C₆H₂(NO₂₎₃(OH) [c 208°] Yellowish green needles, sl sol cold water, v sol alcohol

Dr methylo dr rodide C,H₃S CH(C₆H₄ NMe₃I)₂ [212°] White plates

TETRA METHYL-DI-AMIDO DI-PHENYL-THIOKETONE v Tetra methyl di amido-thio Benzophenone

DI-METHYL DI AMIDO PHENYL THIO-SULPHURIC ACID NMe₂ C₂H₃(NH₂)S SO₃H [193°-204°] Obtained by adding an alkali to a $\frac{1}{15}$ p c solution of methylene red until the colour is destroyed, then acidulating with HOAc and exposing to the air Formed also by the action of a strong solution of SO₂ on di methyl di amido phenyl mercaptan (Bernthsen, A 251, 1) Crystals, sl sol water and alcohol Its dilute aqueous solution gives a purple colour with traces of iodine oi of FeCl₃ The hydrochloride crystallises in prisms

Reactions —1 A mixture of di methyl di amido phenyl thio sulphuric acid with dimethyl aniline when oxidised by k,Cr,O, and HOAc NC₆H₃(NMe₂)

forms the indamine C₄H₄ | S, an NMe₂ O SO₂ | S, an emerald green powder (containing ½aq), and yields NMe₂ C₄H₄ NH C₄H₃(NMe₂) S SO₃H on reduction, a body which is v sol hot alcohol and acids —2 A mixture of the thio-sulphuric acid

with aniline hydrochloride gives on oxidation

C₁₄H₁₅N₂S₂O₂ to C₄H₄(N₁Me₂)

NH₂ O SO₂

S (?) an

insoluble green compound decomposed by water Prolonged boiling with dilute FeCl, gives N(NMe2)

S, a blue powder with bronze

iustre —8 A mixture of di-methyl-di amidophenyl thiosulphuric soid with o-toluidine yields

C.H.

on oxidation the homologous C₁₃H₁, N₂S₂O₃ as a bluish grey powder

Tetra-methyl-di amido phenyl thiosulphuris acid C₆H₄(NMe₂)₂S SO₂H [175°-182°] Obtained by dissolving tetra methyl p phenylene diamine (27g) in HCl (156 c,c of 38 p c) and adding aluminium sulphate (10g), and sodium thiosulphate (6 6 g) dissolved in water (36 c c) A cold solution of K,Cr,O, (25 c o of a 6 67 p c solution) is then added, and the resulting liquid left to stand The precipitate which then separates is recrystallised from alcohol (Bernthsen, A 251, 60) Plates, sol hot water and acids Zinc and HCl reduce it to the mercaptan C₆H₄(NMe)₂SH

TETRA-METHYL DI p-AMIDO-DI-PHENYL THIO UREA C. H., N.S. t.s. (NMe, C.H., NH), S [186°] Formed by boiling di methyl-p phenylene diamine with alcoholic CS₂ (Baur, B 12, 533) White needles, insol water and cold alcohol—B"H,Cl, crystalline powder

Acetyl derivative [71°] White plates TETRA - METHYL-DI-AMIDO-DI-&-PHE.

NYL-TOLUIC ALDEHYDE C₂H₂N₂O te (NMe₂·C₄H₃)₂CH C₂H, CHO Aldehyde of the leuco base of malachite green [143°] Obtained by boiling an alcoholic solution of terephthalic aldehyde C₄H₄(CHO), with di methyl anline and ZnCl₂ (W Löw, A 231, 381) Prismatic needles (from chloroform) Forms a crystalline compound with NaHSO, Its phenyl hydrazide melts at 225°—B"H₂PtCl₅

TRI METHYL-TRI AMIDO-DI-PHENYL-TOLYL CARBINOL C₂H₂,N₃O Formed by heating rosaniline chloride (1 pt) with MeI (2 pts), NeOH (8 pts), and KOH (1 pt) (Hofmann) Formed also by allowing an alcoholic solution containing rosaniline and 'iodine green' to stand in the cold (Girard a Willm, Bl [2] 25, 200) The salt NHMe C₄H₃Me C₄C₆H₄NHMeCl is one

of the substances known as Hofmann's violet (Hofmann, C R 54, 428, 56, 945, 1033, 57, 1131) Its absorption spectrum has been studied by Hartley (C J 51, 172)

Penta-methyl-tri-amido di-phenyl-tolyicarbinol

NMe₂·C₆H₃Me C(OH)(C₆H₄NMe₂)(C₆H₄NMeH)
The obloride NMe₂ C₆H₃Me C
C₆H₄NMe₂
C₇H₄NHeCl

is probably the chief constituent of Hofmann's violet obtained by heating rosaniline with McCl It has a green lustre and forms a violet solution in water. The solution is decolourised by zine dust. HCl turns the solution first green, then yellow. NaOH gives a brownish-red pp. Conc. H₂SO₄ gives a brownish-yellow solution changed, on dilution, through green to blue. It dyes wool, silk, and mordanted cotton violet.

Hexa-methyl-tri-amido-di-phenyl-tolyl carbinol $\text{NM}_0(C_dH_d\text{Me} \in C(OH)(C_dH_d\text{NM}e_d)_s$. The zinc double salt of the methylo chloride of this body C_dH_d , N_dCl_d or

NMe₂ C_cH₄Me C C_cH₄NMe₃Cl appears to

constitute the dye known as 'iodine green,' which is obtained by heating rosaniline with McCl, or by the action of McCl on Hofmann's violet. The

7 Z

scrresponding iodide $C_{ir}H_{35}N_{1}I_{2}$ aq is obtained by beating MeI (2 pts) with MeOH (2 pts) and resamiline (1 pt) at 100° (Hofmanna Gurard, B 2, 440) The zinc double chloride forms a bluishgreen aqueous solution, turned reddish yellow by hydrochloric acid, and rendered colourless by caustic soda. It dyes silk green. When heated strongly in the dry state it becomes violet. Its absorption-spectrum has been studied by Hartley (C J 51, 175). Iodine green may be reduced to penta methyl tri amido-di phenyl tolyl methane. NMe₂ ($c_{1}H_{1}$ Me CH($c_{2}H_{1}$ Me) (173°) (O. Fischer a. G. Körner, B. 16, 2910). Besides the bodies here described other methylated rosamilines are doubtless formed in the methylation of rosamiline.

DI - METHYL - AMIDO - PHENYL p-TOLYL SULPHONE C₁₅H₁₇NSO₂ 2 e

[4 1]C_sH₄Me SÖ₂ C

GH₄Me SO₂Cl and dimethylaniline (Michler a Meyer, B 12, 1793) Split up by HCl at 180° into MeCl, aniline, H₂SO₄, and toluene Zinc and H₂SO₄ reduce it to p tolyl mercaptan and dimethylaniline

DI-METHYL-p-AMIDO-PHENYL-UREA C₅H₁₃N₅O ie NH₂CO NH C₆H₄NMe. [179°] From potassum cyanate and di methyl-p-phenyl ene-diamine (Binder, B 12,536) Long needles, sol hot water—R'H-PtCl. vallow leaflets

ene-diamine (Binder, B 12,536) Long needles, sol hot water — $B'_2H_2PtCl_s$ yellow leaflets Tetra-methyl-di p amido-di-phenyl-urea (P,H₂N₄O *e CO(NH C_sH₄NMe_s)₂. [262°] (B), [246°] (M a Z) Obtained by heating urea with di-methyl p phenylene diamine (Binder, B 12,585) The same body is apparently obtained by the action of COCl₂ on di methyl p phenylene diamine (Michler a Zimmermann, B 14, 2179) — $B''H_2Cl_2$ soluble crystalline powder — $B''H_2SO_4$ sl sol water — $B''H_2PtCl_6$

METHYL AMIDO PROPANE SULPHONIC ACID NHMe CH, CHMe SO, Η [220°-223°] From methyl propylene ψ-thio-urea and brominewater (Gabriel, B 22, 2989) Colourless columns, γ e sol water

METHYL a-AMIDO-PROPIONIC ACID

C₄H_eNO₂ 2.6 CH₂ CH(NHMe) CO₂H [260°] From a chloro proponic ether and aqueous methylamine at 130° (Lindenburg, J pr [2] 12, 244) Prisms Decomposed on fusion Tastes sweet Its copper salt crystallises in dark blue prisms—HA'HCl [110°] Deliquescent prisms HA'HCl₃ Trichine prisms—HA'HNO₃ [126°] Monoclinic prisms

Di-methyl a-amido-propionic acid Methylo chloride CH, CH(NMa,Cl) CO,H Formed by treating a-chloro propionic ether with trimethylamine, saponifying the resulting ether with baryta, and adding HCl (Brühl, B 9, 34) Very hygroscopic, forming (C₄H₄NO₂Cl)₂PtCl₄ crystallising in roseate prisms, and C₄H₄NO₂AuCl₄ crystallising in golden needles The corresponding Anhydride of the Methylo-hydroxide

OH₂ CH CO NMe₂ O or 'betaine' is formed on adding baryta to the methylo-chloride and subsequently neutralising with H₂SO₄. It forms extremely deliquescent crystals, and is neutral in reaction. The loade (C₂H₁₂NO₂)₂HI forms long colourless prisms, v sol alcohol and hot water

DI-METHYL AMIDO PROPYL ALCOHOL v. Dr-methyl oxy-propyl amine

Tetra-methyl-s-di-amido-usopropyl alcohel C,H₁₈N₂O ve (NMe_xCH₂)_zCH OH (170°-185°). Formed from di-chloro-usopropyl alcohol (s di-chlorhydrın) and NMe_zH at 60° (Berend, B 17, 510) Liquid, v e sol water—B'H₂PtCl_e: yellow plates

Benzoyl derivative (NMe, CH₂)₂CH OBL. Forms a platino chloride B"H₂PtCl₂ crystallising in tables

DI-METHYL-AMIDO-PROPYLENE GLYCOL C₅H₁₃NO₂ e NMe₂ CH₂ CH(OH) CH₂OH (217°) From dimethylamine and chloro propylene glycol (chlorhydrin) (Roth, B 15, 1153) Thick syrup, v e sol water, alcohol, and ether—B'₂H₂PtOl₆

Methylo-chloride

NMe, Cl CH₂ CH(OH) CH₂(OH) From the chlor hydrin and NMe, at 100° (V Meyer, B 2, 186, Hannot, A Ch [5] 17, 99) Needles, v e sol water—(C₂H₁₈NO₂Cl)₂PtCl₄ crystalline tables—C₂H₁₈NO₂AuCl₄ [190°] Orange crystals, m sol alcohol

Dr-benzoyl dervative

Picrate B'(C₆H₂(NO₂)₃OH) very fine orange needles [215°]

Methylo rodide B'MeI long red needles —(BMeCl)₂PtCl₄

Methylo-chloride B'MeClaq [244°]
Long scarlet hygroscopic needles (Ostermayer,
B 18, 596)

Methylo chloride of the tetrahydride NMe, C₃H₁₀NMeCl aq [220°], fine colourless needles With IClitforms NMe C₄H₁₀NMeClICl [127°], separating in small yellow crystals (Ostermayer, B 18, 596)

TETRA - METHYL - DI - AMIDO - QUINONE C_sH₂(NMe₂)₂O₂ [174°] Red tables Formed by dissolving ordinary quinone in aqueous dimethyl amine (Mylius, B 18, 467)

DI-METHYL-AMIDO-SULPHO-BENZOIC ACID C₆H₄(NMe₂)(SO₃H) CO₂H [4 2 1] Obtained by heating the silver salt of amido sulpho benzoic acid with MeI and MeOH at 100° (Hedrick, Am 9, 413) Easily soluble crystals—CaA"—BaEtA".

TETRA-METHYL-DI-AMIDO-THIOBENZO-PHENONE C, H₂N, Ste CS(C, H₁NMe₂)₂ [194°] (B), [202°] (G) S (alcohol) 072 at 18° S (ether) 27 at 18° S (chloroform) 458 at 18° Formed by passing H₂S into an alcoholic solution of the hydrochloride of tetra methyl diamido benzophenone imide (auramine) at 60° (Fehrmann, B 20, 2857, Baither, B 20, 1731, 3289) Formed also by the action of CS₂ on auramine (Graebe, B 20, 3266) Obtained also from CSCl₂ and dimethylaniline Ruby red crystals, with blue lustre Insol water and light petroleum, sl sol other solvents Its

solutions in benzene and CS, are dark red with green fluorescence

Reactions -1 Hot dilute hydrochloric acid gives H2S and tetra-methyl di amido benzophenone - 2 Water at 120° under pressure also forms CO(C₆H₄NMe₂)₂.—8 Boiling concentrated mitric acid forms CO(C₆H₂(NO₂)₂.NMe NO₂)₂, whence hydroxylamine hydrochloride forms $CO(C_cH_2(NO_2)_2 NMeH)_2$ [c 196°] —4 By heating with excess of benzyl chloride it is converted into COl₂(C₄H₄, NMe₂)₂, a greyish green powder, decomposed by writer with production of CO(C.H.NMe.). - 5 Aniline hydrochloride at 150° forms phenyl auramine NPh C(C₆H₄NMe₂)₂ [171°] — 6 Phenyl-hydrazine at 100° forms CO(C₆H₄ NMe₂)₂ Aniline at 150° also forms this ketone —7 Hydroxylamine gives the oxim of tetra methyl di amido benzophenone -8 Dis tillation over red hot zinc dust yields di methyl aniline and tetra methyl-di amido di phenyl methane -9 Acetyl chloride in the CS, solution forms C17H20N2SAcCl, which forms a red alco holic solution and a greenish yellow solution in benzene It begins to decompose at 160° -10 Benzoyl chloride in CS₂ forms a similar compound C_{1,}H₂N₂SBzCl, which is insol water, but decomposed by solution in alcohol— Boiling with Ac2O and NaOAc forms $C_{38}H_{46}N_4SO_4$, a dark grey powder -12 Methyl wolvde appears to give $C_{17}H_{28}N_2SMeI$, which forms green plates with coppery lustre, decom poses at 108°, and yields a deep bluish green aqueous solution with red fluorescence It dyes silk green -13 CSCl₂ acting on its CS₂ solution forms a black powder, probably C1,7H20N2SCSCl2. In chloroform solution, CSCl2 forms white crusts of CCl₂(C₆H₄NMe₂)₂CHCl

METHYL-AMIDO-THYMOQUINONE

C₁₁H₁₈NO₂ 1 e C₃H, C₆HMe(NHMe)O₂ [74°] From methylamine and thymoquinone in alcoholic solution (Zincke, B 14, 97) Dark violet laminæ (from very dilute alcohol) Volatile with steam M sol water, v e sol alcohol The solutions are deep violet Alcoholic HCl converts it into methylamine and oxythymo

D: methyl amido thymoquinone C₁₂H, NO₂ te C3H, C6HMe(NMe2)O2 Prepared by mixing dimethylamine with thymoquinone in alcoholic solution (Schulz, B 16, 899) Dark coloured Volatile with steam Split up by heating with dilute HCl into oxythymoguinone and di

methylamine

Di methyl di-amido-thymoquinone $C_{12}H_{18}N_2O_2$ is C_3H_7 , $C_6Me(NHMe)_2O_2$ Formed, together with methyl amido thymo quinone, by treating a cold concentrated alcoholic solution of thymoquinone with methylamine (Zincke) Formed also by the action of methylamine on di bromo thymoquinone Long reddish violet needles (from alcohol) Decomposed by KOH or H₂SO₄ in alcoholic solution into methylamine and di oxy thymoquinone

METHYL-AMIDO-TOLURNE

TOLUIDINE

Methyl-di-amido-toluene v. METHYL-TOLYL-ENE DIAMINE

Methyl-tri-amido-toluene C,H,,N, C,H2Me(NH2)3(NHMe) The hydrochloride B"H,Cl, aq is prepared by reducing the nitramine of di-nitro-methyl-o-toluidine with tin and

HCl (Van Romburgh, R T C 3, 400) It forms small crystals

Di-methyl-amido-toluene sulphonic acid C₀H_{1,1}NSO, te NMe₂C₀H₃Me SO₃H [2 1 4?]. Formed by heating di methyl-o toluidine (1 pt) with H₂SO₄ (4 pts) at 180° to 210° (Michler a. Sampaio, B 14, 2168) Large glittering prisms (from water), insol alcohol, v sol hot water -CaA'₂ (dried at 130°) Nodules —BaA'₂ (dried at 130°) Laminæ, v sol hot water — ZnA'₃ needles

TETRA METHYL-DI AMIDO-DITOLYL NMe₂ C₄H₃Me C₄H₃Me NMe₂ Tetra - methyl-tolidine [80°] Formed by oxidising di methyl-o toluidine with MnO₂ and dilute H₂SO₄ Tetra - methyl-Formed also by methylation of di amido ditolyl (Michler a Sampaio, B 14, 2170) White plates, sol ether and hot alcohol, insol water -B"H2Cl2 white needles -B"H2PtCl2 yellow

crystalline pp

Tetra methyl di amido-ditolyl C18H24N2 1 e N Me₂ C.H. Me C.H. Me NMe₂ [190°] Formed in small quantity by heating dimethyl o-toluidine with H₂SO₄ (M a S) Long needles, sol hot alcohol, ligroin, and ether, insol water Gives a green colouration with Fe, Cl, and yellow colour with CrO,

Tetra-methyl-di-amido-ditolyl (?) $C_{18}H_{24}N_2$ 2.e $NMe_2 \cdot C_6H_3Me \cdot C_8H_3Me \cdot NMe_2 = [57^{\circ}]$ Prepared by heating dimethyl p toluidine with H.SO. (Michler a Pattinson, B 14, 2167) White needles, sol alcohol and ether, insol water

-B"H,Cl,PtCl

DI - METHYL - AMIDO - TOLYL - BUTANE C₁₃H₂₁N 1e C₄H₄, C₆H₄Me NMe₂ [251°] From amido tolyl butane and MeI (Effront, B 17, 2339) —B .H2PtCl.

DI - METHYL AMIDO - TOLYL METHYL KETONE C,,H,,NO 1 e $[1\ 2\ 5]C_6H_3(CH_3)(NMe_2)$ CO CH_2 [95°] yellowish prisms, e sol alcohol, ether, and hot water, nearly insol petroleum ether by methylation of amido tolyl methyl ketone

(Klingel, B 18, 2699) METHYL a AMIDO n VALERIC ACID

C.H.,NO₂ ie CH, CH, CH, CH, CH(NHMe) CO H Obtained by heating butyric aldehyde with conc aqueous HCy, adding methylamine, and heating The nitrile then separates as an oil, which is hydrolysed by prolonged boiling with dilute HClAq (Menozzi a Belloni, G 17, 116) Long glistening needles (containing aq), decom posed partially at 110° with formation of a sublımate

Salts -CuA'22aq blue prisms -HA'HNO2. prisms, v sol water

Methyl a-amido isovaleric acid C.HisNO. s.s (CH₂)₂CH CH(NHMe) CO₂H Formed by boiling a bromo isovaleric acid with aqueous methylamine (Duvillier, C R 88, 425, A Ch [5] 21 434) White crystalline powder, v e sol water, m sol hot alcohol, insol ether Neutral in reaction With cyanamide it forms a creatinin C.H., N.O. crystallising in slender needles, v. sol bouing alcohol (Duvillier, C R 95, 456) — HA'HOI Crystallises with difficulty H,A',H,SO, HA'HAuCl, aq v sol water prisms , short trimetric prisms copper salt forms an intense blue solution

Di - methyl - a - amido - isovaleric Methylo-rodide of the methyl ether. Pr CH(NMe,I) CO,Me. Formed by heating MeI

4 pts) with zinc amido-valerate (1 pt) and ZnO (1 pt) at 110° for 16 hrs (Duvilher, C R 110, 640) Yields {Pr CH(NMe₂Cl) CO₂H₂.PtCl₄4aq and Pr.CH(NMe₂Cl) CO₂H₃.PtCl₄4aq and Pr.CH(NMe₂Cl) CO₂HAUCl₂ METHYLAMINE ONH₅ 4c CH₅ NH₇ Mol w 31 (-6°) (Hofmann, B 22, 701) S G -108 ·699 H F p 9,540 H F v 8,880 (Thomsen, Th) H C 256,900 (Müller, Bl [2] 44,609) Heat of neutralisation by HCl · 25,900 (Müller, A Ch (5116,531) S (cas) 1150 at 125° . 950 at 25° [6] 15, 531) S (gas) 1150 at 125°, 950 at 25°

Occurrence -1 In bone oil (Anderson, A 80, 44) -2 In Mercurialis annua and M perennas (Schmidt, B 10, 2226, A 193, 73, cf Reichardt, Z 1868, 734) —3 In herring brine (Bocklisch, B 18, 1922) —4 In crude wood spirit (G Williams, Chem Gaz 1853, 409, Commaille, J 1873, 686, Vincent, C R 77, 898) —5 In the product of the distillation of beet root molasses (Duvillier a Buisine, A Ch [5] 23, 317)—6 In the 'yolk' or 'sumt' of sheep When an aqueous extract of this substance is allowed to stand for some time, and is then boiled, it gives off 4 pts of NH₂Me for 95 pts of NH, and 1 pt of NMe, (Buisine,

C R 104, 1292) Formation -1 Discovered by Wurtz, who obtained it by distilling methyl cyanate (or cyanurate) with potash (C R 28, 223, 323, area with potash (Wurtz) —3 In small quantity, together with NHMe₂ and NMe₃, by heating ammonia with MeI (Hofmann, A. 79, 19) Formed also by heating the methyl ethers of other morganic acids with ammonia -4 By heating wood spirit with ammonium chloride or iodide at 800° (Berthelot, J 1852, 551, Girard, Bl [2] 24, 121, cf Weith, B 8, 458) By heat ing methyl alcohol (3 pts) with NH Cl (2 pts) and HCl (1 pt) at 207° for 30 hours Dusart a Bardy converted one third of the NH₃ into NH₂Me (C R 74, 188).—5 By heating methyl alcohol with ammoniacal ZnCl₂ (Gasiorowsky, B 17,639) —6 By heating morphine or codeine with KOH (Wertheim, A 73, 210, Anderson, A 77, 874)—7 By distilling glycocoll with BaO (Cahours, A 109, 28)—8 By the action of chlorine on theobromine or caffeine (Rochleder a Hlasiwetz, J 1850, 434, 437) -9 In small quantity by reducing HCy with zinc and dilute H₂SO₄ (Mendius, A 121, 129) —10 By passing a mixture of HCy and hydrogen over platinum-black at 110° (Debus, A 128, 200) —11 By re ducing nitro methane with iron filings and dilute HOAc (Preibisch, J pr [2] 7, 480)—12 By digesting di methyl unc soid with HClAq for several hours at 170° (Hill a Mabery, Am 2,

Preparation -1 By distilling methyl cyanurate with aqueous KOH (Wurtz) The distillate is received in dilute HCl, and the methylamine hydrochloride dried and distilled with quicklime solution of methyl-bromo-amide thus obtained is then run in a slow stream into a 30 p c solution of 8 mols of KOH heated to 60°-70° and digested for 10 or 15 mins till decolourised. The solution is then boiled and the methylamine received in HCl, the yield is 87 pc of the theoretical (Hofmann, B. 15, 765, 18, 2741).—

3 Methyl nitrate (1 mol) is heated in closed vessels at 100° with a solution of ammonia (1 mol) in wood spirit Besides the nitrate of mono methyl-amine there is formed tetra methyl ammonium nitrate together with small quantities of di- and tri methylamine nitrates At the end of the reaction the product is neutralised with sulphuric acid, heated to evaporate off the alcohol, and the residue decomposed by potash, and the bases received in hydrochloric acid The hydrochlorides are treated with absolute alcohol to remove the ammonium chloride, and again decomposed, the bases being received in sulphuric acid The sulphates are then treated with absolute alcohol in which mono methyl amine sulphate is insoluble To remove the last traces of impurities the insoluble sulphate is again decomposed and converted into di methyl oxamide, which yields on decomposition pure mono-methyl amine (Duvillier a Buisine, A Ch. [5] 28, 322, cf Juncadella, C R 48, 342) -4 By the action of tin and HCl on chloropierin (Wallach, A 184, 51, cf Geisse, A 109, 282) 5 By heating dry ammonium methyl sulphate at 300° and distilling the product with potash (Milner Morrison, Pr = E = 10, 275)

Properties —Colourless gas with strong am monacal odour Not solid at -75° Turns red litmus blue Fumes strongly with HCl Rapidly absorbed by water and by charcoal Of all known gases it is the most soluble in water Burns in air with livid yellowish flame (differ ence from NH_a) The aqueous solution of methylamine is extremely caustic, and gives off the gas when boiled It ppts metallic salts, for the most part in the same manner as ammonia Zinc hydroxide is, however, soluble in a large excess of methylamine With cupric salts it gives a bluish-white pp dissolving in excess and forming a deep blue solution With salts of Cd, Ni, and Co it forms pps insoluble in excess (difference from NH₂) It ppts lead nitrate but not lead acetate With mercurous nitrate it gives a black pp, with HgCl₂ a white pp, with AgNO₂ it gives a pp of Ag₂O soluble in excess It dissolves AgCl With chloride of gold it gives a brownish yellow pp , soluble in excess Platinic

chloride gives a yellow crystalline pp

Reactions -1 Passage through a red-hot tube converts it into hydrogen, CH4, ammonia, and HCy No acetylene, benzene, or C₂H₄ is formed (Muller, Bl [2] 45, 438) When an aqueous solution of methylamine is set on fire, HCy is found in the residue (Tollens, Z [2] 2, 516) —2 Heated potassium forms hydrogen and KCy —3 Cyanogen chloride forms methyl cyanamide (Cahours a Cloez, C R 38, 354)—4

Iodine forms MeNI₂—5 CO₂ forms methylamine
methyl-carbamate—6 According to Berthelot, heating with saturated HIAq yields ammonia and CH₄—7 COCl₂ yields NHMe COCl [90°]—8 Liquid McCl, under pressure, forms NMe₄Cl and NMeH,Cl (Vincent a Chappuis, C R 102, 436) -9 MeBr (1 mol) in MeOH at 100° forms, chiefly, NMe,Br In like manner MeI forms NMe,I (Duvillier a Buisine, C R 90, 1426) — 10 Benzore aldehyde added to aqueous NMeH, forms PhOH NMe, an oil (c 180°) which yields bensyl-methylamine (185°) on reduction (Zaunschirm, A 245, 281).—11 o-Oxy benzoic alde-hyde forms C.H.NO (229°) (Dennstedt a Zimmermann, B 21, 1553) -12 'Dicyanamidobenzoyl' (cf vol 1 p 155) forms small needles of $C_{16}H_{16}N_4O$ (Griess, B 18, 2420) —13 Diazobenzene chloride added to a cool 33 p c solution of methylamine forms MeN(N2Ph)2 [113°] which crystallises in yellow needles, v sol. ether, m sol alcohol It is reduced by Zn and HOAc to Boiling methylamine and phenylhydrazine dilute H2SO4 gives nitrogen, aniline, MeOH, phenol, and some PhN₂C₆H₁NH₂ (Goldschmidt a Badl, B 22, 934) — 14 o Diazo-anisole chloride forms yellow needles of the compound MeN(N₂ C₂H₄OMe)₂ [141°] (G a B) —15 p Dt-azo ansole chloride forms MeN(N₂C₃H₄OMe)₂ [112°] (G a B) —16 p-Diazo-toluene chloride forms MeN(N₂C₃H₄Me)₂ [147°] Salts —B'HCl Large delique reent lamins

(from water), may be sublimed Sol alcohol, in sol CHCl, —B'HAuCl, aq Trimetric crystals (Topsoe, J 1883, 618) —B'HAuCl, Monoclinic (T) — B'₂H₂PtCl₂ Golden hexagonal (Ludecke, J 1880, 511) S 2 at 14° Golden hexagonal scales alcohol, not decomposed by boiling water (De Connex, Bl [2] 45, 131)—B',H,Cl,Ptbr, Scarlet crystals (Maly a Hinterberger, M 3, 89)—
B',PtCl, Insoluble green powder—B',PtCl,

B'₂H₂CuCl₄ Trimetric crystals —B'₂H₂PdCl₄— B'HBr Large deliquescent plates (from alcohol), v sol water and alcohol—B'HI—B'₄H₄I₃BiI₄. Scarlet pp (Kraut, A 210, 312)—B'₄H₃I₂BiI₄. Crystalline pp (K)—B'HNO₃ Elongated tri metric prisms Deliquescent, v sol water, al sol cold alcohol [100°] (Franchimont, R T C 2, 338) -B',H,SO, Deliquescent needles, insol 2, 365) — B. H. SO. Deliquescent accure, moral alcohol — B'HMeSO. Crystals, v e sol water (Claesson a Lundvall, B 13, 1701) — B'HVO, (Bailey, C J 45, 692) — B'HVO, (aq Colourless accoular crystals (Ditte, C R 104, 1844) — B', (H, O)(V, O), (aq Yellow powder (D)) $B'_{2}(H_{2}O)(V_{2}O_{3})_{2}$ 4aq $B_{4}(H_{2}O)_{2}(V_{2}O_{3})_{3}$ 3aq (B) $-B_{2}H_{2}CO_{3}$ Formed, together with methyl carbamic acid NMeH CO2H, by decomposing CaCO, with methylamine hydrochloride Deposited in crystals from the liquid distillate - B.H C.O. Prisms, v sol water, insol alcohol -Benzene sulphonate [147°] (Norton a Westenhoff, Am 10, 129) -Valerate [81°] NH₂Me2CMe₂CO₂H? (175°) NH, Me and tri methyl-acetic acid at 150° (Franchimont a Klobbie, R T C 6, 234)

Acetyl derivative C, H, NO 16 NMeAcH Methyl acetamide [28°]. (206°) From EtOAc and aqueous methylamine at 150° (Hofmann, B14, 2725) — NMeAcHHNO, [58°] Large hygroscopic crystals (Franchimont, R T C 2,

341)

Dr acetyl derivative C,H,NO, as NMeAc₂. (192°) A product of the action of Ac₂O on methyl-acetyl urea (H.) Liquid, miscible with water Split up by HCl into methylamine and acetic acid

Tri-chloro-acetyl derivative
CCl, CO NHMe [106°] From CCl, CO, Et and aqueous methylamine (Franchimont a Klobbie, R T C 6, 234) White crystals, sl sol. water and other Slowly attacked by pure HNO., which gives off N.O

derivative CMe, CO Mills Trom Me, C COCI Valeryl [91°] (204°) and NH₂Me and NH, Me Methylamine and Me₂C CO₂Me yield only (Me₂C CO₂H), NH, Me V sol water and alcohol (F a. K.) Pure HNO₂ gives off

C.H.; CO NHMe Thick liquid (F Heptoyl (266°) derivative 8 G 15 895 aK)

Bensoyl C.H. CO NHMe derivative Crystallises from alcohol (Romburgh, R T C 1, 388)

o Amido benzoyl derivative

C₆H₄(NH₂) CO NHMe [80°] From isatoic acid and methylamine solution (Weddige, J pr [2] 86, 150) Thick prisms (from benzene), v e sol alcohol and ether, sol hot water Ac₂O gives C₆H₄(NHAc) CO NHMe [172°] BzCl forms $C_6H_4(NHBz)$ CO NHMe [181°] (Körner, J pr [2] 36, 159)

Other alkoyl derivatives are described under the acids from which they are derived

Methyl-di chloro-amine CH, NCl, (60° un Pungent yellow liquid (Köhler, B 12, cor) 770)

Methyl-di-bromo-amine CH, NBr, Formed by the action of bromine and potash on methyl amine hydrochloride (Hofmann, B 15, 767) Extremely pungent liquid Slowly converted into methylamine by HCl

Methyl-di 10do-amine CH, NL, Formed by the action of iodine on aqueous methylamine (Wurtz, A Ch [3] 30, 455) Prepared by adding iodine (1g) and water (50g) to methylamine hydrochloride, and then adding aqueous NaOH (Raschig, A 230, 221) Brownish red pp , quickly becoming brick red Completely soluble in aqueous HCl, soon decomposing into methylamine and ICl Ammonia forms NMeH₂ and NHI₂ Cold potash dissolves it, forming methylamine, KIO₂, and KI

Methyl nitro-amine CH, NH NO2. Obtained by treating methyl chloroformate with methylamine, nitrating the resulting methyl methyl-carbamate CH,NH CO OMe, and boiling the product with ammonia (Franchimont a Klobbie, R T C 7, 354, 8, 297) Formed also by decomposing NO2 NMe CO CO NMe NO2 with aqueous ammonia Colourless needles, sol alco hol Strongly acid in reaction Converted by KOH and MeI into crystalline Me.N NO. KMeN NO. Slender needles, sol alcohol and

Dimethylamine C₂H₇N s.e (CH₃)₂NH Mol w 45 (7 2°) (Hofmann, B 22, 702) 687 S V 152 4 (Ramsay) H F p 12,720 (Thomsen), 3,500 (Muller, Bl [2] 44,609) H F v 10,980 (Thomsen, Th) HC 42,600 (M) Heat of neutralisation (by HCl) 23,980 (Müller, A Ch [6] 15, 531)

Occurrence —In herring-brine (Bocklisch, B 18, 1924)

Formation -1 One of the products of the action of MeI on ammonia (Hofmann) -2 A mixture of mono, di-, and tri methyl amine is obtained by heating methyl alcohol with ammoniacal ZnCl, at 200°-220° (Merz a Gasiorowski, B 17, 639) -3 In small quantity by heating the sulphite of aldehyde ammonia in a sealed tube, or by distilling it with lime (Petersen, 4. 102, 317)

Preparation —1 The mixture of iodides obtained by heating ammonia with MeI is distilled with potash, and the evolved bases dried by KOH and condensed by a freezing mixture, the bases NMe₂, NMe₂H, and NMeH₂ being separated by means of oxalic ether (Hofmann, Pr 12, 380) —2 The bases obtained from MeBr and NH, are treated with introus acid, and the dimethylintrosamine decomposed by HCl and distilled over sodium (Hofmann) —8 Nitroso-dimethylianline hydrochloride (2pts) is boiled with water (90 pts) and aqueous NaOH (10 pts of S G 125) (Baeyer a Caro, B 7, 964, 8, 616)

Properties—Highly alkaline liquid or gas Has not been solidified. If to an alcoholic solution of the base picryl chloride $C_0H_2(NO_2)_3Cl$ be added, and then H_2SO_4 followed by water, there is formed a characteristic yellow pp of tri nitrodi-methyl-aniline (Van Romburgh, R T C 2,106)

Reactions —1 MeCl forms only NMe, Cl and NMe, HHCl (Vincent a Chappuis, C R 102, 436) —2 SO, Cl, forms oily NMe, SO, Cl (183°—187°) and SO, (NMe,), (Behrend, B 14, 181°) — 3 Cyanamide heated with NHMe, at 110° forms di-methyl guandine (Tatarinoff, C R 89, 608) 4 p-Diazotoluene chloride forms NMe, N,O,H,

[46°] (Goldschmidt a Badl, B 22, 935) Salts —B'HCl V sol chloroform (differ ence from NH,Cl and NMeH,Cl (Behrend, B 15, 1611, A 222, 119)—B'HAuCl, needles — B'₂H₂PtCl₆ Trimetri Monoclinic Trimetric needles B',H,IrCl, Trimetric octahedra, =1 969 1 1 954 (Vincent, Bl [2] 43, 154) — B' Rh₂Cl₁₂ 3aq Large dark garnet red prisms $B'_{\mathfrak{a}}Rh_{2}Cl_{12}\,3aq$ [2] 44, 513, C R 101, $\hat{3}22$) – (Vincent, Bl B',H,HgCl, Monoclinic crystals (Topsoe, B'HHg,Cl, Monocimic crystals -Monoclinic crystals (T) — B'_H_Hg_Cl₁₂ Truclinic crystais — B'_H_SnCl₄ Trimetric tables (Hjortdahl, J. 1882, 474 — B',H,CuCl, — B',2H,CuCl, Crystals

—B',2H,PtBr, Trimetric needles — B',4H,1,6BiL, -B',H,I,2BiI, (Kraut, A 210, 314) -B'HNO. [74°] Long hygroscopic needles of prisms V sol alcohol (Franchimont, R T C 2, 338, 3, 229) Decomposed by heat, yielding nitrogen, CO₃, and dimethylamine (Romburgh, R T C 5, 246) —B'HVO, (Balley, C J 45, 693) — B'₄(H₂O)₂(V₂O₃), 4aq — Benzene sulphonate [110°] (Norton, Am 10, 129) —p-Toluene sulphonate [78°] (N)

Acetylder vature NMe, Ac (186°) S G 20 941 From dimethylamine and AcCl dissolved in ether (Franchimont, R T C 2, 121, 342) Colourless liqud Fuming HNO, forms in the

cold NMe₂.NO₃ [57°]

Trs-chloro-acetyl derivative CCl₂ CO NMe₃. [104] (C) SG ¹² 1 441 (F a K) From CCl₂ CO CCl₃ and NMe₃ (Cloez, A Ch [6] 9, 145)

Heptoyl derivative C,H₁₃ CO NMe₂ (243°) S G ¹² 894 Solidifies below -10° (Franchimont a Klobbie, R T C 6, 249) With HNO₂ it gives di-methyl-nitro-amine

Valery l derivative CMe, CONMe. (185°) SG H 912 Liquid, v sol water Not solidified at -17° HNO, (SG 152) forms NMe, NO.

Bensoyl derivative C.H. CO NMe.: [42°] (256° uncor) Crystals, v sol water Split up by aqueous HCl at 200° into HOBz and

HNMe, (Hallmann, B 9, 846) Conc HNOs gives C.H.(NO.) CO NMes (Romburgh, R T C 4, 385) With COCl., it forms deliquescent crystals of C.H., CCl., NMes [386°] decomposed by water into HCl and C.H., CO NMes

D1-methyl-iodo-amine NMe₄I From dimethylamine, iodine, and NaOH Pale yellow pp, which rapidly decomposes (Baschig, A 230, 223)

Dimethylnitrosemine NMe, NO (148° at 725 mm) Formed by treating an aqueous solution of dimethylamine hydrochloride with potassium nitrite (E. Fischer, B. 8, 1587, Renouf, B. 13, 2169) Yellow oil Volatile with steam Reduced by zinc dust and HOAc to dimethyl hydrazine "Decomposed by boiling HCl into NMe, H and nitrous acid —B'HCl white needles, decomposed by water or alcohol

Di-methyl nitro amine NMe₂NO₂ [57°] From NMe₂Ac and HNO₃ (Franchimont) Large crystals

Di methyl amme tri-bromide Me₂NBr₃ 2aq or Me₂ N $\underset{\leftarrow}{\otimes} R_3$ Formed, as a yellow pp, on adding an excess of bromine water to a cold solution of dimethylamine—2Me NH + 4Bi + 2H₂O = C₂H₁₀NBr₃O₂ + Me₂NH₂Br yellow powder Sol alcohol and ether, v sl sol water It is very unstable on keeping over night in a closed vessel it liquefies to a brown fluid containing free bromine, but under water it can be kept for several days Alkalis and acids decompose it at once, thus HCl gives dimethylamine hydrochlor ide according to the equation C₂H₁₀Br₃NO₂ + 2HCl = Me₂NH,HCl + 3Br + Cl + 2H₂O (Raschig, B 18, 2249)

Trimethylamine C_sH_sN is NMe, Mol w 59 (35°) SG $\frac{-53}{662}$ (Hofmann, B 22, 703) H F p 15.870 (Thomsen, Th), 14900 (Muller, Bl. [2] 44, 609) H F v 13550 H C 577,600 (M) Heat of neutralisation (by HCl) 17,900 (Muller, A Ch [6] 15, 531)

Occurrence - In herring brine (Hofmann, C J 5, 288, cf Wertheim, J 1851, 480) In the flowers of Cratagus oxyacantha (Wicke, A 91, 121), C monogyna, Pyrus aucuparia, and P communis (Wittstein, J 1854, 479) stinking goosefoot (Chenopodium vulvaria) (Dessaignes, J 1851, 481), in Arrica montana (Hesse, J 1864, 458), and in the seeds of the beech (Brandl a Rakowiecki, J 1864, 607) It also occurs in Mercuryalis annua (E Schmidt, B 10, 2226) In human urine (Dessaignes, A 100, 218), and in calves' blood which has stood 12 hours (Dessaignes, *J. Ph.* [3] 32, 43) In ergot of rye (Walz, *J.* 1852, 552, Rithausen, *Rép.* chim pur 1863, 420, cf Brieger, H 11, 184) In small quantity in guano (Hesse, J. 1857, 402) In bone oil (Anderson, A. 80, 51) According to Ludwig (Z. 4, 96) it occurs in small quantity in several Austrian and Hungarian wines In the product of the destructive distillation of putrid brain (Selmi, G 6, 468) and of beet-root molasses (Vincent, C R 84, 1139, 85, 667, J Ph [4] 30, 132, Roscoe, C N. 39, 107). In the putrefaction of yeast (A Müller, J 1857, 402) and of wheat dough (Sullivan, J 1858, 231). In most of the cases here mentioned the trimethylamine is probably obtained from betaine, neurine, or lecithin, either by putrefactive desomposition or in the chemical treatment

Formation—1 Together with NMeH₂ and NMe₂H by the action of ammonia on MeI, and separated by treatment with oxalic ether, with which it does not react (Hofmann, C J 4, 304) 2 By the distillation of NMe₄OH (Hofmann, A 93, 325)—3 By heating narcotine with KOH at 280° (Wertheim, A 73, 208)—4 By heating extract of calamus root with alkali (Thoms, B 21, 1912)—5 By passing coal gas through heated zinc dust (Williams, C N 51, 15)

Preparation -1 The residues in the preparation of sugar from beet root are, after fer-mentation, subjected to dry distillation The mentation, subjected to dry distillation aqueous portion of the distillate is neutralised by H₂SO₄, ammonium sulphate separated by crystallisation, and, after evaporation, the trimethylamine expelled by an alkali Commercial trimethylamine still contains methylamine, ethylamine, dimethylamine, propylamine, and isobutylamine The proportion in which these bases are present varies greatly in different samples. To the aqueous solution of the bases oxalic ether is added, the primary bases being ppd as di alkyl oxamides The mother liquor is distilled with addition of KOH and the dry bases dissolved in absolute alcohol Oxalic ether is then added to the alcoholic solution, when the diamines are converted into di alkyl oxamic ethers, and the trimethylamine can be obtained by distillation (Vincent, C R 89, 238, 788, Duvillier a Buisine, C R 89, 48, 709, 92, 250, A Ch [5] 23, 298, cf Eisenberg, B 13, 1669) 2 Perfectly pure trimethylamine is obtained by distilling NMe OH and rectifying over sodium (Hofmann, B 22, 699)

Properties —Gas with ammoniacal and fishy odour Remains liquid at -75° V e sol water When an aqueous solution is strongly cooled a hydrate NMe, 7aq [43°] separates

Reactions—1 KMnO, oxidises it to CO, and oxalic acid (Wallach a Claisen, B 8, 1237)—2 At a red heat it is converted into HCy and MH,Cy (Willim, Bl [2] 41, 449) Passed with hydrogen through a red-hot tube it yields NH, cyanogen, hydrocarbons, and CH,(NMe,), (Bo meny, B 11, 835)—3 CS, forms NMe,CS, crystallising in white needles [125°] This body is m sol chloroform and dilute alcohol, nearly insol absolute alcohol, CS, and benzene It splits up into its components, even at ordinary temperatures, but with dilute HCl it forms NMe,CS,HCl and (NMe,CS,),H,Cl, Conc HClAq splits it up into its components Phosphoric acid forms (NMe,CS,),H,PO, (Bleunard, C R 87, 1040)—4 Glycol chlorhydrin forms neurine chloride NMe, ClCH, CH,OH—5 Chlorocacetic acid forms betalne CH, NMe, OS O—

6 Dichlorhydran of glycerin forms 'sepine' chloride C₃H₃Cl(OH) NMe₃Cl and 'aposepine' chloride C₃H₃(OH)(NMe₃Cl)₂ (Niemikovitch, M 7, 249) — 7. Hexa chloro-acetons forms CCl₃ CO NMe₂ [1047] (Cloëz, A Ch [6] 9, 145) 8 When heated with annine hydrochloride it yields a distillate of methyl annine

Salts—B'HCl decomposes at 285°, giving off NMe, and MeCl, and leaving mono- and dimethylamine hydrochlorides. At 305° ammonia

and methyl chloride are given off from the residue, and at 325° the whole has sublimed, the sublimate consisting of NH₄Cl and methylamine hydrochloride This decomposition may be utilised for the manufacture of MeCl (Vincent, C R 84, 1139, 85, 666) —B'HBr decomposed between 230° and 300° into NMe, ammonia, and MeBr -B'HI white scales, decomposed between 210° and 280° into NMe,, ammonia, MeI, and a residue of NMe,I—B',H,PtCl, orange regular crystals (Ludecke, J 1880, 512, Topsoe, J 1883, 618) S (alcohol) 0362 More soluble tuan the di- and still more so than the monomethylamine platinochloride (Eisenberg, A 205, 139) -B'2H_IrCl₄ reddish brown octahedra (Vincent, Bl [2] 43, 155) -B'HAuCl₄ yellow monoclinic crystals V sl sol water, sol alcohol [220°] (Hesse, J pr 71, 480, Zay, G 13, 420)
—B'₆H₆Rh₂Cl₁₂ 9aq (Vincent, C R 101, 322)— B'HCdCl, trimetric crystals (Hjortdahl, J 1882, 475)—B'₂H₂HgCl, monoclinic crystals (T)— B HHgCl, monoclinic crystals (T) -B'HHg2Cl, BHHgCl, monoclinic crystals (T) —B'HHg,Cl, the triclinic crystals (T) —B'HHg,Cl, thombothers (T) - B'HCuCl, 2aq monoclinic crystals —B'HCdBr, six sided hexagonal prisms — B'HPtBr,—B',H,I,2BiI, six sided crimson plates (Kraut, A 210, 316) —B'HNO, [153°] Long needles or prisms, v sol hot alcohol (Franchimont, R T C 2, 338) —B',H,SO,Al,(SO,), 24aq [100°] Large crystals (Reckenschufs, A 83,343)—B',(HO),(V,O),), 7aq (Bailey, C J 45, 692)—B'H,C,O, plates (Loschmidt, J 1865, 375)—Benzene sulphonate [89°] (Westenhoff, Am 10.129) phonate [89°] (Westenhoff, Am 10, 129)

Tetra methyl ammonium hydroxide NMe,OH Heat of neutralisation (by HCl) 27,900 (Muller, A Ch [6] 15, 531) Obtained by digesting NMe,I with moist Ag.O (Hofmann, Tr 1850, 93, C J 4, 321) White crystalline deliquescent mass, v e sol water Absorbs CO₂ with avidity Its solution is strongly alkaline and caustic Decomposed by heat into NMe, and MeOH (Hofmann, B 14, 494) Neutralises acids, forming the following salts

Icdatde NMe,I S G H 1827, 19.5 1831 (Clarke, Am S [3] 16, 401) The chief product of the action of MeI on ammonia and on mono, di, and tri methylamine Best obtained by heating a solution of NH, in methyl alcohol with MeI at 100°-120° (Lawson a Collie, C J 53, 624) Dimetric prisms (from water) S sol water, almost insol alcohol, insol ether Decomposes at a dull red heat into NMe, and MeI Unites with iodoform forming red crystals of NMe,I2CHI, When heated with liquefied NH,, in which potassium has been dissolved, the products are KI, NMe, and ethane (Thompson a Cundall, C J 53, 761) Unites with halogens, forming NMe,I, (Welzien, A 91, 41, 99, 1), NMe,I, [130°], NMe,I, [110°] (Geuther, A 240, 68), NMe,I,, NMe,ICl., (NMe,I),Cl., (W), NMe,IBr, [190°] (Dobbin a. Masson, C J 49, 851), and NMe,ICl., [100°] (Dobbin a. Masson, C J 49, 851), and NMe,ICl., [110°] (Me,I), a dark-coloured explosive body (Stahlschmidt, P 119, 421) — NMe,IGI, small light-yellow prisms, m sol alcohol—(NMe,I),8HgI, lemonyellowscales (Risse, A 107, 223)—(NMe,I),2BII,32mI,32morphous scarlet pp (Kraut, A 210, 316)—NMe,IHgCy, white crystals On heating for a

long time at 200° it is converted into the isomeric

NMe CyHgICy (Claus a Merck, B 16, 2738) Bromide NMe, Br S 55 26 at 15° tained by neutralising the hydroxide by HBr Very deliquescent needles Dissociates at 360° into NMe, and MeBr (Lawson a Collie, C J 53, Forms crystalline compounds with the halogens (Dobbin a Masson, C J 49, 848) — (NMe,Br),PtBr, regular octahedra (Topsoe)
Chloride NMe,Cl H.F 27,500 (Müller, Bl

[2] 44, 192) Deliquescent crystals Decomposed above 360° into NMe, and, doubtless, MeCl (L a C) — (NMe,Cl),HgCl, trimetric crystals (T) — NMe,Cl5HgCl, rhombohedra — (NMe,Cl),CuCl, trimetriccrystals — NMe,AuCl, trimetric dimetric crystals

Fluoride NMe,F From the hydroxide and

HF Radiating crystals Decomposes at 180° into NMe, and MeF (L a C)

Nutrate NMe, NO, S (94 pc alcohol) 3 at 11° Obtained, together with NMeH, NO, NMe₂H₂NO₃, and NMe₃HNO₃ by heating methyl nitrate with NH₂ dissolved in MeOH (Duvillier a Busine, C R 90, 872) The di and tri methylamine are formed in very small quantity (Duvillier a Malbot, C R 100, 177) Formed also by treating NMe,I with AgNO, (Lawson a Collie, C J 53, 628) Needles or plates, v sol water, sl sol cold alcohol Not attacked by boiling KOHAq Above 300° it yields NMe, formic acid, MeNO, and NO (L a C)

Nitrite NMe, NO. From NMe, I and AgNO. Deliquescent crystals Decomposed above 300° into NMe, MeNO, MeO, NO, and oxygen (L a.

Sulphate (NMe,),80, [280°] Deliques at crystals Decomposed above 280° into cent crystals MMe, and NMe, SO, Me, which then undergoes

further decomposition (L a C)

Chromates (NMe.) CrO, yellow trimetric crystals, v e sol water (Hjortdahl, J 1882, 475) -(NMe₄)₂Cr₂O₇ orange trimetric tables, v sol water

Sulphite NMe, SO, H xaq [180°] Decomposes above 300°, yielding NMe, SO, MeOH, and other products (L a C)

Sulphydrate NMe SH Very deliquescent Decomposes above 200° into NMe, and MeSH

Phosphate From NMe,I and Ag,PO,
Forms a strongly alkaline solution Decomposed at a high temperature into NMe, methyl alco-

hol, and HPO, (L a C

Vanadate NMe, VO, (Bailey, C J 45, 693) Carbonates NMe, CO, H HF 20,870 HF 20,870 (Muller) Obtained by saturating a solution of the base with CO₂ (L a C) Deliquescent crys tals, decomposing above 180° into NMe₂, methyl alcohol, and CO_2 — $(NMe_s)_2CO_3$ HF 19,100 Obtained by acting on NMe₄I (2 mols) with Ag_2CO_3 $\frac{1}{10}Ag_3O$ (Muller, Bl [2] 44,191)

 $(NMe_4)_2C_2O_4$ Oxalate Formed NMe,OH and oxalic acid, or from NMe,I and silver oxalate Deliquescent crystals, decomposed above 860° into NMe, and methyl oxalate, the latter being further resolved into Me₂O, CO,

and CO,

Cyanide NMe, Cy Prisms Sublimes at 226° V sol water, m sol alcohol, insol ether and chloroform (Claus a Merck, B 16, 2738)
—NMe,CyHgCy, [275° uncor] Yellow crys-Yellow crystals — NMe, CyAgCy. [212° uncor] From AgCy

and NMe,I or NMe,Cy (Thompson, B 16, 2338) Long colouriess prisms or slender needles, v e sol water and alcohol, insol. ether On dry distillation it yields NMe, acetonitrile, and methyl carbamine

Ferrocyanides (NMe,), FeCy, 13aq mino granular mass (Barth, B 8, 1484) — (NMe.)₂H.FeCy, 2aq (E Fischer, A 190, 184)

Ferricyanide (NMe,) FeCy, 3aq From NMe, I and silver ferricyanide (Bernheimer, B 12. 408) Unstable hygroscopic prisms, sol water, insol alcohol

Cobalticyanide (NMe.), CoCy, 13aq Yel

low tables (C a M)

Acetate NMe,OAc [c 70°] From NMe OH and HOAc Deliquescent needles, de composed at 200° into NMe, and MeOAc (L a.

Benzoate NMe₄OBz [220°-230°] Long deliquescent needles Decomposed above 230° mto NMe, and MeOBz (L a C)

Cyanurate NMe,OC,N,(OH), aq (Claus,

 $J pr^{-}[2] 38, 225)$

Picrate [313°] (Lossen, A 181, 374)
Trimethylamine iodo-methylo iodide

NMe, I CH, I From NMe, and methylene iodide (Hofmann) Needles Not attacked by NH, Moist silver oxide gives NMe, (OH) CH2I and NMe(OH) CH, OH It yields the platinum salt

PtCl₄(NMe₄Cl CH₄I),
Trimethylamine ethylo-iodide C₅H₁₄NI 26 NMesEtI From NMes and EtI (Muller, A 108, 1) Gives the following derivatives (Topsoe, J 1883, 620) — (NMe,EtCl),2HgCl, trimetric crystals — NMe,EtClHgCl, monoclinic crystals — NMe,EtCl(HgCl), trimetric crystals — (NMe,EtCl),CuCl, trimetric crystals —Aurochloride NMe,EtAuCl, dimetric crystals — (NMe,EtCl),PtCl, regular crystals—Picrate [300°] (Lossen, A 181, 374) The ethylohydroxide is decomposed on distillation into NMe₃, ethylene, and water NMe₃LtCl on dis tillation yields MeCl, NMe,Et, and NMe,

Trimethylamine ethylo tri-iodide NMe,EtI, Pagular crystals (Ludecke, A 240, 85)
Tri-methylamine ethylo penta iodide NMe₃EtI, [26°], dark green tables (Geuther, A 240, 66)

Trimethylamine ethylo ennea-iodide NMe₃EtI, [38°], black green crystals

Trimethylamine bromo-ethylo bromide C₂H₄Br NMe₃Br From NMe₃ and ethylene bromide at 45° (Hofmann, C R 47, 558) Needles, v e sol hot alcohol Ammonia as well as moist Ag₂O converts it into C₂H₃ NMe₃OH -(C.H.Br NMe,Cl),PtCl, Octahedra C.H.Br NMe,I (Baeyer, A 140, 312) Octahedral crystals -

Trimethylamine 10do ethylo 10dide C.H.I NMe.I From neurine, HI, and phos phorus (Baeyer, A 140, 309, 142, 324) Crys talline, sl sol cold water Moist Ag,O yields C₂H₃.NMe₃OH — (C₂H₄I NMe₃Ol)₂PtCl₄ hedra

Trimethylamine allylo bromide C.H. NBr 2 & NMe₂C₂H₂Br Forms a dibromide NMe₃C₃H₂Br₁ [175°] of which the gold salt melts at 148° (Partheil, B 22, 3317)

Trimethylamine bromo-allylo-bromide NMe,Br CH2.CH CHBr [165°] Formed from NMe,C,H,Br, and alcoholic KOH Colourless prisms v sol water and alcohol, insol ether, gives a perbromide NMe,Br CH,CHBr CHBr, erystallising in scales [156°] --Platinochloride (C,H,Br NMe,Cl),PtCl, [220°] -- Aurochloride C,H,Br NMe,AuCl, [181°]
Trimethylamine propylo-iodide NMe,PrI

[190°] (Langeli, G 16, 385)

Trimethylamine iodo-propylo-iodide

NMe₃I C₂H₃I [151°] From the allylo iodide and HI at 100° (Partheil, B 22, 3320) Colourless needles, sol water and alcohol, insol ether Alcoholic KOH regenerates the allylo-com-[237°] —Auropound — (C,H,I NMe,Cl),PtCl, chloride (C,H,I NMe,Cl)AuCl, [135°]

Trimethylamine trimethenyl bromide

 $\mathbf{c}\mathbf{H}$ From the bromo allylo-NMe₃Br CH ĊΗ bromide and alcoholic KOH.-Aurochloride

(NMe, Cl C, H,)AuCl, $\mathcal{C}\mathbf{HBr}$

Dibromide NMe,Br CH [187°] ĊНВr

From the preceding and Br Colourless, somewhat hygroscopic crystals Forms a platinochloride [232°] and an aurochloride [193°]

both crystallising in tables

Trimethylamine bromo-pentenyl bromide C.H.BrNMe.Br Formed from trimethylamine and di bromo amylene (valerylene bromide) (Ladenburg, B 14, 231, 1342) With HI it forms C.H., BrNMe, I Silver chloride forms C₅H₈BrNMe₃Cl, whence (C₅H₈BrNMe₃Cl)₂PtCl₄ and C.H.BrNMe.ClAuCl., both crystalline

Trimethylamine isoamylo triiodide NMe₃C,H₁₁I₂ [80°] From NMe₄ and the product being treated with iodine [80°] From NMe, and C,H,I, Darkbrown prisms, nearly insol water, v sol alcohol

TRIMETHYLAMMELIDE v vol 11 p 325 DI-METHYL-AMMELINE v vol 11 p 321 METHYL-AMYL-ACETAL & ALDEHYDE

METHYL-ISOAMYL-ANILINE C₁,H₁,N te C₅H₅NMe C₅H₁₁ (257°) S G ²² 906 Obtained together with C,H₄ and water by distilling C₆H₃NMeEtC₅H₁₁OH (Hofmann, A 79, 15) Formed also by heating dimethylaniline with isoamyl bromide (Claus a Rautenberg, B 14,

622) —B'₂H₂PtCl₆ crystalline pp —(B'HI)₂Bil₃ METHYL AMYL ARSINE v Organic com-

pounds of Arsenic

METHYL AMYL BENZENE AMYL

Di methyl isoamyl benzene v AMYL XYLENE METHYL - ISOAMYL - BENZENE SUL-PHONIC ACID CH, C,H,(C,H,) SO,H From p isoamyl toluene by sulphonation (Fittig a Bigot, A 141, 166) -KA' The Ba salt is a deliquescent gummy mass

Di methyl isoamyl benzene sulphonic acid (OH₃), C₆H₂(C₅H₁₁)SO₂H Formed by sulpho nating isoamyl-xylene (F a B) The K and The K and

Ba salts were not obtained in crystals

METHYL AMYL CARBINOL HEPTYL ALCOHOL

DI METHYL AMYLENE DIKETONE

C₂H₁,O₂ *e CEt₂(CO CH₂)₂. Di ethyl-acetyl acetone (c 203°) From (CH₂ CO)₂CEtNa and EtI at 180° (Combes, A Ch. [6] 12, 250) Liquid Split up by KOH into CH₂ CO₂K and OH, CO OHEt,

Di methyl amylene diketone C.H.O. ie (CH,CO CH,CH,),CH, Di acetyl-pentane

[49°] (212°-215° at 300 mm) From the carboxylic ether and a dilute solution of KOH in MeOH (Kipping a Perkin, C J 55, 337) ▼ sol cold ether, alcohol, acetone, chloroform, and light petroleum Cold cone HNO, dissolves it without decomposition Conc H2SO, forms a colourless oil C.H.O

Dioxim (CH, C(NOH) CH, CH,), CH, [85°], Colourless moss like crystals, v sol cold water DI METHYL AMYLENE DIKETONE CAR-

BOXYLIC ACID

CO₂H CHAo CH₂.CH₂ CH₂ CH₄ CO CH₃ From Liquid, its ether and KOH dissolved in MeOH miscible with water Decomposed by heat into CO₂ and the diketone

Ethyl ether EtA' (240° at 200 mm) Prepared from sodium aceto acetic ether and CH, CO CH, CH, CH, CH, Br (Kipping a Perkin, C J 55, 333) Thick oil Alcoholic NH₃ con verts it into Ac CH2 CH, CH2 CH2 CMe NH [c 235°], which forms monoclinic crystals, $a b c = 7487 1 3997, \beta = 79^{\circ}11'$ This 'dehydro amide ' yields an acetyl derivative C10H14AcNO. an oil, converted by boiling water into the amide CH, CO CH, CH, CH, CH, CH, CH(COMe) CONH, which melts between 200° and 228°

METHYL AMYL ETHER v METHYL AMYL OXIDE

METHYL AMYL KETONE CHIO 16 CH, CO CH. CH. CH CH. CH, (151°) 2 837 Formed by oxidising sec heptvl alcohol obtained from n heptane (Schorlemmer, A 161, 279, 217, 149) Fragrant liquid Unites with NaHSO, Yields on oxidation acetic and n valeric acids Formed also by dissolving heptinene C₅H₁₁ C CH in conc H₂SO₄, and distilling the product with water (Behal, 4 Ch [6] 15, 270)

Methyl isoamyl ketone C H₁₁O ie CH₁ CO CH₂ CH₂ CH(CH₂)₂ (144°) S G ² 828, Lt 818 (Rohn, A 190, 308), ² 821 (Wagner, J R 16,705)

Formation —1 By heating a mixture of calcium hexoate with calcium acetate (Schmidt, B 5, 604) -2 By the action of zinc isoamyl on acetyl chloride (Popoff, A 145, 283) -3 By oxidising the corresponding heptyl alcohol (Grimshaw A 166, 169) -4 By boiling isobutyl aceto acetic acid with aqueous KOH the yield

being 70 pc (Puidie, C J 39, 467)

Properties —Oil Reduced by sodium to sec heptyl alcohol and di isopropyl pinacone CrO, oxidises it to acetic, isovaleric, and isohexoic acids. It combines with NaHSO.

Methyl amyl ketone Me CO CHMePr (142°-From methyl propyl aceto acetic ether (E J Jones, A 226, 293) Oil, smelling of pepper-

Methyl amyl ketone CH, CO CHMePr (135°) S G 22 815 One of the products of the saponification of methyl isopropyl aceto acetic ether (Van Romburgh, R T C 5, 235) Does not combine with NaHSO, Does not give a solid phenyl hydrazide

Methyl amyl ketone CH, CO CH, CMe, (125°-130°) Obtained by oxidising the alcohol CMe, CH2.CMe2 OH (Butlerow, A 189, 78) Oxi dised by CrO, to acetic acid and CMe, CO,H Does not combine with NaHSO

Methyl amyl ketone CH₃ CO CHEt₂. (138°), S G 22 817 Obtained by boiling di ethyl acetoacetic ether with baryta water (Frankland a Duppa, A 138, 212) Forms an oily compound

with NaHSO.

Methyl amyl ketone CH, CO CMe, Et Methyl-(132°) SG 2 842, 21 825 amyl-pinacolin Obtained by the action of ZnMe, on CMe, Et COCl (Wyschnegradsky, A 178, 103) CrO, oxidises it to HOAc and CMe, Et CO, H

Methyl amyl ketone CH_a CO C_aH₁₁ From sec-heptyl alcohol derived from petroleum heptane (90°) Gives acetic acid on

oxidation (Schorlemmer, A 166, 172)

Methyl isoamyl diketone CH, CO CO C,H, Methyl isoamyl-glyoxal (163°) S G 19 8814
From methyl nitrosohexyl ketone (Otto a Pechmann, B 22, 2123) Oil, solidified by cold

White Phenyl-hydraside

needles (from benzene ligroïn)

Di-phenyl-di hydrazide. Needles (from dilute alcohol) [114°]

Di-oxim [173°] Needles

Oxem-phenyl-hydraside [132°] White

needles (from benzene ligroin)

METHYL AMYL KETONE CARBOXYLIC ACID CH, CO CH, CH, CH, CH, CH, CO, H [30°] A product of the action of a boiling solution of KOH in MeOH upon dimethyl-amylene diketone carboxylic ether (Kipping a Perkin, jun, C J 55, 338) Also from sodium malonic ether and CH, CO CH, CH, CH, CH, CH, Br, the resulting dicarboxylic acid being distilled talline plates, v sol water -AgA' colourless

METHYL ISO AMYL OXIDE C₆H₁₄O 1 e (A O C.H., Mol w 102 (92°) V D 3 74 CH₃ O C₄H₁₁ Mol w 102 (92°) V D 3 74 S V 148 I (Schiff) From McONa and isoamyl

iodide (Williamson, C J 4, 233)

METHYL-AMYL-PIPERIDINE C11H23N 2 e $C_sH_9N(C_sH_{11})(CH_8)$ (190°-193°) Prepared by dry distillation of the alkaline hydrate obtained by the action of moist Ag₂O on amyl piperidine methylo iodide (Schotten, B 15, 422) Colourless fluid Sl sol water With Mel it forms a crystalline methylo iodide -B'HCl hygroscopic salt —(B'HCl)2PtCl4 sparingly soluble pp, melts at [140°]

METHYL AMYL SULPHIDE CH, S C, H, (137°)VD 586 From NaSC, H, and MeI

(Obermeyer, B 20, 2924)

METHYL AMYL DI-THIO-CARBONATE $^{\times}$ CO(8Me)(SC₃H₁₁) (c 140°) From Cl CO SC₃H₁₁ and NaSMe (Schöne, J pr [2] 32, 244) Liquid, smelling like CS₂ With ammonia it gives HSC,H₁₁, ures, and HSMe Alcoholic potash forms K₂CO₃, methyl mercaptan, and HSC,H₁₁ METHYL-ANHYDRO-ACETONE-BENZIL v.

METHYL-ANILINE C.H.NHMe Mol w (193° uncor) (Friswell a Green, B 19, S G 15 976 H F -5500 H C v 2035 973,000 (Petit, C R 107, 266) Heat of neutralisation (by HCl) 6,910 (Vignon, C R 106, 1722)

Formation -1 Together with dimethylaniline from aniline and MeI or MeBr (Hofmann, A 74, 150, B 10, 591, of Kern, B 10, 195)—2 Together with dimethylaniline by heating methyl alcohol with aniline and HOl at 200° ander pressure (Girard, Bl [2] 24, 120, cf Poirmer a. Chappat, J 1866, 903) —3 By heating aniline hydrobromide (or hydroiodide) with 10 p.c. more than the calculated quantity of methyl

alcohol to 150° for 8 hours, the yield is 34 p c of the theoretical (Reinhardt a Staedel, B 16, 29, of Kramer a Grodzky, B 13, 1006) —4 By heating acetanilide with alcoholic sodium ethyl ate at 170°-200° under pressure (Seifert, B 18, 1355) -5 By adding sodium to a solution of acetanilide in xylene, treating the resulting sodium-acetanilide with MeI and boiling the pro duct (C_sH₅NMeAc) with alcoholic potash (Hepp, B 10,327) -6 From its formyl derivative (Pictet a Crépieux, B 21, 1108) -7 By boiling diazo benzene methyl anilide (100 g) with conc HCl (200 c c), making alkaline with NaOH, and dis tilling with steam, yield 40 g (Friswell a Green, B 19, 2035)

Purification -By the action of MeOH and HCl on aniline a mixture of bases is obtained On adding dilute H₂SO₄ aniline sulphate sepa rates, and the bases liberated from the filtrate may then be heated with AcCl On pouring the product into water the acetyl derivative of methyl aniline separates in long needles, while dimethyl aniline hydrochloride remains in solution The acetyl derivative may be quickly saponified by boiling with conc HClAq (Hofmann, B 7, 523) The mixture of bases may also be treated with nitrous acid, whereby a diazo benzene salt, phenyl - methyl - nitrosamine, and nitroso di methylaniline are formed The nitrosamine, being insoluble in water and acids, separates as a yellow oil, and may be reconverted by tin and HCl into methyl aniline (Noelting a Boasson, Bl [2] 28, 2)

Properties -Oil Its aqueous solution is not coloured by bleaching powder With NaOBr it gives a yellow pp (Denigès, C R 107, 662) With CuSO, it forms a compound B'(CuSO,),4CuO

(Lachovitch, M 9, 514)

Estimation —1 It is treated with a mixture of Ac₂O (1 vol) and di methyl aniline (10 vols), water is added after the reaction, and the solu tion titrated with phenol phthalein The di methyl aniline does not interfere with the reac tion, and the mixture of it with the acetic anhy dride keeps well (Giraud, Bl [3] 2, 142) -2 In a mixture of aniline, methylaniline, and dimethyl aniline the aniline is first determined by diazo tisation and ppn by (B) naphthol disulphonic acid (R) and NaClAnother portion of the mixed bases (2 g) is mixed with Ac₂O (4 g), and, after 30 minutes water (50 c c) is added liquid is boiled to decompose the excess of Ac2O, and the acid solution titrated with Na₂CO₃ using phenol phthalein as indicator. The amount of Ac₂O found plus that required by the aniline pre viously determined is then subtracted from the amount taken, and gives a measure of the methylaniline present (Reverdin a De la Harpe, B 22, 1004) —3 In a mixture of mono- and di methyl aniline the amount of the former present may be known by observing the rise of temperature on mixing with an equal volume of Ac. C

Reactions —1 HNO, gives off red fumes con taining CO2, and forms tetra-nitro-methyl aniline (Van Romburgh, R T C 2, 31) -2 NaNO₂ added to a solution of its hydrochloride forms phenyl-methyl-nitrosamine C_eH_o NMe NO, a yellow oil solidifying when cooled as needles [12°-15°] It gives no reaction with gallic acid (Reverdin a De la Harpe, B 22, 1006) -8 Boiling sulphur forms methenyl amido-phenyl mercaptan and crystalline C_sH₇NS₂ [89°] (360°) (Möhlau a Krohn, B 21, 59) -4 A solution of methylaniline sulphate saturated with SO, forms with an aqueous solution of alloxan small yellowish prisms of CO NH CO C(OH) SO, NH, PhMe 2sq (Pellizzari, A 248, 148) —5 An aqueous solution of alloxan forms (C₄H₂N₂O₄)(NHPhMe), a compound crystallising in white scales, with a hydro-chloride crystallising in prisms — 6 Diazobenzene chloride and aqueous NaOAc form PhNMe N NPh, a yellowish oil, decomposed by dilute H2SO, into diazobenzene sulphate (or phenol) and methylaniline, and by SnCl, and HCl into phenyl hydrazine and methyl aniline (Nölting a Binder, B 20, 3017) -7 p-Nitro-diazobenzene chlorade and NaOAc form CaH, (NO2) N N CaH, NHMe crystallising in red needles [134°], v sol hot alcohol (N a B) -8 Bromo-acetophenone forms C₆H₅ CO CH₂ NPhMe in the cold, and on boiling it gives phenyl indole and phenyl methyl-indole (Cullmann, B 21, 2595)

Salts -B'2H2PtCl Yellow scales Decom posed by boiling water (De Coninck, Bl [2] 45, 131) —B'HCdBr₃ Trimetric crystals (Hjortdahl, J 1882, 522) —B'₂H₂SnBr₆ Monoclinic crystals —B'HSO₄Me Needles (Claesson a Lundvall,

B 13, 1703)

Formyl derivative CaHaNMeCHO [12 5°] (N a L) (250°) (N a L), (256°) (Pictet a Crépieux, B 21, 1108) S G 3 1097 From (NaL) From sodium formanilide and MeI (Norton a Livermore, B 20, 2273) Formed also from methylaniline and the hydrochloride of formimido ether (Pinner, B 16, 1652) Oil, could not be solidified by Pictet When boiled with 121 pc nitrio acid it yields dinitromethylaniline

Acetyl derivative C.H.NMeAc Exalgin.' [1015°] (Kamensky, A 214, 236) (256°) (P a C) Formed from sodium acetanihde and MeI (Hepp, B 10, 328, Hofmann, B 10, 599) Formed also by the action of acetyl bromide on dimethylaniline (Staedel, B 19, 1947) White needles and tablets, sl sol cold water, v sol dilute alcohol As a medicine it has an energetic action on the cerebro spinal system (Dujardin Beaumetz, C R 108, 571, cf Giraud, C R 108, 749) It is a good antiseptic Boiling nitric acid forms (4, 2, 1)-di nitro methyl aniline

Thio acetyl derivative CH, CS NPhMe [59°] (290°) From the acetyl derivative and sulphide of phosphorus (Wallach, B 13, 528) Monoclinic plates (from CHCl₃) Insol. water and alkalis, sol alcohol and ether

Propiony l derivative CH₂ CH₂ CO NPhMe [58 5°] From sodium proponantilde and MeI (Norton a Allen, B 18, CH, CH, CO NPhMe With boiling HNO₃ (100 pts of SG

1 029) it yields (4, 2, 1) di-nitro methyl aniline Oxalyl derivative (CO NPhMe), (250°) Forms oxalic acid, alcohol, and methylaniline (Norton a Livermore, B 20, 2273) Boiling nitric soid converts it into di nitro-methylaniline

Bensoul derivative C.H.NMeBz From methyl-aniline and BzCl (Hepp, B 10, Formed also by heating di methyl aniline with benzoyl chloride at 180° (Hess, B 18, 685) Large monoclinic crystals, insol water, but v

sol other solvents Gives a mono nitro-deriva tive [136°]

Nitrosamine PhMeN NO [120-150] From methylaniline hydrochloride and aqueous NaNO, (Hepp, B 10, 329, Fischer, A 190, 151, Reverdin a De la Harpe, B 22, 1006) Yellow oil, solidified by cold Reduced by tin and HCl to Gaseous HCl passed into its methylaniline solution in alcohol ether forms the isomeric [4 1]NO C₆H₄ NHMe [118°] which crystallises from water in prisms, v sol alcohol, and is converted by heating with aqueous NaOH into p nitrosophenol and methylamine (Fischer a Hepp, B 19, 2991)

Di-methyl-aniline C₆H₅NMe₂. Mol w 121 [2°-2 5°] (Friswell a Green, private communica tion) (193°) S G $\frac{20}{4}$ 9575 $\mu_{\rm p}=1$ 559 (Bruhl, A 235, 14) SH (9°-82°) 443 (Schiff, G 17, 286) Heat of neutralisation (by HCl) 6,810 (Vignon, C R 100, 1722) Formed by heating Formed by heating aniline with MeI or MeCl

Preparation -1 Aniline hydrobromide (or hydroiodide) is heated with (2 mols + 10 pc excess of) methyl alcohol to 150° for 8 hours, the yield is 95 p c of the theoretical (Reinhardt a Staedel, B 16, 29, cf Lauth, Bl 7, 448) -2 Aniline (18 pts) saturated with HCl is mixed with a further quantity (75 pts) of aniline and methyl alcohol (75 pts) The mixture is heated at 230° in closed vessels until the internal pressure falls The use of a comparatively small quantity of HCl avoids the formation of toluidine and allows of the use of iron vessels The HCl is sometimes replaced by H. SO, (Schoop, Chem. Zert 11, 253)

Purification - Dimethylaniline can be separated from methyl aniline by the methods de scribed under methyl aniline It can also be purified by freezing (Hubner, A 224, 347)

Reactions -1 When its vapour is passed through a red hot tube it forms benzonitrile (25 pc), carbazole, NH_s, benzene, and HCy (Nietzki, B 10, 474) -2 When heated in a current of HCl at 180° the products are MeCl and aniline (Lauth, B 6, 677) -3 With sodium hypobromite it gives a greenish yellow pp in the cold and a red pp on heating (Deniges, C R 107, 662)—4 Bromme (1 mol) at 115° forms methyl violet and naphthalene (Brunner a. Brandenburg, B 11, 697)—5 By nitration with a mixture of equal volumes of ordinary conc HNO, and water at 0° di nitro di-methyl aniline $C_nH_n(NO_2)$, NMe [4 2 1] is formed (yield 116 p c) If the mixture is allowed to get warm another di nitro di methyl aniline [probably 531] is formed (yield 15 pc) By further nitration of the first isomeride by boiling it with fuming nitric acid tri nitro phenyl methyl nitramide $C_8H_2(NO_2)_3NMe(NO_2)$ [6 4 2 1] is produced the same treatment the second isomeride is converted into di nitio phenyl methyl nitramide C_cH_s(NO₂)₂NMe(NO₁) [5 3 1?] (Mertens, B 19, 2123, cf Romburgh, R T C 2, 31) When nitrated in presence of a large excess of H2SO4 (20 pts) it yields as chief product the m nitroderivative whilst the p nitro derivative is formed in smaller quantity (Groll, B 19, 198, Nölting, B 19, 545) -6 Combines with aluminium chlorids with great evolution of heat forming long prisms [88°] (H Giraud, Bl [3] 1, 691).

Heated in sealed tube with 5 pts of aluminium chloride for 10 hours at 250° no change is effected. Heated in air with excess of aluminium chloride it yields a tetra methyl benzidine (CH₃)₂NC₅H₄ C₈H₄N(CH₃)₂, small needles [195°]. This base is split at 180° by action of HCl gas into methyl chloride and benzidine [118°] —7. Nitric cacide passed for 12 days into a solution of dimethylaniline (500 g.) in absolute alcohol (510 g.) forms NMe₂-C₄H₄ N N C₅H₄ NMe₂. After 3 or 4 weeks' passage of the gas there are formed a base C₁₆H₂₈N₂ [173°] and a violet colouring matter C₁₆H₂₈N₃O₃(?) (Lippmann a Lange, B 13,2136) 8 Nitrous acid forms introso di methyl aniline (g. v.) —9 By heating with sulphur there is formed a compound C₈H₁NS, which is converted

the nitrate B'HNO₃ crystallises in colourless needles and the platinochloride B'₂H.PtCl₆ in plates (Mohlau a Krohn, B 21, 65) The com pound C₈H,NS₂ is neither acid nor basic and

89° and forms prisms, insol water, and volatile On heating with sulphur it is conwith steam verted into methenyl amido phenyl mercaptan 10 Chloride of sulphur forms tetra methyl di amido di phenyl disulphide $S_2(C_0H_4NMe_2)_2$ (Hannimann, B 10, 403)—11 Heated with persulphocyanic acid it gives S(C₂H₁NMe₂), with simultaneous formation of thiocyanic acid, CS, H₂S, and NH₃ (Tursini, B 17, 586) —12 Mixed with CS, and then treated with zinc dust and HCl it gives tetra-methyl di amido di phenyl methane [90°] and thioformic paraldehyde [212°] (Wiernik, B 21, 3204) —13 Oxidising agents give rise to penta methyl tri amido tri-phenyl carbinol (methyl violet) (O a E Fischer, B 11, 2099) —14 COCl. forms CO(C, H,NMe,)₂ and, at 120°, NMe, C,H₃(ÖO C,H₄NMe)₂ —15 CCl. gives at 180°C (C,H₄NMe)₄ (Hannimann, B 10, 1689) 16 Chloroform at 230° yields CH(C,H₄NMe)₃ (Hanimann, B 10, 1235) —17 Chloral hydratein presence of ZnCl2 forms CCl3 CH(OH) C6H,NMe2 (Knöfler a Boessneck, B 20, 3195) —18 Fur furaldehyde in presence of zinc chloride yields C₄H₃O CH(C₆H₄NMe₂)₂which crystallises in pale yellow needles [83°] and is a strong base (O Fischer, A 206, 141)—19 With heptoic aldehyde and ZnCl, it also forms a condensation-product (Auger, Bl [2] 47, 42) -20 Benzoic aldehyde and ZnCl, forms C,H, CH(C,H,NMe2), (O Fischer, B 10, 1624) —21 When treated in the cold with acetyl bromide it becomes hot and yields acetyl mono methyl aniline (Staedel, B 19, 1947) -22 Heptoyl chloride in presence of ZnCl₂ forms a base [72 5°] (278° at 15 mm) (Krafit, B 19, 2987) -23 By heating with benzoyl chloride at 190°, benzoyl methyl aniline is formed with splitting off of MeCl (Hess, B 18, 685, cf Michler, B 9, 1899) -24. Benzoic acid (1 mol) and P₂O₅ at 200° forms di-methyl amido-benzophenone [88°] (O Fischer, A 206, 88) -25 Phthalic anhydride in presence of ZnCl₂ forms di-methyl-aniline phthalein —26 Benzotrichloride forms 'malachite green'

(NMe, C,H,),CCI C,H, The same body is formed (NMe₂ C₂H₃),CO C₂H₃. The same body is formed by the action of Bz₂O or BzCl in presence of P₂O₂—27 Orthoformic ether and ZnCl, form CH(O₂H₂NMe₂), —28 Vanillin and ZnCl, form C₂H₂₂N₂O₂ [136°] (Fischer a Schmidt, B 17, 1895)—29 A blue compound is obtained by the oxidation of dimethylaniline with chloranil or other chlorinated quinone It appears to have the same constitution whichever chloro quinone is used, as on reduction it always gives a leuco base of the formula C18H20N2 and melting point [173°] The latter forms glistening plates, sl sol cold alcohol, v sol hot alcohol, benzene, and ether It forms the salts B'H2Cl2 colourless crystals —B'H2Cl2PtCl4 fine needles -B"Me,Cl, crystals, sol water, sl sol alcohol, with wet Ag₂O it gives an alkaline fluid (Meister, Lucius, a Bruning, B 13, 212, 2100, Wichelhaus, B 14, 1952) -30 Acetone saturated Acetone saturated with SO₂ forms (O₃H₂O)(SO₂)(NMe Ph) crys tallising in lustrous plates, v sol water and alcohol, insol acetone (Boessneck, BAcetone and ZnCl₂ at 150° forms 21, 1906) CMe₂(C₀H₄NMe₂)₂ [83°] (Doebner, B 12, 810) — 31 Di methylaniline dissolved in a saturated solution of SO2 and mixed with an aqueous solution of alloxan forms (C4H2N2O4)(NMe.Ph)H.SO, 4aq crystallising in monoclinic plates, a b c = 1 3399 1 3394, $\beta = 93^{\circ}$ 23' (Pellizzari, A 218, 148, G 18, 329) -32 A saturated aqueous solu tion of alloxan forms a compound C, H13N3O, aq crystallising in colourless needles, sl sol water, decomposing at 250° (Pellizzari, G 17, 409) The compound forms a crystalline hydrochloride, nitrate, and oxalate, and yields a silver salt $C_{12}H_{12}AgN_3O_4$ It is decomposed by alkalis forming a compound $C_{11}H_{12}N_{12}O_{3}$, decomposing at $281^{\circ}-33$ s-Trinitrobenzene forms a com pound NMe, PhC, H, (NO2), [108°] which crystal lises in long dark violet needles, sl sol alcohol (Hepp, A 215, 358) - 34 Tri nitro toluene forms a corresponding body (H) -35 Tri nitro antline forms NMe2PhC6H3(NO2)2(NH) [141°] (Hepp)

Salts—Dimethylaniline is apparently less basic than aniline, for if a mixture of the bases is treated with an insufficient quantity of cold aqueous HCl the base left uncombined is chiefly dimethylaniline (Morley, C J 51, 580)—B'H₂SO₄ [80°] Sol water, insol ether and benzene HF 8400 The normal sulphate could not be formed At 190° the acid sulphate splits up into CO₂ and the sulphonic acid (Vignon, C R 107, 263)—B'₂H₂HgCl₄ [149°] Large tables or prisms, sol hot water and hot alcohol Prepared by adding aqueous HgCl₂ to an alcoholic solution of dimethylaniline (Klein, B 11, 1741)—B'₂Hg₂OCl₂ Formed together with the preceding Small needles or glistening leaflets, m sol hot water and hot alcohol, insol cold water, v sol benzene On heating to 100° a blue colouring matter is formed—B'₂HgCl₂ (Leeds, J 1882, 504)—B'₂H₂SnCl₄ Large monoclinic crystals (Hjortdahl, J 1882, 523)—B'₂H₂PtCl₃ Tables—B'₂H₂PtGl₄ (Reinhardt a Staedel, B 16, 29)—B'₂H₂PtBr. Brownish red monoclinic needles—Bil₄2B'HI (Kraut, A 210, 324)—(Bil₃)₃B'HI — (Bil₃)₄B'HI — (Bil₃)₅B'HI — (Bil₃)₅B'HI — (Bil₃)₅B'HI — (Bil₃)₅B'HI — B'₂H₃FeO₃ Lamins, sl. sol cold water, being less soluble than the methylaniline

and antline ferrocyanides (Fischer, A 190, 184) —

B'₂H₄FeCy₂2aq (Eisenberg, A 205, 266) Methylo-rodide C₆H₄NMe₄I Phenyl tri-methyl-ammonium rodide S (alcohol) 22 at 8° The combination of PhNMe, and MeI takes place rapidly (Lauth, Bl 7, 448) It may also be obtained by shaking a mirture of aniline (1 mol) with MeI (3 mols) and KOH (2 mols) dissolved in water (Pawlinoff, J R 13, 448, Bl[2] 37, 493) Plates (from a cohol) Converted by moist Ag,O into C.H.,NMe,OH a deliquescent, crystalline, caustic ase When the methylo nodide is distilled it splits up into NMe2Ph and MeI, but these recombine in the receiver however, a current of HCl be passed through the retort NMe, PhHCl condenses in the receiver, while MeI escapes and may be condensed in a second colder receiver (Merill, J pr [2] 17, 286) When treated in a sealed tube with a solution of potassium in anhydrous liquefied ammonia it yields KI, NMe, and possibly benzene (Thompson a Cundall, C J 53, 761) Boiling conc KOHAq slowly decomposes PhNMe, I into di methylaniline, KI, and MeOH (Claus a Rauten berg, B 14, 621) The methylo iodide gives rise to the following derivatives -PhNMe₃I₃ [115°] Brown trimetric plates (Geuther, A 240, 69) PhNMe₃I₄ [87°] (Dafert, M 4, 500) Lustious green monoclinic needles, $a \ b \ c = 179411251$, $B = 69^{\circ}$ 43' — PhNMe₃I, [65°] Violet black Trimetric crystals plates - PhNMe, IZnI. (Hjortdahl) — PhNMe, ClHgCl₂ [188°] S 36 at 62° Needles (Hubner, A 224, 352) — (PhNMe,Cl)₂PtCl₆ Orange needles (from water) S 33 at 7 4° - (PhNMe₃)₂Cr₂O, Prisms S 5 -(PhN Me,)2Cr,O10 Monoclinic crystals (Hjort

Ethylo rodide B'Etl [125°] Identical with methyl ethyl aniline methylo iodide, KOH splits off dimethylaniline (Claus a Howitz, B 17,1325) —PhNMe,EtI, [81°] Dark violethexagonal rhombohedra (Geuther) -PhNMe,EtI, Lustrous bluish - green plates -[45°] PhNMe EtI Violet black plates

(B 1) METHYL-ANTHRACENE O,H, te. $C_{\bullet}H_{\bullet}Me\begin{bmatrix} 6\\ 5 \end{bmatrix}$ Mol w 192 [208°]

(Börnstein), [200°] (Birukoff) Formed by distilling erythro-oxy methyl anthraquinone with zinc dust (Birukoff, B 20, 2070) Formed also by boiling iso methylanthraquinone with zinc dust and ammonia, and splitting off water from the resulting methyl hydroxanthranol by boiling with xylene (Börnstein, B 15, 1821) plates—B'C₂H₂(NO₂)₃OH red needles Gives on oxidation methyl-anthraquinone [167°] and

the corresponding anthraquinone carboxylic acid. Forms a di bromo methyl anthracene [148°]

Hexahydride C₁₅H₁₆. [c 65°] Formed by reducing the dilactone of benzophenone dicarboxylic acid with phosphorus and hydric iodide (Graebe a Juillard, A 242, 256) Plates V sol alcohol, ether, and chloroform through a red hot tube it yields a hydrocarbon [195°] On oxidation it yields methylanthraquinone [154°]

(B 2) Methyl-anthracene

coal tar oil, and hence is present in crude anthracene and phenanthrene (Japp a Schultz, B 10, 1049)

Formation -1 By passing di-tolyl methane through a red hot tube (Weiler, B 7, 1181) -2 By passing di tolyl ethane through a red hot tube (O Fischer, B 7, 1191, 8, 675) -3 Apparently occurs among the products obtained by passing vapour of oil of turpentine through a red-hot tube (Schultz, B 10, 84)—4 By the action of zinc dust at high temperatures on chrysophanic acid C₁₅H₆O₂(OH)₂, on emodin C₁₄H₆O₂(OH)₈ (Liebermann, B 8, 970, A 183, 183) 163), on aloin (in small quantity) (E Schmidt, B 8, 1275, Ar Ph [3] 8, 496), on the acid [4 1] CH, C, H, CO C, H, CO, H (Gresly, A 234, 238), on abietic acid (colophony), on gum benzoin (Ciamician, B 11, 273), on chrysarobin (Liebermann a Seidler, A 212, 34), and on methyl quini zarın (Nietzki, B 10, 2013) — 5 Byboiling phenyl xylyl ketone C₆H₅ CO C₆H₂Me₂[1 2 4] for a long time (Elbs, J pr [2] 35, 472) The isomeric CaH, CO CaH, Me [1 2 5] condenses on boiling to the extent of 10 to 20 pc to (B 2) methyl anthracene, dehydrating agents either stop the reaction or split off benzoic acid

Properties —Yellowish plates (from alcohol) Sublimes in large white plates, exhibiting blue **fl**uorescen**c**e Sl sol alcohol, ether, and HOAc, v sol CHCl3, benzene, and CS2 Chromic acid in HOAc oxidises it to anthraquinone carboxylic acid [282°] Conc HNO, added to its alcoholic solution forms methyl anthraquinone Bromine in CS₂ forms a di bromo derivative [156°] (Fischer), which yields, on further bromination, a tetra bromo derivative crystallising from toluene in needles The picric acid compound melts at [93°] (Gresly)

Di-methyl-anthracene CieH14 s.c.

One of the products obtained by passing benzyl mesitylene through a red hot tube parated from the di methyl anthracene [218°] which accompanies it in smaller quantity, by crystallisation from toluene, in which the compound, melting at 71°, is extremely soluble Further purified by means of its picric acid compound (Louise, Bl [2] 44, 180, A Ch [6] 6, 191) White needles, v e sol cold benzene and toluene, m sol HOAc and alcohol On oxidation with CrO, in HOAc it yields di methylanthraquinone [158] The picric acid compound forms long red needles. Forms a grey compound with nitro anthracene.

[219°] One of the products of the passage of benzyl-mesitylenethrough a red hot tube (Louise, Bl [2] 44, 178) Rhomboidal plates, insol cold alcohol, sl sol ether, ligroin, and acetic acid, v sol hot benzene and toluene Forms small colourless leaflets when sublimed Br in CS2 forms a crystallised bromo-derivative The picric acid compound crystallises in red CrO, in HOAc oxidises it to a dimethyl anthraquinone [170°] Forms a green compound with nitro-anthracene

Di methyl-anthracene

$$C_6H_*$$
 C_6H_*
 C

Obtained by distilling with zinc dust the tri-oxy- \mathbf{d}_{1} methyl-anthraquinone derived from m xylene carboxylic acid, gallic acid, and H2SO4 (Birukoff, B 20, 871) Plates Oxidised by CrO, to a dimethyl-anthraquinone [112°]

D1-methyl-anthracene
$$C_0H_1$$
 $C_0H_2Me_2$

[216°] Obtained by treating a mixture of toluene (3 pts), CS₂ (3 pts), and chloroform (1 pt) with AlCl_s (2 pts) (Elbs a Wittich, B 18, 348) chromic acid it gives a quinone [162°] Probably identical with the isomeride [219°]

[203°] From [2 4 1]C,H₃Me₂ CO C,H₄ CO₂H[1 2] by heating with red hot zinc-dust (Gresly, A 234, 238) Plates Possibly identical with the 180meride [220°-226°]

Di-methyl-anthracene

$$C_eH_*$$
 $\begin{bmatrix} CH \\ I \end{bmatrix}$ $C_eH_2Me_2\begin{bmatrix} 1 & 3 \\ 6 & 4 \end{bmatrix}$ [246°] Formed by

reduction of di-methyl-anthraquinone [183°] with zinc-dust and NH, White plates, with bluish-green fluorescence Its picrate forms garnet-red needles, decomposed by alcohol (Elbs a Eurich, B 20, 1363)

Di-methyl-anthracene

coal tar xylene by chlorination at boiling temperature, and subsequently heating the resulting [3 1]C₆H₄(CH₃)(CH₂Cl) with water at 210° (Van Dorp, B 5, 674) White fluorescent plates Yields on oxidation with chromic acid a quinone [153°] Br gives a di bromo di-methyl anthracene [154°] Perhaps identical with the following isomeride

Di-methyl-anthracene

$$C_6H_3Me$$
 C_6H_4Me
 C_6H_4Me
 C_8H_4Me
 C_8H_4Me

Occurs in coal-tar (Zincke a Wachendorff, B 10, 1481) Formed from toluena, AlCl, and acetylene tetra-bromide (Anschütz, A 235, 172) Prepared by acting on toluene with methylene chloride in presence of AlCl, (Friedel a Crafts, Bl. [2] 41, 323, A Ch [6] 11, 266). Scales With CrO, in HOAc it gives dimethylanthraquinone [160°], which forms an orange

solution in H2SO4 The picric soid com pound crystallises in slender needles

Di-methyl-anthrasene

methyl anthragene dihydride.

C_eH₃Me<CHMe>C_eH₃Me by distillation over red hot zinc dust (Anschutz, A 235, 320), Greenish-yellow laminæ (from benzene), m sol benzene, sl sol alcohol Gives on oxidation di methyl-anthraquinone [23 6°

C₆H₄<CMeH C_{CMeH} C₆H₄ [181°] From ethylidene bromide, benzene, and AlCl, (Anschutz, A 235, 305) Yellow laminæ (from alcohol) Sublimes in yellow needles V sol benzene, CS2, and ether, sl sol cold alcohol and glacial HOAc Distillation over red hot zinc dust gives anthra cene Oxidation gives anthraquinone Bromine in HOAc gives C₆H₄<CMeBr C₆H₄, which crys tallises from toluene in needles

Picrate C₁₆H₁₆C₆H₂(NO₂)₃OH [174°] u-Di-methyl anthracene dihydride

C_sH₄ CH₂ C_sH₄ [56°] Formed by the action of HI and red phosphorus on dimethylanthron $C_6H_4 < \stackrel{CO}{<} C_6H_4$ at 150° (Hallgarten, B 21, 2508) White crystals, sol ether, benzene, and HOAc

 $\begin{bmatrix} 1 \\ 6 \end{bmatrix} 2 3 5$ [236°] (W), [243°] (G) Obtained by distilling '\$\psi\$ cumene phthaloylic' acid C.H. Me, CO C.H. CO H with zinc dust (Gresly, A 234, 239) Formed also by distilling tri oxy di methyl anthraquinone [244°] over zinc dust (Wende, B 20, 868) Exhibits green fluores

Tri-methyl-anthracene
$$C_1, H_{10}$$
 is $\begin{bmatrix} 2 & 5 & 1 \\ 1 & 6 \end{bmatrix}$ $C_0H_2Me_2$ $\begin{bmatrix} CH \\ CH \end{bmatrix}$ C_0H_3Me $\begin{bmatrix} 1 & 3 \\ 6 & 3 \end{bmatrix}$ $\begin{bmatrix} 2279 \\ 1 & 6 \end{bmatrix}$

Formed by boiling di p xylyl ketone $C_8H_2Me_2$ CO $C_6H_3Me_2$ for six hours, H O being eliminated Colourless plates, with bluish green fluorescence Sublimes below 100°, slightly volatile with alcohol V sl sol cold alcohol, v sol ether By CrO, and acetic acid it is oxidised to tri methyl anthraquinone [184°] (Elbs a Olberg, B 19, 409, J pr [2] 35, 483)
Tetra-methyl-anthracene C₁₈H₁₈ [c 280°]

A small quantity (3 g) is formed from m xylene (100 g), Al_2Cl_8 , and acetylene tetrabromide (Anschutz, A 235, 173) CrO₂ gives a substance (tetra methyl anthraquinone?) which forms needles [c 300°]

Tetra methyl-anthracene (?) [280°] From o-xylene, Al₂Cl₂, and acetylene tetrabromide (Anschütz, A 235, 175) Fluorescent needles

Tetra-methyl anthracene (?) [280°] Formed similarly from p xylene (A)

Tetra-methyl-anthracene C14H6Me4. [163°]. Formed by the action of methylene chloride in presence of AlCl, on m-xylene, and in smaller

quantity on ψ -cumene (Friedel a Crafts, A Ch [6] 11, 268) Crystallises from benzene Gives a dark red crystalline compound with picric acid Conc H2SO4 gives a yellow solution CrO2 in HOAc oxidises it to tetra methyl anthraquinone [206°]

Tetra-methyl-anthracene dibromide

C₆H,MeCBrMeC₆H₂Me From the corresponding tetra methyl anthracene dihydride by bromination (Anschutz, A 235, 321) Yellow needles, decomposes when heated Tetra methyl-anthracene dihydride

[171°] Obtained by the action of ethylidene chloride on toluene in presence of Al₂Cl₂ (Anschutz, A 235, 317) Pale yellow trimetric laminæ, $a \ b \ c = 675 \ 1 \ 924$ (from alcohol and HOAc), v sol benzene, sl sol HOAc, v sl sol alcohol Distillation over red hot zinc dust gives di methyl anthracene Oxidation gives di - methyl - anthraquinone [236°]

Picrate C₁₈H₂₀C₅H (NO₂)₂OH [165°] Red

glistening needles

Hexa-methyl-anthracene C14H4Me [c 220°] One of the products of the action of methylene chloride on \psi cumene in presence of AlCl3 (Friedel a Crafts, A Ch [6] 11, 272) Not vola tile at 410° The alcoholic solution gives with pieric acid a brownish black pp [203°] Conc H,SO, forms a red solution, becoming colourless after absorbing moisture

(B 2) Methyl-anthraquinone

 $C_{e}H_{*} < \stackrel{CO}{<_{CO}} > C_{e}H_{*}Me \begin{bmatrix} 6 & 2 \end{bmatrix}$ [163°] (F), [172°] (E), [177°] (Römer a Link, B 16, 695)

Formation -1 By warming an alcoholic solution of (B 2) methyl anthracene with nitric acid, ppg with water, and subliming (O Fischer, B 8, 675)—2 In small quantity by boiling phenyl m xylyl ketone (Elbs, J pr [2] 35, 471)
3 By warming [4 1]CH, C,H, CO C H, CO₂H with H,SO, at 170° for ten minutes (Gresly, A 234, 239)

Properties — Yellow needles Sublimes in almost colourless needles V sol alcohol, benz ene, and HOAc (R a L), according to Fischer, however, it is al sol these solvents. Conc H SO, forms a blood red solution which becomes When heated with zinc-dust violet on heating it yields methyl anthracene [203°] With fuming HSO, it yields a disulphonic acid, which on fusion with potash forms di oxy methyl anthra quinone (methyl alizarin) [252°] (Fischer)

Isomeride of Methyl anthraquinone

METHANTHRENE

Di methyl-anthraquinone C₁₀H₁O₂ $C_6H_4 < \stackrel{CO}{<} C_0 + H_2Me_2 \begin{bmatrix} 1 \\ 6 \end{bmatrix} ? [158]$ Obtained by oxidising the corresponding dimethyl an thracene [71°] Formed also by heating benzoyl mesitylenic acid C₆H₃ CO C₈HMe.CO H with P.O., and subliming the product (Louise, A Ch [6] 6, 193, 228, Bl [2] 11, 181) Yellow acıcular prisms (from chloroform acetone) or needles (by sublimation) Insol water, sl sol alcohol, sol With zinc-dust and chloroform and acetone KOH it gives an intense red colour This di methyl anthraquinone ought theoretically to be identical with those melting at 180 and 112° (v

Di methyl anthraquinone C₁₆H₁,O₂. [170°] Obtained by oxidising di methyl anthiacene [219°] with CrO, in HOAc (Louise, A Ch [6] 6, 189, Bl [2] 44, 180) Yellow needles (from 189, Bl [2] 44, 180) Yellow needles (from alcohol) With zinc dust and KOH it gives a characteristic red tint, which disappears en heating

Di methyl anthraquinone

$$C_{\bullet}H_{\bullet} < \stackrel{CO}{<} C_{\bullet}H_{\bullet}Me \begin{bmatrix} 1 & 3 & 4 \end{bmatrix}$$
 [183°]

Obtained by heating oxylyl phenyl ketone carboxylic acid (oxyloyl obenzoic acid) [3 4 1] C, H, Me, CO C, H, CO, H[1 2] with conc. H₂SO₄ By HNO₅ (S G 1 2) at 220° it is oxi dised to anthraquinone di carboxylic acid [340°] (Elbs a Eurich, B 20, 1361).

Di-methyl-anthraquinone

$$C_{e}H_{e} < \frac{CO}{CO} > C_{e}H_{e}Me_{e} \left[\frac{1}{6} 24 \right]$$
. [180°].

and alcohol By dil HNO, it is oxidised to anthiaquinone m di carboxylic acid [above 330°] Reduced by zinc dust and ammonia to a hydrocarbon [85°] which forms with pieric acid reddish-brown scales [135°]

Di methyl anthraquinone

C₆H₄CO C₆H₂Me₂[$\frac{1}{6}$ 25] [118°] Formed by warming [4 1 x]C₆H₃Me₂ CO C₆H₄ CO₂H[2 1] with cone H₂SO₄ at 120° (Gresly, A 234, 240) Di methyl anthraquinone

 $C_eH_e < CO_o > C_eH_2Me_2 \begin{bmatrix} 1 \\ 6 \\ 2 \\ 4 \end{bmatrix}$? [112°] Obtained by oxidising the di methyl anthracene [220°–226°] (Birukoff, B 20, 871)

Di methyl-anthraquinone

 C_0H_* $\stackrel{CO}{CO}$ $C_0H_2Me_2$ [162°] Obtained by oxidising di methyl anthracene [216°] (Elbs a Wittich, B 18, 348)

Di-methyl anthraquinone

C_oH_sMe CO C_oH_sMe [236°] Formed by oxidation of di methyl anthracene [244°] Pale yellow needles, si sol HOAc, v si sol alcohol (Anschutz, A 235, 321)

Di-methyl-anthraquinone

 $C_oH_sMe < \stackrel{CO}{CO} > C_oH_sMe$ [155°] Obtained by oxidising the di methyl anthracene occurring in coal tar xylene (Wachendorff a Zincke, B 10, 1482) Small light yellow needles (from dilute alcohol) May be sublimed M sol alcohol, ether, and HOAc

D1-methyl-anthraquinone

 $C_eH_3Me < \stackrel{CO}{CO} > C_eH_3Me$ [160°] Obtained by oxidising the di-methyl anthracene formed from toluene, methylene chloride, and AlCl₃ (Friedel a Crafts, A Ch [6] 11, 266) Forms an orange solution in H_2SO_4 Probably identical with the preceding

Tri-methyl anthraquinone

C₆H₄CO_{CO}C₆HMe₄ [Me Me Me = 1 2 4] [161°] Formed by warming ψ cuminoyl benzoic acid C₆H Me₄CO C₆H₄CO₂H for a short time with cone H₂SO₄ (Gresly, A 234, 240) Needles

Tri-methyl-anthraquinone

 $\begin{bmatrix} 2 \ 5 \ 6 \end{bmatrix} C_6 H_2 Me_2 < \begin{matrix} CO \\ CO \end{matrix} > C_6 H_3 Me \begin{bmatrix} 1 \ 6 \ 3 \end{bmatrix}$ [184°] Formed by oxidation of the tri methyl anthra cene obtained from di p xylyl ketone (Elbs a Olberg, B 19, 409)

References — Amido-, Nitro, and Oxy-METHYL ANTHRAQUINONES

METHYL ANTHRAQUINONE CARBOXY. LICACID $C_{16}H_{16}O_4$? & $C_9H_3Me < {}^{CO}_{CO} > C_8H_3$ CO_2H

[246°] Occurs among the products of the oxidation of coal tar di-methyl anthracene by CrO. in HOAc (Wachendorff a Zincke, B 10, 1483) Small needles (by sublimation); v. sol. hot alcohol

D1-methyl-anthraquinone carboxylic acid C₁,H₁,O₄, c C₂H₄,CO_CO C₂H₂Me₂ CO₂H [240°] Formed by heating ψ-cuminoyl-benzoic acid C₂H₂Me₂ CO C₂H₄ CO₂H[2 1] with fuming H₂SO₄ (Gresly, A. 234, 241). Small needles. V. sol.

alkalıs, al. sol alcohol and benzene May be sublimed

DI-METHYL-ANTHRARUFIN v DI OXY DI-METHYL ANTHRAQUINONE

DI-METHYL-ANTHRONE C₁₆H₁₄O t.c. C₆H₄CO_CCMe₂C₆H₄ [94°] Formed by the action of MeI and KOHAq on anthranol (Hallgarten, B 21, 2508) Transparent crystals, v sol benzene, ether, sl sol petroleum ether Converted by the action of HI and red phosphorus into di methyl anthracene dihydride

METHYL-ARBUTIN v' Arbutin

METHYL ARSENATE Me, AsO, (214°) S G 14 1 559 Formed from Ag, AsO, and MeI (Crafts, Bl [2] 14, 99)

METHYL ARSENITE Me, AsO, (129°) SG 1428 VD 601. From AsCl, and NaOMe (Crafts, Bl [2] 14, 104) When arsenious acid is dissolved in aqueous NaOH and treated with alcoholic MeI the product is not mono methyl arsenite but methane arsonic acid CH₃ AsO(OH)₂ (Klinger, A 249, 149, cf vol 1 p 317)

Penta-methyl benzene C₁₁H_{1e} ie C_eHMe, Mol w 148 [52°] (231° 1 V) V D 5 27 (calc 5 12) H F 31,900 H C 1,554,100 (Stohmann, Kleber, a Langbein, J pr [2] 40, 83) One of the products of the action of MeCl on benzene or toluene in presence of AlCl, (Friedel a Crafts, A Ch [6] 1, 472, Ador a Rilliet, B 12, 332) bormed also in like manner by the action of MeCl and AlCl, on tri methyl benzenes at 100°- 110° , the fraction (220°-235°) on crystallisation from alcohol deposits C_6Me_6 first, and the pentamethyl benzene remaining in the mother liquor may then be purified by means of its sulphamide (Jacobsen, B 20, 896) Penta methyl benzene is a by product in the formation of tetramethylbenzene by the action of MeI and AlCl, on ψ cumene (Claus, J pr [2] 38, 231)

Properties —Flat prisms, v e sol alcohol Reactions — 1 Bromine in CHCl, forms C. Me. Br $[163^\circ]$ (292° 1 V) (F a C , Jacobsen, B 20, 898) -2 AgNO, and vapour of Br forms dı bromo c durene [202°] (Gottschalk, B 20, 3288) —3 CISO,H forms the sulphone and sulphochloride (Jacobsen) -4 Cold conc H2SO4 does not form the corresponding sulphonic acid, but yields c tetra methyl benzene sulphonic acid and hexa methyl benzene (J) -5 KMnO, forms benzene penta carboxylic acid (F a C) —6 Fum ing nitric acid forms di nitro c tetra methyl benzene [178°] (Gottschalk, B 20, 3287) Dilute nitric acid acting on its solution in benzene produces tetra methyl benzoic acid [165°] -7 Heat ing with AlCl, forms isodurene, C₆Me₆, and other hydrocarbons (Jacobsen, B 18, 340) — 8 Cl CONH₂ and AlCl, convert C₆HMe₅ dissolved in CS, into the amide of penta-methyl benzoic acid (Jacobsen, B 22, 1219)

Picric acid compound $C_6HMe_3C_6H_2(NO_2)_3OH$ [131°] Golden yellow

Hexa methyl-benzene $C_{12}H_{16}$ i.e. $C_{0}Me_{0}$ Mol w 162 $[164^{\circ}]$ (F a C), $[166^{\circ}]$ (J) (264°) S (95 pc alcohol) 2 at 0° V D 5 73 $(calc\ 5\ 61)$ (Fa C), $5\ 58$ (H) H C v 1,709,600 H C p 1,712,200 H F 36,800 (Stohmann, Kleber,

a Langbein, J pr [2] 40, 84)
Formation -1 The final product of the action of McCl on benzene or toluene in the presence of AlCl, (Friedel a Crafts, A Ch [6] 1, 467, C R 91, 257, Ador a Rilliet, B 12, 332) -2 From o-di chloro benzene, MeCl, and AlCl, at 100° (Friedel a Crafts, A Ch [6] 10, 411) — 3 A by product in the formation of (1,2,3,4)-tetra methyl benzene by the action of MeI and AlCl, on ψ cumene (Claus, J pr [2] 38, 231) 4 By heating dimethylaniline methylo-iodide at 330° (Hofmann, B 5,721) —5 Said to be a product of the action of fused ZnCl, on sugar (C. J. 38, 863, D P. J 237, 146) —6 Formed as a

by product in the preparation of cumidine by heating xylidine hydrochloride with methyl alcohol, also in small quantity by the action of methyl alcohol at a high temperature on aniline hydrochloride (Hofmann, B 13, 1729) -7 By dropping methyl alcohol upon strongly-heated ZnCl₂ (Le Bel a Greene, Am 2, 21) —8 By pouring acetone upon fused ZnCl₂ (H Greene, C R 87, 931) —9 By shaking crotonylene CMe CMe with H2SO4 (3 pts.) diluted with water (1 pt) (Favorsky, J pr [2] 37, 384, Lwoff a Almedingen, Bl [2] 37, 493)—10 Together with other products by the prolonged action of conc H.SO, upon durene (Jacobsen, B 19, 1211)—11 A product of the action of cold conc H.SO, on penta methyl benzene (Jacobsen, B 20, 901)

Properties - Colourless plates (from alcohol) or prisms (from benzene), insol water, sl sol cold, v sol hot, alcohol, v sol benzene Forms iridescent plates on sublimation Does not dis

solve in conc H₂SO₄

Reactions — 1 Bromine at 100° yields

C₁:H₁:Br₄ [255°] (F a C), [227°] (H) —

2 KMnO₄ oxidises it at a low temperature to mellitic acid -3 Dilute mtric acid yields c tetramethyl benzene dicarboxylic acid (Jacobsen, B 22, 1216) -4 When heated with AlCl, at 200° a gas is given off and penta methyl benzene, durene (Friedel a Crafts, C R 100, 692), isodurene, tri methyl benzenes, xylenes, toluene, and benzene are formed (Jacobsen, B 18, 339) -5 PCl, forms hexa chloro hexa methyl-benzene $(q \ v)$

Picric acid compound

C₆Me₆C₆H₂(NO₆),OH [169°] Golden plates METHYL BENZENE CARBOXYLIC ACID vTOLUIC ACID

Di methyl-benzene carboxylic acid o MESITYLENIC and DI METHYL BENZOIC ACIDS

Tri - methyl - benzene carboxylic acid c. **♦ CUMINIC ACID**

Methyl-benzene dicarboxylic acid v Uvitic ACID, METHYL ISOPHTHALIC ACID, METHYL TEREPH-THALIC ACID, and TOLUENE DICARBOXYLIC ACID

Di-methyl-benzene dicarboxylic acid v Di-METHYL-ISOPHTHALIC and DI METHYL-TEREPH-THALIC ACIDS

Tri-methyl-benzene dicarboxylic acid C.HMe,(CO,H), Obtained by oxidising C.HMe, CO C.H, with KMnO, in alkaline solution (Ador a Meyer, J 1879, 562) Needles (fromwater)—BaA"aq Slender needles, almost insol water

Tetra-methyl-benzene dicarboxylic acid C₆Me₄(CO₂H)₂ [6 5 4 3 2 1] [249°] Formed by boiling C₆Me₆ with dilute HNO₅ (Jacobsen, B 22, 1215) Small needles (from hot water) or prisms (from alcohol) Yields c durene when distilled with lime -BaA', 2aq

DI-METHYL-BENZENE GLYCOL v Dr-w-OXY XYLENE

METHYL-BENZENE SULPHINIC ACID v. TOLUENE SULPHINIC ACID

Tri-methyl-benzene sulphinic acid C.H.Me. (SO.H) [1:8 4.6] [98°] Long needles (from water) —NaA' —BaA'. S 5 at 7°. Thin plates —AgA' (Badloff, B. 11, 82)

METHYL-BENZENE SULPHONIC ACID . TOLUMNE SULPHONIC ACID.

Di methyl-benzene sulphonic acid v XYLENE SULPHONIC ACID

c-Tri-methyl benzene sulphonic acid

C₆H₂Me₃(SO₃H) [1 2 3 5] Hemmellithene sul-phonic acid Formed by sulphonation of hemimelli hene (Jacobsen, B 15, 1858, 19, 2517) Crystallises from dilute H2SO4 in six sided plates or tables (containing aq) -NaA'aq tables, v sol hot, m sol cold, water - *BaA'2 brittle plates, v sl sol water

Amide C.H.Me,SO2NH2 [196°] Prisms or needles Less soluble in alcohol than the amide of ψ -cumene sulphonic acid

Isomerides v ψ -Cumene sulphonic acid and MESITYLENE SULPHONIC ACID

Tetra methyl-benzene sulphonic acid v. DURENE SULPHONIC ACID

Penta-methyl-benzene sulphonic acid C.Me.SO.H Obtained by treating penta methylbenzene with ClSO₃H and treating the product with NaOH to convert the C.Me.SO.Cl first formed into C₆Me₃SO₃Na (Jacobsen, B 20, 899) In the action of CISO, H on C, Me, H a sulphone [98 5°], crystallising from petroleum ether in needles, is also formed The free acid, liberated by shaking the sodium salt with light petroleum and H2SO4, at once undergoes hydrolysis, C.HMe, dissolving in the petroleum

Salts -A'Na tables (from neutral aqueous solution) or plates (from hot, dilute, NaOH), sl sol cold water, m sol hot water, insol cold, dilute NaOH —A'K plates (from hot water) —A'aBa A'Ag plates, v sl sol cold, m sol hot, water - A', Cu greenish white tables sl sol water plates, v sl sol hot water -A'2Ca plates

A'₂Cu greenish white tables, sl sol water

Chloride [82°] Plates (from EtOH), or
prisms (from Et₂O), v sol EtOH and Et₂O

Amide [186°] Prisms, v e sol hot, m

sol cold, EtOH, insol water KMnO, produces a sulphamic acid [c 265°]

C_eH_sMe₂ CO H [6 2 1] m-Xylene c-carboxylic acid [97°-99°] Formed by fusing potassium m xylene c-sulphonate with sodium formate (Jacobsen, B 11, 21) Short needles (from water) Forms m-xylene when distilled with

D1-methyl-benzoic acid

 $H_{2}Me_{2}CO_{2}H$ [4 2 1] m Xylens i carboxylic acid Xylylic acid Xylorc acrd [126°]. (267°) at 727 mm

Formation.—1 By the oxidation of ψ -cumene by dilute nitric acid, being separated from the accompanying C₀H₃Me₂CO₂H [5 2 1] through the greater solubility of its Ca salt Fittig a Laubinger, A 151, 269) -2 By treating bromom xylene with sodium and OO2 (Kekulé, A 187, 186) -3 By warming its nitrile with H.SO. (85 pc) and heating the resulting amide with cone HClAq at 170° (Birukoff, B 20, 871, A \$40. 286) -4. By heating its diphenylamide

with HClAq (v infra) -5 By decomposing its chloride (v infra) with water

Properties - Slender needles (from water) or monoclinic prisms (from alcohol) May be sublimed Almost insol co'd water, sl sol hot water, v sol hot alcohol Gives m xylene when Chromic acid mixture oxiheated with lime dises it to $C_6H_3Me(CO_2H)_2$ [3 1 4]

Salts —CaA', 2aq monoclinic prisms, ▼ sol water —BaA', 8aq ?—AgA'

Chlorade C, H, Me, COCI [25 5°] Formed by passing COCl₂ into m xylene containing AlCl₃, and heating to 100° (Ador a Meyer, B 12, 1968)

Amide C.H.Me. CONH [180°] Formed by warming the nitrile with H.SO. (85 pc) Formed also by the action of NH, COCl on m xylene in presence of AlCl, (Gattermann, 244, 53) Formed also by passing gaseous HCNO and HCl gas into m xylene containing AlCl, on the water bath (Gattermann a Rossolymo, B 23, 1196) Long shining needles (from water) Almost insol cold water, v sol alcohol

Anilide C.H.Me CONHPh [138 5°] Crys-

tals, v sl sol hot water

Diphenylamide C. H. Me, CONPh, [142°] Formed from m xylene and NPh, COCl in pre sence of AlCl, (Lellmann a Bonhöffer, B 20, Monoclinic crystals, v e sol hot alco hol, HOAc, and chloroform, sl sol hot ether, v sl sol hot petroleum ether

[25°] Nitrile C₆H₃Me₂CN (221°) 18 9871 (Hinrichsen, B 21, 3082) VD 464. Formation -1 By heating the formyl deri vative of m-xylidine with zinc-dust, the yield being about 12 pc (Gasiolovsky a Merz, B 18, 1012) -2 By distilling the corresponding PO(OC,H3Me,), with KCy, the yield being 15 p c (Kreysler, B 18, 1713) -3 From m xvli dine by Sandmeyer's reaction (Birukoff B871) Properties - Triclinic crystals (from dilute alcohol) Volatile with steam Yields benzyl di methyl amine on reduction

Amidoxim C₆H₃Me₂C(NH₂) NOH [178°] Xylenyl-amidoxim Formed by the action of hydroxylamine on the nitrile at 85° (E Oppen heimer, B 22, 2443) White needles, v sol alcohol, ether, chloroform, and hot water, sl sol cold water Reactions -1 Etlacting on its Na. derivative forms CoH3Me C(NH) NOEt which crystallises in white needles, [172°], v sol alco hol, ether, chloroform, benzene, and boiling water, sl sol cold water Excess of HCl converts the ethyl derivative into C,H,Me,CCl NOEt, a yellow aromatic oil -2 Chloral forms a com pound CCl₃ CHO(C₆H₃Me₂ C(NH) NOH) [112° crystallising in white scales, sol alcohol and ether but decomposed by water and dilute acids 3 ClCO₂Et acting on the amidoxim in chloroform forms C₆H₃Me₂ C(NH₂) NOCO₂Et [143°] which crystallises in white needles, v sol alcohol, ether, and chloroform, sl sol ligroin It is converted by heat into $C_6H_3Me_2C < N O > CO$ which crystallises in needles [182°], v sol alcohol and ether -4 Potassium cyanate acting on the hydrochloride of the amidoxim forms CaHaMe2 Č(NOH) NH CO NH2 [153°] which crystallises from dilute alcohol in white scales, and forms an unstable platinochloride — 5. Phenyl cyanate at 100° reacts forming C₈H₈Me₂C(NOH) NH CO NHPh [138°] which crystallises from alcohol in light yellow scales, sol acids, alcohol, ether, chloroform, benzene, and hot water −6 Phenyl thro-carbunde at 100° forms C₈H₈Me₂C(NOH) NH CS NHPh [150°], sol alcohol, ether, benzene, boiling water, and acids −7 Heating with Ap₂O forms the azoxim C₈H₈Me₂C⟨NO⟩ CCH₈ [89°] −8 Succinic anhydride fowns the azoxim C₈H₈Me₂C⟨NO⟩ CCH₂CH₂CO₂H which forms long white needles, [112°], v sol alcohol, ether, benzene, CHCl₈, and hot water, and yields crystalline salts

Acetyl derivative of the amidoxim C.H.Me. C(NOAc)NH. [189°] Small white needles, v sol alcohol and chloroform, al sol

ether (Oppenheimer, B 22, 2445)

Bensoyl derivative of the amidoxim C_sH₂Me₂C(NOB₂)NH₂ [158°] White crystals, v sol alcohol, ether, and chloroform, sl sol water and ligron Converted by heat into C_sH₂Me₂C(N) C_sH₃, which crystallises in faintly yellow scales, v sol alcohol, ether, and chloroform, volatile with steam (Oppenheimer, B 22, 2444)

Di-methyl benzoic acid C_eH₄Me₂.CO₂H_[5 2 1] p Xulene carboxulic acid [1327] (268° 1 V)

p Xylene carboxylic acid [132] (268° 1 V)
Formation —1 From bromo-p xylene by
treatment with ClCO₂Et and sodium amalgam,
the resulting ether being then saponified (Jacobsen, B 14, 2111) —2 By oxidation of methyl
xylyl ketone CH, CO C₆H,Me₂ [1 2 5] by dilute
HNO₂ or by kMnO₄ (Claus, B 18, 1858, 19,
3183) —3 From its amide

Salts - CaA'2 2aq crusts, m sol water -

BaA'2 4aq small needles

Amide C,H,Me, CONH, [186°] Formed by the action of Cl CO NH, (or of HNCO and HCl) on p xylene in presence of AlCl, (Gatter mann, A 244, 54, B 23, 1199) Colourless needles (from water), m sol hot water, v e sol alcohol

Dr-methyl-bensoic acid C₆H₃Me₂·CO₂H [3 2 1] o Xylenec carbovylic acid Hemimellithylic acid [144°] Formed by the oxidation of hem melithene C₆H₃Me₄, [3 2 1] by dilute nitric acid (Jacobsen, B 19, 2518) Prisms (from hot alcohol) or plates (from dilute alcohol) Volatile with steam, v sl sol hot water, insol cold water Yields o-xylene when distilled with lime CaA'₂ aq Long piisms, m sol cold water

Di-methyl benson said C,H,Me,.CO,H[4 3 1] o Xylene i carboxylic acid [165°] Obtained by boiling its amide for 2 days with caustic potash solution Formed also, together with the isomeric m-xylene i carboxylic acid [126°] (v supra), by oxidising \(\psi\$ cumene with dilute \) HNO₈ (Fittig a Laubinger, A 151, 275) Its ether is formed by the action of sodium-amalgam on a mixture of bromo-o xylene and ClCO₂Et (Jacobsen, B 17, 2874) Prisms (from alcohol), almost insol cold water, v sl sol boiling water, v e sol alcohol Gives o xylene when distilled with lime Gives C₄H₂Me(CO₂H)₂

[3 4 1] on oxidation with dilute nitric acid—CaA'₂ 3½aq Needles—BaA'₂ 4aq Needles, v. sol water

A mide C₆H₈Me₇CONH₂ [131°] Formed by the action of NH₂ COCl on o xylene in presence of ACl₂ (Gattermann, A 244, 52) Long shining needles (from water) The amide obtained from o xylene, gaseous cyanic acid, HCl, and AlCl, melts at 165° (Gattermann a Rossolymo, B 2°, 1199)

Diphenylamide C. H. Me. CONPh. [136°] From NPh. COCI, o xylene, and AlCI, (Lellmann a Bonhoffer, B 20, 2119) Small prisms v sol hot alcohol, sl sol ether and ligroin

Nttrite C.H.,Me., CN (232°) VD 461
Formed by fusing potassium o xylene sulphonate with KCy (Jacobsen, B 11, 23) Formed also by heating the corresponding xylenyl phosphate PO(OC,H.,Me.,), with KCy, the yield being 20 p c (Kreysler, B 18, 1711) Liquid, miscible with alcohol and ether

Di-methyl-benzoic acid C₆H, Me₂ CO₂H [5 3 1]

is described as MESITYLENIC ACID

Di-methyl-benzoic acid C₆H₃Me₂CO₂H?

Lauroxylic acid [155°] Produced by the action of dilute nitric acid on laurene C₁₁H₁₆
(Fittig, Köbrich, a Jilke, A 145, 151) Hard nodules (from alcohol) Nearly insol cold, al sol boiling, water, v sol alcohol Yields acetic acid on oxidation with chromic acid mixture — BaA'₂4aq Concentrically grouped needles, v sol water —CaA'₂4aq —AgA' White pp, may be crystallised from water

Tri-methyl-benzoic acid v \(\psi \) Cuminic acid Another tri methyl-benzoic acid, \(Hemimellithens \) carboxylic acid, is described as c-Cuminic acid.

Terra-methyl-benzoic acid C.HMe.CO.H. [5 4 3 2 1] [165°] (G), [150°] (C) (c 270°). Formed by oxidising penta methyl benzene, dissolved in benzene, with dilute nitric acid (dott-schalk, B 20, 3286). Formed also by oxidising tetra methyl-phenyl methyl ketone or tetra methyl-phenyl acetic acid with KMnO. (Claus, J pr [2] 38, 234). Needles (G), m sol hot water, v e sol alcohol, ether, benzene, CS2, and chloroform (C). Its alkaline salts are very soluble. The Ag salt is v sl sol water. The cupric salt forms light-green plates.—BaA'.2aq. Plates or nodules, v sol water and alcohol (G).—BaA'. 6aq (C).—CaA'. 3aq (C).—NaA'.3aq

Tetra-methyl-bensoic acid C.HMe, CO.H. [6 4 3 2 1] Formed by oxidising the corresponding C.HMe, CO.CH, with KMnO, (Claus a. Foecking, B 20, 3103) Yellow liquid, not solidified at 0°

Tetra-methyl-bensoic acid C_sHMe₄ CO₂H [6 5 3 2 1] [109°] (C a F), [112°] (G) Formed by oxidising the corresponding C_sHMe₄ CO CH₅ with KMnO₄ (Claus a Foecking, B 20, 3108). Formed also by boiling its amide for several days with alcoholic potash (G) Plates

Amade C. HMe, CONH. [178°] From durene, CICONH., and AlCl. (Gattermann, A 244, 55); Shining plates (from dilute alcohol)

244, 55): Shining plates (from dilute alcohol)
Tetra-methyl-bensoic acid C₆HMe₄ CO₂H
[179°] From durene COCl₂, and AlCl₃, the product being decomposed by water (Jacobsen, B
22, 1223) Also from O₅HMe₄ CO C₅H, and
KMnO₄ (Meyer a Ador, J 1879, 562) Must be identical with one of the three preceding acids,

probably with that of Gottschalk Large plates (from dilute alcohol), v sl sol cold water Volatile with steam May be distilled Cone HClAq at 210° yields durene and CO₂—CaA'₂ Short prisms, sl sol hot water —BaA'₂4aq Small plates (from hot water)

Methyl ether C. HMe, CO. Me [59°] (269° LV) Plates (Jacobsen, B 22, 1223) Saponified

by alcoholic potash at 210°

Nitrile C₅HMe₄CN [77°] Formed by distilling tetra methyl benzoic acid with PbCy₂ (Jacobsen, B 22, 1224) Needles, v e sol al cohol Split up by HCl at 215° into durene and CO₂ A crystalline nitrile C₅H(CH₃)₄CN [69°], (260°), probably identical with the last is formed by the isomeric change of the carbamine derived from duridine (q v) by distillation It is very stable towards HCl, by which it is not saponified to the acid, but at 250° it decomposes with formation of tetra methyl benzene (Hofmann, B 17, 1914)

Amide C_sHMe_s CONH₂ [173°] Formed by passing gaseous evanic acid and HCl into durene containing AlCl₃ at 100° (Gattermann a Rossolymo, B 23, 1199) It is probably the amide of the acid [179°], but has not been fully

examined

Penta-methyl-benzoic acid C₆Me₅ CO₂H [210 5°] Formed from penta methyl benzene, COCl₂, and AlCl₃ at 0°, after a fortnight the product is exposed to moist air and then treated with water (Jacobsen, B 22, 1220) Needles (from water) or prisms (from 70 pc alcohol), v sl sol cold, sl sol hot, water, v e sol hot alcohol Volatile with steam May be distilled With H₂SO₄ it yields C₆Me₅ and c durene (prehintene) HNO₃ forms di nitro c durene Fuming HClAq at 200° yields CO₂ and pentamethyl-benzene — CaA'₂ Prisms, m sol water—BaA'₂2aq Plates, sol hot water

water —BaA'₂2aq Plates, sol hot water Methyl ether MeA' [67 5°] (300° 1 V)

Plates, v sol alcohol

Amide C₆Me₅ CONH₂ [206°] From C₆HMe₅, chloro formamide, and AlCl. Plates, sl sol hot.

w sl sol cold, water

Nitrile C₄(CH₃), CN [170°] (J), [168°] (H) (292°) (H), (295°) (J) Formed from the carbamine C₆Me₅NC by intra-molecular trans formation by heating it a few degrees above its melting point (Hofmann, B 18, 1825) Large white needles, sol alcohol and ether, insol water It is remarkably stable, and could not be saponified by treatment with acids or alkalis. By heating with HI at 220°-230° it yields pentamethyl benzene, NH₂, and CO₂. Cone HClAq at 215° also yields C₆HMe₅.

METHYL-BENZOIC ALDEHYDE v Toluic

ALDEHYDE

Di-methyl-benzote aldehyde C₆H₄Me₂CHO [421] m Xylobenzaldehyde Xylyhc aldehyde, [-8°] (216°) Formed by oxidising di methyl-benzyl alcohol with K₂Cr₂O₂ and H₂SO₄ (Hinrichsen, B 21,3085, 22, 121) Separated by K₂CO₂ Colourless oil, volatile with steam HNO₃ oxidises it to di-methyl benzote and [126°].

Di-methyl-bensoic aldehyde C₆H₄Me₂ CHO [58 1] (221°) Formed from mesitylene by treatment in CS₂ with CrO₂Cl₂, followed by water (Etard, C. R 97, 909) The yield is almost the theoretical quantity Yields mesitylene and on

exidation.

Tri - methyl - bensoic aldehyde Phenyl hydrasıde Ma₂C₂H₂CH N₂HPh [129°] Formed by the action of tri methyl benzoic aldehyde on a solution of phenyl hydrazine in dilute HOAe (Rudolph, A 248, 100) Colourless needles, very sensitive to light, v sol ether, hot alcohol, and petroleum ether

DI - METHYL - BENZOÏN C₁₆H₁₆O₂ * e [4 1] C₄H₄Me CO CH(OH) C₆H₄Me [1 4] [89°] p Toluotn Prepared by boiling 10 pts of p toluic aldehyde (from p xylene) with 2 pts of KCy and 30 pts of 50 pc alcohol, and shaking the mass, after cooling, till the yellow product separates (Stierlin, B 22, 380, cf Grimaux a Lauth, Bl. 7, 233) Pale yellow prisms (from dilute alcohol), sl sol hot water, v sol alcohol, ether, and benzene Fuming H₂SO₄ gives a beautiful green colour

Acetyl derivative C_{1e}H_{1s}AcO₂ [100°] White crystals, v sol alcohol and ether Benzoyl derivative C_{1e}H_{1s}BzO₂ [119°]

White crystals, v sol alcohol and ether

METHYL BENZONITRILE v Nitrile of Toluic acid

Di-methyl-benzonitrile v Nitrile of Di-METHYL BENZOIC ACID

METHYL - BENZOPHENONE v PHENYL

TOLYL KETONE

Di-methyl-benzophenone v PHENYL XYLYL

KETONE AND DI TOLYL KETONE
TRI - METHYL - BENZOQUINONE CARB
OXYLIC ACID v \(\psi \)-Cumoquinone carboxylic

METHYL - BENZOYL - ACETIC ACID v. a Benzoyl propionic acid

"BaA'₂ faq prisms, si sol cold water —AgA'

TETRA - METHYL - BENZOYL - BENZOIC

ACID C₈HM₆, CO C₈H₄, CO₂H [2 1] Duroyl
bensoic acid [c 260°] Formed by heating phthalic

anhydride with durene in presence of AlCl,

(Friedel a Crafts, A Ch [6] 14, 454, C R 92,

833) Insol water, v sol alcohol, ether, and

benzene May be crystallised from HOAc The

Pb, Cu, and Ag salts are insol water —*KA'

minute needles, v sol cold water —*NaA', v

sl sol alcohol —*NH₄A' needles —BaA'₂ aq

groups of needles, v sl sol water —CaA'₂ aq

needles, v sl sol water

METHYL-BENZOYL-ETHYL-HYDROXYL-AMINE v Hydroxylamine derivatives

METHYL-DIBENZYL v PHENYL TOLYL-ETHANE

METHYL-BENZYL-ACETIC ACID v PHENYL-250 BUTYBIG ACID

DI-METHYL-BENZYL ALCOHOL C,H₁₂O t e [4 2 1]C_eH₄Me₂ CH₄OH Xylyl alcohol [22°] (232°) Formed by adding KNO₂ to a solution of dimethyl benzyl amine sulphate (Hinrichsen, B 21, 3085) Colourless liquid, with aromatic odour, volatile with steam Oxidised by chromia acid mixture to di-methyl-benzoic aldehyde

Acetyl derivative C.H.,OAc (230°-

Benzoyl derivative C.H., OBz (333°)

Yellow oil (Hinrichsen, B 22, 123)

Penta-methyl-benzyl alcohol C12H18O 2 e G.Me, CH, OH Mellityl alcohol [160 5°] tained by saponifying its acetyl derivative with alcoholic potash (Jacobsen, B 22, 1217)

metric prisms, insol water, v sol alcohol
Acetyl derivative CaMe, CH,OAc (310°) Obtained by the action of KOAc and HOAc on the chloride C.Me, CH, Cl, which is got by heating hexamethyl benzene with PCl, at 140° (Jacobsen) Plates or prisms (from alcohol), v sol ether, m sol alcohol at 0°, insol weter

o METHYL-BENZYL-AMINE

[2 1]C_sH,Me CH, NH₂ o-Tolyl methyl-amme Xylylamine (202°) Formed by heating methyl-benzyl phthalimide (derived from ω bromo-o xylene) with conc HClAq in sealed tubes at 200° (Strassmann, B 21, 577) Liquid, which absorbs moisture and CO from the air -B'₂H₂PtCl₈ yellow needles —B'HCl needles (from alcohol) -Picrate B'C₆H₃N₂O₇ long yellow needles, decomposing above 170°

Acetyl derivative C.H.Me CH2NHAC [69°] Formed by heating the hydrochloride with NaOAc and Ac.O Crystallises from alcohol

m Methyl-benzyl-amine

[3 1] $C_6H_4Me\ CH_2NH_2$ (202°) Formed by heating ω bromo m xylene with potassium phthalmide, and decomposing the product with cone HClAq at 190° (Bromme, B 21, 2700) Colour-Colourless liquid, miscible with alcohol and ether Absorbs CO₂ from the air—B'HCl needles B'.H₂PtCl_b [212°] Golden plates—Sulphate $[248^{\circ}] - B'_{2}H_{2}C_{2}O_{4}$ [172°] water — Picrate [156°] Plates, v sol

Acetyl derivative C.H.Me CH, NHAc

(235°-240°) Oıl

Benzoyl derivative C.H., Me CH., NHBz [69°] White plates (from alcohol), v sol chlo roform, HOAc, and benzene

p Methyl-benzyl-amine

[4 1]C₆H₄Me CH₂NH Formed by treating an alcoholic solution of the amide of this p toluic acid with zinc and HClAq (Paterno a Spica, B

8, 441)

m (?) Methyl-benzyl-amine C₆H₄Me CH₂NH (196) Formed, together with Xylylamine di methyl di benzyl amine and tri methyl tri benzyl amine by heating w chloro xylene with alcoholic NH, at 116° (Pieper, A 151, 129) Oil, smelling like herring brine. Is either the mcompound or a mixture Lighter than water Absorbs CO₂ from the air—B'HCl [185°] Needles, v sol water and alcohol -B'2H2PtCl6

Di m (?) methyl-di-benzyl-amıne $C_{1e}H_{19}N$ i e(C₆H₄Me CH₂)₂NH Formed as above (Pieper) Oil smelling like herring brine Lighter than water Decomposes above 210° -B'HCl [198°] Needles, sl sol cold water, v sol hot water and alcohol —B'HBr [196°]

Tri m (?) methyl-tri-bensyl-amine $C_{24}H_{27}N$ oil, si sol alcohol Cannot be distilled With bromine water it yields (C,H,Me CH,),NH and C,H,Me CHO —B'HCl [212°] (P), [204°] (Jannasch, A 142, 303) Needles, al sol cold alcohol, insol water and ether Heated in a

current of dry HCl it yields (C,H,Me CH2)2NH

and C₈H₄Me CH₂Cl —B'HNO₃ [122°] (J)

Di methyl-benzyl-amine C₈H₁N₁ e

[4 2 1]C₈H₄Me₂ CH₂NH₂. (219°) Xylyl-methyl
amine Xylobenzyl amine Formed by reducing with sodium the nitrile of the corresponding di methyl benzoic acid dissolved in alcohol (Hinrichsen, B 21, 3083, 22, 122) Liquid, sl sol water, v sol alcohol and ether Readily absorbs CO2 and moisture from the air Nitrous acid converts it into the corresponding alcohol
—B'HCl [210°] Needles or plates —B'_HLPtCl_,

[428°] —B'HHgCl_ [205°] —Nitrate [158°] —
Sulphate [254°] —Picrate [223°] —B'CdI_ — B',H2I2CdI2.

Benzoyl derivative C.H.2BzN Needles, v sl sol water, v e sol alcohol and

benzene

Di-methyl-benzyl amine BENZYL DI METHYL AMINE

METHYL-BENZYL ANILINE

C₆H₆NMe CH₂Ph (306°) (N), (above 360°) (S) From methyl anilne and benzyl chloride (Noelting, J 1883, 702, Stebbins, A C J 7, 42). Pale yellow oil

METHYL - BENZYL - BENZOIC p METHYL-BENZIL-BENZIL-C₁₅H₁₁O₂ te [4 1]C₅H₁Me CH₂C₆H₄CO₂H [134°] Formed from C₆H₁Me CO C₆H₄CO₂H by reducing with zinc dust and ammonia, filtering, diluting with water, adding HCl, dissolving the pp in NH₄Cl, and re ppg with acid (Gresly, A 234, 235) Long needles (from alcohol), v sol alcohol, HOAc, and benzene, almost insol water -BaA'₂ plates, v sol water

Di-methyl benzyl benzoic acid C16H16O2 2. [4 2 1] C, H, Me₂ CH. C, H, CO₂H[1 2] [188°] Ob tained by reducing C, H, Me₂ CO C, H, CO₂H with zinc dust and ammonia (Gresly, A 234, 237) Small needles (from alcohol) - BaA'asq Plates

(from dilute alcohol), sl sol water

METHYL-BENZYL BROMIDE v . Bromo XYLENE

DI METHYL-BENZYL CARBAMIC ETHER C₁₂H₁,NO₂ is [6 4 2 1]C₄H₂Me₅ NH CO₂Et

Mestlyl carbanuc ether [62°] From mesidine
and ClCO₂Et (Eisenberg, B 15, 1016) Long
needles (from water) Volatile with steam

METHYL-BENZYL-CARBINOL v PHENYL-

250 PROPYL ALCOHOL PENTA - METHYL - BENZYL CHLORIDE

C₆Me₅CH₂Cl [99°] (c 285°) Formed by heating C₆Me₆ (40 g) with PCl₃ (50 g) at 140° (Jacobsen, B 22, 1217) Plates (from alcohol ether), v e sol ether, sl sol alcohol TRI METHYL BENZYL CYANATE

[6 4 2 1]C₆H₂Me₂N CO (219°) From tri methylbenzyl carbamic ether and P₂O₅ (Eisenberg, B 15, 1017) Pungent liquid

METHYL-BENZYL GLYOXIM v. BENZYL-METHYL GLYOXIM

DI-w METHYL DI-BENZYLIDENE-ETHYL-ENE DIAMINE C18H20N21 e C2H4(N CMe C6H5)2 [c 104°] Formed by heating ethylene diamine (1 mol) with acetophenone (2 mols) to 120° White needles V sol alcohol and benzene, sl sol ether It is readily decomposed into its constituents, especially by acids (Mason, B 20,

METHYL BENZYL KETONE v BENZYL-METHYL-KETONE.

Methyl benzyl diketone $C_{10}H_{10}O_2$ i.e. (176°) SG $\frac{1}{2}$ 1 0721 CH, CO CO CH₂C₆H₅ (176°) S G 1 1 0721 This ketone is formed by distilling its monoxim CH, CO C(NOH) CH₂ C₆H₅ with FeCl, and dilute HCl (H Muller a Pechmann, B 22, 2133) Thick yellow oil, smelling like honey.

Dr-phenyl-drhydraside CH, C(N,HPh) C(N,HPh) CH2C,H, [173°]

Almost colourless flat silky needles

CH₃ CO C(NOH) CH₂C₆H₅ Mono oxim Isomtroso benzyl acetone [81°] Formed by the action of nitious acid on barium benzylacetoacetate (Ceresole, B 15, 1876, 3072, 16, Needles, insol ligroin May be sublimed 836) Dissolves in aqueous alkalis forming yellow solutions With NaOEt and benzyl chloride it gives CH₂ CO C(NOCH₂Ph) CH₂ C₆H₅, a thick yellow oil, volatile with steam

Di-oxim CH₃ C(NOH) C(NOH) CH₂ C₆H₅ Methylbenzylacetoximic acid [181°] by adding an alcoholic solution of hydroxylamine hydrochloride to an alcoholic solution of the mono-oxim (Schramm, B 16, 181, 218s) Small needles With Ac₂O it yields a di acetyl derivative CH₃ C(NOAc) C(NOAc) CH₂C₆H₅[80°]

METHYL-BENZYL MALONIC ACID BENZYL-METHYL-MALONIC ACID

o METHYL BENZYL-PHTHALAMIC ACID

 $C_{1e}H_{1b}NO_3$ 1 e [1 2] C_eH_4Me CH₂ NH CO C_eH_4 CO₂H[2 1]

o Xylyl phthalamic acid [156°] Formed by o methyl-benzyl phthalimide aqueous NaOH and ppg the solution with HCl (Strassmann, B 21, 576) Slender needles -AgA'

m-Methyl-benzyl-phthalamic acid

[1 3]C₆H₄Me CH₂ NH CO C₆H₄ CO₂H[2 1] [131°] Formed in like manner from m methyl benzylphthalimide (Bromme, B 21, 2700) Slender needles (from hot alcohol) -AgA' v sol boiling

o METHYL-BENZYL-PHTHALIMIDE

[1 2] C₆H,Me CH₂ N < CO > C₆H, [149°]

tained by heating ω bromo o-xylene with potassum phthalimide at 200°, the yield being 76 pc of the theoretical amount (Strassmann, B 21, 576) White hexagonal crystals (from alcohol), insol water With conc HClAq at 200° it forms methylbenzyl amine (202°) Aqueous NaOH converts it into o methyl benzyl phthalamic acid

m Methyl-benzyl-phthalimide

[18] C₆H₄Me CH₂ N CO C₆H₄

phthalimide [118°] Formed in like manner by heating ω bromo-m xylene with potassium phthalimide at 190° (Brömme, B 21, 2700) Slender hexagonal needles (from hot alcohol), v sol ether, chloroform, and alkalıs

METHYL-BENZYL-PIPERIDINE v BENZYL-METHYL-PIPERIDINE

METHYL BENZYL SULPHIDE CaH10S 26 CH, S CH, C, H, (195°-198°) Formed by heating benzyl chloride with Pb(SMe), at 100° (Obermeyer, B 20, 2926)

o Methyl-benzyl thiocarbimide C.H.NS 2 c. [21]C₆H₄Me CH₂ N CS o Xylyl throcarbinide (256°) Formed by boiling an ethereal solution of o-methylbenzyl-amine with CS, and HgCl.

(Strassmann, B 21, 578) Oil, smelling strongly like horse radish

D1-methyl-benzyl thiocarbimide $C_{10}H_{11}NS \ \imath \ \epsilon$ [4 2 1]C₆H₃Me₂.CH₂ N CS Xylobenzyl mustard oil Formed by heating the corresponding urea (C,H,Me, CH, NH),CO with syrupy phosphoric acid (Hinrichsen, B 22, 123)

METHYL-BENZYL-THIO-UREA

CH, NH CS NH CH, C,H, [74°] Formed by exposing an alcoholic solution of benzylamine mixed with methyl thiocarbimide for some days to the air (Dixon, C J 55, 619) White octa hedra, v sol hot benzene and hot alcohol, m sol ether Gives a black pp with ammoniacal AgNO₃, but the aqueous or alcoholic solution is not desulphurised by prolonged boiling with alkalıne lead tartrate

Methyl di-benzyl \(\psi \) thio-urea \(v \) DI BENZYL

METHYL-V-THIO UREA

o-Methyl-benzyl-thio-urea C,H, NS ic [2 1]C, H, Me CH, NH CS NH. o Xylyl thro urea [167°] Formed by evaporating a solution of potassium sulphocyanide and o methyl benzyl amine hydrochloride, and heating the residue to 140° (Strassmann, B 21, 578) White necdles (from water), m sol hot water Turns red in Alr

m Methyl-benzyl-thio-urea

[3 1]C,H,Me CH, NH CS NH, [112°] Prepared in the same way as the preceding body, using [3 1]C₅H₄Me CH₂NH₂ (Bromme, B 21, 2700)

Di m methyl-di-benzyl-thio-urea C, H, N,S e (C₆H₄Me CH₂ NH)₂CS [97°] Prepared by boil ing m methylbenzyl amine with alcoholic CS2

Needles, insol water, acids, and alkalis Tetra methyl-di-benzyl thio-urea $C_{19}H_{24}N_{\circ}S$ $(C_0H_3Me_2CH_2NH)_2CS$ **D**ixylobenzylsul phourea [177°] From (4, 2, 1) di methylbenzyl amine and alcoholic CS_2 (Hinrichsen, B22, 123) Glittering needles (from hot alcohol)

o METHYL-BENZYL-UREA CoH, 2N,O 1 c [2 1]C₆H₄Me CH₂ NH CO NH o-Xylyl urea [173°] Formed from o methylbenzyl amine sulphate and potassium cyanate (Strassmann, B 21, 578) Radiating moss like crystals (from alcohol), insol water

m Methyl-benzyl-urea

[3 1]C,H,Me CH, NH CO NH. [148°] Long needles from alcohol (Bromme, B 21, 2700)

D1-m-methyl-d1-benzyl-urea

 $(C_6H_4Me\ CH_2NH)_2CO$ [137°] Formed from m methylbenzyl-amine and COCl, in ethereal solution (B) Slender needles (from alcohol or ether)

Di-methyl-benzyl-urea C10H14N2O 2 e [4 2 1] C, H, Me, CH, NH CO NH, m Xylobenzyl-urea [184 5°] Formed by mixing concentrated solutions of (4, 2, 1) di methyl-benzyl amine hydrochloride and potassium cyanate (Hinrichsen, B 22, 122) Slender needles (from alcohol), m sol water from which it separates as a flocculent pp METHYL-BISMUTHINE v Bismuth methods

under Bismuth, organic derivatives

METHYL BORATES

Tri-methyl-borate Me, BO, (72°) (E a B), (65°) (S) SG 2 955 (E a B), 940 (S) VD 866 (E a B) Prepared by heating B,O, with methyl alcohol at 100° in sealed tubes, and distilling The distillate is freed from MeOH by shaking with conc H2SO4, and the upper layer is then rectified (Schiff, Bl [2] 5, 372, 6, 36) Formed also by the action of BCl, on dry methyl alcohol, the upper layer of the product being rectified (Ebelmen a Bouquet, A Ch [3] 17, 59, A 60, 251) Colourless mobile liquid, sol alcohol and ether Burns with a green flame (greener than that of Et.BO.) Decomposed by water into boric acid and MeOH

Methyl metaborate MeBO A thick liquid. formed by heating Me, BO, with BO, When heated, it begins to decompose a 160° giving off Me.BO, and at 250° there remains a mass of the composition MeB,O, which becomes vitreous

on cooling

An acid methyl rorate Me B.O. was described by Ebelmen (A Ch [3] 16, 1.7) as obtained by treating BO, with dry MeOli, and as being a vitreous mass, readily decomposed by water into boric acid and MeOH It was probably a mixture of Me, BO, and MeBO,

METHYL-BORNYL UREA BORNYL-

METHYI UREA

TRI-METHYL-BRAZILIN C16H11Me3O5 3aq Formed in the preparation of tetra methyl brazilin (v infra) Crystalline, sol dilute alco hol Its solution in aqueous NaOH is colourless

and gives a brown pp with FeCl,

Acetyl derivative C₁₆H₁₀AcMe₃O₅ [97°]
Tetra-methyl-brazilin C₁₇H₁₀Me₄O₅ [139°] [139°] Formed by the action of NaOEt and MeI on brazilin (Schall a Dralle, B 20, 3365, 21, 3009) Snow white crystals Bromine in HOAc forms C16H9BrMe4O, [181°] and crystalline di bromo tetra methyl brazilin dibromide C16H8Br Me4O3

METHYL-BROMACETOL aa Di bromo-I ROPANE

METHYL BROMIDE CH.Br Bromo methane Mol w 95 (45°) SG ${}_{8}^{8}$ 17331, ${}_{2\overline{2}}^{2}$ 17235 (Perkin), ⁰/₂ 1 732 (Merrill) V D (H=1) 95 M M 4 644 at 15° (Perkin, C J 45, 454) H F p 14,700 H F v 14,210 (Phomsen) S V 55 7 (Lossen, A 254, 68)

Preparation - Methyl alcohol (800 grms) and amorphous phosphorus (133 grms) are put into a retort Bromine (800 grms) is slowly After some hours the retort is heated and the product condensed in a receiver surrounded by a freezing mixture. It is washed with dilute potash, dried over calcic chloride and distilled (Merrill, J pr 126, 296, cf Pierre, J Ph [3] 13, 156, Bunsen, A 46, 44)

Properties - Colourless, mobile liquid, with burning taste and pleasant smell resembling chloroform Burns with greenish brown smoky flame Miscible with alcohol, ether, chloroform, and CS₂ Poured into cold water a white ice like mass is formed It is approximately CH, Br, 20aq At 5° it begins to split up with evolution of methyl bromide gas

METHYL-BROMO-ACETOACETIC ETHER v

Bromo aceto-acetic acid

METHYL-BROMO-ACETOL v DI BROMO PRO-

METHYL a-BROMQ-ALLYL OXIDE C,H,BrO e CH, O CH, CBr CH. (116°) SG 10 135 Formed by the action of NaOH CH, O CH, CHBr CH, Br (Henry, B 5, 455)

METHYL BROMO - ALLYL SULPHIDE C.H.BrS to CH. S CH. CH CHBr Formed by heating Pb(SMe), with s-tri-bromo propane in

ethereal solution at 150° (Obermeyer, B 20, 2925) Decomposes at 120°-130° Combines Combines with Br (1 mol)

METHYL-BROMO-AMINE v METHYLAMINE METHYL-DI-BROMO-ANTHRACENE v 1/1. BROMO METHYL ANTHRACENE

METHYL-DI-BROMO ATROLACTIC ACID v. DI BROMO OXY-TOLYL PROPIONIC ACID

METHYL BROMO - BUTYL KETONE ACETYL BUTYL BROMIDE

TRI METHYL - BROMO - ETHYL AMMO-NIUM BROMIDE v TRIMETHYLAMINE bromo. ethylo bromide

METHYL-BROMO ISATIN v Methyl derivative of Bromo Isatin, p 71

METHYL BROMO ISATOID v Bromo methylisatoid, p 71

METHYL BROMOPROPYL KETONE

CH₂ CO CH₂ CH₂ CH₁ Br Acetyl propyl bromide. (118°) at 90 mm (P), (106°) at 60 mm (L) Formed by treating acetyl propyl alcohol (q v) with a saturated aqueous solution of HBr (Colman a Perkin, jun, C = J = 55, 357, Lipp, B = 22, 1196) Colourless mobile liquid with penetrating Turns brown in light SI sol cold odour water, quickly decomposed by hot water, dissolving as acetyl propyl alcohol Forms a crystalline compound with NaHSO, NaOEt and KOH act on it, forming a light ethereal oil C.H.O (113°), probably methylene furfurane tetrahydride

METHYL BROMO-STYRENE v BROMO TOLYL-

METHYL BRUCINE v Methylo- compounds of Brucine, vol 1 p 637

BUTENYL TRICARBOXYLIC METHYL **ACID** v Pentane tricarboxylic acid

METHYL BUTENYL KETONE vACETONE

METHYL ISOBUTYL ACETAL v ALDEHYDE METHYL-BUTYL-ACETIC ACID v Heptoic

ACID Methyl-di-butyl acetic acid v Hendecore

METHYL-BUTYL-ACETYLENE v HEPTIN-

METHYL-ISOBUTYL ANILINE C,,H,,N . e $C_{e}H_{s}NMe CH_{2}Pr (235^{\circ})$ (Noelting, J 1883, 702). METHYL - ISOBUTYL - BENZENE v Iso-

BUTYL TOLUENE METHYL - BUTYL - CARBINOL v HEXYL

ALCOHOL Di methyl butyl-carbinol v HEPTYL ALCOHOL.

METHYL ISOBUTYL CARBONATE C.H. O. te CH,O CO OC,H, (143 6° cor) 8 G 17 95 (Rose, A 205, 230)

DI - METHYL - BUTYLENE - DIKETONE C.H.O. re CH. CO CH. CH. CH. CH. CH. CO CH. Dr-acetyl butane [44°] Obtained by heating its dicarboxylic ether with NaOMe in MeOH (Marshall a Perkin, jun, C J 57, 241) Crystalline mass, sl sol water, v sol other menstrua Combines with NaHSO, Reacts with phenylhydrazine and with hydroxylamine Boiling alcoholic potash condenses it forming methylpenta methenylyl trihydride methyl ketone $CH_{\bullet}C < C(COCH_{\bullet}) > CH_{\bullet}$

DI - METHYL - BUTYLENE - DIKETONE CARBOXYLIC ETHER C11H18O, 10 CH2 CO CH2 CH2 CH4 CH(CO2Et) CO CH2.

di-acetyl n valeric ether (195°-200°) at 100 mm. Obtained by distilling the corresponding di-carboxylic ether (di-acetyl adipic ether) with potash, neutralising the residue with H2SO4, extracting with ether, washing the ether with water, drying and evaporating (Perkin, jun, C J 57, 229) Colourless oil, v sol ether and alcohol, sl sol water Its alcoholic solution is coloured violet by FeCl, On hydrolysis it yields acetyl-valeric acid and acetic acid

D1-methyl-butylene-diketone dicarboxylic ether C₁,H₂O₅ te CH₃ CO CH(CO₂Et) CH₄,CH₂CH(CO₂Et) CO CH₃ Ethylene diaceto acetic ether Di acetyl adipic ether Formed by the action of sodium (40 g) on aceto acetic ether (260 g) and ethylene bromide (190 g), dissolved in alcohol (Perkin, jun, C J 57, 215) It may be purified by conversion into the yellow flocculent di sodium compound (Ac CNa(CO₂Et) CH₂)₂, decomposing this with very dilute HCl, and extracting with ether Thick oil, miscible with alcohol and ether, sl sol dilute aqueous KOH FeCl, colours its alcoholic solution intense violet red Combines with great difficulty with NaHSO₃ Decomposed by heat into di-methyl butylene diketone carboxylic ether, and the two ethers

C(CH₃) C CO CH₃ and CO₂Et CH CH, CH₂ C(CH₃) C CO₂Et Alcoholic ammonia

CO.Et CH CH, CH,

converts the dicarboxylic ether into the di imide (CH₃ C(NH) CH(CO₂Et) CH₂)₂ [174°] which is reconverted by warming with dilute HCl into the

original ketonic ether

Phenyl hydrazide (CH₃ C(N₂HPh) CH(CO₂Et) CH₂)₂ Formed by heating di methyl butylene diketone carboxylic ether with phenyl hydrazine on the water bath (Perkin, jun, a Obremsky, B 19, 2049, Perkin, jun, C J 57, 221) Plates or needles (from MeOH), v sol cone HClAq, insol alkalis, v sl sol ether At 200° it gives off EtOH (2 mols), forming di oxy di phenyl dimethyl ethylene - di - pyrazole tetrahydride CO CH CH, CH, CH CO

CMe CMe `N ĊMe METHYL-ISOBUTYL-GLYOXALINE thylo rodide CoH1, N2I re N2C2H2MeC4H9MeI Formed by treating isobutyl glyoxaline (glyoxal-isoamyline) with MeI in MeOH (Radzis zewsky a Szul, B 17, 1294) Trimetric prisms (from alcohol)

\NPh

METHYL-n-BUTYL KETONE CH, CO C.H. (127°) SG 2.830 Formed by the oxidation of sec hexyl alcohol (Erlenmeyer a Wanklyn, A 135,

144, Schorlemmer, A 161, 263) Combines with NaHSO, Gives on oxidation acetic, nbutyric, and valeric acids (Wagner, B 18, 2267)

Methyl isobutyl ketone CH, CO CH, Pr (115°) S G § 8195, 19 8034 (Wagnes, J R 16, 703) A product of the distillation of potassium isovalerate with NaOAc (Williamson, 4 Formed by the action on valeryl chloride of ZnMe, followed by water Formed also by boiling isopropyl-aceto acetic ether with baryta water (Frankland a Duppa, A 145, 82)

Combines with NaHSO. Yields on oxidation acetic, isobutyric, and isovaleric acids

Methyl sec-butyl ketone CH, CO CHMeEt S G 14 5 8181 Formed by boiling (118° 1 ♥) methyl ethyl acetoacetic ether with dilute KOH or baryta water (Wishcenus, A 219, 307, Wagner, J R 16, 711) Oil, smelling of peppermint Oxidised by chromic acid mixture to methyl ethyl ketone and HOAc Sodium reduces it to the corresponding nexyl alcohol and methyl sec butyl pinacone [249°]

Methyl tert-butyl ketone CH, CO CMe, (105 3°) (Schiff, B 19, 562) SG. Pinacoline

2 8265, 1ª 800

Formation —1 By distilling pinacone with dilute sulphuric acid (Fittig, A 114, 56) —2 By the action of CMe, COCl on ZnMe, followed by water (Butlerow, A 174, 125) —3 By the dry distillation of calcium isobutyrate (Barbaglia a Gucci, B 13, 1572)

Properties -Liquid, smelling of peppermint, nearly insol water Sodium amalgam forms the corresponding hexyl alcohol with NaHSO₃ Chlorine forms pungent C₆H₁₀Cl O

crystallising in needles [51°], (178°) Oxim CH, C(NOH) CMe, [75°] Slender needles, very volatile with steam (Janny, B 15, 2780) May be sublimed Sl sol cold, v sol hot, water Has a camphor like smell and taste Not decomposed by acids

Methyl isobutyl diketone C,H12O CH, CO CO CH, CH(CH,) Acetyl isovalcryl Diketoheptane (138°) S G 22 908 Formed by distilling its mono oxim with dilute H SO (Otte a Pechmann, B 22, 2122) Yellow oil with irritating smell, becoming fruity when di Sl sol water

Mono oxim CH, CO C(NOH) CH2Pr Ni troso isobutyl acetone [42°] Formed by adding NaNO, (10g) to a solution of isobutyl aceto acetic ether (27g) in water (300 cc) and KOH (8g), and extracting with ether (Treadwell a Westenberger, B 15, 2786) White plates, v sol alcohol and ether, sl sol cold water, dis solves in alkalis

CH₃ C(NOH) C(NOH) CH Pr DioximSmall white shining plates (from [c 172°] dilute alcohol) (O a P)

Oxim phenylhydrazide C₁₃H₁₈N₃O i e CH₃C(N₂HPh) C(NOH) CH₂Pr [151°] Almost colourless needles

Phenylhydrazide C₁₃H₁₈N₂O [98°] Almost colourless needles

Diphenylhydrazide CH₃ C(N₂HPh) C(N₂HPh) CH₃Pr [116 5°] Almost colourless needles

METHYL n BUTYL KETONE CARBOXYLIC ACID C,H,1O, i e
CH, CO CH, CH, CH, CH, CO, H

valeric acid [42°] A product of the hydro

lysis of di methyl butylene diketone carboxylic ether by a solution of KOH in methyl alcohol (Perkin, jun, C J 57, 231) Colourless crystals, v sol water, alcohol, and ether Its ammo nium saltis very soluble —AgA' leafy masses The cupric salt forms (from hot water) minute spherules

METHYL-ISOBUTYL-KETONE SULPHONIC ACID CH₂ CO C₁H₂(SO₂H) The sodium salt of this acid is slowly formed by the action of a saturated solution of NaHSO, on mesityl oxide It is easily soluble in water and alcohol, melts at 95°, is not attacked by Na₂CO₂, but by NaOH it gives mesityl oxide (Pinner, B 15, 592)

METHYL BUTYL KETOXIM v. Oxim of

METHYL BUTYL KETONE

METHYL n BUTYL OXIDE C3H12O 16 CH, OC,H, (703°) SG \$ 7635 SV 1 CE (0°-10°) 00125 (Dobreiner, A 243, 3) 127 2

Methyl isobutyl oxide CH, O CH₂Pr One of the products of the action of NaOCH₂Pr on methylene iodide oi iodoform (Gorboff, J pr Oil Conc HIAq yields MeI [2] 41, 238, 254) and isobutyl iodide

METHYL-ISOBUTYL-PHENOL C11H16O 1 e $C_6H_3(CH_3)(C_4H_9) OH[1 3 6]$ (236°) Isobutyl o cresol Formed by the action of nitrous acid on methyl isobutyl phenyl amine (Effront, B 17, 2324) Oil V sol alcohol and ether, nearly insol water

Isomeride v Methyl ether of Isobutyl-PHENOL

METHYL-ISOBUTYL PHENYL AMINE

 $C_0H_3(CH_3)(C_4H_9)NH_2[1\ 3\ 6]$ Isobutyl tolyl (243°)amine or toluisobutylamine Formed by heating o toluidine hydrochloride with iso butyl alcohol at 200°-300° (Effront, B 17, 2317) Colourless liquid Volatile with steam Miscible with alcohol and ether, nearly insol water

Salts -B'HCl Long thin needles, sl sol cold water, v sol hot water -B'HBr long soluble needles -B'.H SO, needles, sl sol cold water - B' H₂C₂O₄ silvery needles, insol ether

Formyl derivative C11H15 NH(COH) [106°] Colourless tables, v sol alcohol and ether, nearly insol cold water

Actual derivative C,H, NHAc [162°] Colourless plates, sparingly sol hot water, easily

Benzoyl derivative C,H, NHBz [168°] Small white needles, insol cold water, v sl sol hot

METHYL-ISOBUTYL PHENYL-AMINE

 $C_{1}H_{2}(CH_{2})(C_{1}H_{2})NH_{1}[1\ 5\ 6]$ (244°) by heating o toluidine with isobutyl alcohol and ZnCl. at 270°-280° (Effront, B 17, 2339) Colourless liquid Volatile with steam

Salts -B'HCl Plates -B'2H2SO4 plates

-B'.H C.O. easily sol ether Formyl derivative $\mathbf{C}_{11}\mathbf{H}_{10}$ NH(CHO) White plates, v sol alcohol and ether, nearly insol water

Acetyl derivative CnH15 NHAc [141°] Long silky needles

Benzoyl derivative C11H15 NHBz [142°] Silvery plates

MÉTHYL - ISOBUTYL - PHENYL - DI -**METHYL-AMINE** $C_6H_3(CH_3)(C_4H_9)NMe_2[1 \ 3 \ 6]$ Dimethyl toluisobutylamine (250°) Colourless Formed by methylation of methyl iso butyl phenyl amine -B'2H2Cl2PtCl4 (Effront, B 17, 2339)

DI METHYL-DI-BUTYL-DI PHENYL-THIO-UREA v DI BUTYL DI-TOLYL THIOUREA

METHYL BUTYL PINACONE DI-OXY-DODECANE

DI METHYL DI ISOBUTYL-PYRAZINE

 $N \leqslant_{\mathbf{C}(C_4\mathbf{H}_9)}^{\mathbf{CMe}} \stackrel{\mathbf{C}(C_4\mathbf{H}_9)}{\mathbf{CMe}} N D_i$ isobutyl-C,4H24N2 2.6 (243°)Formed by reducing the oxim of methyl isobutyl diketone Me CO C(NOH) C.H.

with tin and HCl (Lang, B 18, 1364, Oeconomides, B 19, 2526, Wolff, B 20, 433)

oil -B'H.PtCl₆ orange needles
DI METHYL ISOBUTYL PYRIDINE C11H1,N $N \leqslant_{CMe\ CH}^{CMe\ CH} > C C_4H_4$ Isobutyl lutidine. (210°-213°) S G 12 8961 Formed by distilling its carboxylic acid with lime (Engelmann, A 231, 65) Oil, smelling of violets Tastes bitter More soluble in cold water than in hot water -B₂H,PtCl₆. [209°] Yellow crystalline pp -B',H,Cr,O, Yellow plates, v sol boiling water -Picrate [115°] Yellow needles

Hexahydride C11H22N 1e

NH CHMe CH₂ CH C,H, s Isobutyl lupe-Di methyl isobutyl piperidine at 720 mm Formed by reducing di methyl isobutyl pyridine in alcoholic solution with sodium (Jaeckle, A 246, 47) Oil With NaNO, and HCl it yields a nitroso compound — B'HCl [184°] Prisms, v sol water and alcohol—B'HBr Prisms The platinochloride and chromate could not be crystallised

DI METHYL-ISOBUTYL PYRIDINE DI-CARBOXYLIC ACID C12H17NO4 1 e

N≪CMe C(CO,H)>C C,H, [273°] Formed by boiling its diethyl ether with alcoholic, and afterwards with aqueous, potash (Engelmann, A 231 57) Long monoclinic prisms (containing Decomposed by fusion M sol cold, v sol hot, alcohol -CaA"3aq Small four-sided pyramids, v sol water -BaA"5aq -H2A"HCL M sol cold water

HEtA" [135°] Mono ethyl ether Formed by boiling the di ethyl ether with alco holic potash Long prisms, v sol water and alcohol -Ba(EtA") 5aq -HEtA"HCl2aq thick prisms

Et,A" Diethylether (312°-318°) Formed by passing nitrous acid gas into an alcoholic solution of its dihydride Thick oil -It A' HCl long needles, decomposed by water into HCl and Et₂A' -(Et₂A")₂H₂PtCl₆ [208°]

Cubes Dihydride of the diethyl ether

NH Cyle C(CO H) CH C,H, [100°] Formed by warming acetoacetic ether with isovaleria aldehyde ammonia in alcohol (E) Long prisms. v sol alcohol, ether, and benzene

METHYL ISOBUTYL SULPHATE C,H12SO, ie (CH3)(C4H9)SO4 appears to be formed by the action of methyl alcohol on C,H,O SO,Cl, the product of the action of isobutyl alcohol on SO.Cl., (Behrend, J pr [2] 15, 34) Decomposed by water into HOMe and C₄H₉O SO₄OH

DI METHYL ISOBUTYRYL-ACETIC ETHER

v Di isopropyl ketone carboxylic ether METHYL CAFFEIC ACID v Caffeic acid METHYL CAFFURIC ACID v CAFFEINE

METHYL CARBAMATE NH₂ CO₂Me Methyl urethane [52°] (G), [56°] (F a K) (177°). Formed from NH, COCl and excess of methylalcohol (Gattermann, A 244, 39) Formed also from C.H.(N(NO.) CO.Me), by the action of NH₈ (Franchimont a Klobbie, R T C 7, 343)

METHYL CARBAMIC ACID *NHMe CO2H The methylammonium salt NHMe CO,NH,Me appears to be formed by passing CO, into dry methylamine (Wurtz, A Ch

[8] 30, 450, 461)

Methyl ether NHMe CO.Me (158°) SG 15 1065 Formed by treating methyl chloro formate Cl CO, Me with an aqueous solution of methylamine (Franchimont a Klobbie, R T C Colourless liquid, with characteristic With pure HNO₃ it yields a character odour' istic nitro- derivative

Ethylether NHMe CO2Et (170°) Formed from methylamine and chloro formic ether (Schreiner, J pr [2] 21, 124) Oil, with pleasant When boiled with potash or baryta it yields alcohol, methylamine, and K2CO3

NHMe COCl From COCl₂ and methylamine hydrochloride (Gattermann a Schmidt, B 20, 118)

posed on boiling

Di methyl-carbamic acıd *NMe, CO,H

Methyl ether NMe₂CO₂Me (131°) SG 15 1012 Formed by treating Cl CO OMe with an aqueous (33 p c) solution of dimethylamine (Franchimont a Klobbie, R T C 8, 299) Colourless liquid, smelling like menthol Pure HNO, forms NMe(NO.) CO.Me

Ethyl ether NMe, CO,Et (140°) (Schreiner, J pr [2] 21, 125), (147°) (Franchimont a Mobbie, R T C 3, 223) SG 11 978 From With ammonia Cl CO Et and dimethylamine

obloride NMe₂ CO NH₂ Chloride NMe₂ COCl (1 (165°) From dimethylamine and a solution of COCl₂ in benzene (Michler a Escherich, B 12, 1162) with peculiar odour, v sol ether and CS₂ Decomposed slowly by water into HCl, dimethylamine, and CO,

METHYL CARBAMINE C2H3N te CH3N C Methyl isocyanide Methyl cyanide Methyl mine Isoacetomirile Mol w 41 (596°) V D 144 (calc 142) S G S 10 at 15° Formed by the action of carbylamine ₹ 75**6** MeI (1 mol) on silver eyanide (2 mols) the product being decomposed by KOH and dried over CaCl₂ (Gautier, C R 63, 924, 65, 468, 862, 66, 1214, A 152, 222, A Ch [4] 17, 203) Formed also by the action of MeI on mercuric fulminate (Calmels, J pr [2] 30, 319, C R

Properties -Liquid with powerful odour,

producing nausea

Reactions -1 Aqueous acids decompose it into methylamine and formic acid -2 HOAc forms CH₈NH CHO and Ac₂O —3 Oxidised by HgO at 50° to methyl cyanate CH,N CO and a compound Me₃N₃C₃O₃(NH₂ CHO) [175°] in ethereal solution appears also to form diin ethereal solution appears also to form differmamide NH(CHO)₂ or, rather, a compound Me₂N₃C₃c₃(NH(CHO)₂) [163°] (Gautier, C R 67, 804)—4 With AgCy it forms a compound MeNCAgCy [80°-90°] (Meyer, J 1856, 528) Salt—(MeNO)₂3HCl. Formed by passing HCl into an ethereal solution of methyl carbanna Creatallyna Becomposed by water. Crystalline Decomposed by water, partially reproducing methyl carbamine — 5 MeI acts in a complicated manner (Lubavine, Bl. [2] 45, 246, Gautier, A Ch [4] 17, 148)
Tri-methyl-carbsmine. A name used by

Rudneff (Bl [2] 33, 297) to denote tert-Buttle-

METHYL-SEMI-CARBAZIDE C,H,N,O ... NH. CO NH NH. Me [113°]. Formed from

methyl-hydrazine acid sulphate KHO and KCNO (Bruining, A 253, 10) Prismatic tables, v sol water and EtOH, m sol ether

METHYL-CARBAZOLE C15H11N 4.6

>NMe [87°] Formed by heating potas C'H' sium carbazole with MeI at 180° (Graebe, A 202, 23) Micaceous leaflets or needles, insol water, sol ether Conc H SO, containing a little HNO, gives a green colour—Picrate C₁₅H₁₁NC₆H₂(NO₂)₃OH [141] Dark redneedles METHYL CARBIMIDO ALLYL-THIO UREA

 $SC <_{\rm NH}^{\rm NC_3H_5} > C \ {\rm NMe} \ \ {\rm or} \ \ C_3H_5 \ {\rm NH} \ {\rm CS} \ {\rm N} \ C \ {\rm NMe}$ Allyl-thro-carbamine-methyl cyamide Formed by the action of methyl iodide upon sodium carbimido allyl thio urea Crystalline sol water and alcohol Indifferent body (Wunderlich, B 19, 448)

METHYL-CARBIMIDO-ETHYL-THIO-URBA

SC<NEt>C NMe or EtNH CS N C NMe

Ethyl-thro-carbamine-methyl cyamide Formed by the action of methyl iodide upon sodium carbimido ethyl-thio-urea (Wunderlich, B 19, 448)

TRI-METHYL CARBINOL v Tert Butyl ALCOHOL

METHYL CARBONATES

Hydrogen methyl carbonate *MeHCO3 The Ba salt, Ba(MeCO₃), appears to be the white pp formed when CO₂ is passed into a solution of BaO in anhydrous methyl alcohol (Dumas a Péligot, A Ch [2] 74, 6) It is insol alcohol, but dissolves in water, the solution soon depo siting BaCO.

Di-methyl carbonate C,H₃O₃ v e (CH₃).CO₃ [0.5°] (Röse, A 205, 231) (91°) S G = 1 069 HFp 138,890 HFv 136,360 (Thomsen, Th)
Formed by boiling methyl chloroformate ClCO₂Me with lead oxide (Councler, B 13, 1697) Formed also from ClCO₂Me and NaOMe (Schreiner, J pr [2] 22, 354) Oil, insol water, sol alcohol and ether Converted by dry chlorine into hexa-chloro di methyl carbonate $(q \ v)$

METHYL-CARBOPYRIDIC ACID v METHYL-PYRIDINE CARBOXYLIC ACID

METHYL-CARBOSTYRIL v Methyl ether of CARBOSTYRIL and OXY METHYL QUINOLINE

METHYL CETYL KETONE C18H18O 16 C₁₆H₃₈ CO CH₃ [52°] (252° at 100 mm) Formed by distilling a mixture of barium margarate and barium acetate (Krafft, B 15, 1707). Yields palmitic and acetic acids on oxidation

METHYL-CHELIDAMIC ACID v CHELIDONIC

METHYL-CHLORACETOL 12. DI CHLORO-PROPANE

CHLORIDE METHYL CH,Cl Chloro. methane Mol w 50.5 (-28 7°) (Regnault) V D 178 (calc 175) S G 22 9915, 2 9523 (Vincent a Delachanal, A Oh [5] 16, 429) S 5 03 at 7°, 8 46 at 20° (Baeyer, A 107, 181) S, (alcohol) 35 S (HOAc) 40 HFp 22,550 HF v 21,970 (Thomsen) S V 50.8 (Lossen, A 107, 181) A 254, 68) Latent heat of evaporation 96,900

at 0° (Chappus, A Ch [6] 15, 507)

Formation —1 By heating a mixture of NaCl (2 pts), wood spirit (1 pt) and H₂SO₄ (8 pts) and collecting the gas over water (Dumas a. Péligot, A. Ch. 61, 193, A. 15, 17) — 2 By exposing a mixture of equal volumes of methane and chlorine to daylight (Berthelot,

A Ch [3] 52, 97)

Preparation—1 HCl is passed into MeOH (2 pts) containing ZnCl, (1 pt) The gas is passed through KOH and H.SO, (Groves, C J 27,641, A 174,378)—2 By heating trimethylamine hydrochloride at 260°, the reaction being perhaps 3NMe₃HCl = 2NMe₃ + NH₂ + 3MeCl (Vincent, J Ph [4] 30, 132)

Properties — Colouriess gas, with ethereal odour Burns with a bright flame, edged with

green

Reactions -1 When passed through a redhot tube it deposits charcoal and yields HCl, methane, ethylene, CO, and naphthelene (Perrot, A 101, 375)—2 When passed over heated potash-lime it yields potassium formate, KCl, and hydrogen -3 Not attacked by chlorine in diffused daylight, but when the mixture is exposed to direct sunlight, substitution occurs, the products being methylene chloride, chloroform, and CCl. The chlorination may also be effected by passing a mixture of chlorine and methylchloride over animal charcoal at $250^{\circ}-350^{\circ}$ (Damoiseau, C R 92, 42) -4 When equal volumes of methyl chloride and of an amine are submitted to a piessure of 25 atmospheres for 48 hours the following reactions occur—(a) Ammonia forms NMeH,Cl, NMe,HCl, and 2NH, Cl -(b) Methylamine forms 2NMeH, Cl and NMe Cl —(c) Dimethylamine reacts with forma tion of NMe H,Cl and NMe,Cl -(d) Trimethylamine forms NMe,Cl (Vincent a Chappuis, Bl [2] 45, 496)

Hydrate MeCl 9aq Formed by cooling below 0° water into which MeCl is passed Its vapourtension has been studied by De Forcrand a Vil-

lard C R 106, 1357, 1404)

METHYL-CHLORO-ALLYL CARBINOL v Chloro pentenyl alcohol

DI-METHYL-CHLORO-ANILINE v CHLORO DI METHYL ANILINE

TRI-METHYL CHLORO-AURO-PHOSPHITE Me,PAuClO, [101°] Formed by the action of pure methyl shochol on aurous chloride and phosphorus (Lindet, C. R. 103, 1014) Slender colourless needles, insol water, sol MeOH

METHYL CHLORO-BUTYL CARBINOL v

CHLORO HEXYL ALCOHOL

METHYL - CHLORO - CARBOSTYRIL

CHLORO OXY METHYL QUINOLINE

METHYL CHLORU-ETHYL OXIDE C₃H ClO te CH₃ CHCl OMe (72°-75°) S G ¹⁷ 990 Formed from aldehyde (1 vol), methyl alcohol (1; vols), and dry HCl at 0° (Geuther, A 225, 270)

METHYL TETRA-CHLORO-ETHYL OXIDE C,H,Cl,O :s CCl, CHCl O CH, (178°) S G 2 184 Formed by the action of PCl, on chloral methylate (Magnanini, G 16, 330) Colourless liquid

METHYL CHLORO-FORMAMIDE v CHLORO FORMIC ACID

METHYL CHLORO - PROPYL KETONE C₃H₁ClO 1.5 CH₂CO CHClEt (130°) Formed by heating CH₃CO CClEt CO₂Et with dilute HCl at 180° (Conrad, A 186, 241)

Methyl tri-chloro-propyl ketone C₃H₂Cl₃O t.s CH₄CO C₂H₄Cl₂ (193°) Formed by oxidising

C₂H₄Cl₄ CHMe OH with chromic acid mixture (Garzarolli Thurnlackh, A 223, 152) oil Does not combine with NaHSO₂ Yields CO₂, acetic acid, and HCl on oxidation

DI METHYL - CHLORO - QUINALDINE .

CHLORO TRI METHYL QUINOLINE

METHYL-TRI CHLORO-QUINOLINE v TRI-CHLORO METHYL-QUINOLINE

METHYL DI-CHLORO-VINYL OXIDE C₃H₄Cl₂O te CCl, CH O CH₂ (110°) S G 2 12934, ¹⁰² 11574 Prepared by heating trichloro ethylene with KOMe, being ppd on addition of water (Denaro, G 14, 117) Colourless oil, with an odour resembling that of acetal Decomposed on exposure to air, with evolution of HCl When heated with dilute H₂SO₄ it yields di chloro acetic orthaldehyde

Methyl tri chloro-vinyl oxide CCl₂ CCl O CH, Readily absorbs dry oxygen, forming the compound COCl CCl(OMe), which, by the action of water, gives oxalic acid (Henry, B 12.1838)

METHYL CHRYSOIDINE v Benzene-Azo methyl phenylene dramme

METHYL-CINCHENIC ACID v CINCHENE
METHYL-CINCHONAMINE v CINCHONA

DI-METHYL-CINCHONIC ACID v Dr METHYL QUINOLINE CARBOXYLIC ACID

METHYL-CINCHONIDINE v CINCHONIDINE
METHYL-CINCHONINE v CINCHONINE

METHYL CINNOLINE CARBOXYLIC ACID

 $C_{10}H_8N_2O_2$ is $C_8H_3(CO H)$ CMe CH N=N[6 280°]

Small tables or fine needles Sol acetic acid, sl sol hot alcohol and hot water, insol cold water Dissolves both in aqueous acids and alkalis, forming easily soluble salts Obtained, as a yellow pp, by adding NaNO, to a cold solution of the hydrochloride of amido propenyl benzoic acid C₆H₃(CMe CH | (NH₂)CO.H(1 2 4], very probably di azo-propenyl-benzoic acid C₆H₃(CO₂H) < CMe CH | s first formed, which then splits off H O (Widman, B 17, 722)

METHYL-GITRACONIC ACID C₆H_xO₄, [100°] A product of the dry distillation of methyl-paraconic acid (Frankel A 255, 25) Long needles (from CHCl₃) Reduced by sodium amalgam to ethyl succinic acid — CaA" aq — BaA" 4aq —

Ag 4'

METHYL COCAINE C₁₈H₂₂NO, [47°] Extracted from synthetical cocaine (cf vol 11 p 230), in which it occurs in very small quantity (Luebermann a Giesel, B 23, 508, 926) An oil, which crystallises after standing some hours Ppd. by Na.CO, from its salts Very sol ether, chloroform, benzene, and ligron It can be separated from ordinary cocaine by means of its nitrate A 54 p c solution of the hydrochloride in a 2 dm tube gave a rotation of +45° By heating with water it is not so easily decomposed as ordinary cocaine By boiling with hydrocia acid MeI is split off By hydrochloric acid it is split

ip finally into methyl alcohol, benzoic acid, and methyl ecgonine hydrochloride This reaction is also more difficultly brought about than with ordinary cocaine. Methyl cocaine appears to be identical with 'dextro cocaine,' a body got by heating the methyl ether of dextro ecgonine with BzCl (Einhorn a Marquardt, B 23, 468)

Salts -B'HCl [210°] needles or columns forming rosettes (from hot alcohol), much less soluble than the hydrochloride of ordinary cocaine —Sulphate plates, v sol water, sl sol alcohol —Nitrate crystals, al sol water — Platino chloride (C18H23NO, HCl)2PtCl48 glittering yellowish needles (from hot water) — Auro-chloride C18H28NO4HClAuCl3 [1480]. needles, melts under water to a yellow oil

METHYL CODEINE C₁₈H₂₈NO, 2 e C₁₈H₂₉MeNO, or C₁₇H₁₇Me₂NO, [118 5°] $[a]_{\rm p} = -209^{\circ}$ in a 4 p c solution (in 97 p c alcohol) at 15° Formed by boiling code me methylo iodide C_{1s}H₂₁NO₂MeI with potash, and extracting with benzene (Grimaux, A Ch [5] 27, 276, Hesse, A 222, 218) Anhydrous prisms (from alcohol or ether), or hydrated crystals (contain- $\log aq$) (from water) Insol water, v e sol hot alcohol, m sol ether Its solution in conc H_2SO_4 is violet, but becomes blue on heating Boiling Ac₂O forms a compound C₁,H₁₄O₃ [131°] Its hydrochloride forms a brown solution in H₂SO₄, which becomes violet on warming, and finally blue on exposure to the air -B'HCl 2aq V e sol alcohol, sl sol needles S 9 at 18°

NaClAq —B'2H2PtCle aq Acetyl derivati derivative C₁₃H₁₆AcMe₂NO₃ [66°] Formed by heating methyl codeine with Ac₂O at 85°, adding aqueous NH, and extracting with ether (Hesse, A 222, 222) Glittering tables (from ether), v sol alcohol and ether, sl sol water, insol KOHAq Alcoholic potash Alcoholic potash forms potassium acetate and methyl codeine -satiny plates —(C₁₇H₁₆AcMe₂NO₃)₂H₂SO₄ 8aq

(a) Methylo-rodide C19H23NO3MeI 2aq prisms, formed at once on dissolving methyl codeine in a mixture of MeI and methyl alcohol

(B) - Methylo - rodide C₁₉H₂₃NO₃MeI Slender crystals, formed by boiling the preceding with aqueous NaOH, and ppg with KI It is less soluble in water than its (a) isomeride Ag₂SO₄ forms (C₁₉H₂₃NO₂Me)₂SO₄, crystallising

ın plates

C₁₉H₂₃NO₃MeCl (a)-Methylo-chloride From the (a)-10dide and AgCl Amorphous With platinic chloride it yields a yellow floccu lent pp of (C₁₈H₋₃NO₃MeCl),PtCl, 8aq With Ac₂O it yields C₁₈H₋₂₂AcNO₃MeCl 2½aq, which crystallises in long satiny needles, v e sol alco hol, sl sol cold water Its platinochloride (C19H22AcNO,MeCl)2PtCl, 4aq 1s a yellow crystalline pp

(B)-Methylochloride C19H23NO2MeCl 3sq Radiating crystalline mass, v sol water and alcohol With cone H₂SO₄ it gives a purple colour With platinic chloride it yields an orange pp of small needles of the platinochloride (C₁,H₂₂NO₂MeCl)₂PtCl₄ aq With Ac₂O it yields amorphous C₁,H₂₂AcNO₂MeCl, which forms (C₁,H₂₂AcNO₃MeCl)₂PtCl₄ Saq, a yellow powder

Methylo-hydroxide *C19H28NO3MeOH. Formed from the (B) methylo sulphate and Colourless plates, insol ether, v sol baryta Strongly alkaline in reaction Conc alcohol H₂SO, forms a blue solution Gives off trimethylamine when strongly heated

METHYL COLCHICINE C23H27NO6 1 e C₁₈H₉(OMe)₂(NAcMe) CO₂Me Occurs in the mother liquor from which the compound of col chicine with chloroform has separated (vol 11 p 234) Decomposed by boiling dilute HCl into methyl chloride and methyl colchicein C13H9(OMe) (NAcMe) CO2H (Johanny a Zeisel,

M 9, 871 DI METHYL-COLCHICINIC ACID v D

methyl derivative of Colchicinic acid

Tri methyl-colchicinic acid C19H21NOs i e $[150^{\circ}]$ $\mathbf{C}_{15}\mathbf{H}_{9}(\mathrm{OMe})_{8}(\mathrm{NH}_{2})\mathbf{CO}_{2}\mathbf{H}$ Formed by the action of HCl on colchice $(q \ v)$ Forms a platinochloride B', H.PtCl, 2aq On warming with acetic anhydride it yields colchicein C₁₅H₉(OMe),(NHAc) CO₂H With MeOH it forms an addition product C₁₉H₂₁NO₅2MeOH warming with MeOH, methyl iodide, and so dium it yields 'tri methyl colchidimethinic acid' $C_{15}H_{s}(OMe)_{s}(NMe_{s})CO_{s}H$ [125°] The methyl ether of this body forms an iodomethylate $C_{22}H_{36}NO_{5}Iaq$ (Johanny a Zeisel, M 9, 877)

METHYL-CONIINE v CONIINE METHYL-COUMARIC ACID v Methyl deri vative of Coumaric acid

Di-methyl di coumaric acid so called v Di METHYL DI-COUMARIN

METHYL COUMARILIC ACID C, H,O, te C₆H₄<0Me CO₂H [126°] Formed by the action of dilute KOH upon the methyl derivative of exo bromo coumaric acid (Perkin, C J 39, Needles (from CS2)

(β) Methyl coumarilic acid C₁₀H₂O₃ ι e $C_6H_4 < CMe > CCO_2H$ [189°] Formed by saponifying its ethyl ether with alcoholic potash (Hantzsch, B 19, 1290) Feathery needles (from dilute alcohol) Decomposed by heat into CO₂ and (β) methyl coumarone — KA'aq needles — NH₄A'aq needles (from water) —

BaA', 3aq —AgA' minute prisms Ethylether EtA' [51°] (290°) Formed by the action of sodium phenylate NaOC, H, upon chloro aceto acetic ether, the resulting phenoxy aceto acetic ether being condensed by

cold conc H₂SO₄ (Hantzsch)

A mide C₈H₄(CH₉)O CO NH₂: needles (Hantzsch, B 19, 2401)

Di-methyl-coumarilic acid C11H10O3 2 &

C₆H₃(CH₃) CC(CH₃) CCO₂H Di methyl coumarone-a carboxylic acid [225°]

Formation —1 By the action of hot alcoholic KOH upon brome di methyl cumarin

C₆H₃(CH₃) CGr O____CO -2 By saponification of the ethyl ether obtained by the reaction of

sodium p cresol and chloro aceto acetic ether Properties — Short prisms or tables On heating the sodium salt with lime di methylcoumarone is obtained

[55°], Ethyl ether A'Et 728 mm) (Hantzsch a Lang, B 19, 1299). Reference — Coumarilio acid and Oxy-

METHYL COUMARIN v Anhydride of Oxy-PHENYL CROTONIC ACID

m β D1 methyl coumarin C11H10O2 2.6.

by the action of H.SO, on a mixture of acetoacetic ether and p cresol (Pechmann a Dusberg, B 16, 2127, Pechmann a Cohen, B 17, 2187) Long colourless needles

Reference —Brom. DI METHYL COUMARIN DI methyl di coumarin C₁₄H₁₀O₄ 2 e

C.H (CMe CH) Formed by dissolving resor cin (1 mol) and acetoacetic ether (2 mols) in

cin (1 mol) and acetoacetic ether (2 mols) in cone H_2SO_4 , yield 10 pc Microcrystalline white powder V sl sol boiling alcohol, nearly msol water, ether, chloroform, benzene, &c Dissolves in aqueous alkalis to a yellow solution, from which acids ppt di me thyl di coumaric acid $C_4H_2(OH)_2(CMe\ CH\ CO_2H)_2$ The latter forms a white powder, sol alcohol, at 140° it is completely reconverted into the anhydride (Hantzsch a Zurcher, B 20, 1328)

Tri methyl tri coumarin C18H12O6 26

C. (CMe CH Formed by dissolving phloro

cO—CO/s gluein (1 mol) and acetoacetic ether (3 mols) in conc H.SO₄, the yield is less than 10 pc. Amor phous powder. Insol all solvents. Dissolves in aqueous alkalis to a yellow solution, from which acids ppt tri methyl tri coumaric acid. C₆(OH)₄(CMe CH CO,H)₃, whose sodium salt is Na₃A" baq (Hantzsch a Zurcher, B 20, 1330)

(β) METHYL COUMARONE C₉H₅O ι e

Constant Country Count

Di methyl coumarone $C_{10}H_{10}O$ is $C_{10}H_{10}CH_{10}O$ is $C_{10}H_{10}CH_{10}CH_{10}$ at 728 mm) indifferent oil. Formed by distilling the sodium salt of di methyl coumarilic acid (di methyl coumarone a carboxylic acid with lime (Hantzsch a. Lang, B 19, 1300)

METHYL - CREOSOL v Methyl ether of

METHYL CROTONIC ACIDS v Angelic acid and Tiglic acid

METHYL ISOCROTYL OXIDE v Sec ISO BUTENYL ALCOHOL

METHYL CUMARIN v METHYL COUMARIN METHYL - CUMAZONIC ACID C₁₂H₁₃NO,

• $e \ C_e H_3(CO_2H) \left\langle \begin{array}{c} CMe_2 \ O \\ N-CMe \end{array} \right\rangle$ (?) [218°].

Formation —1 By boiling (3 4 1) amidooxypropyl benzoic acid with acetic anhydride 2 By boiling acetyl amido oxypropyl benzoic acid with HCl —3 By boiling acetyl amido propenyl benzoic acid with HCl Small colour less trimetric tables V sol alcohol, insol water Its N is tertiary

Reactions -By reduction with sodium-

amalgam it yields the acetyl derivative of amido cuminic acid

Salts — A'H,HClx very soluble white needles — (A'H,HCl)₂PtCl₄ tables, cubes, or prisms — A'H,H₂SO₄ aq very soluble white silky needles (Widmann, B 16, 2576)

METHYL-CUMENE v CYMENE

METHYL - ψ - CUMIDINE $C_{10}H_{13}N$ to $C_{4}H_{4}(CH_{1)}$, v - MHMe [44°] (237°) Formed by methylation of solid cumidine [63°] — By-H.Cl.-ptCl. sparingly soluble needles (Hofmann, B 15, 2896)

Di methyl - ψ cumidine $C_sH_2(CH_1)_3$ NMe₂ (222°) Oil Formed by methylation of solid cumidine [63°] — B'₂H₂Cl₂PtCl₄ (Hofmann, B 15, 2897)

Methylo - todrde C.H (CH.,),NMe,I Prisms Yields (C.H.,(CH.,),NMe,Cl),PtCl, METHYL CUMYLETHYL KETONE

METHYL CUMYLETHYL RETONE
C,H, C,H, CH, CH, CH CH, CO CH, Cummyl acetone
(260°-265°) Is one of the products of the
action of NaOEt and cuminyl chloride on aceto
acetic ether (Widmann, B 22, 2271) Colourless
liquid, with fragrant odour Is not acted upon
by NaOBr Oxidised by KMnO, to cuminic
acid

Oxim C₁H, C₆H, CH₂ CH₂ C(NOH) CH, [57°] Long shining prisms (from ligroin) METHYL CUMYL KETONE

CH₃ CO C₄H₄Pr [1 4] (253°) SG 15 9755 Formed by the action of AcCl on cymene in presence of AlCl₃ (Widmann, B 21, 2225)

Oxim CH, C(NOH) C,H,Pr [71°] Four-

sided tables (from petroleum ether)

Phenyl hydrazide

CH, C(N,HPh) C,H,Pr [82°] Colourless thick six sided tables (from petroleum ether)

METHYL CYANAMIDE v Cyanamide in the article Chanic acids

METHYL CYANATE v CYANIC ACIDS
METHYL-GYANETHINE v CYANETHINE
METHYL CARBIMIDE is Methyl isocyanate
v Cyanic acids

METHYL CYANIC ACID v CYANIC ACID METHYL CYANIDES v Acfionitrile and METHYL CARBAMINE

Di methyl di cyanide C₁H_eN i e NH CMe CH₂CN oi NH₂CMe CH CN [53°] V D 425 Formed by the action of dry sodium on acetonitrile dissolved in ether Methane is evolved in the reaction, and the product is decomposed by water (Holtzwart, J pr [2] 38, 343, 39, 240) White needles, v sol ether, alcohol, chloroform, and benzene, m sol water, sl sol petroleum ether

Reactions—I Boiling water liberates ammonia forming $C_8H_8N_2O$, a body which is converted by PCl₈ into crystalline $C_8H_8N_1Cl_1$ [175°], which, on recrystallisation from water, becomes $C_8H_4N_2$ —2 Acetyl chlorade forms a compound $(C_1H_4N_2)_1CH_3COCl$, which on decomposition by water yields $C_8H_8N_8$, crystallising in beautiful white needles [223°]—3 Warm dilute (25 r c) HClAq forms NH₄Cl and an oil which has the composition of cyano acetone—It solidifies to a glassy fhass, carbonises above 230°, and forms with phenyl hydrazine a condensation product [97°]

Tri-methyl tri-cyanide v Cyanmethinf METHYL-CYANO FORMAMIDE v Methylamde of Para-Cyanofobmic acid METHYL-CYANO-SUCCINIC ETHER

C₁₀H₁₈NO₄ is CO₂Et CH₂ CMeCy CO₂Et An oil formed by treating cyano succinic ether with Na and MeI successively (Barthe, C R 108,

s-Di-methyl cyano-succinic ether C11H17NO4 te CO2Et CHMe CMeCy CO2Et (273°) 245 10577 A product of the action of alcoholic KCy on a bromo propionic ether (Zelinsky, B 21, 3164) Formed also by adding α bromopropionic ether to cyano-propionic ether mixed with KCy (Z)
METHYL CYANURIC ACID v Cyanuro

acid in the article Cyanic acids

METHYL CYMYL KETONE C12H16O 26 (247°) An oil, CH, CO C,H,Me C,H, [2 1 4] formed by the action of AcCl on cymene in presence of AlCl. (Claus, B 19, 233)

METHYL-DAMBOSE v BORNESITE, vol 1.

D1-methyl-dambose v DAMBONITE METHYL-DAPHNETIN v DAPHNETIN

METHYL DECYL KETONE C12H24O 18 CH, CO C₁₀H₂₁ [21°] (247°) Formed by distilling a mixture of barium acetate and barium hendecoate (undecylate) (Krafft, B 15, 1708) Yields acetic and decoic acids on oxidation

METHYL - DESOXYBENZOIN BENZYL KETONE

Dimethyldesoxybenzoin v Benzyl xylyl

METHYL DODECYL KETONE C,4H 8O 16

(206° at 100 mm) CH₂ CO C₁₂H₂₅ [34°] (Formed by distilling barıum tridecoate $(C_{13}H_{23}O_2)_2$ Ba with barium acetate (Krafft, B 15, 1708) Yields lauric and acetic acids on oxidation

METHYL c-DURYL KETONE C12H16O 16 (259°) CH, CO C₆HMe₄ [1 2 3 4 5] From c durene, AcCl, and AlCl, (Claus a Fohlisch, J pr [2] 38, 230) Oil

Phenyl hydrazide [129°] Laminæ Isomerides v DURYL METHYL KFTONES

METHYL-ECGONINE C10H17NO3 A product of the action of HCl on methyl cocaine, the resulting methyl ecgonine hydro chloride being decomposed by Ag₂O (Liebermann a Gresel, B 23, 510) May be crystallised from methyl alcohol containing a trace of water Extremely sol water, insol absolute alcohol, v sl sol absolute MeOH Decomposed by fusion A 9 6 p c solution of the hydrochloride exhibits $\alpha = +2^{\circ}$ —B'HCl [236°], needles (from methyl alcohol ether) —B'HAuCl [220°], lemon yellow needles

Benzoyl derivative Hydrochloride of hydrochloric acid on methyl cocaine [47°], the base being just dissolved in HCl and then heated $\frac{1}{2}$ hour at 90° Glassy columns (from hot water) The base is not ppd by carbonate of soda —Aurochloride C₁₇H₂₁NO₄ HCl AuCl₃ The nitrate is v sl sol water

METHYLENE The radicle CH2, which is not known to exist in the free state

Dimethylene C2H4 we CH, CH, 18 called ETHYLENE $(q \ v)$

CH₂ Trimethylene CaHate CHat HFp -8470 H.F v. -4630

when trimethylene bromide CH2Br CA2 CH3Br (140 g) is boiled with sodium (5 g) The contents of the flask become pasty, but still contain much of the bromide (120 g), which can be mostly recovered by filtration (Freund, J pr [2] 26, 367) It is also formed by heating tri methylene bromide with zinc dust and 75 pc alcohol (Gustavson, J pr [2] 56, 800) Trimethylene burns with a bright flame and smells like butylene

Reactions -1 Trimethylene is readily ab sorbed by fuming HI The product is n propyl iodide, whereas propylene gives iso propyl iodide Trimethylene is very slowly absorbed by bromine, the product is trimethylene bromide (165°) Propylene is readily absorbed, forming propylene bromide - 3 Conc H2SO, forms liquid hydrocarbons, and on diluting and distil ling n propyl alcohol is got (G) -4 KMnO. does not oxidise it (Wagner, B 21, 1230)

References -TRIMETHYLENE CARBOXYLIC ACIDS, TRIMETHYLENYL METHYL KETONE, and PHENYL TRIMETHYLENYL KETONE

Tri methylene is a term also applied to the divalent radicle CH, CH, CH,

Tetra methylene is a term applied to the ring

CH, CH, , and it is also used to denote the group ĊH, ĊH,

CH. CH, CH, CH Pentamethylene is a name used to denote CH, CH, CH, CH, CH, CH

Hexamethylene is benzene hexahydride Ac cording to Baeyer (A 258, 156), it should be regarded as lying entirely in one plane

METHYLENE ACETATE v Acetyl der iva tive of Formic orthaldehyde, vol 11 p 570

TRIMETHYLENE ACETO ACETIC ACID, so

called, v vol 1 p 24
METHYLENE DIAMINE Di benzoyl de rivative CH (NHBz), [221°] S 47 at 14 5°, 63 at 22°, Hipparaffin S (alcohol)

Formation -From hippuric acid, PbO2 and HNO₃ or H SO₄ (H Schwarz, A 75, 201, Stt. W 77, 11 762, J Maier, A 127, 162, kiaut a Y Schwarz, A 223, 40)

Preparation - From benzonitrile (15 g). methylal (6 g) and conc H₂SO₄ (100 g) (Hepp a Spiess, B 9, 1424)

Properties —Long white felted needles (from

alcohol), v sol CS₂, ether, and chloroform

Reactions —1 Dissolves unchanged in conc H₂SO₄, and in fuming HNO₃ -2 On distillation some passes over unchanged along with benzoic acid -3 Not affected by bromine -4 Boiled for some time with dilute (32 p c) H2SO4 it gives formic aldehyde, NH, and benzoic acid -5 Heated in sealed tubes with dilute HCl it yields benzamide and formic paraldehyde

Trimethylene diamine C,H,,N, i e NH,CH,CH,CH,NH, (c 140°) Formed by heating trimethylene bromide (1 mol) and NH, (20 mols) in alcohol for 10 hours at 100° liquid is decanted from NH, Br and evaporated, treated with KOH and distilled (Fischer a Koch, B 17, 1799, Lellmann a Wurthner, A 228, Colourless mobile liquid, easily miscible 227) with alcohol, ether, and benzene Fumes in This gas is formed moist air, combining with water to form a hydrate Readily takes up CO₂ becoming solid Condenses with benzoic aldehyde forming $C_3H_4(N \text{ CHPh})_2$ Phenanthraquinone forms C_8H_1,NO_2 a yellow powder, melting above 250° Benzil forms $CH_2 < CH_2 \ N \ CPh > a$ transparent

vitreous mass [c 76°]

Salts —B"H₂Cl₂ Easily soluble prisms — B"H₂Cl₂PtCl₄ Orange prisms — B"(HSCN)₂ [102⁶] At 140° it is partially decomposed into trimethylene thio-urea and NH₄SCN — B"H₂Br₂.

Diacetyl derivative C₂H₆(NHAc)₂ [79°] White needles, v e sol water, v sol alcohol, chloroform, sl sol benzene, insol ether, petro

leum ether (Strache, B 21, 2364)

Dibensoyl derivative C,H₆(NHBz)₂ [148°] White orystalline powder, insol water, m sol benzene, v sol alcohol and chloroform On heating in a stream of HCl the product is C,H₆
NH
OPh, an only base which slowly becomes crystalline and forms crystalline salts (Hofmann, B 21, 2337)

Oxalyl derivative CH2 CH2 NH CO

A sparingly soluble white powder, formed on mixing trimethylene diamine with an alcoholic solution of methyl oxalate It does not melt at 250°

Derivative — V OXY TRI METHYLENE DIAMINE Trimethylene di nitro di-amine C,H₄N,Q₄ ie NO, NH CH₂ CH₄ CH₂ NH NO, [67°] Formed by heating C,H₆(N(NO,) CO,M₉), (v Tri METHYLENE DICARBAMIC ACID) with aqueous ammonia (Franchi mont a Klobbie, R T C 7, 343) Short thick prisms (from water or alcohol), v sol water and alcohol, less sol ether and chloroform Boiled with dilute (2 p c) H₂SO₄ it evolves N₂O It has no acid reaction, and easily forms metallic derivatives

Tetra methylene diamine $C_1H_{12}N_1$ is NH_2 CH_2 CH_3 CH_4 CH_4 CH_5 CH_7 NH_2 CH_7 CH_8 CH_9 CH_9

NH₂ CH₁ CH₂ CH₂ NH₂ [24] (159°) Obtained by reducing ethylene cyanide in alcoholic solution with sodium (Ladenburg, B 19, 780) Identical with the ptomaine 'putrescine' (cf. L. Brieger, 'Die Ptomaïne,' Berlin, 1885–1886, 1, 43, 3, 101) and also with a base obtained from a morbid urine (Udranszky a Baumann, B 21, 2938). Strong base, smelling like piperidine Solutions of its salts give a crystalline pp with iodine dissolved in KIAq but no pp with HgCl₂ or KCdI₄. When shaken with aqueous NaOH and BzCl it gives a crystalline pp of the dibenzoyl derivative Methyl chloroformate ClCO₂Me forms (CH₂)₄(NH CO₂Me)₂ which crystallises in flattened needles [128°], sl sol cold water, and is nitrated by HNO₃, yielding (CH₂)₄(N(NO₂)CO₂Me)₂ which crystallises from ether and melts at 62° (Dekkers, R. T. C. 9, 97).

Salts —B"H₂Cl₂. Plates (from alcohol) — B"H₂PtCl₆ Needles —P10rate Thin yellow needles — Aurochloride [210°] Minute thread like needles, v sol hot water (Ciamician

a Zanetti, B 22, 1978)

D1-bensoyl destructive C,H,(NHBs),[175°] (U a B), (178°] (C a Z) Plates, insol water, almost insol ether, v sol hot alcohol

Dr acetyl derivative
CH₂(CH₂ CH₂ NHAc)₂ Small needles (from al cohol) May be distilled

Di benzoyl derivative

CH₂(CH₂CH₂NHBz), [130°] (above 360°) Ppd by adding aqueous NaOH and BzCl to a solution of the base (Udranszky a Baumann, B 21, 2744) Long needles and plates, v sol alcohol, m sol ether, insol water Not affected by hot dilute acids or alkalis

Penta methylene di nitro di amine
CH₂(CH₂ CH₂ NH(NO₂))₂ Formed by treating
CH₂(CH₂ CH₂ N(NO) CO₂Me)₂ with aqueous
ammonia (Franchimonta Klobbie, R T C 7,
343) Small oblong plates (from chloroform),
v sol water and alcohol, sol ether, sl sol
CHCl₂ When boiled with dilute (2 p c) H₂SO₄
it evolves N₂O

Di nitroso penta methylene tetramine (so called) $C_3H_{10}N_4O_2$ is $C_3H_{10}N_4(NO)_2$. [207°] (G), [203°] (M) Formed by the action of nitrous acid on 'hexamethylene tetramine' (Griess, B 21, 2738, Mayer, B 21, 2888) Needles (from alcohol), v sol hot alcohol, m sol chloroform, insol ether Not affected by boiling with zincdust Dilute HCl decomposes it into nitrogen, ammonia, and formic aldehyde

Hexa methylene tetramine (so called)

C₃H₁₂N₄ Hexamethyleneamne [189°] S

(alochol) 7 Mol w 115 (by Raoult's method)

(calc 140) (Tollens a Mayer, B 21, 1566)

Formed by passing dry NH₃ over heated trioxy methylene (formic paraldehyde) (Butlerow,

A 115, 322, Z [2] 5, 278) Prepared by dissolving methylal in dilute H₂SO₄, and distilling
the product with steam into a receiver containing
ammonia (Wohl, B 19, 1842)

Properties—Rhombohedra (from alcohol), v sol water, chloroform, and CB. May be sublimed Scarcely attacked by sodium-amalgam Acts nutritiously upon algae (Loew a Bokorny, J. pr [2] 86, 272)

Reactions, -1. Split up by boiling dilute

acids into formic aldehyde and ammonia -2 MeI at 190° forms NMe₄I (Tollens, B 17, 656) 3 Sodrum nitrite $(2\frac{1}{2} \text{ pts})$ added to a solution of the base (1 pt) in dilute HCl at 0° forms 'tri methylene tri nitrosamine' CaHaNaOa, which crystallises from alcohol in needles or prisms [106°], and is split up by warming with dilute acids into nitrogen and formic aldehyde Ιt exhibits Liebermann's reaction When acetic acid is added gradually to a solution containing hexamethylene tetramine and sodium nitrite there is formed the so called di nitioso penta methylene tetramine (v supra), which is much less soluble in the usual menstrua than the tri methylene tri nitrosoamine

Salts -B"H₂Cl₂ (dried at 100°) prismatic needles, v e sol water, sl sol alco hol -B"2H2PtCl, 4aq -B"23AgNO3 Whitecrys talline pp, formed on adding AgNO, to an aqueous solution of hexamethylene tetramine (Pratesi, G 13, 437) Sl sol cold, m sol hot, water, with partial reduction to silver

Methylo rodide B"MeI [190°] water, sl sol alcohol, insol ether, chloroform, and CS₂

Ethylo rodide B"Etl [133°]
Methyleno rodide B"CH₂I₂

Di-bromide C₆H₁₂N₄Br₂ Insol ordinary

solvents (Legler, C C 1888, 1604)

Tetrabromide C, H₁₂N, Br. Red crystals, obtained by the action of bromine vapour on hexamethylene tetramine (Horton, B 21, 1999)

Decomposed by boiling water $Di\ iod\ id\ C_eH_{12}N_4I_2$ Obtained by adding an alcoholic solution of iodine to an aqueous solution of the base Crystalline, v sl sol

Tetra rodide C_eH₁₂N₄I₄ Obtained when sess of rodine is used Minute brown plates, excess of rodine is used sol acetone, CHCl_s, and CS₂ Decomposed by boiling water

METHYLENE DI-ISOAMYL DIOXIDE v FORMIC ALDEHYDE

METHYLENE - ANILINE $(\mathbf{C},\mathbf{H},\mathbf{N})_x$ Anhydro formaldehyde aniline $(CH_2 NPh)_x$ [138°] Formed by mixing aniline and crude formic aldehyde in the cold (Tollens, B 17,657, 18, 3309, Kolotoff, Bl [2] 43, 112) White silky crystals, v sol chloroform and benzene, sl sol alcohol, insol water Decomposed by boiling

with water or alcohol —B', H, PtCl, Methylene-aniline C, H, N Formed, together with di phenyl methylene diamine and the preceding body by the action of formic aldehyde on aniline (Pratesi, G 14, 355) Minute crystals, decomposed by heat V sl sol alcohol

Methylene-di-aniline v DI-PHENYL METHYL-ENE DIAMINE

METHYLENE-DIBENZYLAMINE O18H18N e CH₂(NH CH₂Ph)₂ [46°] (c 227°) Formed by the action of methylene chloride on benzyl amine at 100° (Kempff, A 256, 220) Rhombie prisms, insol water, v sol absolute alcohol and ether

Salts—C₁₅H₁₈N₂2HOl [242°] Colourless monoclinic plates—B"2HBr silky plates— B"2HI monoclinic plates (from benzene), sl sol water and alcohol -B"H2SO42aq colourless prisms —B"2H,PO, [c 230°] Needles -B"H_Cl_PtCl. monoclinic plates —Aurochlor-

ide B"H₂Cl₂AuCl₂ golden yellow needles,—Oxalate B"(H₂C₂O₄)₂ [c 134°]—Picrate Oxalate $B''(H_2C_2O_4)_2$ [o 134°]—Piorate $B''(C_6H_2(NO_3)_2OH)$, not stable in a hot solution, sl sol alcohol, and water

METHYLENE BLUE v TETRA METHYL DI AMIDO IMIDO DI PHENYL SULPHIDE

TRIMETHYLENE BROMHYDRIN \boldsymbol{v} Bromo PROPYL ALCOHOL

Formed by adding bromine to methylene iodide under water (Butlerow, A 111, 251, Henry, A Ch [5] 30, 266) Formed also by heating methyl bromide with bromine at 250° (Steiner, B 7, 507) Found among the bromides obtained by passing into bromine the products got by passing ethylene through a red hot tube (Norton a Noyes, Am 8, 362) Colourless mobile liquid, insol water, sol alcohol and ether Converted by PCl₅ at 190° into CCl₄ and CBr₄ (Holand, A 240, 230) When heated with 18 vols water and excess of PbO at 145° it yields ethylene glycol, traces of ethylene oxide, and PbBr₂ (Jeltekoff, B 6, 558) Slowly converted by SbCl, into methylene chloride Potassium phenylate KOC₆H₅ yields CH (OC₆H₅)₂
Trimethylene bromide v Di Bromo Propane

Tetra-methylene bromide C₄H₈Br₂ (189°) Formed from ethylene cyanide by successive conversion into tetra methylene diamine and CH₂(OH) CH₂ CH₂ CH₂(OH), the glycol being then treated with HBr (Gustavson a Dem janoff, J pr [2] 39, 542) The yield is small

Penta methylene bromide C₅H₁₀Br, reCH₂(CH₂CH₂Br)₂ (205°) Formed by satu rating the corresponding di oxy pentane (derived from tri methylene diamine) with HBr (G a D)

METHYLENE BROMO-IODIDE v Bromo IODO-METHANE

METHYLENE-TETRA-BUTYL-DIAMINE CH₂(N(C₄H₉)₂)₂ (250°) Obtained by distilling trimethylene oxide with dissolutyl amine (Ehrenberg, J pr [2] 36, 124) - B"H₂PtCl₆ [198°] Pale yellow powder — Aurochloride [c 195°] — B'CS₂ [54°] METHYLENE DI ISOBUTYL DIOXIDE v

Di isobutyl ether of Formic orthaldfhydf, vol

n p 571 METHYLENE CAFFEIC ACID v vol 1 p 659

TRIMETHYLENE DICARBAMIC ACID *CH₂(CH₂ NH CO₂H)₂

Methylether CH2(CH2 NH CO2Me), [75°] Formed by treating trimethylene diamine with methyl carbonate (Franchimont a Klobbie, R. T. C. 7, 343) Oblique rhombic plates V sol water, alcohol, and CHCl,, m sol ether, v sl sol benzene and light petroleum Pure HNO, yields a dinitro-derivative forming tufts of needles or prisms from alcohol [90°], and this when treated with solution of ammonia gives tri-methylene dinitramine [67°

Ethyl ether CH₂(CH₂NH CO₂Et)₂ Tri methylene-drurethane [42°] (210° at 30 mm) When a solution of trimethylene diamine in alcohol and ether is added to an ethereal solution of chloro formic ether ClCO, Et, a pp of trimethylene diamine hydrochloride is formed, and the filtrate leaves on evaporation oily $C_3H_6(NHCO_2Et)_2$ (Fischer a Koch, A 232, 225) It crystallises after some time, and separates V sol ether, from ether in colourless prisms alcohol, and chloroform, sl sol ligroin, insol It dissolves in acids but is reppd by water alkalıs

Tetra methylene dicarbamic acid Methyl ether C4H8(NH CO2Me)2 [128°] Formed from tetra methylene diamine and ClCO2Me (Dekkers, R T C 9,97) Flattened needles, sol warm water Converted by HNO₃ into C₄H₈(N(NO₂) CO₂Me), which separates from ether in small brilliant crystals [62°], v al sel cold water, al sol ether, sol warm alcohol, and is converted by NH, Aq unto C₄H₈(NH NO₂)₂ [163°]

Pentamethylene dicarbamic acid Methyl ether CH₂(CH₂ CH₂ NH CO₂Me)₂ . [114°] Formed by treating penta methylene diamine with methyl carbonate Fine needles (from boiling water) V sol hot alcohol (Franchi mont a Klobbie, R T C 7, 343) Pure HNO3 gives a di nitro derivative, forming small bril liant prisms [37°], and this treated with aqueous ammonia gives penta methylene dinitramine [60°] together with methyl carbamate

TRIMETHYLENE CARBOXYLIC ACID CH₂ CH CO₂H or C,H,O, re

CH2 CH CH2 CO2H Isomeride of crotonic acid [19°] (183°) Formed by heating ethylene malonic acid (trimethylene dicarboxylic acid) at 210° (Roder, A 227, 24, Perkin, jun, C J 47, 817, B 17, 57) White crystals, m sol water Has a powerful odour and a burning taste -CaA', 6aq Needles, v sol water — BaA', 2aq Needles, v sol water — AgA' Small needles Gives off a low boiling oil on (from hot water) distillation

Ethyl ether EtA' (134°) Formed by digesting the Ag salt with an ethereal solution of EtI Volatile oil, with pleasant odour affected by bromine in the cold, and only slowly attacked when boiled with bromine, HBr being given off

Trimethylene (1 1)-di-carboxylic acid so called $C_4H_6O_4$ is e $C(CO_2H)_2$ or CH_2

CH₂ CH CH(CO₂H)₂ Vinaconic acid Ethylene malonic acid [141°] Obtained by saponification of its ether Colourless triclinic crystals, $a\ b\ c = 0\ 7712\ 1\ 8702$ Crystallises with aq (from water), v e sol water, v sol ether At 160° it begins to give off CO2, leaving trimethylene carboxylic acid It is not attacked by sodium When heated with bromine it gives off HBr slowly It combines, however, with HBr, forming bromo ethyl malonic acid (Per kin, O(J) 47, 814), and it combines with bromine when this is dissolved in chloroform (Fittig) Boiling dilute H₂SO₄ forms γ-oxy ethyl-malonic acid Alkaline KMnO₄ does not attack it (Buch ner, B 28, 704)

Salts-Ammonium salt Four-sided plates — CuA" aq Deep blue octahedra, sl sol hot water At 160° it becomes a light green powder -- BaA" Needles -- BaH, A", 4aq Pris matic needles -- PbA" (dried at 100°) Insol cold, al sol. hot, water -AgA" Needles, v. al

sol cold water, sl sol hot water -AgHA" Long

colourless needles (from water) Ethyl ether $\text{Et}_2\text{A}''$ (213°) VD 632 (calc 643) SG $\frac{15}{15}$ 10646, $\frac{25}{25}$ 10566 Formed by the action of ethylene bromide on sodiummalonic ether (Perkin, jun, C J 47, 812, B 17, 54, Fittig a Roder, A 227, 13) Oil Not attacked when successively treated with benzyl chloride and NaOEt (Perkin, jun, B 18, 1734)

Dibromide C3H4Br2(COOH), [110°] From tri methylene di carboxylic acid and Br in chlo roform (Fittig a Marburg, B 18, 3413)

Trimethylene (1 2)-di-carboxylic acid CH CO.H

CH₂CH CO₂H or CH₂ C(CO₂H) CH₂ CO₂H.

Allo tiacome acid [137°] (C a G), [139°] (B)
Formation—1 By heating its anhydride with water at 140° (Conrad a Guthzeit, B 17, 1187) -2 From sodium propane tetracarboxylic ether (CO2Et)2CNa CH2 CNa(CO2Et), by treatment with bromine, the resulting trimethylene tetracarboxylic ether being saponified, and the free acid heated to 230°, and then distilled under 16 mm pressure the oil which passes over at 170° to 180° is heated with water at 140° (Perkin, jun, B 19, 1056, Dressel, A 256, 197)

Properties — Prisms, v sol water, alcohol, and ether Not attacked by alkaline KMnO, or by sodium amalgam (Buchner, B 23, 705)

$$CH_2$$
 CH_2 CO O CH_2 CO O CH_2 CO CH_2 CH_2 CO CH_2 $CH_$

tricarboxylic acid CH₂C(CO₂H)₂ or possibly

CH_TC(CO₂H) CH(CO H)₂ at 184° to 190° for a long time (C a G) Needles, sl sol ether

Trimethylene (1 2)-di-carboxylic acid

CH CO,H [175°] \(\Gamma\)-cistrans-tri-methyl-∕¢н со³н

ene-12 di carboxylic acid Formed by saponification of the di methyl ether (Eduard Buchner, B 23, 705) Compact apparently rhombic crystals (from water), containing no water of crystallisation Grouped needles (from ether) Less sol water than the isomeric glutaconic acid, but Distils without splitting off more sol ether water Acetyl chloride forms no anhydride Not oxidised by permanganate in alkaline solution Not reduced by sodium amalgam Chloride of iron gives a weak red brown colour

Salts -The zinc saltis more sol cold than hot water It crystallises in nodular groups of needles A solution of the ammonium salt gives no pp with CaCl, and BaCl, but white crystalline pps with silver and lead salts By heating the silver salt a white body sublimes in needles, probably the anhydride

Do methyl ether C.H.(CO.Me), (205-215 at 718 mm) Formed by heating sorylodi azo acetic ether C.H.N.(CO.Me), for 40 minutes to 160°-185°. Saponified by boiling with aque ous potash.

28

Isomerides of trimethylene dicarboxylic acid v Itaconic, Citraconic, Mesaconic, and Gluta CONIC ACIDS

Trimethylene (1 1 2) tricarboxylic acid

∠ĆH CO₂H C_eH_eO_e ve CH₂ C(CO₂H)₂ CH₂ C(CO₂H) CH(CO₂H)₂ [184°] possibly

Formed by saponification of its ether, which is prepared by the action of as di bromo propionic ether on di sodio malonic ether (Conrad a Guthzeit, B 17, 1185) Its ether is also formed by the action of a bromo acrylic ether upon sodio malonic ether CHNa(CO₂Et)₂ (Michael, *J pr* [2] 35, 132, 351, *Am* 9, 121) Prisms (from water) At 184°... 190° it is split up into CO2 and the dicarboxylic acid or its anhydride

Tri-ethyl ether Et, A" (276°) 1 127 Colourless liquid Does not react with NaOEt and BzCl

Trimethylene (1 2 3)-tri-carboxylic acid

 $CH(CO_2H)$ (CO₂H)CH(or possibly `ĊH(CO₂H)

CO₂H CH C(CO₂H) CH₂ CO₂H [150°-153°] Formed by heating the tetra carboxylic acid (1 1 2 3) at 200° for a long time (Perkin, B 17, 1654, C J 47, 826) Colourless crystalline solid V sol water, alcohol, and acctone, sl sol benzene, chloroform, ligroin, and CS₂ On heating it yields a sublimate, probably of an an hydride

Salts —A"'Ag, white granular pp — A"'2Ca, crystalline pp, soluble in cold water, nearly insoluble in hot The cupric salt is a The beautiful light green pp, sl sol water Ba and Pb salts are white pps

Trimethylene (1, 2, 3) tri-carboxylic acid CH CO.H

co,H ch([220°] Obtained by CH CO2H

saponifying its methyl ether with alcoholic potash (Buchner, B 21, 2641) Small aggregates of needles (from ether), v sol alcohol and water, sl sol ether Not affected by bromine or by KMnO4 Its ammonium salt crystallises in plates

Methyl ether Me, A" $[61^{\circ}]$ (267°) at 732 mm , (224° at 180 mm) Obtained by distilling the compound of methyl fumarate with Needles (from alcohol or methyl diazo acetate water), v sol alcohol, ether, benzene, and petroleum-ether

Anhydride C,H,(CO,H) < CO > O [189°]

(265° at 75 mm) Obtained by distilling the acid under reduced pressure Small prisms, v sol water and alcohol, m sol ether Its Pb, Ba, and Ag salts are m sol water

Trimethylene (1,1,2,3) tetra-carboxylic acid

$$(CO_2H)_2O \begin{array}{c} CH(OO_2H) \\ \\ CH(CO_2H) \end{array} \quad \text{or} \quad \text{possibly}$$

(CO₂H)₂C C(CO₂H) CH₂ CO₂H [95°-100°] The tetra-ethyl ether of this acid is obtained by the action of di bromo succinic ether on di sodiomalonic ether (Perkin, B 17, 1652, C J 47, 824) Crystalline colourless solid V sol water, alcohol, ether, and acetone, sl sol ligroin and bonnene. Very strong acid The acid loses CO.

on heating to 200° giving the (1, 2, 3) tri carboxylic acid

Salts -A'Ag, white amorphous pp ---A''Ca2aq crystalline pp, more soluble in cold water than in hot

Tetra-ethyl ether AivEt. mm), thick colourless oil

Tri-methylene (1,1,2,2)-tetra-carboxylic

acid CH, (CO₂H), et [200°] Formed by saponifying the ethyl ether with alcoholic KOHAq (Dressel, A 256, 196) Large shining crystals (from water) When heated to 230° it gives off 2CO2 and H2O and is converted into the anhydride of trimethylene dicarboxylic acid, and from this the dicarboxylic acid itself can be ob-

tained by heating with water to 140° Ethyl ether $H_2C < \frac{C(CO_2Et)_2}{C(CO_2Et)_2}$ [43°]

(187°)Formed by the action of bromine on the disodium compound of propane tetra car boxylic ether (Dressel, A 256, 194, cf Perkin, B 19, 1056) Long needles, v sol ether, alcohol, CHCl, and benzene (D)

Tetra-methylene carboxylic acid C,H,O, te $CH_2 < CH_2 > CH CO_2H$ (191°) at 720 mm 8 G $\frac{15}{13}$ 1 0548, $\frac{25}{25}$ 1 0476 M M 5 048 at 18° μ_D 1 4403 at 26° Formed by heating tetra methylene dicarboxylic acid at 200°, CO₂ being given off (Perkin, B 16, 1795, C J 51, 8) Colourless oil, smelling like butyric acid, sl sol water, miscible with alcohol and ether Not attacked by bromine below 100°

Reaction -The calcium salt distilled with lime gives C₂H₄, H₂, CH₄, CO, di tetramethylenyl ketone, and tetramethylenyl methyl ketone (Colman a Perkin, jun, C J 51, 228, B 19, 3112)

Salts -AgA' sparingly soluble white pp -CaA'2 5aq

Ethyl ether EtA' (151°) at 720 mm (P),

(162°) (Freund, B 21, 2694) Chloride C₄H,COCl (143°) (F) tained by heating the amide with PCl's

Amide C₄H, CONH₂ [138°] (c 240°) Formed by heating the ammonium salt of the acid to 250° (Freund, B 21, 2694) Plates (from alcohol), v sol water, ether, chloroform, benz-May be sublimed Decomposed by treat ment with bromine and KOH

Natrale C.H, CN (150°) Formed by dis tilling the amide of tetra methylene carboxylic acid with phosphoric anhydride (Freund, B 21, 2696) Colourless oil, with pleasant odour Is converted into the amine by reducing with sodium and alcohol

Antlide C.H., CONHPh [111°] Formed by heating the amide with aniline until no more ammonia is given off (Freund) Long needles (from alcohol), sl sol hot water

Anhydride (C,H, CO)2O (160°) Formed by distilling the sodium salt with the chloride of the acid (F)

Tetra-methylene (1,1)-dicarboxylic acid $C_6H_6O_4$ to $CH_2 < \frac{CH_2}{CH_2} > C(OO_2H)_2$ [156°] From the ether (Perkin, O J 51, 4) Monoclinic crystals (from ether), a b c = 10324 1 1 1854, \$=98° 58'. V. sol. ether and bensene, nearly insol chloroform and ligroin, v sol water few degrees above its melting point it splits off CO, becoming tetramethylene carboxylic acid

Salts - AgaA" - CuA" aq - PbA" aq

BaA" aq

Ethyl ether Et₂A" (221°) at 720 mm SG § 10533, 25 10405. MM 9940 at 189° $\mu_{\rm D}$ 1 433 Formed from malonic ether, trimethylene bromide, and NaOEt (Perkin, B 16, 1793, C J 51, 2) Oil, smelling like camphor

Tetramethylene (1,2)-di-carboxylic acid CH2 CH(CO2H)

[130°] Formed by heating CH, CH(CO,H) the tetra carboxylic acid to 180°-200° (Perkin, B 19, 2042, C J 51, 22) Colourless feathery crystals (from water) V sol water, alcohol, and ether, more sparingly sol benzene and ligroin By alkaline KMnO4 it is oxidised to

oxalic acid Salts —A"Ag, heavy white pp —A"Bax sparingly soluble six sided transparent tables Diethyl ether A"Et2 $(238^{\circ}-242^{\circ})$,

colourless liquid CH2 CH CO

O [78°], colour-Anhydride CH, CH CO/

less crystals, easily soluble in alcohol, sparingly in ether and benzene Formed by heating the acid to 300° Reconverted into the acid by boil ing with water Heated with resorcin it gives a beautifully fluorescent condensation product

Tetramethylene (1,3) dicarboxylic acid

со н сн<^{СН}₂>сн со_лн Homortaconic Formed by boiling its ether with [171°] fuming HClAq (Markownikoff a Krestownikoff, A 208, 333) Prisms, v sol hot water and alcohol, sl sol ether May be sublimed not combine with bromine, but when heated with Br it gives off HBr and CO₂ It is not reduced by sodium amalgam Does not form an anhydride Does not unite with HBr or HI

Salts -PbA" laq Crystalline crusts -Ag₂A" Amorphous pp, not decomposed by

boiling water

Methylether Me.A" (220°)

Ethylether Et.A" (230°) Formed in very small quantity when CH, CH(OEt) CO, Et is prepared by the action of dry NaOEt on a chloro propionic ether (M a K)

Tetramethylene (1,1,2,2) - tetra - carboxylic CH₂ C(CO₂H)₂

. [145°-150°] Obtained by acid CH. C(CO2H)2

saponification of the tetra-ethyl ether, which is formed by the action of bromine upon the di sodio derivative of butane tetra carboxylic CH₂ CNa(CO₂Et)₂

ether (Perkin, B 19, 2041,

CH2 CNa(CO2Et)2

C J 51, 21) Colourless crystals Easily soluble in water, alcohol, and ether, more sparingly in benzene and ligroin It evolves CO2 at its melting point, and is converted into the di carboxylic acid

Tetramethylene (1,1,3,3) - tetracarboxylic acid Ethylether

(CO'Et)'CCCH'
CH'
CO'Et)'CCC'Et)' Formed by the action of methylene iodide on the di sodium de

rivative of propane tetra carboxylic ether in an alcoholic solution on the water bath (Dressel, A 256, 198) Colourless viscid oil, distilling with some decomposition between 220° and 250° at 15 mm

Pentamethylene dicarboxylic acid CH2-CH CO2H [160°]

CH,-CH CO,H

Preparation - Disodium pentane tetra carboxylic ether.

(CO,Et)2CNa CH2 CH2 CH, CNa(CO,Et)2 18 con- $CH_2-C(CO_2Et)_2$ verted by Br into CH. `CH₂---Ċ(CO₂Et)₂

yields pentamethylene tetracarboxylic acid on saponification, and this acid is decomposed by heat into CO2 and pentamethylene dicarboxylic This is purified by conversion into its ethyl salt (Perkin, jun, C J 51, 244, B 18, **3250)**

Properties - Nodules (from water) hot water, alcohol, and acetic ether, sl sol

Salts -Ag,A" Very stable white pp (° 250°) ,CH₂—CH CO. Ethyl sther Et.A" Anhydride CHA **℃H,**—ĊH CO∕

[64°-67°] Formed by heating the acid to 300° M sol alcohol and ether, sl sol CS₂, insol cold, but saponified by hot, Na₂CO₃Aq With resorcin and H.SO, it gives the fluorescein reaction

Penta-methylene tetracarboxylic acid

 $CH_2-C(CO_2H)_2$ Formed as above Sol. $^{\circ}CH_{2}$ — $C(CO_{2}H)_{2}$ ether

TETRAMETHYLENE CARBOXYLIC ALDE HYDE CH₂<CH₂>CH CHO (115°-117°) From

calcium tetramethylene carboxylate by distilling with calcium formate (Colman a Perkin, C. 51, 238) Oil, smelling like isobutyric aldehyde Gives a purple colour with rosaniline hydro chloride which has been bleached by SO2, reduces ammoniacal AgNO Aq, combines with NaHSO,, reacts with hydroxylamine and with phenyl hydrazine

TRIMETHYLENE CHLORHYDRIN CHLORO PROPYL ALCOHOL

METHYLENE CHLORIDE CH.Cl. D_{i} chloro methane Mol w 85 (418°) (Thorpe, C J 37, 195) S G $\stackrel{?}{_{\sim}}$ 1 3778 (T), $\frac{1}{15}$ 1 3377, $\frac{25}{35}$ 1 3220 MM 4 313 at 11 9° (Perkin C J\$\frac{95}{25} 1 3220 45, 527) (0°-10°) 001335, (0°-40°) 12 H C p 106800 (Berthe CES V 65 12 001416 lot a Ogier, Bl [2] 36, 68)

Formation -1 From chlorine and methyl chloride in sunlight (Regnault, A 33, 328, A Ch [2] 70, 377)—2 By the action of zinc dust and ammonia on chloroform, the yield being very small (Perkin, C N 18, 106) -8 By the action of chlorine on methylene iodide (Butlerow, A 107, 110, 111, 251, Z [2] 5, 276) — 4 By the action of AlCl, on the compound of Cl CO₂CCl, with Cl CO₂CH, (Hentschel, J pr [2]

Preparation - Aqueous HCl is cautiously added to a mixture of alcohol (5 vols), chloroform (1 vol), and sinc Sufficient heat is produced in the reaction to distil over much of the methylene chloride The product is fractionally distilled (Greene, C R 89, 1077, A Ph S 18, 847, C N 50, 75, A C J 1, 522)

Properties—Oil Like CCl₄ (but unlike CCl₄)

Properties—Oil Like CCl₄ (but unlike CH₃Cl and CHCl₅) it exerts a poisonous action when inhaled (Regnault a Villejean, C R 100,

1146

Reactions -1 Converted by ICl or ICl, into CHCl₃, and hexachloro benzene Converted by IBr into iodoform and di chloro di iodo methane (Holand, A 240, 234) Converted by IBr, into CBr, CHBr, and C2Br, -2 Heated with KI, iodine, and alcohol, it gives CH2I2, EtI, and alcohol (H) —3 Iodine at 200° gives methylene iodide (H) —4 Bromine at 170° forms iodide (H) -4 Bromine at 170° forms CHBrCl₂ (91°), and a little CBr₂Cl₂ [38°] (150°) (Arnhold, A 240, 204) -5 Alcoholic NaOAc forms CH₂(OEt)₂ and acetic acid (A) -6 Con verted by alcoholic NH, at 125° into so called hexa methylene diamine (Holand, A 240, 225) Aqueous ammonia at 140° forms NH₄Cl, methylamine hydrochloride and formic acid (André, C R 102, 1474) -7 Mixed with benzene it is converted by AlCl, into anthracene and other products (Friedel a Crafts, A Ch [6] 11, 264) 8 Water at 200° forms HCl, formic acid, MeCl, and MeOH (André) -9 With H.S it forms a crystal line compound CH2Cl2(H2S)2 23aq (Forcrand, A Ch [5] 28, 17)

TRIMETHYLENE CHLORIDE v $\omega\beta$ Dichloro propane

METHYLENE CHLORO BROMIDE CHLORO BROMO METHANE

Tri methylene chloro-bromide v Chloro BROMO PROPANE

TRIMETHYLENE CYANHYDRIN v Nutrile of γ Oxy-butyric acid

TRIMETHYLENE CYANIDE C₃H₄N₂ 2 e CH₄(CH₄CN)₂ Glutaromtrale (274°) (H), (286°) (Perkin, C J 55, 702), (203° at 100 mm), (142° at 10 mm) (Krafft a Noerdlinger, B 22, 817) SG $\frac{15}{15}$ 9952, $\frac{2}{3}$ 9894 M M 5 136 (P) Formed from trimethylene bromide and alco hohe KCy (Henry, Bl [2] 43, 618, C R 100, 742) Liquid, sol water, alcohol, and chloro form, insol ether and CS₂ Yields glutaric acid on saponification Sodium reduces it in alcoholic solution to pentamethylene diamine and piperidine

TRIMETHYLENE-DI ETHYL ALKINE ETHYL OXYPROPYL AMINE

METHYLENE-ETHYL AMINE C₃H,N te EtNCH₂ (208° 1 V) V D 2 Formed by the action of ethylamine on formic aldehyde (tri oxymethylene) (Kolotoff, Bl [2] 43, 112, J R 17, 231) Liquid, with unpleasant odour, sol cold water, but separates again on warming, v sol alcohol HCl splits it up into ethylamine and trioxymethylene (formic paraldehyde)—B'2H,PtCl₂ Yellow crystalline pp An isomeride (CH₂),N₂Et₄ of this base is described by Lermontoff (B. 7, 1252) as an oil formed by heating

ethylamine with alcoholic methylene iodide at 100°—(CH.). N. Et. H. PtCl. Amorphous

100°—(CH₂)₄N₄Et₄H₂PtCl₆ Amorphous Methylene tetre ethyl-diamine C₉H₂₂N₂ is CH₂(NEt₂)₂ Tetra ethyl-diamine C₉m₂N₂ is CH₂(NEt₂)₂ Tetra ethyl-di-amido methane (169° i V) 8 10 Formed by heating trioxy methylene (formic paraldehyde) with diethyl amine in sealed tubes at 100° (Kolotoff, Bl [2] 43, 112, Ehrenberg, J pr [2] 36, 118) Inquid with peppery odour, sl sol water, miscible with alcohol, ether, and CHCl₃ Split up by dilute acids, even by oxalic acid, into NHEt₂ and formic aldehyde Combines with CS₂, forming C₉H₂₂N₂OS₂

Tetra - methylene tetra - ethyl - tetramine $C_{12}H_{28}N_4$? e $CH_2 < NEt$ CH_2 NEt CH_2 NEt CH_2 NEt CH_2 Formed by heating methylene iodide with alcoholic ethylamine at 100° (Lermontoff, B 7, 1252) Liquid, yielding amorphous salts $-B''H_2PtCl_6$ sl sol water

METHYLENE - ETHYL PHTHALIMIDINE $C_{11}H_{11}NO$ & e $C_{e}H_{4}$ C_{CO} NEt Obtained by heating $C_{22}H_{24}N_{1}O_{5}$ which is produced by adding aqueous ethylamine to phthalyl acetic acid (Mertens, B 19, 2369) Colourless oil, smelling of fresh carrots Volatile with steam, v sol alcohol and ether

METHYLENE DI-ETHYL DISULPHIDE C₅H₁₂S₂ te CH₂(SEt)₂ Formac addehyde cthyl mercaptal Ethyl derivative of di thio formic orthaldehyde (178°-181°) SG ²⁰ 987 Formed from methylene chloride and NaSEt in alcoholic solution (Niederist, A 186, 391, Fromm, A 253, 155)

METHYLENE DI ETHYL DISULPHONE

C₃H_{1,2}S₁O₄ ie CH₁(SO₂Et)₂ [104°] Formed
by the action of KMnO₄ and H.SO₄ on CH₁(SEt)₄
(Fromm, A 253, 156, cf Baumann, B 1°,
2811) Needles, v sol water and alcohol, sl sol
ether Chlorine forms CCl₂(SO₂Et)₂ [99°] crys
tallising in needles, while bromine produces
CBr₂(SO₂Et)₂ [132°]

Di-methylene di-ethyl trisulphone (Et SO₂CH₂)₂SO₂ [149°] Formed by treating formic aldehyde with H₂S₁, dissolving the product in aqueous NaOH, shaking with EtBr, and oxidising the product with kMnO₄ (Baumann, B 23, 1875) Sparingly soluble colourless plates METHYLENE_FURFURANE TRIHYDRIDE

C₃H₃O 2 & CH₂ CH₂ C(OH₂) (111°) at 718 mm

Formed by the action of solid KOH on methyl bromo propyl ketone (Lipp, B 22, 1207) Mobile liquid, m sol water Yields a hydrazide When heated with 5 pc HClAq at 100° it yields aceto propyl alcohol (methyl oxypropyl ketone) Probably identical with trimethylenyl methyl ketone of Perkin, jun (B 17, 1440)

TRI-METHYLENE GLYCOL C.H. O. 1 C.CH. (CH.OH.) (214°) SG § 10625 (Z), $\frac{166}{10536}$ (F) CE (0°-10°) 00060 SV 84 (Zander, A 214, 178, Lossen, A 254, 59) One of the products of the fermentation of glycerin by schizomycetes (Freund, M 2, 636)

Formation —1 By saponifying its diacetyl derivative with baryta water (Reboul, A Ch [5] 14, 491) —2 By warming trimothylene bromide with moist Ag₂O (Beilstein a Wiegand, B 16,

1497) -8 By allowing CH₂(CH₂Br)₂ to stand for some time with a large excess of water (Niederist, M 3, 839) -4 By boiling trimethylene bromide with dilute aqueous K2CO, (Z)

Properties -Viscid liquid, with sweet taste,

miscible with water

Reactions —1 Fuming HClAq at 100° con verts it into CH₂(CH₂Cl)₂ •-2 Trimethylene glycol (35 g) heated with aldehyde (12 g) at 100° yields the ethylidene derivative (v infra)

Dracetyl derivative CH₂(CH₂OAc)₂ (210° cor) (c 111°) SG ² 991, ¹⁸ 1070 11 Formed by boiling CH₂(CH₂Br)₂ with NaOAc (Reboul)

Ethylidene derivative C₅H₁₀O₂ re CH₂CH₂O CH CH, V D 3 62 (calc 3 53) Obtained by heating the glycol with aldehyde at 100°, the yield being nearly the theoretical (Lochert, A Ch [6] 16, 49) Colourless liquid, with slight aldehydic odour Dissolves in 1; volumes of water, v sol alcohol and ether Separated from its aqueous solution by CaCl2 and by KOH Saponified by boiling water, al kalis, and dilute acids aldehyde and CH₂(CH Cl) With PCl, it yields

Amylidene derivative C,H14O2 1e CH CH O CH C₄H, (c 165°) S G 2 995 VD 503 (calc 498) Formed by heating tri methylene glycol (35g) with valeric aldehyde (20g) in a sealed tube at 125° Colourless mo bile liquid, v sl sol water, v sol alcohol and ether Saponified by boiling water

Heptylidene derivative C10H OO2 16 CH $\stackrel{\text{CH}_2 \text{ O}}{\text{CH}_2 \text{ O}}$ CH C₆H₁₃ (c 216°) 8 G $\stackrel{\text{Q}}{\text{O}}$ 933 From the glycol (30 g) and heptoic aldehyde (cenanthol) at 160° (L)

Bromhydrin v Bromo PROPYL ALCOHOL TRI METHYLENE IMINE C3H, N i e

CH, CH, NH (65°-80°) Formed, together with a polymeride C_aH_{1,}N (160°-167°), from CH_aBr CH₂ CH₂ NH₂ and NaOH in the cold (Gabriel a Weiner, B 21, 2669) Volatile liquid, smelling like NH, and fuming in the air Eagerly combines with CS₄ - B'HAuCl₄ -B' H.PtCl₆ -B'C₆H (NO),OH [167] METHYLENE IOI

IODIDE CH,I, Di rodo methane [4°] (152° at 330 mm) SG $\frac{15}{15}$ 3 2853, $\frac{25}{25}$ 3 2656 MM 18 827 at 15° (Perkin, C J 45, 464

Formation -1 By heating iodoform (4 mols) with NaOEt (9 mols) dissolved in alcohol (But lerow, A 107, 110, 111, 242, cf Bruning, A 104, 187) -2 By heating chloroform with HIAq at 130° (Bluducho, Z [2] 7, 91) -3 By heating 10doform (50 g) with cone HIAq (200 g) to boiling (127°) and adding phosphorus (Lieben, Z 1868, 712, Baeyer, B 5, 1095)—4 From methylene chloride and CaI, at 75° (Spindler, A 231, 262) -5 By warming a mixture of iodoform (5 pts), water (2 pts) and reduced iron (5 pts), and fractionally distilling in vacuo (Cazeneuve, C R 98, 369) -6 An alcoholic solution of 10do form is decomposed by light, yielding CH,I, and Oxalic acid accelerates the reaction (Mulder, R T C 7, 316)

Properties -Yellowish liquid, boiling with partial decomposition at 180°.

Reactions -1 Potassium has no action in the cold, but on heating it acts with explosive violence -2 Heated with copper and water, the products are cuprous iodide and a mixture of CO, methane, CO, and ethylene (Butlerow, A 120, 356) —3 Silver acetate forms the diacetyl derivative of formic orthaldehyde CH. (OAc), -4 Silver oxalate yields formic paraldehyde (trioxymethylene) -5 Chlorine yields CH₂Cl₂-6 Bromine forms CH2Br2 (Arnhold, A 240, 207) -7 Converted by PCl, at 70° into methylene chloride and a trace of chloriform (Höland, A 240, 227) —8 Alcoholic Na₂S yields thioformic aldehyde —9 NMe, combines with formation of (CH.I)NMe₃I -10 Annline forms CH₂(NHPh)₂ 11 Mercury forms IHg CH₂I (Sakurai, C J 37, 658)

Trimethylene iodide v Di 1000 PROPANE DI-TETRAMETHYLENE KETONE v DI-

TETRAMETHYLENYL KETONE METHYLENE-MALONIC ETHER $C_8H_{12}O_4\nu$ e CH C(CO₂Et)₂ [156°] Formed by heating malonic ether with methylene iodide and NaOEt (Zelinsky, B 22, 3294) Mobile liquid Isomeric with fumaric and maleic ethers. With bromine it yields CH₂Br CBr(CO₂Et)₂ (185°-190° at 75-85 mm)

Polymeride {CH₂ C(CO_.Et)₂}₂ [156°] Ac companies the preceding (Z) Minute amorphous granules, insol water, m sol ether and alcohol Its molecular weight determined by

Raoult's method is 342 (calc 344)

DI-METHYLENE-DI-METHYL-DIAMINE $C_1H_{10}N_2$ i.e. $(CH_2)_2N_2Me_2$ VD (H=1) 41.5 (calc 43) Formed by passing a mixture of tri methylamine and hydrogen through a red hot tube (Romeny, B 11, 835) Crystalline Hot dilute HClAq splits it up into formic aldehyde and methylamine -B"H PtCl,

A base, boiling at about 207°, formed by the action of methylamine upon trioxymethylene (formic paraldehyde) is perhaps identical with the preceding (Kolotoff, Bl [2] 45, 253)

TRIMETHYLENE - HEXA - METHYL - DI **AMINE** $(C_3H_6)N$ $(CH_3)_6$ Formed by heating trimethylene bromide (CH_6Br) with trimethyl Formed by heating

Salts - B'H2Br2 aq soluble colourless needles -B' H, Cl2PtCl, sparingly soluble (Roth, B 14, 1351)

METHYLENE METHYL BUTENYL DI KETONE CH, CO CH. CO C,H, Acetyl mesityl Acetyl angelicyl methane Formed as a secondary product in the prepara tion of methylene dimethyl diketone by the action of acetone and NaOEt on acetic ether (Claisen a Ehrhardt, B 22, 1012, Bl [3] 1, 498) soluble in aqueous alkalis Its alcoholic solu tion gives a red colour with FeCla Cuprio acetate in concentrated solutions gives a dark green pp -CuA' [123°] Crystalline, v sol warm alcohol and ether

METHYLENE DIMETHYL ETHER v D.

methyl ether of Ortho Formic aldehyde METHYLENE METHYL ETHYL DIKE TÔNE CoH10O2 1 e C2H5 CO CH2 CO CH3 CO CH, Acetyl S G 15 9538 promonyl methane (158°) Formed by the action of EtOAc and NaOAc upon methyl ethyl ketone (Classen a Ehrhardt, 22, 1014) —Cu(C₆H₈O₂)₂ [179°] Slender blue needles (from hot alcohol) METHYLENE METHYL HEXYL DIKE FONE $C_{10}H_{18}O_2*.e$ CH_1 CO CH_2 CO C_6H_{11} (229°). Formed from methyl hexyl ketone, AcOEt, and AcONa (Claisen a Ehrhardt, B=22, 1015) aquid $-Cu(C_{10}H_{11},O_2)_2$ [122°] Crystalline METHYLENE DI-METHYL DIKETONE

 J₆H₈O₂ re OH₂(CO CH₃), Dr acetyl methane
 dcetyl-acetone (186°) S G 15 987 (Combes)
 Preparation —1 By slowly adding acetone 1 mol) to a mixture of acetic ether (3 mols) ind dry NaOEt (1 mol) heated on the water The product is poured into ice cold vater, and the aqueous liquid mixed with HOAc. and cupric acetate, which ppts Cu(C,H,O2), The yield is 35 pc of the weight of acetone imployed (Claisen, Bl [3] 1, 498) -2 Acetone 58 pts) mixed with EtOAc (33 pts) is treated n the cold with sodium wire (2 3 pts) nost of the sodium is dissolved, the mixture is neated on a water bath The product is ppd as supric salt, the yield of ketone being 55 p c of he acetone employed (Classen a Ehrhardt, B 22, 1009) In either case the diketone is ob ained from the copper compound by adding lilute H2SO, and extracting with ether -3 From he compound C₁₂H₁₀O_cAl₂Cl₆ (obtained from icetyl chloride and AlCl₂) by adding water and attracting with chloroform The yield is 85 p c

of the theoretical (Combes, A. Ch. [6] 12, 211)
Properties—Colourless liquid with pleasant icetic odour, sol water, v. sol aqueous HCl, miscible with alcohol, ether, and chloroform

Not attacked by PCl₃

Phenyl hydrazıne Reactions -1 forms phenyl dimethyl pyrazole $CMe \stackrel{CH}{\leqslant_{NPh}} OMe$ 270 5°) (Combes, Bl [2] 50, 145) -2 Potash lecomposes it into acetone and KOAc -3 PCl, yields HCl and C₅H₆Cl₂ (145°), a di chloro amyl one which readily combines with bromine 1 Sodium amalgam yields isopropyl alcohol and ofnacone But in acid solution the products of eduction by sodium amalgam are di oxy pentane CH₂ CH(OH) CH₂ CH(OH) CH₃, and a tetra nydric alcohol analogous to pinacone —5 Conc HIAq at 185° reduces it to pure n pentane (38°) At lower temperatures it forms CH2(CHI CH3) and CH, CHI CH, CH, CH, -6 Excess of thlorine in sunlight yields (CCl₃ CO)₂CH₂ as final product -7 Bromine attacks the diketone finally producing (CBr, CO)2CH2 ngorously, 108°] —8 Oxidation by CrO, or by KMnO yields acetic acid -9 Warm dilute nitric acid produces CH₂(NO₂)₂ and HOAc —10 Dry am nonia passed into its ethereal solution ppts white pearly scales of the ammonium salt CH(NH₄)(CO CH₃)₂—11 Ethylene dramme (2 mols) forms C₂H₄(N CMe CH₂Ac)₂ [111°] which yields a violet cupric salt $C_{12}H_{18}N_2O_2Cu$ [137°] and a hydrochloride $C_{12}H_{20}N_2O_2H_2Cl_2$ melting above 280° Other diamines act in like manner (Combes, C R 108, 1252) -12 Unites with benzidine (1 mol) forming a base melting at 195° (Combes) -13 Aldehyde ammonia (mol) ht 100° forms diacetyl tri methyl-pyrdine diahydride O₁₂H₁₇NO₂ [153°] (Combes, Bl [3] 1, 14).

14 Tolylene m diamine at 100°, followed by H₂SO₄, yields amido trimethyl quinoline C₁₂H₁₄N₂ [191°] (Combes, C R 108, 1254) -15 SO₂Cl₂ forms the chloro derivative C₅H₇ClO₂ (156°) (Combes, C R 111, 272)

Salts —CH(NH_a)(CO CH_a)_a. Pearly scales, ppd by passing NH_a into the ethereal solution Decomposes readily into acetone and acetamide. -Ac₂CHNa Formed by dissolving sodium in the diketone (Combes, C R 104, 920) White sixsided prisms, insol ether Decomposed by water into acetone and NaOAc With ethyl iodide at 140° it gives CHEt(CO CH₂), a liquid boiling at 171° Amyl iodide, in like manner, yields C₅H₁₁ CH(CO CH₂). The second atom of hydrogen in the methylars group may in sind company. gen in the methylene group may, in such com pounds, be displaced by Na, and by acting with an alkyl iodide R'I upon RONa(CO CH₃), we may obtain compounds of the form RCR'(CO CH₃), These reactions take place with hardly any These homologues secondary decompositions of methylene. dimethyl diketone are decom posed by potash like the diketone itself (Combes, A Ch [6] 12, 211) ClCO₂Et acting on the sodium derivative of methylene dimethyl diketone forms C(COMe)₂(CO.Et)₂ (Classen a Zedel, B 21, 3397)—KCHAc₂ White six sided prisms, sl sol alcohol, insol ether Formed by adding KOEt to an alcoholic solution of the diketone Decomposed by hot water into acetone and KOAc -Mg(CHAc₂)₂ (dried at 125°) From the diketone and magnesium carbonate (Combes, C R 105, 868) Transparent six sided prisms -Al(CHAc₂)₃ A by product in the rectification of the diketone, from which it may be obtained by treatment with AlCl_s Small red crystals, insol water, sl sol alcohol, v sl sol ether Can be partially volatilised Acts on polarised light Not decomposed by alcoholic NH₃ —Cu(HCAc₂)₂ (dried at 125°) Pale blue needles, obtained by adding cupric acetate or chloride to an aqueous solution of the diketone Insol water, the ppn being complete in dilute solutions At 65° it forms with COCl₂ dissolved in benzene a crys talline compound melting at 121° (Thomas a Lefèvre, Bi [2] 50, 193) —Fe(HCAc2), Red crystals, deposited from the ethereal extract of the red solution obtained by adding FeCl, to the diketone dissolved in water -Pb(HCAc) From the diketone and lead carbonate Transparent crystals, sol water

Oxim CH, CO CH, C(NOH) CH, Anhy dride CH CMe N (142°) 8 G 1 985

Formed by the action of hydroxylamine on the diketone (Zedel, B 21, 2178) Colourless oil, with peculiar alkaloidal odour

Dioxim CH₂(C(NOH) CH₃)₂ [150°] Large

transparent crystals (from ether)

Phenyl methyl hydraside CH₂ CO CH₂ C(N₂PhMe) CH₃ (Kohlrausch, A 253, 22)

Di-methylene di-methyl triketone (CH₂ CO CH₂)₂CO Di-acetyl acetone [49°]
Formed from its anhydride (v infra) Plates
Sl sol water, sol alkalis, warm alcohol, and ether FeCl₂ gives a deep-red colour Converted by NH₂ into oxy-di methyl pyridine [225°]

by NH, into oxy-di methyl pyridine [225°]

Anhydride COCCH CMeOD Di methyl pyrone [182°] (249°) Formed by the action of HIAq on dehydracetic acid at a high temperature (Feist, B 22, 1570, A 257, 253) The yield is 70 pc of the theoretical Crystals, ve sol water Converted by baryta, followed by HCl, into di methylened i methyl tri ketone The carboxylic

acid of this anhydride is dehydracetic acid. The petroleum ether dicarboxylic ether $CO < C(CO_2Et) CMe > O [80^\circ]$ 8 8 at 20° is formed by the action of COCl2 on copper acetoacetic ether, and is converted by P_2S_4 into $CS < \frac{C(CO,Et)}{C(CO_2Et)} \frac{CMe}{CMe} > O$ [110°] (Conrad, B 19, 22, 20, 152, 2111)

Di phenyl hydrazide (CH₃ C(N HPh) CH₂),CO [142°]

Trimethylene methyl ketone v TRIMETHYL ENYL METHYL KETONE.

Tetramethylene methyl ketone v Tetra MFTHYLI NYL METHYL KETONE

METHYLENE DIMETHYL ETHER

Methul ether of formic orthaldehyde

METHYLENE DIMETHYL DIOXIDE Methyl ether of Formic orthaldehyde, vol 11 p 570

METHYLENE METHYL PHENYL DI KETONE v BFNZOYL ACETONE

METHYLENE METHYL-PHTHALIMIDINE C=CH₂ C₁₀H₉ON ie C_eH₄ NMe Formed by heat

ing phthal methyl imidyl-acetic acid

crystals V sol alcohol, Volatile with steam ether, and chloroform, more spanngly sol Very unstable body (Gabriel, B 18, 2454)

METHYLENE METHYL PROPYL **KETONE** $C_7H_{12}O_5$, i.e. CH_3 CO CH. CO C_3H_7 (175°) S G $\frac{15}{2}$ 9411 Formed by the action of EtOAc and NaOAc upon methyl propyl ketone (Claisen a Ehrhardt, B 22, 1015) Formed also from butyiic ether, acetone, and NaOEt Colourless oil Boiling alkalis yield acetic and Yields C₆H₅N, CHAc COPr [55°] butyric acids crystallising in yellow prisms -Cu(C,H11O2)2 [161°] Blue needles

TETRA METHYL TRIMETHYLENE DI-PYRROLE C₁₅H ₂N₂z e (| CH CMe CH CMe on ch,),ch,

[77°] Formed by heating acetonyl acetone with alcoholic tri methylene diamine at 120° (Paal a Schneider, B 19, 3157) Crystalline

METHYLENE DI METHYL DISULPHONE (CH, SO), CH₂ [141°] Formed from methyl mercaptan and methylene chloride, and oxida tion of the product (Baumann, B 23, 1875) On treatment with bromine water it Plates gives CBr₂(SO₂Me)₂ [234°]

Dı methylene di methyl trısulphone (CH, SO, CH,), SO, [185°] Formed by satu rating a solution of formic aldehyde with H,S, extracting with ether, evaporating, dissolving the residual oil in aqueous NaOH, adding MeI, and oxidising with KMnO4 (Baumann, B 23, 1872) Prisms, v sl sol cold water, alcohol, and ether Yields with bromine-water insoluble C4H6Br4S3O6 [190°]

TRIMETHYLENE TRINITROSAMINE

C₃H₆N₆O₃ : e (CH₂N NO)₃ [106°] Formed by the action of nitrous acid upon hexamethyleneamine (F Mayer, B 21, 2883) Yellow needles or prisms (from alcohol), v. sol. alcohol, insol.

Decomposed by water with production of formic aldehyde

METHYLENE DI-OCTYL OXIDE v Octul ether of Formic orthaldehyde

METHYLENE OXIDE 18 FORMIC ALDEBYDE

METHYLENE-DI-OXY compounds v Methyl

ene derivatives of DI OXY compounds METHYLENE DI PHENYL DIAMINE

METHYLENE DIPHENYLENE OXIDE v DI PHENYLENE METHANE OXIDE

METHYLENE DIPHENYL DIKETONE v DI PHENYL METHYLENE DIKETONE

TRIMETHYLENE PHENYL KETONE v PHENYL TRIMETHYLENE KETONE

Tetramethylene phenyl ketone v Anhydride of Phenyl oxybutyl ketone

METHYLENE DIPHENYL OXIDE v Di

PHENYLENE METHANE OXIDE METHYLENE HEXAPHENYL

PHONIUM IODIDE v Methyleno di iodide of TRI-PHENYL PHOSPHINE

TRIMETHYLENE DI PHTHALAMIC ACID C₁₀H₁₀N₂O₆ is CH₂(CH₂NH CO C₆H₄ CO H), [70°-123°] Obtained by boiling trimethylene dı phthalimide with potash (Gabriel, B 21, 2670) Crystalline Decomposed by water On boiling with aqueous HCl it is converted into phthalic acid and trimethylene-diamine

METHYLENE PHTHALIDE C,H,O, 1.4. C=CH2 C_4H_4 Anhydride of o Oxy vinyl-

>0

\c=0 [60°] Formed by heating benzow acid phthalyl acetic acid in vacuo (Gabriel, B 17, 2521) Small glistening crystals Soluble in hot water, easily in alcohol, ether, benzene, &c Volatile with steam It readily polymerises Combines with Br (1 mol)

glistening crystals Formed by the combination of methylene phthalide with bromine warming with aqueous KOH it yields aceto phenone o carboxylic acid C₆H₁(CO₂H) CO CH₂ Boiled with water it gives methylene phthalide oxide C₂H_eO₃ (Gabriel, B 17, 2524)

Methylene-phthalide oxide C,H,O, [146° Long needles Formed by boiling the dibromide of methylene phthalide with water Formed also by the action of water on the product of the bromination of acetophenone o carboxylic acid (Gabriel, B 17, 2524)

Di chloro-methylene phthalide C.H.Cl.O. t s.

$$C_0H_4$$
 $\begin{array}{c} C=CCl_2 \\ > O \\ C=O \end{array}$ [128°] Formed by passing

chlorine into a mixture of a chloro phenylacetic acid (1 pt) and HOAc (10 pts) Formed also by warming di chloro acetophenone carboxylic acid with conc H₂SO₄ (Zincke a Cooksey, A 255, 383) Long slender needles, gradually becoming compact when left in the liquid The needles are v sol hot alcohol, benz ene, HOAc, and benzoline, the compact crystals are soluble with difficulty Alcoholic potash

converts it into di chloro acetophenone ocarboxylic acid Forms a dichloride CCI_CCI3

00 which crystallises in colourless prisms [94°], v sol alcohol and HOAc, and tonverted by alcoholic potash into phthalic

Bromo methylene phthalide v vol 1 p 580

Isomeride of methylene phthalide v Метн YLFNE PHTHALYL

Polymeride of methylene phthalide $C_{18}H_{12}O_4$ [216°] Obtained by allowing a solu tion of acetophenone carboxylic acid (1 pt) in H,SO, (2 pts) to stand in the cold, and then ppg with water (Roser, B 17, 2620, Gabriel, B 17, 2666, cf Acetophenone o carboxylic acid, reaction 2) Plates Insol water and cold alkalis, sl sol alcohol, v sol HOAc

 $Oxim C_{18}H_{19}NO_{4} [180^{\circ}]$ Obtained by heating the substance with alcoholic hydroxylamine hydrochloride at 160° Crystalline granules (from dilute HOAc)

METHYLENE-DI-PHTHALIMIDE

 $\mathrm{CH_2(N < }^{\mathrm{CO}}_{\mathrm{CO}} > \mathrm{C_6H_4)_2}$ [226°] Formed by heat ing potassium phthalimide (2 mols) with methylene 10dide (1 mol) at 175° (Neumann, B 23, 1002) Light brown crystals (from HOAc), insol dilute alkalis Yields phthalic acid on heating with HClAq

TRIMETHYLENE-DI-PHTHALIMIDE

C₁₉H₁₄N₂O₄ 1 e C₈H₄O₂ N CH₂ CH. CH₂ N C₈H₄O₂ [198°] Formed by the action of tri methylene bromide on potassium phthalimide (Gabriel, B 21, 2669) White needles, m sol hot HOAc, sl sol ether, CS2, chloroform, and cold alcohol, v sl sol water and petroleum ether Converted by heating with KOH into tri methylene di Converted phthalamic acid C3H6(NHCOC6H4CO2H)2 composed by heating with HCl at 180° into phthalic acid and tri methylene diamine

METHYLENE-PHTHALYL C.H.O. ...

 $C_8H_4 < CO > CH_2$? [219°] Fine yellow needles

Formed, together with o tribenzoylene benzene, by heating phthalic anhydride with malonic ether and sodium acetate (Gabriel, B 14, 925)

METHYLENE-DI-PIPERIDINE

 (230°) CH2(NC3H10)2 Formed by distilling piperidine with trimethylene oxide (formic par aldehyde) (Ehrenberg, J pr [2] 36, 126) Liquid, with pepper like smell Is decomposed by dilute acids into its constituents CS2 forms an addition product B"CS₂, [58°], sol alcohol and ether, insol water

METHYLENE-TETRA-PROPYL-DIAMINE CH₂(NPr₂)₂ (220°) Formed by distilling di-propylamine with trimethylene oxide (formic paraldehyde) (Ehrenberg, J pr [2] 36, 122) Inquid, sl sol water, v sol alcohol, ether, and chloroform

METHYLENE DI-PROPYL OXIDE # Dipropyl ether of Formic orthaldehyde

TRI-METHYLENE SELENO-UREA v Sele-MIUM COMPOUNDS, ORGANIC

METHYLENE SULPHIDE C. THIOTORMIC ALDEHYDE.

Tri methylene tetrasulphide C.H.S. te. CH₂ \langle CH₂ S CH₂ S \rangle [84°] Formed by the action of H2S on formic aldehyde (Baumann, B 23, Colourless needles, msol water, m sol alcohol and ether, v e sol CHCl, and benzene **METHYLENE SULPHOCYANIDE** C,H,S,N,

ie CH₂(SCy)₂ [102°] Formed by digesting potassium sulphocyanide (2 mols) with methyl ene iodide (1 mol.) in alcoholic solution for 2 or 3 hours on the water bath, ppg with water, and recrystallising from alcohol (Lermontoff, B 7, Crystals, v sol alcohol and ether, m 1282) sol hot, nearly insol cold, water Oxidised by cone HNO, to methane disulphonic acid

TRI-METHYLENE-TRISULPHONE

C₃H₆S₃O₆ ie CH₂ SO₂ CH₂ SO₂ Formed by oxidising thioformic paraldehyde (trithio form aldehyde) with KMnO, (E Baumanna R Camps, B 23, 69) Crystalline powder, insol water, dilute acids, alcohol, ether, chloroform, and glacial acetic acid, v sol cold caustic soda, ammonia (by warming), and sodic carbonate Expels CO from Na CO₃ on warming Conc HNO₃ and H₂SO₄ have no action even on warm Its solution in HSO, is ppd by water unaltered It partially sublimes The six hy drogen atoms can be displaced by alkyl groups The hexamethyl derivative

 $CMe_2 < SO CMe_2 > SO_2$

is identical with the product obtained by B Jaffé, E Baumann, and Fromm (B 22, 2598, 2609) by oxidising trithio acetone

TRIMETHYLENE-DI-SULPHONIC ACID so called v Propane di sulphonic acid

METHYLENE TRI-THIO-CARBONATE

CH₂<S>CS Separates on gently heating CS(SNa)2 with methylene iodide in alcoholic solution (Husemann, A 126, 292) Amorphous yellowish white powder, insol water verted by fuming nitric acid into methane di sulphonic acid

TRIMETHYLENE THIO UREA C,H,N S i e CH CH, NH CS [198°] Formed, together with ammonium sulphocyanide, by heating the sulphocyanide of trimethylene diamine C,H₆(NH₂),(HNCS), (Lellmann a Wurthner, A 228, 232) White needles (from chloroform mixed with light petroleum) Sol water, alco hol, CHCl,, and benzene, m sol aqueous NaOH, $\begin{array}{ll} \text{nnsol light petroleum} & \text{Forms a sparingly soluble} \\ \text{compound with } \text{HgCl}_{2} \end{array}$

Trimethylene-\(\psi\) thio-urea

CH₂ CH₂ S NH Formed by evaporating a solution of γ bromo propyl amine hydrobromide and potassium sulphocyanide to dryness at 100° (Gabriel a Lauer, B 23, 94) Liquid, v sol water forming an alkaline solution, from which it can be extracted by benzene —B'HBr [136°]
—B'C_eH₂(NO₂)₃OH [128°] Long needles
TRIMETHYLENE-UREA C₄H₈N₂O 2 e

OH₂ CH₂ NH CO Oxy-pyrimidine tetrahy dride [260°] Formed by heating trimethylene diamine (1 mol) with carbonic ether (1 mol) for 6 hours at 180° (Fischer a Koch, A 282, 224). White needles, v sol water, sl sol alcohol and ether Its solution is neutral, and is not ppd by HNO₃ or oxalic acid By chromic acid mixture it is oxidised to a compound C4H4N2O2 crystallising in plates [275°]

Trimethylene ψ-urea CH₂ CH₂ NH CNH

or $CH_2 < \stackrel{CH}{CH_2} \stackrel{O}{N} > C$ NH. Formed by evaporating a solution of equivalent qualitities of potassium cyanate and γ bromo propyl amine hydrobromide (Gabriel a Lauer, B 23, 95) Thick liquid, v sol water —B'C₂H₂(NO₂),OH [200°] Long yellow needles

Trimethylene-di-ures CH₁₂N₁O₂ ie CH₂(CH₂NH CO NH₂)₂ [182°] Formed by warming a dilute aqueous solution of tri methylene diamine hydrochloride with silver cyanate (F a K) White needles, v sol water,

sl sol alcohol, insol ether
METHYLENE VIOLET C1.H12N2SO 16.

diphenylene sulphide Oxy dimethylamido thio diphenylimide Formed by boiling a solution of methylene blue (base) Formed also by oxi dising a mixture of di methyl di amido phenyl, mercaptan, and phenol (Bernthsen, A 230, 171, 251, 96) Needles, v sl sol water, sl sol alco hol, ether acetone, chloroform, benzene, ligroin, and cumene, with a reddish brown fluorescence, v sol aniline, without fluorescence -B'HCl sl sol cold dilute HClAq

METHYLENITAN ι vol 11 p 571 DI METHYL ENNYLENE DIKETONE

C13H24O2 1 c CH (CH2 CHEt CO CH3) (208° at 110 mm) acityl di ethyl n pentane Formed from its dicarboxylic ether by treatment with alcoholic potash (Kipping a Perkin, jun, C J 57, 33) Colourless oil, with slight aro matic odour, v sl sol water, miscible with alcohol and ether It dissolves without change in conc H SO, forming a yellowish brown solu tion It does not combine with NaHSO,

Orim CH (CH, CHEt CMe NOH), Obtained by heating the ketone with an alcoholic solution of hydroxylamine, evaporating, adding water, and extracting with ether Minute colour less crystals (from benzene ligroin), v sol al cohol, ether, HOAc, benzene, and aqueous alkalıs

DI-METHYL ENNYLENE DIKETONE DI-CARBOXYLIC ETHER

CH₂(CH₂CEt(CO CH₂) CO₂Et)₂ as Di acetyl as di ethyl pimelic ether [45°] Obtained, to gether with compounds of low boiling point, when sodium ethyl acetoacetic ether is heated with an alcoholic solution of trimethylene bromide on a water bath (Kipping a Perkin, jun, C J 57, 81) Very slender needles (from ether alcohol), v sol ether and alcohol, v e sol benzene, light petroleum, xylene, and chloro form, insol cold water Gives no colour with Readily decomposed by warm alcoholic potash

METHYL ENNYL RETONE CH. CO C.H. (16°) (224°) S G 17 5 8295 The chief constituent of oil of rue, obtained by distilling Ruta | Perkin, jun, C J. 51, 285)

graveolens with steam (Greville Williams, T 1858 [1] 99, Hallwachs, A 113, 109, Harbordt, A 123, 293, Giesecke, Z [2] 6, 429, cf Gerhardt C R 26, 225, 361, Cahours, C R 26, 262) Occurs in the essential oil obtained from lime leaves (citrus Limetta) (F Watts, C J 49, 316) Formed also by distilling a mixture of calcium acetate and calcium decoate (Gorup Besanez a Grimm, A 157, 275, B 3, 518), and by boiling octyl acetoacetic ether with alcoholic potash (Guthzeit, A 204, 4) It is oxidised by chromic acid mixture to acetic and ennoic acids Sodium amalgam reduces it, in alcoholic solution, to sec hendecyl alcohol (229°), SG
22 826 It combines with NH, With alka 12 826 It combines with NH₃ line bisulphites it forms compounds such as $C_9H_{19}CMe(OH)SO_3NH_4$ aq, which crystallises in pearly plates PCl₃ converts the ketone into C₁₁H₂₂Cl₂, which is resolved by distillation into HCl and C₁₁H₂₁Cl (222°) Oxim C₂H₁₂ CMe NOH

[42°] prisms (from alcohol), v sol ether (Spiegler, M

5, 242, B 17, 1575) METHYL ENNYL KETONE CARBOXYLIC ACID CH₃ CO CHEt CH₂ CH₂ CH₂ CHEt CO₂H « Acetyl-a∈ di ethyl-caproic acid Formed, together with di methyl ennylene diketone and acetic acid, by boiling di ethyl ennylene diketone dicarboxylic acid with alcoholic potash (Kipping a Perkin, C J 57, 36) Thick oil, miscible with alcohol, ether, and benzene -AgA' Amorphous pp, m sol hot

Oxem CH, C(NOH) C,H, CO,H Minute plates (from benzene ligroin), v sol alcohol and benzene, sl sol ligroin, sol alkalis and conc HClAq

TETRAMETHYLENYL-CARBINYL-AMINE

C3H11N re CH2 CH CH2NH2 (83°) methylenylamine' Formed from the nitrile of tetramethylene carboxylic acid CH₂CH₂CH CN by reduction in alcoholic solution with sodium (Freund a Gudeman, B 21, 2692) Oil, with alkaline reaction, which absorbs CO₂ from the air -B'HCl Crystallises from alcohol ether, v sol water and

alcohol, insol ether —B',H,PtCl, Crystalline TETRAMETHYLENYLCARBINYL - THIO -UREA CoH12N2S 2 6

CH, CH₂ CH CH, NH CS NH, [68°] pared by the action of ammonium sulphocyanide upon the hydrochloride of tetramethylenylcarbinyl amine (Freund, B 21, 2697) needles (from water or alcohol)

TETRAMETHYLENYLCARBINYL UREA C₆H₁₂N₂O to CH₂CH₂CH CH₂NH CO NH₂ [116°] Obtained by evaporating a solution of tetramethylenylcarbinylaminehydrochloride with potassium cyanate (Freund, B 21, 2697) Needles, sol alcohol, v sol hot, m sol cold

DI-TETRAMETHYLENYL KETONE C.H.O $\bullet e \quad CH_2 < \stackrel{CH_2}{CH_2} > CH \quad CO \quad CH < \stackrel{CH_2}{CH_4} > CH_2 \quad (205^\circ)$ A product of the distillation of calcium tetra methylene carboxylate with lime (Colman a. Oil, smelling of peppermint, combines with NaHSO, Bromine reacts, giving off HBr

Oxim [51°

TRIMETHÝLENYL METHYL KETONE

CH CO CH, or

CH₂ OH CH₂ CH₂ CH₂ Acetyl - trimethylene Methylene furfurane tetrahydride (114°) SG 15 9047, 25 8971 MM 5 245 at 22 3° Formed by distilling its carboxylic acid (Perkin, jun, C J 47, 836, 51, 832, B 17, 1440) The same substance appears to be formed by treating methyl bromo propyl ketone with solid potash (Lipp, B22, 1207) Oil SI sol aqueous NaHSO₃ Gives an oily phenyl-hydrazide Does not combine with water when left in contact with it in the cold According to Lipp the formula may be written CH₂ C CH₂ CH₂ since it yields methyl oxy propyl ketone (acetopropyl alcohol) on heating with dilute HClAq at 100°

Tetramethylenyl methyl ketone CeH10O 1 e OH₂ CH₂ CH CO CH₃ or CH₂ CH CMe OCH₂ CH₂ CH₂ CH CMe

or CH₂ CCC_{O-CH₂}CH₂ CH₂ Anhydride of methyl oxy butyl ketone Anhydride of acetobutyl al **c**ohol Acetyl tetramethylene (137°) A product of the distillation of calcium tetramethylene carboxylate with lime (Colman a Perkin, jun C J 51, 237, B 16, 1789, 19, 3112) Formed also by heating acetobutyl alcohol (Perkin, B 19, 2558) Oil, smelling of peppermint, combines with NaHSO, forming a crystalline body, v sol water

TRIMETHYLENYL METHYL KETONE CARBOXYLIC ACID C.H.O. 1 e

<CH₂>C(CO₂H) CO CH₃ or

OH₂ CCH(CO₂H) CH, Methylene furfurane tetrahydride carboxylic acid Obtained by sa ponifying its ether which is formed by the action of ethylene bromide and NaOEt on aceto acetic ether (Perkin, jun, B 16, 2136, 19, 2561, C J51, 823, Lipp, B 22, 1210) Thick oil, converted by boiling with water into CO2 and acetyl propyl alcohol CH₃ CO CH, CH, CH₂OH (145° at 100 mm) — AgA' Easily soluble crystalline nodules Ethyl ether EtA' (196°) S G 15/15 1 0517, 25/5 1 0439 MM 8 198 at 15° According to

Perkin, the physical constants of this ether indi cate the presence of the trimethylene ring Con verted by HBr into brome ethyl acete acetic ether CH, CO CH(CH₂ CH₂Br) CO₂Et Phos phorus pentachloride, followed by water, forms an oil $C_8H_{,2}O_2Cl_2$ (173° at 150 mm), which may possibly be chloro ethyl chloro-crotonic ether CH₂ CCl C(CH₂Cl CH₃) CO₂Et, since it is reduced by sodium amalgam to di ethyl acetic ether, and by zinc dust and HCl to CH₂ CCl CEt CO₂H

Phenyl hydraside of the ethyl ether

C₁₄H₁₈N₂O₂ Amorphous solid Trimethylenyl methyl ketone dicarboxylic acid $C_7H_8O_8$ 2 $e < \stackrel{CH_2}{CH_2} > C(CO_2H)$ CQ CH_2 CO_2H , or CO,H CH C CH(CO,H) CH, Methylene-

furfurane tetrahydride dicarboxylic acid 175°] Obtained from the ether which is got by acting on sodium acetone dicarboxylic ether with ethylene bromide (Perkin, C J 51, 847) White crystalline solid, sl sol water and chloroform, v sol other solvents Boiling water splits it up into CO2 and acetyl propyl alcohol -- Ag2A"

Tetramethylenyl methyl ketone carboxylic acid $C_7H_{10}O_3$ te $OH_2 < CH_2 > C(OO_2H)$ CO CH_3 [115°] The ether of the acid to which this con stitution was at first assigned by Perkin, jun (B 16, 208, 1787), was subsequently shown by him (B 19, 1244) to be indifferent towards phenyl hydrazine, and to possess a magnetic rotation at variance with this formula, and to behave rather as $CH_2 < \stackrel{CH_2}{O} - \stackrel{CH_2}{CMe} > 0$ CO_2Et The acid is a crystalline solid, obtained by saponifying its ether, which is formed by the action of tri methylene bromide and NaOEt on acetoacetic ether On boiling with water it is converted into acetobutyl alcohol with evolution of CO2 (Perkin, jun, B 19, 2557) On distillation it is split up into CO, and C,H10O

Salt -AgA' Ethyl ether EtA' (224°) VD 621 M M 10 195 Does not react with phenyl hydrazine Concentrated hydrobromic acid in the cold yields methyl ω bromo butyl-ketone CH, CO CH, CH, CH, CH, Br

METHYL ETHÂNE v PROPANE Di methyl-ethane v Butane Tri-methyl ethane v Pentane Tetra-methyl-ethane v HEXANE Penta-methyl ethane v HEPTANE Hexa-methyl-ethane v OCTANE

METHYL - ETHENYL TRICARBOXYLIC ACID v PROPANE TRICARBOXYLIC ACID

D1 methyl - ethenyl - tricarboxylic acid v BUTANE TRICARBOXYLIC ACID

METHYL ETHENYL ETHYL DIKETONE C₇H₁₂O₂ ie CH₃ CO CHMe CO Et (167°-170°) Formed by the action of NaOEt on a mixture of acetic ether and di ethyl ketone (Claisen a Ehr hardt, B 22, 1016) Colourless oils - CuA' Formed from the acid and Crystalline an ammoniacal solution of cupie oxide

METHYL ETHENYL TOLYLENE DIAMINE $\begin{bmatrix} 4 & 1 \\ 2 \end{bmatrix}$ CH₂ C₆H $\begin{pmatrix} NMe \\ N \end{pmatrix}$ CMe $C_{10}H_{12}N_2$ ıе [192°] Formed by reducing the acetyl deriva tive of nitro methyl p toluidine with tin and HCl (Niementovsky, B 20, 1878) Cubes (by subli mation at 110°), plates, or needles, v e sol alcohol, ether, and boiling water Its aqueous solution is coloured red by FeCl, The solution in alcoholic ammonia exhibits blue fluores cence —B'HCl ½aq Needles, v sol water — Tables, decomposed on B',H₂PtCl₅ [244°] Tables, decomposed on fusion—B'HI Formed by heating ethenyl tolyl ene diamine with MeI and MeOH at 130° (Nie

mentovsky, B 20, 1886) Grey plates
Methylo rodrdes B'MeI [221°] B'MeI, and NaOH Needles, v sol boiling alco hol and water, v sl sol boiling chloroform, insol ether—B'MeI, Formed in small quan tity in the preparation of B'HI as described above Black crystals

Methylo-hydroxide B'MeOH Formed by heating the methylo-rodide with KOH on the water bath White plates, sol boiling water, v sl sol cold water, v e sol alcohol and ether Forms the salts —*B'MeCl crystallising in rhombohedra, v e sol water—
*B'₂Me₂PtCl_e—Picrate [112°] crystallising in needles, m sol boiling water and alcohol

ETHYLENE DISJLPHIDE DI METHYL $C_4H_{10}S_2$ re $C_2H_4(SMe)_2$ Do methyl ether of di thio glycol (183°) Formed from ethylene bromide and NaSMe (Ewerlof, B 4, 716)

DI METHYL ETHYLENE DISULPHONE v Do methyl ether of Ethane disulphinic acid METHYL ETHYLENE ψ THIO UREA

CH₂ N Methyl CH₂S C NMe or ÓH, NH∕ ımıdo thiazole tetra hydride Methyl amido thiazole dihydride [90°] Formed, together with a crystalline compound C₆H₁₁N₃O₂ [70°], by the action of methyl thiocarbimide on bromo ethylamine (Gabriel, B 22, 1148) Needles, v e sol water, v sol ordinary solvents Strongly Oxidised by bromine water to an acid (? NHMe CO NH, CH CH, SO3H), which is de composed by fuming HClAq at 155° into CO., methylamine, and taurine—Picrate [226°] needles -Aurochloride needles -Platino-

Methyl ethylene ψ thiourea

chloride needles

CH₂ S

CH₂-S C NH Imulo methyl - thiazole CH₂ NMe Formed by heating ethylene ψ this urea with methyl iodide (Gabriel) Oil When it is oxi dised by bromine water it yields methyl taurine NHMe CH, CH SO₃H Salts -B'HI [160°] Colourless crystals, sol water and alcohol-[200°-203°] —The aurochloride Picrate and platinochloride form long needles, sol boiling water

METHYL ETHYL ETHER v METHYL ETHYL OXIDE

METHYL-ETHYL-ETHYLENE v AMYLENF METHYL-ETHYL-GLYOXAL v METHYL ETHYL DIKFTONE

METHYL-ETHYL-GLYOXALINE C.H. N. 2 6 NEt CH

C₃H₂(CH₃)(C₂H₅)N₂ or CH₃ C Oval-ĊН

8 G 15 98 (213°)Formed ethyl ethyline by the action of ethyl bromide on methyl glyoxalıne (glyoxal ethyline) (Radziszewski, B Formed also from di ethyl oxamide NHEt CO CO NHEt by treatment with PCl, and heating the hydro iodide (10 g) of the resulting 'chloroxalethyline' C₆H₂ClN₂ with HIAq (7 g of S G 19) and amorphous phosphorus (1 g) for 6 hours at 140° The product is dissolved in water, rendered alkaline, and extracted with chloroform (Wallach, 4 214, 298) Colourless liquid, with narcotic smell. Sol. water and

alcohol AgNO, gives a crystalline pp , HgCl, a white pp The zinc double chloride forms crystals melting at [160°] Burns with a blue flame It is a strong base and ppts metallic oxides from their salts. Its zinc double salt distilled with lime yields pyrrole, ammonia, HCy, ethylene, and methyl glyoxaline (para oxalmethyline) (Wallach, A 214, 305) It acts physiologically like atropine (Schulz, B 13, 2353) When heated in a sealed tube with dilute H₂SO, at 240° it yields ethylamine KMnO, yields oxalic acid, NH, and acetic acid When passed through a red hot tube it yields HCy and methyl glyoxaline (para oxal methyl ine) H_2O_2 oxidises it to ethyl oxamide (Radzi szewsky, B 17, 1290)

Salts -B'HCl deliquescent crystals -

Crystals, e sol water and alcohol Not decomposed by aqueous NaOH — C₆H₁₀N₂MeI₃
Benzylo chloride C₆H₁₀N₂C₆H₅CH₂Cl

Methyl - ethyl - glyoxaline C₆H₁₀N₂

NMe CH EtC Oxalmethylpropyline The `N ---- ĊH

methylo 10dide B'MeI of this body is formed by the action of MeI on para ethyl glyoxaline (Radziszewsky, B 16, 490)

acetone DIMETHYL ETHYLIDENE DIKETONE

(CH₃ CO)₂CHMe (165°) Formed from sodium methylene dimethyl diketone and MeI (Combes, C R 105, 868)

METHYL ETHYL INDAZINE C10H12N2 16

.CMe C.H. NEt Formed by heating methyl-

indazine with EtI at 100° (Fischer a Tafel, A 227, 303) Liquid, m sol water, v e sol alco hol and ether, volatile with steam -B'HCl needles

 $C_{\bullet}H_{\bullet} < CMe > N$ Methyl ethyl-180 indazine Formed by Ethyl-quinasole [80°] (235°)heating its carboxylic acid at 160°-190° (Fischer a. Kuzel, A 221, 285, B 16, 655) Formed

also by reducing the nitrosamine of ethyl amido acetophenone, dissolved in dilute acetic acid, with zinc dust, adding NaOH, and distilling with steam The oily distillate is dissolved in dilute H₂SO₄, mixed with NaNO₂, and extracted with ether (Fischer a Tafel, A 227, 303) Plates, sl sol water, v e sol alcohol and ether Vola tile with steam, giving off a pungent odour Not affected by nitrous acid or by Ac₂O Does not reduce Fehling's solution Forms crystalline pps with AgNO, and HgCl2, which may be recrystallised from hot water in slender needles Its salts are extremely soluble in water — $B'H_2SO_4$ long needles — $B'_2H_2PtCl_6$ sparingly soluble orange prisms — Picrate yellow needles

Methylo-rodide B'MeI [192°] METHYL-ETHYL-ISO INDAZINE CARB-OXYLIC ACID C.H. NEt N

Formed by treating the nitrosamine of ethyl-oamido cinnamic acid with zinc dust and acetic acid (Fischer a Kuzel, A 221, 285) Colourless plates [131°] (from water) or groups of smaller plates [126°] (from chloroform ligroin) Sl sol water, v sol alcohol, ether, and chloroform Combines with alkalis and with acids not reduce boiling alkaline solutions of silver or With bromine in HOAc it forms a bromo derivative [173°] and a di bromo-derivatave [196°

METHYL-ETHYL-INDOLE C,1H,1N v.e $C_6H_4 < \stackrel{CEt}{\sim} CMe$ (292° 1 V) Formed by heating the phenyl hydrazide of methyl propyl ketone with ZnCl, at 180° (E Fischer, B 19, 1565, A 236, 132) Yellowish oil, v sl sol water, v sol alcohol and ether Its picrate erystallises from hot benzene in dark red needles With NaNO₂ and HOAc it yields a nitrosamine

 $C_6H_4 < CH_{NEt} > CMe$ Methyl - ethyl - indole Ethyl-methyl ketole (288° 1 V) Formed, together with a base boiling at 256°, by heating methyl indole (methyl ketole) with Etl and alcohol at 100° (E Fischer a Steche, B 20, 2199) Oil, insol dilute acids Colours pinewood red —Picrate [146°] Slender darkred needles (from benzene)

 $C_eH_eMe < CH_{NEt} > CH$ Methyl-ethyl-indole

Ethyl p tolindole (254°) Formed by heating its carboxylic acid for some time at 205° (Hegel, 4 232 218) Oil. volatile with steam Resim-A 232, 218) Oil, volatile with steam Resinified by conc H₂SO₄ Colours pine wood moist ened with HCl red Fuming HNO₂ gives a red colour and a pp

Di-methyl-ethyl-indole C12H15N t.e.

C₆H₄ CMe CMe (281°) Formed by heating bromo levulic (bromo acetyl propionic) acid with Yellowish ethyl aniline (Wolff, B 21, 3363) oil, v sol ether, alcohol, and benzene, sl sol water -Picrate $B'C_6H_2(NO_2)_8OH$ [105°] Red needles, m sol benzene

METHYL-ETHYL-INDOLE CARBOXYLIC ACID $C_{12}H_{12}NO_2$ so $CH_1C_2H_2 < CH_3 > CO_2H$ [202°] Formed from the p tolyl-ethyl-hydrazide of pyruvic acid by warming with dilute (10 p c.)

HClAq, or with phosphoric acid (Hegel, A 282, 218) V sol alkalis, ether, and benzene, insol ligroin With NaOCl it yields a chloro derivative, which is converted by boiling water into methyl ethyl ψ -ısatın

PENTA-METHYL-ETHYL IODIDE v HEPTYL IODIDE

METHYL ETHYL-ISATIN v ISATIN METHYL-ETHYL-KETOLE METHYL ETHYL INDOLE

METHYL ECHYL KETONE C4H8O 10 OH, CO CH, OH, Methyl acetone Mol w 72 (81°) (F a D), (78° at 740 mm) (Schramm, B 16, 1581) S G 13 8125 (F a D), 22 8045 (S).

Formation -1 By the action of ZnEt, on acetyl chloride, or of ZnMe2 on propionyl chlor ide (Freund, A 118, 3, Popoff, A 145, 289) --2 By boiling methyl acetoacetic ether with potash (Frankland a Duppa, A 138, 336), or dilute H₂SO₄ (Böcking, A 204, 17) —3 Among the products of the distillation of crude calcium acetate (Fittig, A 110, 18) - 4 By distilling a mixture of calcium acetate and calcium pro pionate (Schramm, B 16, 1581) -5 By the oxidation of sec butyl alcohol (Kanonnikoff a Saytzeff, A 175, 377) -6 By the action of H_2SO_4 on crotonylene (Lwoff a Almédingen, Bl[2] 37, 493)

Properties - Colourless liquid, smelling like acetone, miscible with water and alcohol With hydrogen sodium sulphite it forms the compound

MeCEt(OH) SO, Na jaq (Fittig)

Reactions —1 Sodium converts it into homo logues of mesityl oxide, of phorone, and of pinacone (Lawrenovitch, B 8, 767) Sodium, added to its solution in benzene, forms an oil C₁₂H₂₀O, smelling like camphor -2 Chromic acid in HOAc oxidises it to acetic acid -3 PCl. yields di chloro-butane CH, CH2 CCl2 CH, treating this body with alcoholic potash at 170° there is formed CH, CH, CH, which ultimately changes into the isomeric CH, C C CH, which yields hexa methyl benzene on condensation with H₂SO₄ (Favorsky, Bl [2] 43, 112) - 4 On warming with pyrrol, MeOH, and a little hydro chloric acid, there is formed a butylidene pyrrole C=CH

body, when crystallised as C15H22N2 5aq, melts at 80°, but when anhydrous it melts at 142° With alcoholic AgNO₃ it yields slender needles of B'₂AgNO₃ (Dennstedt a Zimmermann, B 20, 2454)

Ozim CH, CH, CH, CH (153° cor) SG 24 9195 Formed by the action of an aqueous solution of hydroxylamine on methyl ethyl ketone (Janny, B 15, 2779) Colourless liquid, soluble in ten volumes of water, miscible with alcohol and ether Concentrated NaOHAq forms a crystalline Na salt

Reference - HEXA-BROMO-METHYL-ETHYL KE-

Methyl ethyl diketone CH, CO CO CH, CH, Diketopentane Acetyl propionyl (108°) S 7 at 15° Formed by the action of amyl nitrite on its mono-oxim (nitroso-di-ethyl ketone) (Manasse,

B 21, 2177) Formed also from ethyl aceto acetic ether by saponfying with dilute (3 pc) alkali, treating the product with NaNO₂ and H₂SO₄, removing alcohol by distillation, adding dilute H₂SO₄ (15 pc) and distilling with steam (Von Pechmann, B 21, 1411, 2140) yellow liquid, smelling like quinone, v sol ordi Forms an unstable compound nary solvents Reacts with aniline, forming a with alcohol compound crystallising in needles and melting at 137° Aqueous NaOH converts it into a 'quinogen,' and finally into a quinone [112°], which may be reduced to a hydroquinone [220°], and yields a phenyl hydrazide [225°]

(a) Oxim CH, C(NOH) CO C,H, Isomitroso & ethyl ketone [59°-62°] Formed by the action of amyl mitrite and NaObt upon diethyl ketone (Claisen a Manasse, B 22, 528) Colour

less plates

(Å) $Oxim CH_a CO C(NOH) C_2H_a$ Isomtrosomethyl propyl ketone [55°] (183°-187° cor) Formed by the action of KNO₂ and H,SO₄ on ethyl acetoacetic ether (V Meyer a Zublin, B 11, 323, 695) Crystals, v e sol alcohol and ether m sol cold water Dissolves readily in alkalis, forming a yellow solution

Di oxim CH₃ C(NOH) C(NOH) C₂H₅ [170°] Formed by the action of hydroxylamine on the mono oxim (Schramm, B 16, 180, 2187) Small white needles May be sublimed —C₅H₉N₂O Na white pp

coming liquid

METHYL ETHYL PYRIDINE C.H.IN 10 N CH CH CEt (a) Collidine Mol w 121 S G 9 929 (Richard, Bl [2] 32, 488) 168 929 (Weidel a Pick, M 5, 659) SV 1579 (Ramsay) A base found, together with many others, among the products of the dry distillation of bones (Anderson, P M [4] 9, 145, 214, A 94, 360), of bituminous shale (Greville Williams, C J 7, 97) and of peat (Church a Owen, P M [4] 20, 110) It occurs in coal tar Colourless oil, with unpleasant odour Fumes with HCl V sl sol water, separating again when warmed, v sol alcohol, ether, and oils Ppts ferric, alu minium, chromium, and mercurous oxides from their salts, but not manganese and nickel oxides Its salts are deliquescent and gummy KMnO oxidises it to pyridine dicarboxylic (lutidinic) acid [219°], which is converted by heat into pyridine carboxylic acid [302°] -B'2H2PtCla Orange yellow flakes

Ethylo-rodide BEtI Oil -

(B'EtCl)₂PtCl₄ Sparingly soluble crystalline pp (Anderson, P M [4] 9, 221) 'a'-Collidine C₂H₁₁N (179°-188°) This base, according to Oechsner de Coninck (A Ch [5] 27, 468), accompanies (β) colliding in the product of the distillation of cinchonine with

KOH It is perhaps identical with (a) collidine When 'a' collidine is heated with ethylene chlorhydrin and a little water for a few hours at 100° combination takes place. After removing uncombined collidine and chlorhydrin by shaking with ether, the residue is evaporated in vacuo PtCl, forms with the product an owange yellow pp of {C₈H₁₁N(C H₄OH)Cl}₂PtCl. Boiling water removes HCl, forming oxethyl-s collidine chloroplatints {C₈H₁₀N(C,H₄OH)Cl}₂PtCl. This forms brilliant scales (from alcohol) Oxethyl a collidine forms a gold sstt, B'AuCl, crystallising in thin golden needles (Wurtz, Pr 33, 450, C R 95, 263, Bl [2] 39, 536)

Methyl-ethyl pyridine N CH CEt CMe (8) Collidine (196°) S G 2 966 V D 4 25 (calc 4 19) Obtained by distilling cinchonine or brucine with KOH (Oechsner de Coninck, C R 91, 296, A Ch [5] 27, 469, Bl [2] 37, 457, 42, 100, R T C 1, 132, cf Greville Williams, Tr E 21, Part 2, A Ch [3] 45, 488) Colour less, mobile, highly refractive liquid, rapidly turning yellow on exposure to air Sl sol water, sol alcohol and ether When left in contact with moist air it takes up water (1 mol) but does not form a well defined hydrate Potassium permanganate oxidises it to homo nicotinic acid N CH C(CO H) CMe, cinchomeronic acid

 $N \leq CH C(CO_2H) > C CO_2H$, and formic acid It is very poisonous, a sub cutaneous injection of 1 g paralysing the nerve centres HI reduces it to the hydride $C_3H_{13}N$, and, at 250°, forms a brown oil $C_4H_{19}NI_4$ Sodium in alcohol reduces it to the hexahydride C_8H_1 N (175°-180°)

Salts -B'HCl White deliquescent tables -B'H PtCl₆ S 2 1 at 60° (Richard, Bl [2] 32, 488) Orange led powder, converted by bolling water into B' PtCl₄, a yellow crystalline powder -B'HAuCl₄ -B' H.Cl 3AuCl₃ -B',H.HgCl₄ Minute white needles, sl sol water, insol alcohol

Methyl-ethyl pyridine N CH CET CH CH CET CT CH Aldchyde collidine (176°) S G ♀ 9389 (D) Occurrence —As acetate in fusel oil (Kramer

a Pinner, B 3, 77)

Formation -1 By heating ethylidene chloride with alcoholic or aqueous ammonia for 12 hours at 160° (Kramer, Z [2] 6,568, B 3, 202, Durkopf, B 18, 920) Ethylidene bromide may be used instead of the chloride, the temperature employed being then 125°-140° (Tavildaroff, A 176, 12) -2 By heating an alcoholic solution of aldehyde ammonia at 120° (Baeyer a Ador, A 155, 297) 'Para' collidine, picoline, and lutidine are also formed in this reaction (Vohl, J 1870, 807) -8 By distilling aldol ammonia (aldehydine) (Wurtz, Bl [2] 31, 433) -4 By heating glycol with ammonium chloride for 8 hours at 185°, the yield being from 15 to 20 pc of the theoretical quantity (Hofmann, B 17, 1905) -5 By heating ethylene chloride with ethylamine at 190° (Hofmann, B 17, 1907) -6 By heating paraldehyde with acetamide and P.O. at 1600 (Hesekiel, B 18, 3091) —7 By heating aldehydeammonia with paraldehyde at 220° (Ladenburg a Dürkopf, A 247, 42)

Properties—Oil, with aromatic odour, insol. water and dilute acids, v sol alcohol and ether. Fumes with HCl Oxidised by KMnO, to methylpyridine carboxylic acid N<CH C(CO₂H) CH

and isocinchomeronic acid N CC(CO,H) CH (Durkopf a Schlaugk, B 21, 294, cf Wischnegradsky, B 12, 1506) Bromine forms an oily Fuming HIAq and amorphous compound phosphorus at 140° yield brownish blue prisms of $C_8H_{14}NI_3$ or $C_8H_{12}NI_3$ (Ladenburg, B 14, 232) Sodium, acting on its alcoholic solution, forms a hexahydride Heated for some days at 100° with glycolic chlorhydrin and a little water it forms oxethyl aldehydine, of which the platinochloride, (C_sH₁₁N(C H₄OH)Cl)₂PtCl₄, forms orange crystals (from dilute alcohol) It may be decomposed by H2S, the hydrochloride produced would not crystallise, but it is converted by Ag20

into a caustic base (Wurtz, Pr 33, 448)
Salts—B'₂H₂PtCl₈ [180°] Very unstable trimetric crystals—B'HAuCl₄ [72°] Yellow needles, v sol water (Hesekiel, cf Herzig, M 2, 404)—B'C₈H₂(NO₂)₃OH [157°] Greenishyellow four sided tables

Ethylo rodrde B'EtI Trimetric tables, v sol water and alcohol Yields (B'EtCl)₂PtOl₄ crystallising in needles or prisms

Methyl ethyl pyridine N CMe CH CH (161°) S G 2 9361 Formed by heating (a)-methyl pyridine (a picoline) with Et1 at 280°–300° (Ladenburg a Schultz, A 247, 46, B 20, 2720) Liquid, almost insol water, but takes up water from the air Very volatile with steam. Oxidised by KMnO, to pyridine dicarboxylic acid N C(CO,H) CH CH [226°] Sodium reduces it, in alcoholic solution, to a hexahydride

Salts—B'₂H.PtCl₅ [174°] Triclinic tables, sl sol cold, v sol hot, water, insol alcohol— B'HAuCl₄ [110°] Yellow needles, sl sol. water, v sol ether alcohol

Methyl ethyl pyridine NCH CH CH CH (173°) S G 2 9353, 2° 9218 Formed by heating (a) methyl pyridine with Et1 at 280°–300°, and separated from the preceding by fractional distillation (Schultz, B 20, 2720, Ladenburg, A 247, 46) Colourless hygroscopic liquid, with unpleasant odour, sl sol water Oxidised by KMnO, to pyridine dicarboxylic acid NCH CH CH CO₂H Sodium, added to its alcoholic solution, reduces it to the corresponding hexahydride

Salts —B'.H.PtCl_s [190°] Reddish yellow plates, si sol cold, v sol hot, water, insol alcohol—B'HAuCl, [90°] Yellow needles, si sol cold, m sol hot, water, v e sol alcohol—The phosphomolybdate and bismuthiodide are amorphous, the cadmium iodide and periodide are oily

Faracollidine C.H.i.N. (220°-230°) Formed, together with the collidine boiling at 176°, by heating aldehyde ammonis (Baeyer a Ador, A 155, 307) Liquid, with pungent aromatic odour. Its salts crystallise with difficulty Its ethylocodide is syrupy The platinochloride is amorphous

Isomeride of collidine -- Obtained by the putrefaction at 40° of pancreas (200 g) mixed with gelatin (600 g) and water (10,000 g) After 5 days the liquid is distilled, first with H₂SO₄ and afterwards with baryta The alkaline disand afterwards with baryta tillate is neutralised by HCl, evaporated to dryness, and extracted with alcohol The hydrochloride of the base crystallises from alcohol in trimetric needles The free base is got by adding NaOH to the hydrochloride and shaking with ether (Nencki, J pr [2] 26, 49) —(B',HCl)₂PtCl₄ Flat needles Gives off an odour of xylene when The base is not identical with collidistilled dine (from NH, and ethylidene chloride), for it differs in odour, in the crystalline form of the platino chloride, and in being more soluble in

Isomeride of collidine C₈H₁₁N (202°) S G 987) Occurs in the flesh of putrid cuttle fish (Oechsner de Coninck, C R 106, 858, 1604) Mobile liquid, v sol water, alcohol, and ether Absorbs moisture from the air, becoming brown Deliquescent radiating masses --B'HCl B'₂H₂PtCl_e Deep yellow crystals, almost insol cold water Decomposed by hot water, with for mation of B'2PtCl₄, a pale brown powder — B'2H₂HgCl₄ Small white needles —B'2H₂Hg₃Cl₈ Long yellowish needles

Methylo rodrde B'MeI Slender needles Isomeride of collidine v TRI METHYL PYR-

Di-methyl-ethyl pyridine C₉H₁₃N Parvol-(199° cor) (D a G) SG 9 9419, 🋂 9289 (DaS)

Formation -1 By heating propionic aldehyde ammonia (Waage, M 4, 718) -2 By heat ing methyl-ethyl acrolein ammonia (Hoppe, M 9, 643) -3 By heating propionic aldehyde with acetamide and P2Os (Hesekiel, B 18, 3097) 4 By heating propionic aldehyde ammonia with paraldehyde in sealed tubes for 10 hours at 210° (Durkopf a Schlaugk, B 21, 832) -5 By heat ing propionic aldehyde ammonia (4 g) with pro pionic aldehyde (6.5 g) for 6 hours at 210° (Durkopf a Gottsch, B 23, 685)

Properties —Colourless oil, not turned brown by light and air, with faint and not unpleasant smell M sol cold water, sl sol hot water, v sol alcohol and ether KMnO, oxidises it to methyl pyridine dicarboxylic acid [225°] and

pyridine tricarboxylic acid [318°]
Salts —B'₂H₂PtCl₅ [189°] Large mono clinic crystals, sl sol cold water —B'HAuCl₅ Large mono-Glittering lemon yellow spangles, sl sol cold water Not hygroscopic - B'HHg,Cl, [119°] Long pointed needles, almost insoleold water —B'C₆H₂(NO₂)₃OH [152°] Yellow Yellow plates.

Di-methyl ethyl pyridine C₂H₁₃N (217°)Formed, together with the preceding, by heating propionic aldehyde ammonia with propionic aldehyde at 200° (Durkopf a Göttsch, \hat{B} 23, Colourless liquid, not affected by air and light. Has a faint odour of nicotine alcohol and ether, sl sol water Yields a dimethyl pyridine carboxylic acid on oxidation

Salts -B'2H2PtCl6 [above 270°] Yellowishred needles, sl sol water —B'HAuCl, [140°] Silender lemon-yellow needles, sl sol, water containing HCl.—B'HHgCl. [159°]. Long

glittering spangles or well formed monoclinic crystals, sl sol cold water

Di methyl-ethyl pyridine C₉H₁₃N & e N CMe CH CEt (187°) SG 14 916

13 at 0° Obtained by the action of propionic aldehyde and ammonia on acetoacetic ether (Jaeckle, A 246, 45) Formed also by heating to redness a mixture of potassium di methyl ethyl pyridine dicarboxylate (1 mol) with lime (2 mols) (Engelmann, A 231, 44) Liquid, more soluble in cold than in hot water Its solution has a very bitter taste "MnO4 oxidises it to methyl ethyl pyridine carboxylic acid and uvitonic acid

Salts -B',H,PtCl, [211°] Crystalline pp, v sol, hot water and alcohol -B'2H2Cr2O, [120°] Needles Crystalline pp -Picrate

METHYL-ETHYL PYRIDINE DIHYDRIDE (β) Di-hydro collidine $(200^{\circ}-205^{\circ})$ Formed by heating (3) collidine with HIAq and red phosphorus at 140° (Oechsner de Coninck, Bl [2] 42, 116)

Methyl ethyl pyridine hexahydride C₈H₁₇N Formed by adding sodium to an al (c 177°) coholic solution of (B) collidine (Oechsnei de

Coninck, Bl [2] 42, 116)

Methyl ethyl pyridine hexahydride C.H., N te NH CHM CH, CH₂ Copellidine (164°) SG 2 8653, ½ 8546 Formed from the collidine derived from aldehyde, by reduction in alcoholic solution with sodium (Durkopf, B 18, 920, Ladenburg, A 247, 90) Colourless alka Its physiological line liquid, sl sol water action resembles that of comine, but is weaker

Salts-B'HCl [171°] Colourless needles. v sol water -B'HBr [165°] Tufts of needles -B'HAuCl₄ [104°] Dimetric prisms, v sol hot water —B'2H2PtCl, [147°] Long yellow needles, v e sol water

Acetyl derivative C8H16NAc (254°) SG 2 9787, 21 966

Methyl ethyl pyridine hexahydride

NH CHMe CH₂ CH₂ CH₂ 8550, 20 8410 Form $(147^{\circ}-151^{\circ})$ Formed by reducing the cor responding methyl-ethyl pyridine in alcoholic solution with sodium, the product being purified by means of its oily nitrosamine (Schultz, B 20, 2723, Ladenburg, A 247, 95) Colourless alka line liquid, smelling strongly like ammonia and like piperidine, sl sol water

Salts —B'HCl Needles, v e sol water and

alcohol —B'HBr Needles

Methyl ethyl pyridine hexahydride

NH CHMe CH₂ CHEt Copel 160°) S G ² 8515, ²² 8389 Copellidine (155°-Obtained by reducing the corresponding methyl ethyl pyridine in alcoholic solution with sodium, product being purified by means of the nitros amine (Ladenburg a Schultz, B 20, 2723, A 247, 96) Colourless, strongly alkaline liquid White needles, v e sol -B'HCl [c 213°] water and alcohol

v-Methyl ethyl-pyridine hexahydride NMe CHEt CH OH, (c 149°) 8495 Formed by the action of MeI on the corresponding ethyl-pyridine hexahydride dissolved in MeOH, the product being distilled with strong aqueous NaOH (Ladenburg, A 247, 71) Liquid, smelling like ν methylpyridine hexahydride, al sol water Its hydrochloride crystallises in small needles

Di-methyl-ethyl pyridine hexshydride C.H. N Parpevoline (177°) SG 2 8628, ¥ 8542, 20 8474 Formed at the same time as di methyl ethyl pyridine (199°), when pro pionic aldehyde ammonia and propionic aldehyde are heated together at 200° Formed also by reducing the same di methyl ethyl pyridine by adding sodium to its alcoholic solution (Durkopf a Gottsch, B 23, 690) Very mobile colourless liquid, with penetrating odour like rotten hay, v sol ether and alcohol, sl sol Strongly alkaline in reaction — [120°-130°] White sparingly B',H,CdI, soluble needles (from hot water) -The hydro chloride and hydroiodide are hygroscopic Chlorides of gold and of platinum give no pp in dilute solution, and oily pps in concentrated Picric acid acts in like manner solutions

Di methyl ethyl pyridine hexahydride

C₂H₁₉N ie NMe CH₂CHEt CH₂ V Methylcopellidine (165°) V D (H=1) 139 5 (obs S G ²/₂ 8519, ¹/₄ 814 Formed from methylethyl pyridine hexahydride (164°) and MeI in the cold (Ladenburg a Durkopf, B 18, 925, A 247, 90). Strengtiv all always colourless of all 247, 90) Strongly alkaline colourless oil, sl sol water —B'HBr [151°] White needles -Picrate [162°] Yellow needles

Methylo vodide B'MeI [268°] Long white needles, m sol water, v sol alcohol, ppd by ether from alcoholic solution With moist Ag₂O it yields a methylo hydroxide which is split up on distillation into water and tri methyl

ethyl pyridine

Wethylo chloride B MeCl Formed from the rodide by shaking with AgCl -(B'MeCl) PtCl. Yellow octahedra — (B'MeCl) HgCl [108°] Long white needles

Di methyl ethyl pyridine hexahydride

C9H19N 1 e NH CH VICH CH Parperol-(167°) at 725 mm Ethyl lupetuline Formed by reducing di methyl ethyl pyridine (187°) in alcoholic solution with sodium (Jaeckle, A 246, 45) Liquid Gives, in a dilute alco holic solution, dark brown pps with silver or mercurous nitrate —B'₂H₂PtCl₄ Orange prisms -B',H2Cr2O, Long prisms

Tri methyl ethyl pyridine hexahydride C10H 1N 1 e C2H MeNMe Dr methyl collidine Di methyl copellidine hexahydride SG 7816 Formed by distillation of the methylo hydroxide of v methyl copellidine (di methyl ethyl pyridine hexahydride) (165°) (Durkopf, B 18, 927, Ladenburg, A 247, Colourless alkaline liquid, sl sol water. Smells like trimethylamine —B'HAuCl, Yellow needles or glistening plates -B'2H2PtCl₆ [93°] Silky yellow needles

METHYL ETHYL PYRIDINE CARBOXYLIC $N < C(CO_2H) CH > CEt$ ACID C.H.NO. 16 Formed by oxidising the corresponding dimethyl-ethyl-pyridine with KMnO₄ (Altar, A 228, 189) — (HA')₂H₂PtCl₄ [195°]. Red prisms

Di methyl ethyl pyridine dicarboxylic acid C₁₁H₁₃NO, ie N CMe C(CO₂H) CEt Parvol me dicarboxylic acid ີ່ [**2**90° ∫ Obtained by saponifying its ether with alcoholic potash (Engelmann, A 231, 40) Thick prisms, m sol cold water and alcohol, decomposed on fusion On distillation with lime it yields di methylethyl pyridine —BaA' 3aq Plates, v e sol water — $(H_2A'')_2HCl$ aq Prisms $Ethyl\ ether\ Et.A''$ (305°-308°) Formed

by passing nitrous acid gas into an alcoholic solution of the dihydride Thick liquid -(Et, A"), H, PtCl, [139°] Long prisms (from

alcohol)

DI-METHYL - ETHYL PYRIDINE DIHY. DRIDE DICARBOXYLIC ETHER C13H23NO, 1 e $\mathrm{NH} <_{\mathrm{CMe~C(CO~Et)}}^{\mathrm{CMe~C(CO_2Et)}} >_{\mathrm{CHEt}}$ Hydroparioline dicarboxylic ether [110°] Formed by boiling acetoacetic ether (45 g) with propionic aldehyde (10 g) and alcoholic ammonia (Engelmann, A 231, 38) Prisms (from alcohol), v e sol hot alcohol, ether, chloroform, and benzene

METHYL ETHYL PYRIMIDINE C H, N, 2 e. CEt N CMe CH (160°) Formed by reducing oxy methyl ethyl pyrimidine with zinc dust (Pinner, B 22, 1619) Prisms (Py 2 3) METHYL ETHYL QUINOLINE

C₁₂H₁₃N re C₆H CH CMe N CEt $[56^{\circ}]$ (268° at 710

mm) Formed by the action of propionic aldehyde and HCl upon aniline (Dabner a Miller, B 17, 1714) Large monoclinic prisms V sol alcohol, ether, and benzene, sl sol water On oxidation with CrO, and H2SO, it yields (Py 2)-

methyl quinoline (Py 3) carboxylic acid
Salts -B',H Cl.PtCl, fine yellow needles.
-Picrate B'C,H (NO),OH yellow crystals -B'2H2Cr2O, small yellowish brown prisms

Methylo-rodide B'MeI [196°], yellow needles, insol ether

(B 2) Methyl (Py 3) ethyl-quinoline

CH CH C,H3(CH3) Ethyl toluquinoline. N C(C,H,)

(270° at 718 mm) Formed by heating its (Py 2) carboxylic acid (Harz, B 18, 3395) White needles V sol ether or petroleum-Yields on oxidation ethyl quinoline ether carboxylic acid (Daniel, B 23, 2267)

Salts -B'HClx small white concentric crystals—B'HNO₃* fine white needles—B'₂H₂SO₄* colourless crystals—B'₂H₂Cl₂PtCl₄: fine orange needles, sol hot water, sparingly incold -B'C,H2(NO2),OH [244°], verysparingly soluble yellow microscopic crystals

(B 4-Py 2) D1 methyl-($\dot{P}y$ 3)-ethyl quinol-CH C(CH₃) nne $C_6H_8(CH_8)$ [44°] (280° at · N C(C₂H₈)

717 mma) Formed by the action of propionic aldehyde and HCl upon o toluidine (Harz, B 18, Large colourless monoclinic crystals It is reduced by tin and HCl to a tetra hydride, which is a yellowish oil of boiling point 275° at 724 mm Yields methyl ethyl-quinoline (B 4)carboxylic acid on oxidation

Salts -B'HCl easily soluble fine colour-

less needles — B'HI*, very long colourless needles, v sol. hot water, very sparngly in cold — B'2H₂Cl₂PtCl₄ large plates — B'C₈H₂(NO₂)₈OH: f187°]. nearly insoluble vellow needles

[187°], nearly insoluble yellow needles

Methylo-rodide B'MeI 2aq white needles

Gives (B'MeCl), PtCl, small glistening orange

red needles

(B 10r3 Py 2) Di-methyl (Py 3) ethyl-quinoline $C_aH_a(CH_a)$ (CH_a) [41°] (288°-

292° at 720 mm) Formed by the action of piopionic addehyde and HCl upon m toluidine (Harz, B 18, 3397) Colourless trimetric hexa gonal plates 1t is reduced by tin and HCl to a tetrahydride, which is a colourless oil of boiling

point 282°-285° at 720 mm

Salts—B'HCl× easily soluble colourless prisms—B'HI× long colourless needles, soluble in hot water, very sparingly soluble in cold—B'₂H₂Cl₂PtCl₄ 2aq orange plates or fine needles, sl sol cold water—B'C₆H₂(NO₂)₃OH [220°], yellow needles, sol hot alcohol, nearly insol water

Methylo vodide B'MeI aq yellow needles, ▼ sol hot water, gives (B'MeCl)₂PtCl₄ small glistening orange red crystals

 $(B \ 2 \ Py \ 2)$ D1 methyl $(Py \ 3)$ ethyl quinol-

ine $C_eH_s(CH_s)$ $\stackrel{CH}{\underset{N}{(C(C_2H_s)}}$ [54°] (288° at

720 mm) Prepared by adding propionic alde hyde (60 g) to a cooled mixture of p toluidine (50 g) and strong HCl (90 g), finally heating for a short time on the water bath White trime tric crystals Sparingly volatile with steam V sol alcohol, ether, and benzene, insol water It is reduced by tin and HCl to a tetra hydride (286°) It combines with bromine, forming a dibromide, which crystallises in yellow needles [91°] By CrO₃ and dilute H_2 SO₄ it is oxidised to (B 2) methyl (Py 3) ethyl quinoline (Py 2) carboxylic acid

Salts—B'HCl syrup, which slowly crystallises—B'HBr easily soluble white silky needles—B'HI long colourless needles, v sol hot water, spaningly in cold—B',H,Cr,O, spaningly soluble red needles—B',2H,Cl PtCl, 2aq orange-red needles [208°] (Jungmann, B 23, 2273)—B'C,H_(NO_2),OH [177°], small yellow needles

Methylo vodide B'MeI aq [218°], mono-

clinic yellow crystals

METHYL-GUANAMINE The name originally given by Nencki to Acetoguanamine, vol. 11 p. 655

11 p 655

METHYL-DIGUANIDE $C_1H_2N_3$ Obtained, in combination with CuSO₄, by adding a 20 p c solution of methylamine to a mixture of di-oyan di amide $C_2N_2(NH_2)$, and copper sulphate, the crystalline $(C_3H_4N_5)$, CuSO₄ $2\frac{1}{2}$ aq which separates is then decomposed by baryta (Reibenschuh, M 4, 388) Thick alkaline syrup, which absorbs CO_2 from the air

Safts — Colourless leaflets or prisms, v sol. water — B'₂H₂SO₄ Prisms, obtained by decomposing B'₂CuSO₄ by H₂S — B'H₂SO₄ From B'₂H₃SO₄ and H₂SO₄ Crystalline powder V al sol alcohol — Cu(C₂H₂N₃)₂ 3\$aq Formed by shaking di cyan diamide with cupric oxide and methylamine Rose-red crystalline powder —

B',CuSO, 2 ag Pink needles — The chromate and piciate form yellow prisms

METHYL-GUANIDINE $C_2H_7N_3$ re

NH C(NH₂)(NHMe) Methyl uramine Formation—1 By boiling an aqueous solu tion of creatine with HgO or with PbO₂ and dilute H₂SO₄ (Dessaignes, C R 38, 839, 41, 1258, A 92, 407, 97, 340) —2 By oxidising crea tinin with KMnO, (Neubauer, A 119, 46) -3 By heating cyanamide with methylamine hydro chloride in alcoholic solution at 100° (Erlenmeyer, B 3, 896) -4 By the action of methyl cyan. amide on NH₄Cl (Tavildaroff, B 5, 477)

Properties — Strongly alkaline, deliquescent, crystalline mass Decomposed by KOH, giving off NH3 and methylamine When boiled with chloro acetic acid it yields glycolyl methylguanidine C4H11N3O8, which crystallises in tablets, v e sol water, and neutral in reaction, and forms the salts C4H11NO23HCl, and

C4H11N8O8H2PtOL

Salts — B'_HPtCl_s Monoclinic crystals (Haushofer, J 1878, 351) S 143 at 19° — B'HAuCl₄ Trimetric crystals, v sol ether, m Monoclinic crystals B'HAuCl₄ Trimetric crystals, v sol emer, in sol water —B₁H₂C₂O₄2aq Crystals, v sol water Di-methyl-guanidine C₃H₅N₃ v e

NH C(NH2)(NMe) Formed by heating equimolecular quantities of cyanamide and dimethylamine hydrochloride at 110° (Tartarinoff, C R 89,608)

-B'HCl Trimetric crystals, a b c Salts . = 862.1 x (Haushofer, Z K 6,130) — $B'_2H_2PtCl_6$ Triclinic crystals, a b c = 941 1 678, a = 90° 55′, β = 90° 20′, γ = 90° 4′—B′HAuCl, Trimetric crystals (Haushofer, J 1882, 364)

s - Di - methyl - guanidine NH C(NHMe), Formed by the action of methylamine on cyanogen iodide (Erlenmeyer, B 14, 1868)

Platinochloride B.H.PtCl₆ Triclinic crystals, $a \ b \ c = 1 \ 212 \ 1 \ 1 \ 761$, $a = 90^{\circ} \ 22'$, $\beta = 110^{\circ} \ 20'$, $\gamma = 90^{\circ} \ 5'$ METHYL - GUANIDO - ACETIC ACID v

(a) METHYL-GUANIDO-BENZOIC ACID $C_9H_{11}N_3O_2$ 1 e NH $C(NH_2)$ NMe C_6H_4 CO NH C(NH₂) NMe C₆H₄ CO₂H (a)-Benzcreatin Formed by methylation of benzglycocyamine (Griess, B 8, 324) Small acccular plates (containing 11 aq), sl sol hot water and alcohol Decomposed by boiling baryta water into methyl amido benzoic acid and urea —HA'HClaq plates, m sol water — (HA')2H2PtCl62aq

Anhydride v Benzcreatinine

(β)-Methyl-guanido-benzoic acid $C_9H_{11}N_2O_2$ * NH C(NHMe) NH C6H4 CO2H Formed by the action of a cold concentrated solution of methyl amine on the so called ethoxy carbimidamido benzoic acid (Griess, B 8, 325, vol 1 p 157) Plates, sl sol cold water and alcohol Decom posed by baryta-water into mamido benzoic acid, CO₂, and methylamine — HA'HCl — (HA')2H2PtCl2aq

Anhydridev (β) Benzcreatinine METHYL-GUANIDO-ETHANE SULPHONIC ACID CN₄H₂Me(CH₂ CH₂ SO₂H) or probably NH C(NHMe)NH CH₂ CH₂ SO₂H Formed by heating methyl amido ethane sulphonic acid (2 grms) and cyanamide (7 grms) with enough water to dissolve them, for 5 hours at 120° Crystals of the new body are found in the tube (E. Dittrich, J. pr. [2] 18, 72). Transparent

monoclinic prisms Crystallises with a molecule of water that goes off at 110° V sol hot, m sol cold, water, insol alcohol and ether Turns brown at 285°, giving off methylamine Does not form salts

METHYL-GUANIDO-VALERIC ACID

hydride C,H, N,O ie

(CH_s)₂CH CH $\stackrel{NMe}{<_{CO\ NH}}$ C NH Isovalercrea-Formed by heating methyl - amidoisovaleric acid with cyanamide and ammonia (Duvillier, Bl [2] 39,539) Sol alcohol

METHYL-HEMIPIC ACID v Methyl ether of Hemipic acid

METHYL HENDECYL KETONE C13H26O 2 e. CH, CO C, H., Methyl undecyl ketone [28°] (263°) S G (liquid) 28 823 Formed by distilling a mixture of barium laurate and barium acetate (Krafft, B 12, 1667, 15, 1724) acetic and hendecoic acids on oxidation

Isomeride C₁₃H₂₆O (265°-275°) S G 15 887 One of the products of the action of CO on a mixture of NaOAc and NaOC₅H₁₁ at 180°

(Poetsch, A 218, 62) Liquid

METHYL HEPTADECYL KETONE C, H, SO ie CH₃ CO $C_{17}H_{35}$ [56°] (267° at 110 mm) S G (liquid) $\frac{59}{2}$ 811 Prepared by distilling a mixture of barium stearate and barium acetate On oxidation it gives margaric acid (Krafft, B 12, 1672, 15, 1724)

Methyl heptadecyl ketone C19H38O 2 c CH, CO CH(C₈H₁₇)₂ Dr octyl acetone (325°-330°) Formed by boiling di octyl acetoacetic ether with alcoholic potash (Guthzeit, A 204,

METĤYL HEPTINYL KETONE C,H,,O i e CH, CO CH(C,H)₂ Dr allyl acetone (175°) Formed by boiling di allyl acetoacetic ether with cone KOHAq (Wolff, A 201, 48) V sol alco hol and ether

METHYL HEPTINYL OXIDE C8H14O 1 e CH₃ O CH(C₃H₅)₂ (136°) S G $\frac{6}{0}$ 8258 Formed from NaOCH(C₃H₅), and MeI (Rasbinin, J pr [2] 23, 270) Yields, on oxidation by cold KMnO,

CH₂O CH(CH₂ CO₂H),

METHYL HEPTYL KETONE C₂H₁₈O 16 CH₃ CO CHPr₂ Dr propyl - acetone (174°)Formed by heating di propyl acetoacetic ether with alcoholic potash (Burton, Am 3, 390) Liquid Appears not to combine with NaHSO,

Methyl heptyl ketone CH₃ CO C₇H₁₅ (177°) Formed by the decomposition of sec hexyl acetoacetic ether by KOH (Lundahl, B 16,789)

METHYL HEPTYL OXIDE C₈H₁₈O 2e CH₈ O C₇H₁₈ (161°) S G 165 830 V D 4 2 (calc 4 5) S V 194 6 (Lossen, A 254, 57) (calc 45) SV 1946 (Lossen, A 254, 57) Formed by the action of MeI on NaOCH derived from cenanthol (Wills, C J 6, 314) Mobile liquid, with strong odour, insol water, v sol alcohol and ether

METHYL-HESPERETIC ACID v Dimethyl derivative of CAFFEIC ACID

METHYL-HEXADECYL-BENZENE v HEXA-DECYL-TOLUENE

Di-methyl-hexadecyl-benzene v HEXADECYL-

Tri-methyl-hexadecyl-benzene v Hexadecyl-MESITYLENE

METHYL-HEXANE v HEPTANE. METHYL-HEXOSE C,H14O, 20 CH. CH(OH) CH(OH) CH(OH) CH(OH) CH(OH) CHO 181°] Formed by reducing the lactone of rhamnose carboxylic acid with sodium amalgam (Emil Fischer, B 23, 936) Crystallises from methyl alcohol Hydrogen cyanide yields C₈H₁₈O₆N, which on saponification forms methyl heptonic acid C₈H₁₆O₈, the lactone of which crystallises easily, and gives rise, on reduction, to methyl-heptose $CH_3(CH\ OH)_3$ CHO, of which the phenyl hydrazide is sl sol water

V sol water Phenyl-hydrazide [200° with decomposition] Osazone METHYL HEXYL-CARBINOL v

DI METHYL HEXYLENE DIKETONE

C₁₀H₁₈O₂ ie (CH₃CO),CH C₅H₁₁ Iso amyl acetyl acetone (c 222°) Formed by heating (CH₃ CO)₂CHNa with isoamyl iodide at 180⁵ (Combes, A Ch [6] 12, 249) Liquid Decom posed by caustic potash into acetic acid and

CH₂ CO CH₂ C₃H₁₁
D₁ methyl hexylene C10H18O2 diketone CH₃ CO CH₂ CH₂ CH₂ CH₂ CHMe CO CH₃ a methyl ac-di acetyl pentane $(232^{\circ}-235^{\circ})$ Formed by decomposing its carboxylic ether with alcoholic potash (Kipping a Perkin, C J 55, 346) Colourless mobile oil Dissolves in a solution of NaHSO, and is reprecipitated by

K₂CO, DI METHYL HEXYLENE DIKETONE

CARBOXYLIC ETHER C13H22O4 1 e CH, CO CMe(CO2Et) CH2 CH2 CH CH2 CH2 CH2 (255°-260°) Formed by the action of NaOEt and BrCH₂ CH CH₂ CH₂ CO CH₃ on methyl acetoacetic ether (hipping a Perkin, C J 55, Colourless liquid, with faint odour, v sl sol water

METHYL-HEXYL-GLYOXALINE C10H18N2

NMe CH (262°) SG 165 928

Formed by heating hexyl glyoxaline with a solution of MeI in methyl alcohol (Karcz, M 8, 221) Colourless oil, insol water, sol alcohol and ether Gives the alkaloidal reactions -B'2H.PtCl6 yellow plates, sol water

Methylo rodide B'MeI [124°] V sol

alcohol and ether

METHYL n HEXYL KETONE C.H. O 1.6 CH₃ CO CH₂ CH₂ CH₂ CH₂ CH₃ (172°) S G ²⁹ 8185 (Bruhl, A 203, 29), $\frac{9}{2}$ 835 (C) 186 6 (R Schiff, A 220, 103) $\mu_{\beta} =$ $\mu_{\beta}=1\ 4213$ R_∞ 63 29 H C 1,209,510 (Louguinine, Bl [2] 41, 389)

Formation —1 By distilling sodium ricinoleate with NaOH (Limpricht, A 93, 242, Bouis, A 97, 34) -2 By distilling a mixture of calcium acetate and calcium n heptoate (cenanthate) (Stadeler, J pr 72, 246) -3 From octoic aldehyde by treatment with PCl, decomposing the resulting C₁H₁₃CHCl₂ by alcoholic KOH, and adding the octinene C₆H₁₃ C CH so formed to cold H2SO4, diluting and distilling with water (Béhal, Bl [2] 47, 33, A Ch [6] 15, 275) -Together with ethyl amyl ketons by treating C.H., C C CH, with H.SO, and water successively (Béhal, Bl [2] 48, 704) —5 'Oil of wine' contains a methyl hexyl ketone (164°), which yields hexore and acetic acids on oxidation (Hartwig, Scholl, J pr. [2] 23, 449) -6 By heating octyl alcohol with boracic acid at 170°, and distilling en pacuo (Councler, B 11, 1108)

Properties - Colourless, mobile liquid, smell ing like apples and tasting like camphor, sol alcohol and ether, insol water Combines with NaHSO₃, forming a compound sol alcohol, but decomposed by hot water Does not reduce ammoniacal AgNO, or Fehling's solution Chromic acid mixture oxidises it to acetic and hexoic acids (Béhal a Combes) Nitric acid oxidises it to heptoic acid (Petersen, A 118, 78) PCl, forms C₈H₁₆Cl₂ (190°-200°) (Dachauer, A 106, 271) Combinations — C₈H₁₆OKHSO₃ 3aq — C₈H₁₆ONH₄HSO₃ V sol water (L) Oxim CH₂ C(NOH) C₈H₁₅ (214°) at 725 mm (B 21, 509, c f Béhal, Bl (2) 47, 163)

Methyl isohexyl ketone CH₃ CO CH₂ C₅H₁₁ Isoamyl acetone (170°) Formed by the action of KOH upon di methyl hexylene, diketone $(CH_3 CO)_2 CH C_3 H_{11} (Combes, A Ch [6] 12, 249)$ Limpid liquid, with agreeable odour with NaHSO,

Methyl hexyl ketone (?) Me CO C₆H₁₃ (208°-210° cor) S G 15 843 Occurs in small quan tity (40 g) among the products of the passage of CO over a mixture of sodic acetate (546 g) and sodic iso amylate (746 g) (Poetsch, A 218, 60) Methyl hexyl diketone $C_8H_{14}O_2$ i.e

CH₃ CO CO CH₂ CH₂Pr (165°) (Von Pechmann, B 21, 2140)

DI-METHYL-HEXYL-PYRIDINE $C_{1}H_{2}N$

 C_bH_{13} C < CH CMe > Nn Hexyl lutidine (250°) at 719 mm Obtained by distilling its dicarboxylic acid with lime (Jaeckle, A 246, 41)

Colourless liquid, with faint blue fluorescence B'2H.PtCl, [163°] Orange prisms -B'2AgNO, White needles, sol hot water and alcohol

Hexahydride C, H. N 26 C.H. CH CH NH Hexyl lupetidine

Obtained by the action of (240°) at 715 mm sodium amalgam on an alcoholic solution of di methyl hexyl pyridine (J) Colourless oil, not exhibiting fluorescence Its dilute alcoholic solu tion gives a dark brown pp, with mercurous nitrate Its platinochloride and dichromate could not be obtained in a crystalline state-B'HCl long white prisms, v sl sol water

DI-METHYL-HEXYL-PYRIDINE DICARB. OXYLIC ACID C15H 1NO. 1e

C_cH_{1s} C C(CO₂H) CMe N Hexyl lutidine ds-carboxylic acid The potassium salt is formed by saponifying its ether with boiling KOHAq (Jackle, A 246, 40) The free acid has not been prepared -PbA" 13aq

Dr ethyl ether Et,A" Formed by oxidising its dihydride with nitrous acid Yellowish. brown oil, forming salts with mineral acids -H₂A"H₂PtCl₈ [141°] Orange plates

Dihydride De ethyl ether

 $C_{e}H_{1s}CH < C(CO_{e}Et)CMe > NH$ [54°] Formed by the condensation of heptoic aldehyde (cenanthol) (1 mol) with acetoacetic ether (2 mols) and ammonia (1 mol) (J) Yellow prisms, crystallising with difficulty from a dilute alcoholic solution

DI-METHYL-HOMO-CAFFEIC ACID v Damethyl derivative of (4 3.1) DI OXY-PHENYL-CRO-TONIC ACID.

METHYL-HOMO FERULIC ACID v Dimethyl derivative of (4 3 1) Di-OXY PHENYL-CROTONIC ACID

METHYL-HYDANTOIC ACID C₄H₈N₂O₂ re NH₂ CO NMe CH₂ CO₂H Methyl uramido acetic acid

Formation—1 Occurs in the urine of a dog whose food is mixed with methyl amido acetic acid (Schultzen, B 5, 578)—2 By digesting an aqueous solution of sarcosine with potassium cyanate and ammonium sulphate for two days at 40° (Baumann a Hoppe Seyler, B 7, 35)—3 By boiling methyl amido acetic acid with ursa and excess of baryta-water, or by digesting the same mixture for two days at 40° (B a H)—4 By the action of potassium cyanate and H₂SO₄ on methyl amido acetic acid (E Salkowsky, B 7, 116)

Salkowsky, B 7, 116)

Properties—Transparent plates (from alcohol), m sol cold water and cold alcohol, v sol hot water and hot alcohol Acid in reaction When the concentrated aqueous solution is boiled it is partially converted into methylhydantoin, this dehydration is more rapidly deffected by boiling with water and PbCO₃ or BaCO₃, only traces of the acid then passing into solution. When heated in a sealed tube with a saturated solution of baryta at 140° it yields NH₃, methyl amido acetic acid, and CO₂. Moist Ag₂O forms lamine of silver methyl hydantoin

Salts — *BaA'₂ Ppd by adding alcohol to its aqueous solution — *CuA'₂ Amorphous

Di methyl hydantoic acid v Acetonuramic

METHYL - HYDANTOIN $C_1H_eN_2O_2$ • 6 $CO < NMe CH_2 > Anhydrade$ of methyl ura mudo acetic acid Mol w 114 [182°] (F a K), [156°] (E Salkowsky, B 7, 119), [145°] (N)

Formation—1 By heating creatinin with baryta water at 100° in a sealed tube (Neubauer, A 137, 288)—2 By boiling methyl hydantoic acid with water and PbCO₂ or BaCO₂—3 By melting methyl-amido acetic acid with urea (Huppert, B 6, 1278)—4 By the action of cyanogen chloride on melted methyl amido-acetic acid (Traube, B 15, 2110)—5 By warming caffuric acid with baryta water (Fischer, A 215, 286)—6 By the reduction of methyl allantoin by HI (Hill, B 9, 1091)—7 By heating a mixture of hydantoin (3 pts), MeI (6 pts), methyl alcohol (16 pts), and KOH (2 pts), for three hours at 100°, and extracting the product with boiling alcohol (Franchimont a Klobbie, R T C 8, 289)

Properties —Short prisms, v sol boiling water, sl sol cold water, v sol alcohol, v sl sol ether May be sublimed It does not unite with baryta, but its hot solution dissolves Ag₂O, and the alkaline filtrate then deposits C₄H₃AgN₂O₂ as groups of thin lamine. The mercuric compound, obtained in like manner, forms nodular groups of minute needles, very soluble in water Nitric acid (S G. 15) converts methyl hydantom into the nitramine

 $\rm CO < NMe-CH, \ \)$ which crystallises from alcohol in scales [168°], v sl sol cold water, de composed by bolling water

(a)-Methyl-hydantoin v Lactyl-URBA.

Di-methyl hydantoïn C₃H_aN₂O₂ s.e NH CMe₂

METHYL-HYDANTOIN CARBOXYLIC ACID C₃H₆N₂O₄ Formed by boiling caffuric acid with baryta water (E. Fischer, A. 215, 286). The free acid is decomposed into CO₂ and methylhydantoin when its aqueous solution is warmed

[156°] Formed, together with hydrastine methylo hydroxide, by the action of alkalis on a solution of hydrastine methylo chloride pared by adding potash to a hot aqueous solution of hydrastine methylo iodide until no further ppn takes place (Freund a Rosenberg, B 23, 406) Small yellow needles (from alcohol), almost insol water, sol chloroform, benzene, CS, ether, and dilute alcohol With sulphomolybdic acid (Frohde's reagent) it gives a violet colour, changing through blue to green Forms spa ringly soluble double salts with SnCl, And chloride, and HgCl, Ammonia converts it into the amide $C_{22}H_{26}N_2\tilde{O}_6$ [180°] which forms a crys talline hydrochloride C 2H26N2O6HCl 2aq, and on boiling with dilute nitric acid yields hemipic acid (Freund a Heim, B 23, 2902) The formula of this amide may be written

C,H2(OMe2)CONH2

CO CH₂ C₆H₂(O₂GH₂) CH₂ CH₂NMe₂

and it may also be got by heating hydrastine methylo iodide with alcoholic ammonia. The corresponding methylamide $C_{22}H_{-8}N_2O_6$ [182°], ethylamide $C_{24}H_{56}N_2O_6$ [162°], allylamide $C_{22}H_{36}N_2O_6$ [158°], and amylamide $C_{27}H_{36}N_2O_6$ [171°] have been prepared

Salts—B'HCl [241°] M sol hot water Decomposed on fusion A 1 p c solution is in active—B'₂H₂PtCl₈ sl sol water—B'H SO₄ [250°] Less soluble than the chloride—B'HNO₃ Decomposes at 250° V sl sol water

Methylo-rodrde C₂₂H₂₂NO₅MeI Yellow needles, more soluble in water than in alcohol Decomposes at 250° On warming with aqueous KOH it gives off trimethylamine

Methyl-hydrastimide C22H21N2O5 s.e

C₀H_{*}(OMe), CONH C₀H_{*}(O₄OH_{*}) CH_{*} CH_{*} NMe_{*} [192°] Formed by the action of dilute H_{*}SO₄ on the amide (Freund a Heim, B 23, 2899) Yellow needles, insol water, sl sol alcohol—B'HCl [227°]—B'HCl xaq.—B'₂H_{*}PtCl_{*} [205°].

-B'H.SO. [218°] Yellow crystals (from alcohol) -B'HNO, aq

Methylo-rodide B'Mel ag

Methyl hydrasteineC₂₂H₂₇NO₈ [151°] Formed by warming hydrastine methylo-chloride with excess of KOHAq, or, better, by warming methyl-hydrastine with strong caustic potash (Freund a Rosenberg, B 23, 408) Colourless needles (containing aq) (from water), sl sol cold water, more sol hot water and alcohol Decomposed by long heating at 110° Very soluble in alkalis, but reppd by CO2, insoluble in aqueous Na2CO3 It dissolves in aqueous NH₃, but is ppd on eva poration It also dissolves in HClAq In a 5 pc hydrochloric acid solution it is inactive Tertiary base Coloured reddish brown by chlorine water and ammonia Iouine has no Hot conc HBrAq reconverts it into methyl hydrastine Its salts are colourless -B'HCl aq [290°] Compact groups of crystals

Methyl hydrastinine Methylo rodide C₁₃H₁₈NO₂I i e CHO C₇H₄O₂ CH₂ CH₂ NMe₂I [267°] Formed by heating hydrastinine with Pale yellow needles MeI (Freund, B 22, 2329) (from alcohol or water) AgCl gives C13H18NO3Cl [213°], which forms white crystals (containing aq) -(C₁₃H₁₈NO₈Cl)₂PtCl₄ yellow crystalline pp

Oxim of the methylo rodide HON CH C9H,O. NMe3I Yellowish needles, de composed at 250° V sol alkalıs and ppd un changed by acids Gives a dark reddish brown pp with platinic chloride

METHYL HYDRAZINE CN₂H₆ ie CH₇ NH NH (87° 1 V) at 745 mm Formed by treating methyl uiea nitrate with NaNO, re ducing the resulting nitroso methyl urea [124°] with zinc and dilute acetic acid, and decomposing the product with HCl (Bruning, B 21, 1810, A 253, 7) Mobile liquid with strong ammoniacal odour, soluble in water (heat being evolved), miscible with alcohol and ether Reduces Feh ling s solution

Salts - B'H₂SO₄ [139 5°] White needles v sol water, sl sol alcohol --B'HCl v sol $[162^{\circ}]$ water and alcohol -B'C,H (NO),OH Yellow needles, decomposed on fusion

Di benzoyl derivative CH, N. HBz, [c 143°] Colourless needles (from water), m sol hot water, v sol alcohol, sl sol ether Does

not reduce Fehling's solution

Picryl derivative CH, N2H2C6H2(NO.), [171°] Obtained from the hydrazine and picryl chloride (chloro tri nitro benzene) in diluted al coholic solution Yellow plates, v sol alcohol and ether, m sol chloroform Decomposed on

Oxalyl derivative CH₈N₂H₂ CO CO N₂H₂CH₃ [221 5°] Formed by adding an aqueous solution of methyl hy drazine to oxalic ether White needles, v sol alcohol, m sol water, v sl sol ether Sublimes at about 160° in needles Reduces Fehling's Nitrous acid forms the nitrosamine CH₃ N₂H(NO) CO CO N₂H(NO) CH₃ [147°]

Di methyl-hydrazine $C_2H_4N_2$ i.e NMe₂ NH₄ (63°) at 720 mm S G $\stackrel{11}{\sim}$ 801 V D (H=1) 30 Prepared by reducing di methyl nitros amine (OH₁)₂N NO with zine dust and acetic acid (Fischer, B 9, 111, Renouf, B 13, 2171) Fermed also by reducing di methyl nitramine

(CH₂)₂N NO₂ (Franchimont, R T C 2, 123) Light volatile liquid with ammoniscal odour, v sol water, alcohol, and ether Its haloid salts

volatilise without decomposition

Reactions —1 CS₂ forms di methyl thio-carbazic acid NMe₂ NH CS₂H —2 Phenyl thiocarbimide(phenyl mustard oıl) C.H.NH CS NH NMe2-3 Oxalic ether pro duces NMe2 NH CO CO NH NMe2 -4 Alkul vodides unite, forming azonium iodides, such as NH₂ NMe₃I -5 K₂S₂O, forms NMe₂ NH SO₃K, which crystallises in white plates, v sol water It is split up by hot HClAq into dimethyl hydrazine and H₂SO₄ —6 HgO oxidises it, form ing tetra methyl tetrazone NMe, N N NMe, a yellow oil (130°) which explodes when heated above its boiling point It forms a mirror with ammoniacal AgNO_s, even in the cold, and is de composed by boiling dilute acids into formic aldehyde, NH₂Me, nitrogen, and NHMe₂. The tetrazone is a strong base -7 Nitrous acid de composes it into N₂O and dimethylamine -8 Acetophenone at 100° forms NMe, N CMePh, a hquid (165° at 100 mm) It is split up again by acids into its generators (Reisenegger, B 16,

Salts -B'HCl -B H,Cl, hygroscopic crys tals -B'2H.PtCl, orange yellow prisms, v sol water, sl sol alcohol - B', H, SO, [105°] White needles —B'₂H C O₄ colourless plates, v sol water and alcohol, sl sol ether

Ethylo chloride NH...NMe.EtCl tallises with difficulty, v e sol water ethylo hydroxide is reduced by zinc dust and acetic acid to HCl, ammonia, and NMe.Et -(NH2 NMe EtCl) PtCl. Crystals

methyl amido methyl thiazole

METHYL-IMIDO-DI-METHYL-THIAZOLE S C(NMe) NMe [96°] Formed by the action CH CMe / of chloro acetone on di methyl urea (Traumann, A 249, 49) White needles (from water), with strong alkaline reaction Is identical with di

METHYL-IMIDO DI (β) NAPHTHYL SUL-PHIDE NMe $<_{C_{10}H_s}^{C_{10}H_s}>S$ [285°] Formed by heating imido di naphthyl sulphide (10 g) with MeI (5g) and MeOH (12cc) for five hours at Formed also by heating di-(\$) naphthylmethyl amine with sulphur (Kym, B 23, 2459) Lemon-yellow plates or needles Gives a blue colour with H2SO4 containing HNO3

METHYL-IMIDO PHENYL NAPHTHYL

SULPHIDE NMe $< \begin{array}{c} C_{10}H_{\bullet} \\ C_{6}H_{\bullet} \end{array}$ N [133°] Formed by heating NH $< \begin{array}{c} C_{10}H_{\bullet} \\ C_{10}H_{\bullet} \end{array}$ N with MeI and MeOH at 150° (Kym, B 23, 2466) Light greenishyellow needles, sl sol hot spirit, v e sol hot benzene

METHYL IMIDO DI PHENYL SULPHIDE $C_{13}H_{11}NS \ i \ e \ S < C_{6}H_{4} > NMe \ [99 \ 3^{\circ}] \ (c \ 363^{\circ})$ Formed by heating imido di phenyl sulphide (thiodiphenylamine) with MeI and MeOH in sealed tubes at 110° (Bernthsen, A 230, 88, B 16, 2899) Long white prisms (from alcohol), insol water, v sol ether, benzene, and hot HOAc Its alcoholic solution is coloured brown by FeCl₃ Nitric acid forms a yellow nitro deri vative which, unlike that of imide di phenyl sulphide, is insol NaOHAq The nitro deriva tive may be reduced to an amido compound which gives a deep bluish green colour with FeCl₂

action of SCl2 dissolved in petroleum on di phenyl methyl amine NMePh₂ (Holzmann, B 21, 2065) Thin yellow scales (from hot benzene alcohol), insol water, sl sol hot alcohol and ether, v sol hot benzene On heating with sopper it yields di phenyl methyl amine

METHYL IMIDO-DI PHENYL SULPHONE $C_{12}H_{11}NSO_2$ is $NMe < C_6H_4 > SO_2$ Formed by the action of KMnO, on methylımıdo dı phenyl sulphide suspended in water (Bernthsen, A 230, 91) Chains of white needles, often slightly reddish (from alcohol) or small compact prisms (from glacial acetic acid) V sl. sol cold alcohol, glacial acetic acid of ether Insol acids or alkalis, not affected by boiling KOH or HCl Boiled with conc H2SO4 it forms a splendid blue liquid, turned pale violet-brown by pouring into water Its nitro-derivative after reduction gives no colour with FeCla.

METHYL INDAZINE C.H.N. t.c.

C,H NH. Quinazole, Methyl indasole. [113°]. (281° 1 V) at 736 mm VD 4 37 (calc 4 53) Formed by slowly adding NaNO₂ to a paste composed of o amido acetophenone and HClAq The resulting diazo compound is soluble in water, and the liquid is poured into a solution of Na,SO₃ The product at first contains CH₃ CO C₆H₄ NH NHSO₃Na, but it gradually loses its reducing power, and deposits needles of

CMe N SO, Na When these needles are

heated with HClAq they yield methyl indazine and H₂SO₄ (Fischer a Tafel, A 227, 303) Methyl indazine is also formed, together with carbonic acid gas, when indazyl acetic acid

CCH, CO,H C₆H₄ is heated

Properties - Colourless needles (from water), m sol hot water, v sol alcohol, ether, and chloroform, almost insol cone NaOHAq be sublimed Does not reduce Fehling's solu Gives crystalline compounds with metallic salts

Salts—B'HCl [177°] Needles, v sol water and alcohol—Sulphate needles— Picrate yellowcrystalline powder -Platino chloride yellow needles

Nitrosamine C.H.N.Oie

N NO [60°] From B'HCl and

cold aqueous NaNO, Yellow needles, v sol. alcohol, ether, and chloroform

Di methyl indazine C₂H₁₀N₂ i e

NMe [80°] Formed by methyla-

tion of the preceding Colourless plates, v sol alcohol, ether, benzene, and hot water

Di methyl ψ indazine $C_6H_4 < \frac{CMe}{NMe} > N$ [36°]

Formed from methyl o amido acctophenone by conversion into the nitrosamine

CH3 CO C6H4 NMe NO and reducing this body with zinc and HOAc (Fischer a Tafel, A 227, 336) Yellow oil, solidifying on cooling as nearly colourless plates Very volatile with steam It forms crystalline compounds with metallic salts -The chloride forms colourless needles -

The sulphate crystallises in needles, and the picrate in rectangular tables

METHYL INDAZINE v-SULPHONIC ACID $C_8H_8N_2SO_2 \quad \text{i.e.} \quad C_8H_4 \begin{matrix} CMe \\ | \\ N- \end{matrix} N \ SO_3H$ The

sodium salt of this acid is formed as described under methyl indazine It is m sol cold water, but ppd on addition of NaOH or NaCl It does not reduce HgO or Fehling's solution Boiling cone HClAq splits it up into NaHSO, and methyl-indazine

METHYL INDAZOLE v METHYL INDAZINE. DI-METHYL-INDIGO v Indigo METHYL-ISO-INDILEUCINE v Indico.

(In. 1) METHYL INDOLE C.H.N s.c.

C,H, CMe CH 195°7 Scatole Skatole (266° 1 V) VD (H-1) 65 2 (calc 65 5)

Occurrence -The chief volatile constituent of human fæces, but not present in that of dogs (Brieger, J pr [2] 17, 129, A 12, 1986) occurs among the products of the putrefaction of albuminous substances (Brieger, Nencki, J pr [2] 17, 98, H 4, 371, E a H Salkowsky, B 12, 651)

Formation —1 By fusing egg albumen with KOH (Nencki) —2 By reducing indigo with tin and HCl, and distilling the product with zincdust A mixture of indole and scatole is thus obtained, and these are combined with picric When the picrates are distilled with conc NaOHAq the indole is destroyed, and the scatole passes over, and may be crystallised from water The yield is 3 pc Scatole prepared in this way has no fæcal odour (Baeyer, B 13, 2339) -3 By heating aniline zinc chloride with gly cerine (Fischer a German, B 16, 710) -4 By adding nitro cuminic acid (6 pts) to amido cuminic acid (obtained by reducing 4 pts of the nitro acid), mixing with baryta (10 pts), drying, and distilling (Fileti, G 13, 358, 378) -5 The phenyl hydrazide of propionic acid is warmed with ZnCl2, and the product distilled with steam (E Fischer, A 236, 138) -6 In small quantity in distilling strychnine with lime (Stochr, B 20, 1108, Lobisch a Malfatti, M 9, 629) -7 By heating its carboxylic acid (Arnold, A 246,

Preparation from pancreas - 2,300 grms pancreas and 500 grms flesh are freed from fat, cut up and put into a loosely covered pot containing 8 litres of water. The whole is left for 5 months at the ordinary temperature the end of the fourth month the odour of skatole The liquid is acidified with acetic distilled. The distillate is acidified appears acid and distilled with HCl and picric acid is added Red needles of skatole picrate, C,H,N C,H2(NO2)3OH, separate This is decomposed by ammonia, and the skatole is distilled over with steam and crystallised from

water (Nencki, J pr [2] 20, 467)

Properties—Glittering plates of powerful fæcal odour, sl sol water—It differs from indole in giving no colour when its solutions are treated with chlorine water Its solution gives with fuming HNO, an opalescence, with KNO, and acetic acid a white pp of the nitrosamine, with CrO, a red amorphous pp in concentrated solutions, and with FeCl, no colour (Brieger, J pr [2] 17, 130) It is not attacked by warm dilute HNO. It colours pine wood moistened with HCl red, this is best seen by dropping pine wood saturated with an alcoholic solution of scatole into cold conc HClAq (Fischer, A 236, 138)

Reactions -1 Potash-fusion yields the corresponding indole carboxylic acid (Ciamician a Magnanini, B 21, 673) -2 By passing CO, over a mixture of sodium and scatole, heated at 240° there is formed indole (In-1)-carboxylic (C a M) -8 With chloroform and NaOEt it yields a chloro methyl-quinoline C, HaClN -4. Bensoic aldshyde and ZnOl₂ form, slowly at 100°, C_cH₃ CH(C_cH_aN), which crystallises from alcohol [142°] (Fischer, B 19, 2989) —5 When adminis-VOL III

tered to animals it appears in the urine in the form of the chromogen of a red pigment and as methyl indyl sulphuric acid C₀H₄N SO₄H (?) (Brieger, H 4, 414, Mester, H 12, 130) Salts -B'₄HCl Ppd in needles when ether

is added to its alcoholic solution (Wenzing, A [168°] Insol ether, v 'sl sol water, 239, 239) v sol alcohol -Picrate B'C,H2(NO2),OH Red needles

Acetyl derivative so called v METHYL-INDYL METHYL KETONE

Dihydride C.H., N & e

C.H. CHMe CH. (232° 1V) at 744 mm Formed by reducing an alcoholic solution of scatole with zinc dust and HCl (Wenzing, A 239, 242) Colourless oil, resembling quinoline and piperidine in odour V sol alcohol, ether, and ligroin Its alcoholic solution stains pine wood, moistened with HClAq, orange It re duces AgNO, and FeCl, on warming It yields a nitrosamine which may be reduced to an oily hydrazine With phenyl thiocarbimide it forms a compound melting at 125° - *B'HCl alcohol and water, insol ether - Oxalate [126°], insol ether -B'2H2PtCl, yellow needles, sl sol water, decomposed by hot water —Pi crate [150°], yellow granular crystals (from benzene)

(In 2) Methyl-indole C.H.N & & C.H. CH SCMe Methyl hetole [60°] (272° 1 V) at 750 mm V.D 4 75 (calc 4 54) (Tread well, B 14, 1466)

Formation -1 By nitrating benzyl methyl ketone with fuming HNO₃, reducing the result ing [21]C₃H₄(NO₂) CH₂ CO CH₃ with zinc dust and ammonia, and distilling with steam (Baeyer a Jackson, B 13, 187, 14, 879) -2 Obtained by heating the phenyl hydrazide of acetone (CH₃)₂C N NHC₆H₅ (1 pt) with ZnCl₂ (5 pts) for half an hour at 100° and then for some minutes at 180° (E Fischer, B 19, 1564, A 236, 124)

Properties - Needles or plates (from ligroin), al. sol hot water, v sol alcohol and ether Smells like indole V sol cold HClAq, but de composed on boiling with conc HClAq colours its solution yellow, and soon gives a yellow amorphous pp which does not give Liebermann's reaction Colours pine wood, moistened with HClAq, red

Reactions —1 kMnO, oxidises it to acetyl o amido benzoic acid —2 Potash fusion yields indole (In 2) carboxylicacid (Ciamician a Magna nini, \hat{B} 21, 673) —3 By heating with sodium in a stream of CO₂ at 240° there is formed methyl ındole carboxylıc acıd (Cıamıcıan a Magnanını, B 21, 671) -4 Reduced by tin and HCl to a hy dride, although sodium amalgam does not act upon it -5 With chloroform and NaOEt it yields chloro methyl quinoline [71°] form and NaOEt yield the corresponding bromo methyl quinoline (Magnanini, G 17, 246) -6 On heating with cone HClAq for 7 hours at 225° there is formed aniline and a liquid base CiaHaN (250°) which smells like quinoline and forms the salts B', H.PtCl, and B'HAuCl, (Magnanini, B 20, 2609) -7 Benzoic aldehyde at 100° forms C.H.CH(C CMe NH), which separates from acetone in colourless shining crystals

ether On boiling with Fe₂Cl₆ in HOAc it is converted into di-methyl rosindole (Fischer, A 242, 378, B 19, 2988) — 8 Nitro-benzoic aldehyde heated with (In 2) methyl indole on the water bath forms the corresponding [3.1] C₆H₄(NO₂) CH(C₉H₈N)₂, small crystals (from acetone), sl sol alcohol, ether, and HOAc This body melts at 263°, and is reduced by zinc dust and ammonia to C_cH₄(NH₂) CH(C_cH₅N)₂ a yellow crystallisable oil (Fischer, A 242, 375) -By fusing with phthalic anhydride and a little ZnCl₂ there is formed an acid C₁₇H₁₈NO₈ pro bably CoH, N CO CoH, CO2H which crystallises from alcohol in colourless prisms, insol water, l sol ether, v sol hot alcohol and HOAc Fischer) -10 On heating with benzoyl chloride nd a little ZnCl2 the products are di methylosındole $C_{23}H_{20}N_2$ and benzoyl methyl ındole 1 On heating with sinc chloride alone, a small uantity of quinoline is formed (Fischer a steche, B 20,819) -12 Diazo benzene chloride ind NaOAc form compact red crystals (from retroleum ether) of C_6H_5 N N $C < C_0H_4 > NH$, 116°], insol water, v sol alcohol, ether, and penzene, m sol petroleum ether This body is plit up again, by reduction, into aniline and $C_0H_4 < NH^{C(NH_2)} > CMe$ mido methyl indole 113°] (Fischer, A 242, 384) -13 When (In 2) nethyl indole (1 pt) is heated with MeI (22 pts) and a little methyl alcohol at 100° for 15 hours,

[247°], msol water, v. sl sol hot alcohol and

here is produced di methyl quinoline dihydride 243°) (Fischer a Steche, B 20, 818, 2199) Salts—B'HI Formed by passing dry HI Salts—B'HI Formed by passing dry HI nto a solution of the methyl indole in ether Wagner, A 242, 388) Flocculent pp, very easily decomposed by water and by moist air B'2H2PtCl, 3aq yellow needles, decomposed by

Acetyl derivative C.H. CH (200°-210° at 40 mm) Formed in small quan ity, together with methyl indyl methyl ketone (qv), by heating (In 2) methyl indole with Ac O and NaOAc The product is extracted with shloroform, and the extract distilled in vacuo (Magnanini, G 18, 95) Pale yellow liquid Decomposed by boiling aqueous KOH into KOAc and methyl indole Yields indole carboxylic acid on fusion with potash KMnO, oxidises it to acetyl o-amido benzoic acid (Ciamician a Mag nanını, B 21, 673)

(B) Acetyl derivative v METHYL INDIL METHYL KETONE

Benzoyl derivative C,H,NBz Formed, together with di methyl rosindole, by heating (In 2) methyl indole with BzCl and a little ZnCl2 on the water bath (Fischer a Wag ner, B 20, 817) Glittering plates (from alcohol), v sl sol hot water, m sol alcohol and ether

Dihydride $C_9H_{11}N$ is $C_6H_4{\stackrel{CH}{\sim}}NH^2>CHMe$ (228° 1 V) at 742 mm **H**ydromethylketole Prepared by reduction of (In 2)-methyl indole with tin and HCl (Jackson, B 14, 883, Wen zing, A 239, 244) Colourless oil with powerful odour Heavier than water Strong base With phenyl-thiocarbimide it forms a compound C14H14N2S, which crystallises from ether in prisins

[101°] —B'₂H₂PtCl₄. orange yellow needles, decomposed by water — Oxalate [130°], crystalline — Picrate [151°], crystalline — Acetyl derivative C.H. (56°) From the dihydride and Ac₂O White needles,

insol water, sol most other solvents

Nitrosamine C.H. NO [55°] Formed by adding NaNO2 to a solution of the hydrochloride of (In 2) methyl indole dihydride (Jackson) Yellow crystals (from ligroin), v sol alcohol, ether, and boiling ligroin On treatment with tin and HCl, methyl indole dihydride is regene rated On reduction with zinc dust and HOAc it yields the hydrazine C_sH₁₀N NH, which crys tallises from ligroin in prisms [41°], and yields a crystalline sulphate and hydrochloride

(In 3)-Methyl indole $C_6H_4 < {
m CH}_{
m NMe} > CH$ (240° 1 V) at 720 mm SG 2 1 0707 Obtained by long heating at about 205° from its carboxylic acid [212°], which is formed by the action of HCl on the phenyl methyl hydrazide of pyruvic acid (Fischer a Hess, B 17, 562) Formed also by heating ω chloro methyl o amido styrene C₆H₄(NHMe) CH CHCl with NaOEt at 135° (Lipp, B 17, 2510)

Properties — Yellowish liquid, nearly insol

water, v sol alcohol, ether, and benzene Vola tile with steam A chip of pine wood, dipped in HClAq, is coloured violet red by its vapour or solution It dissolves in cone HClAq and is reppd by addition of water Fuming nitric acid added to (In 3) methyl indole suspended in water gives a deep red colour and finally a red pp

Reactions -1 Analkaline solution of bromine

(NaOBr) converts it into di bromo methyl oxin dole C₈H₂Br₂NO, which crystallises in transpa rent tables, melting at 204° It is converted by heating with alcoholic potash into methyl \$\psi\$ isatin, which is ppd, after boiling off the alcohol, by adding HCl = 2 (In 3) methyl indole (2 mols) heated with benzoic aldehyde (1 mol) and ZnCl₂ for 2 hours on the water bath forms C_eH_s $CH(C \leqslant \stackrel{C_eH}{CH} > NMe)_2$, which crystallises in colourless prisms [197°], insol water, sl sol al cohol and ether, v sol hot acetone and HOAc It yields a red dye on heating with FeCl in HOAc (Fischer, A 242, 377, B 19 2988) — 3 On fusing equal weights of phthalic anhydride and (In 3) methyl indole with a little ZnCl, at 100° there is formed C₈H₄ C₂O₂(C₉H₈N), which crystallises from acetone in colourless prisms [300°] It is insol water and alkalis, v sl sol ether and alcohol, but v sol hot acctone (Fischer, A 242, 382, B 19, 2989) —4 Scarcely attacked by MeI at 100°, but at 120° it appears to yield a methyl quinoline dihydride (Fischer a Steche, B 20, 2199)

Picrate CoHoNCoH2(NO2)sOH [150°] Long dark red prisms or needles, v sol benzene, sl sol ether Decomposed by alcohol

Chloro derivative v Di-chloro METHYL-

Dihydride $C_0H_4 < \frac{CH_2}{NMe} > CH_2$ (216° 1 V) at Formed by reducing (In 3) methyl indole with zinc dust and cone HClAq (Wenzing, A 239, 246) Liquid, sl sol water, v sol alcohol and ether, volatile with steam Most of itc

salts dissolve in alcohol and water -B'sHsPtCls:

yellow needles, decomposed by boiling water — Oxalate [105°] —Picrate [155°], yellow tables (from benzene)

CMe CH C CH (B 2) Methyl-indole CH CH CNH

Tolindole [585°] Formed by heating at 240° its carboxylic acid, which is obtained from the p tolyl hydrazide of pyruvic ether (Raschen, A 239, 226) Needles (from water), m sol hot water, v sol alcohol, ether, benzene, and ligroin Volatile with steam Reacts like indole with pine wood and with introus acid—Picrate B'C₄H₂(NO₂)₃OH [151°] Red needles (from water)

(In 1,2) Di methyl indole C, H, N 2.6

C₆H₄< CMe SCMe. [108°] (285° 1 ♥) Formed by heating the phenyl hydrazide of methyl ethyl ketone with ZnCl, at 180° (E Fischer, B 19,1565, A 236, 126) Formed also by heating bromo acctyl propionic acid CH, CO CHBr CH, CO2H (1 pt) with aniline (3 pts) at 100° (Wolff, B 20, 427, 21, 123) Obtained likewise by heating at 225° (Fischer)

C₆H.<

Properties —White plates (from dilute alco hol) Smells like indole V sl sol hot water, v e sol alcohol and ether, sl sol cold ligroin Dissolves in conc HClAq but is reppd on dilution with water Does not colour pine wood Reactions —1 NaNO, added to its solution

in HOAc forms a nitrosamine [63°], crystallising in yellow needles, v sl sol water, v sol alcohol By zinc dust and HCl it is re converted into di methyl indole It exhibits Liebermann s reaction -2 MeI in MeOH converts it into tri methyl quinoline dihydride

Picrate B'C₆H₂(NO₂)₈OH [157°] Brown needles (from alcohol)

Dihydride C_eH₄< CHMe CHMe (231°) at

Formed by reducing di methyl indole with zinc dust and HClAq (Steche, A 242, 371) (In 2,3) D1 methyl indole C10H11N te

 $C_{\rm e}H_{\rm 4}<_{
m NMe}^{
m CH}>$ CMe [56°] Formed by heating the phenyl methyl hydrazide of acetone (1 pt) with zinc chloride (5 pts) for 3 hours at 130° (Fischer, B 19, 1565, Degen, A 236, 153) Formed also by heating its carboxylic acid C₆H₄ C(CO₂H) CMe at 200° (D) needles, v sol alcohol, ether, benzene, and ligroin, v sl sol water, v sol conc HClAq May be distilled without decomposition It gives the pine wood test very distinctly Nitrous acid The picrate forms a complicated product The hydride crystallises in dark red needles 18 v sol weak acids

(In 1,3) D1 methyl indole $C_{e}H_{4} < \frac{CMe}{NMe} > CH$ (230°-255°) Formed by heating the phenylmethyl hydrazide of n propionic aldehyde (1 pt) with ZnCl₂ (5 pts) at 135° (Degen, A 236, 163) Oil

(B 2-In-3) Di-methyl-indole C, H, N i.e CMe CH C CH Methyl - p - tolindole CH CHÜNMe

(242°-245°) Formed by heating acid at 225° (Hegel, A 232, 216) Formed by heating its carboxylic Liquid, volatile with steam, v sol. alcohol, ether, and benzene Dyes pine wood, moistened with HCl, red. Fuming HNO, gives a red colour and, finally, a The picrate is crystalline

CMe CH C CH (B 2, În 2)-Di methyl indole CieHiiN 1.4.

Methyl - p tolindole CH CH C NH [114°-117°] Formed by heating the p-tolylhydrazide of acetone with ZnCl2 (Raschen, A May be distilled without decompo-Almost insol hot water, v sol hot alco sition hol, ether, and benzene -B'C,H2(NO2)2(OH) [155°] Dark red needles (from benzene)

(B 4, In 2) Di methyl indole C_{1e}H₁₁N CH CH CH CH Methyl o-tolundole

tained by the action of heat on its carboxylic acid, which is derived from the o tolyl methylhydrazide of pyruvic acid (Hegel, A 232, 220) Liquid, smelling like indole, volatile with steam Dyes pine wood, acidified by HCl, violet red. Behaves like indole towards nitrous acid

Di-methyl indole C₁₀H₁₁N (275) Formed by allowing a solution of the hydrochloride of (a) di methyl dipyrrole in dilute H.SO, to stand for some time in the cold (Dennstedt, B 21, 3439) Liquid, volatile with steam—Picrate B'C₆H₂(NO₂)₃OH [156°] Dark red silky needles

(from benzene)

Di methyl indole C₁₀H₁₁N (c 270°) Formed from (3) di methyl dipyrrole in the same way as the preceding isomeride (D) Liquid Smells like scatole —Picrate B'C.H (NO.),OH [149°] Red silky needles

(In 1,2,3) Tru methyl indole C, H, N C_eH₄<CMe CMe (280°) Formed by heating di methyl indyl acetic acid for several hours at 210° (Degen, A 236, 160) Formed also by heating the phenyl methyl hydrazide of methyl ethyl ketone with ZnCl₂ at 180° (D) Yellow oil with characteristic odour Miscible with alcohol and ether Gives no colour to pine wood Picrate B'C,H2(NO2),OH [150°] Dark red needles (from hot benzene)

CH CH C CMe CMe (B 4, In 1, 2) Tri methyl indole C, H, N t.e

[79°] (283° uncor) CH CMe C NH Formed by heating bromo acetyl propionic (bromo levulic) acid CH, CO CHBr CH₂ CO₂H with o toluidine (Wolff, B 21, 3362) White plates, v sol alcohol, chloroform, and petroleum ether, v sl sol water Volatile with steam — Picrate B'C₄H₂(NO₂)₃OH [152°] Purple red

(B 2, In 1,2) Tri-methyl indole C,1H,2N : 6. CMe CH C CMe CMe [1219] (297° cor)

CH CH CNH / Formed by warming & bromo acetyl propionic acid (1 pt) with p toluidine (3 pts), and finally heating the mixture to boiling (Wolff, B 21, 3361) Plates, v sol alcohol, chloroform, and petroleum ether, v sl sol water Does not give the pine wood reaction The solution in HOAc, mixed with FeCl, becomes green on boiling, and

finally blue Picrate B'C_eH₂(NO₂)₃OH [189°] Brownish-red needles, v sol benzene and alsohol

Netrosamene $C_{,H_{\circ}} < \frac{CMe}{N(NO)} > CMe$ [73°] Golden-yellow needles, v e sol alcohol and HOAc, al sol water

Tetra-methyl-indole C₁₂H₁₅N (285°) Lightyellow oil, with characteristic odour (Dennstedt, B 22, 1924) Picrate B'C₂H₂(NO₂)₃OH [100°] Shining red needles

METHYL-INDOLE ACETIC ACID v METHYL INDYL-ACETIC ACID

 $\begin{array}{cccc} (In & 1)\text{-}\mathbf{METHYL}\text{-}\mathbf{INDOLE} & (In & 2)\text{-}\mathbf{CARB}\text{-}\\ \mathbf{OXYLIC} & \mathbf{ACID} & \mathbf{C_{10}H_2NO_2} \ \imath \ e \end{array}$

C.H. CMe C CO.H Scatole (B)-carboxyluc acid [165°] Formed by saponifying with alcoholic potash its ether which is obtained by boiling with alcoholic hydrogen sulphate (10 pc), the phenyl hydrazide of ethyl glyoxylic ether CH. CH. C(N.2HPh) CO.H (Wishicenus a Arnold, B 20, 3395, A 246, 335) Formed also by heat ing scatole with sodium in a current of CO.2 at 240° (Chamician a Magnanini, G 18, 61, B 21, 672, 1927, Rend Accad Linc [4] 4, 740) Thin white needles (from boiling water), v sol alcoholic solution is coloured deep red by FeCl. On heating above 165° it is split up into CO.2 and scatole [95°]—AgA' white powder, insol water

Ethyl ether EtA' [134°] Needles (from alcohol), insol water, v e sol benzene and ether

(In 1)-Methyl-indole carboxylic acid
C_{1c}H₂NO₂. Scatole (a) carboxylic acid [164°]
(Possibly identical with the preceding acid)
Occurs among the products of the putrefaction
of serum albumen, and of muscular tissue (H a
E Salkowsky, B 13, 191, 2217, H 8, 23, 9,
8) Small plates (from benzene) Decomposed
on heating above its melting point into CO₂ and
scatole V si sol cold water, v sol alcohol and
ether, m sol benzene FeCl, colours its dilute
solution (containing HCl) violet on boiling
Nitrous acid colours its dilute solution cherry
red, and presently gives a pp Bleaching powder
colours a dilute solution, acidified by HCl, purple,
this reaction, and that with introus acid, are not
exhibited by (In 1)-indole (In 2) carboxylic acid

Methyl ketole carboxylic
NH CMe

acid [172°] or [183°] Prepared by heating (In 2)-methyl indole (10 g) mixed with sodium (36 g) in a current of dry CO, first at 235° and finally at 315°, the unaltered methyl-indole is removed by steam distillation, and the acid re crystallised from acetone (Ciamician a Magnanin, G 18, 60, B 21, 672, Rend Accad Linc [4] 4, 740) White crystalline rowder, completely decomposed at its melting point into CO, and methyl indole (methyl ketole), this decomposition is partially effected by merely boiling the aqueous solution. Sl. sol water and benzene, v sol alcohol and acetone. It gives white pps with lead and mercuric salts, and a

green pp with a cupric salt —AgA' white crys talline pp

(In 3)-Methyl-indole (In 1) carboxylic acid C₂H₄ C(CO₂H) CH [212°] Obtained by heating the phenyl methyl hydrazide of pyruvic acid (1 pt) with 10 pc aqueous HCl (15 pts) on the water bath (E Fischer a Hess, B 17, 559) White needles, v sol hot alcohol, ether, and benzene, sl sol hot water, nearly insol cold water Its solution in H₂SO₄ is red By prolonged heating at its melting point it is split up into CO₂ and (In 3)-methyl-indole Readily oxidised by KMnO₄ An alkaline solution of Br or Cl oxidises it to methyl-ψ isatin and CO₂ (B 4)-Methyl-indole (In 2) carboxylic acid

(B 4)-Methyl-Indole (1n 2) value (1n 2) CH CH C OH CH CH CO OH [171°] Formed by CH CMe C NH saponfying with alcoholic potash its ethyl ether which is obtained by heating the o-tolyl hydra

zide of pyruvic ether (1 pt) with ZnCl₂ (1 pt) at 220° (Raschen, A 239, 228) Needles (from water), v sol alcohol, ether, and HOAc (B 2)-Methyl-indole (In 2) carboxylic acid

CMe CH C CH

CH CH CNH

CH CH CNH

its ethyl ether which is obtained by heating the p-tolyl hydrazide of pyruvic ether with ZnCl, at 220° (Raschen, A 289, 228) Needles (from water), m sol hot water, v sol alcohol, ether, ohloroform, and HOAc Decomposed on fusion

into CO₂ and (B 2) methyl indole

Ethyl ether EtA' [160°] Colourless

needles or plates (In 2, 3) D1 methyl-indole (In 1)-carboxylic acid $C_{11}H_{11}NO_2$ i.e. $C_0H_1 < \begin{array}{c} C(CO\ H) \\ NMe \end{array} > CMe$

[185°] Formed by saponifying its ether which is obtained by heating the phenyl methyl hydra zide of acetoacetic ether with ZnCl₂ (Fischer, B 19, 1569, Degen, A 236, 157) Six-sided plates, m sol hot alcohol and chloroform, sl sol water, ether, benzene, and ligroin Splits up at 200° into CO₂ and (In 2 3) di methyl indole The Na salt is insol cone NaOHAq The Ag salt is insol NH₂Aq Colours pine wood

salt is insol NH,Aq Colours pine wood

Ethyl ether Eth' [95°] Colouriess
needles (from alcohol-ligroin), v sol alcohol
ether, benzene, and chloroform, sl sol ligroin

(B 4, In 3) Di-methyl indole (In 2)-carbexplic acid C₁₁H₁₁NO₂ ie CH CH CCH

CH CH CCH CO₂H [210°] Formed by CH CMe C NMe warming the o-tolyl methyl-hydrazide of pyruvic acid (1 pt) with phosphoric acid (20 pts of S G 1 17) on the water bath (Hegel, A 282, 220) Colourless needles (from benzene), v e sol alcohol Splits up on heating into CO₂ and the corresponding di methyl indole When its alka line solution is warmed with NaOCl and the product heated with water there is formed dimethyl \(\psi \) isatin C₂H₂Me \(\begin{center} \mathbb{CO} \text{NMe} \rightarrow \mathbb{CO} [157°] \end{center} \]

nde of pyruvic acid (1 pt) with HCl (20 pts of 10 pc), the acid being ppd (Hegel, A 232, 216) Needles (from hot alcohol), al sol ether, sol hot penzene, chloroform, and glacial HOAc, insoligroin Forms the corresponding dimethylndole on heating A neutral solution of its Na salt gives with NaOCl a yellow crystalline pp 135°], which on boiling with water is changed io di methyl ψ isatin C_eH₃Me<CO crys allising in red needles [148°]

METHYL INDOXAPHTHENE C, H, С,Н, СМе СН Methyl - undene (206°)(Roser), (201°) (Von Pechmann, B 16, 516) Formed by distilling methyl indonaphthene carpoxylic acid with soda lime (Roser, A 247, 159) Transparent highly refractive liquid, smelling somewhat like naphthalene Absorbs oxygen from the air, becoming gummy On heating with conc HClAq it also becomes gummy, and H SO, has a like effect By heating with HIAq at 180° it is converted into a solid body, fusible under water, v sol ether, sl sol alcohol

Picric acid compound

C₁₀H₁₀C₈H₂(NO₄)₈OH [76°] U powder (Von Miller, B 23, 1882) Unstable orange

CARBOXY METHYL INDONAPHTHENE LIC ACID C11H10O2 te C6H4CCH2CO2H 'Dihydronaphthoic' acid [200°] Formed by gently warming benzyl aceto acetic ether (1 pt) with conc H.SO, (7 pts), and pouring the product into water (Von Pechmann, B 16, 516, Roser, B 20, 1574, A 247, 158) White needles (from alcohol), almost insol water, m sol hot alconol and ether Crystallises from glacial acetic acid in prisms (containing HOAc) May be distilled with slight decomposition, but when boiled for a long time it splits up into CO2 and methyl indonaphthene On oxidation it yields phthalic acid

Methylether *MeA' [78°] Small needles, v sol alcohol and ether

C_eH₄<CH₂CBr CO₂H Dı - bromide [215°] Formed by exposing the acid to brominevapour White crusts (from ether) On warm ing with HOAc it gives off HBr and leaves $C_eH_4 < \stackrel{CMeBr}{CH} > C CO_2H$ [245°], which forms a methyl ether melting at 100°

Methyl ether C10H2Br2CO2Me. [157°] White needles, sl sol methyl alcohol

METHYL INDONAPHTHENE DIHYDRIDE CARBOXYLIC ACID C11H12O2 te

C.H. CHMe CH CO.H Methyl-hydrindonaphthene carboxylic acid [80°] (300°-310°) Formed by the action of sodium amalgam on an alkaline solution of methyl indonaphthene carboxylic acid (Roser, B 20, 1574, A 247, 165) Small needles (from hot water), v sol alcohol and ether, scarcely volatile with steam On continued heating above 310° it becomes viscid, but the crystalline acid is reproduced on treating this viscid mass with alkalis -AgA' -BaA', 2aq needles (from alcohol), v sol water METHYL INDONAPHTHOQUINONE

C1.H.O2 2.6. C.H. CO CHMe. Methyl-da-keto-

hydrindene [85°] (c 150° at 18 mm) Formed by the action of sodium on a mixture of ethyl propionate and phthalate (Wislicenus a Kötzle, A 252, 80) Blunt pyramids (from alcohol) or needles (from light petroleum), sol ether and hot water The sodium derivative C16H,NaO3 crystallises in small dark-red prisms

Di-oxim C_eH₄ C(NOH) CHMe [1177]. Needles, sol alcohol, ether, alkalıs, and HOAc Mono-phenyl-hydrazide

 $C_0H_4 < CO \xrightarrow{C(N_2HPh)} CHMe$ [164°] Crystals, \forall . sol ether and benzene Forms a green solution in HOAc

Di-methyl-indonaphthoquinone C, H, O. t.s C_eH_•COCMe [108°] (c 250°) Formed by heating methyl indonaphthoquinone with MeI and MeOH at 100° (W a K) V sol alcohol, ether, and benzene

Phenyl hydrazide

C₀H₄ C(N,HPh) CMe₂ [184°-187°] Slender yellowish prisms (from alcohol), sol ether and HOAc FeCl, colours its solution in H2SO, intensely dark green

METHYL INDOPHENINE v Indophenine METHYL-INDYL ACETIC ACID C,H,1NO. CH2.CO2H

Te C'H' CNE [195°-200°]

Formed by warming the phenyl hydrazide of acetyl propionic (levulic) acid with ZnCl₂ at 125° (E Fischer, B 19, 1565, A 236, 149) Colourless plates, sl sol hot water and chloroform, m sol ether, v sol hot alcohol, v e sol acetone and hot HOAc Nitrous acid yields a nitrosamine At 225° it is split up, slowly into CO₂ and di methyl indole. Its picric acid compound crystallises in slender dark red needles

Di-methyl-indyl-acetic acid CigHisNO, s.c. CH, CO,H

O.H. NMe CMe [188°] Formed by saponification (by alcoholic KOH) of its ether. which is obtained by warming the phenyl methylhydrazide of acetyl propionic ether with ZnCl, (Fischer, B 19, 1568, Degen, A 286, 158) Colourless plates, sl sol water, ether, and benzene, v sol alcohol and chloroform Its alkaline salts are v e sol water, but ppd on addition of caustic alkalis At 210° it is split up into CO, and (In-1,2,3) tri methyl-indole Does not give the pine-wood reaction

METHYL INDYL KETONE v (β) Acetyl-

INDOLE (In 1) METHYL INDYL METHYL KETONE C,H,NO ce. C,H, CMe CO CH, Acetyl-[148°] Formed by heating (In-1)methyl indole (scatole) (1 g) with AcCl (10 g) and ZnCl_2 ($\frac{1}{2}$ g) (Magnanini, G 18, 99, B 21, 1938) Long needles (from dilute alcohol), insol. cold water, v sol hot alcohol and acetone, m sol ether Volatile with steam Not affected by KOHAq, but conc HCl forms scatole cone H₂SO₄ gives a purple solution Picrate [156°] Yellow needles, at sol.

cold, v sol hot, benzene

Oxem C.H. CMe C C(NOH) CH. [119°]. Small needles, decomposed by acids and alkalis, reproducing the ketone

(In. 2)-Methyl-indyl methyl ketone

CO CH,
Acetyl methyl ketole
CMe
CMe

[196°]. Formed by heating (In 2) methyl indole (methyl ketole) (1 pt) with Ac₂O (5 pts) and NaOAc (1 pt) for six hours with inverted condenser (Jackson, B 14, 879, Fischer, A 242, 879) Colourless needles (from acetone), sl sol water, v sol alcohol and hot benzene Dissolves in HClAq Not decomposed by boiling NaOHAq, but boiling cone HClAq regenerates the ketone KMnO₄ oxidises it to acetyl amido benzoic acid (Magnanim, G 18, 97)

Phenyl hydraside C₁,H₁₇N₂ 16 C(N₂HPh) CH₂

C.H. CMe [c 136°] Formed

by heating the ketone with phenyl hydrazine hydrochloride and NaOAc Colourless plates, m sol hot benzene, v sl sol petroleum ether

DI-METHYL INOSITE v DAMBONITE METHYL-IODAMINE v METHYLAMINE

METHYL IODIDE CH,I Iodo methane Molw 142 (428°) (Dobrner, A 243, 23), (423°) (Perkin, C J 45, 459) S G § 2 3346 (D), 152 2252, 252 2529 (P) S 008 at 15° (Bardy a Bordet, A Ch [5] 16, 569) C E (0°-10°) 00118 (D) S V 641 (Lossen, A 254, 69), 648 (Ramsay), M M 9 009 at 195° H F p (gas) +3420 H F v (gas) 2840 (Thomsen, Th) Obtained by distilling phosphorus (1 pt) with iodine (8 pts), dissolved in moist methyl alcohol (14 pts), or phosphorus (60 g) with iodine (1000 g) and methyl alcohol (500 g) (Dumas a Péligot, A 15, 30, Pierre, A 56, 147, Landolt, A 84, 44, Hofmann, C J 18, 69) Prepared also from red phosphorus (10 pts), MeOH (35 pts), and I (100 pts) (Personne, J 1861, 607, Butlerow, B 6, 561), and from KI, MeOH, and gaseous HCl (De Vrij, J 1857, 441) The distillate is washed with water and rectified over CaCl₂ and lead oxide Colourless, slightly combustible liquid Not at acked by gaseous HCl

Reactions—1 Chlorine converts it into MeCl—2 When heated with zinc it forms IZnMe—The moist copper zinc couple forms methane (Gladsone a Tribe, C J 26, 682)—8 When heated with alloys of K or Na with As or Sb it yields methides of arsenic or an timony—4 With Mg and Al it forms methides—5 When heated in a sealed tube with aqueous NH, it forms mono, di, and tri methylamine and NMe,I—6 With EtOH at 125° it forms EtI and MeOEt (Busse a Kraut, A 177, 272)—7 Heated with water (15 pts) at 100° it is converted into methyl alcohol (Niederist, A 196, 350)—8 With H₂S and water it forms MeI(H₂S)₂28aq (Forcrand, A Ch [5] 28, 21)—9 Sulphur at 160° to 190° forms SMe₂I and other products (Klinger, B 10, 1880)

other products (Kinger, B 10, 1880)

Hydrate (MeI)₂ aq [-4°] (F), [4 8°]
(Villard, C R 111, 185) Formed by passing a current of most air through the iodide (Forcrand, C. R 90, 1491)

METHYL-IODOFORM v TRI 10DO ETHANE

METHYL-ISATIC ACID v ISATIC ACID METHYL-ISATIN v ISATIC METHYL-ISATOIC ACID v ISATOIC ACID METHYL-ISATOID v ISATOID

METHYL-ITACONIC ACID C.H.O. [166]. A product of the distillation of methyl paraconic acid (Fränkel, A 255, 37) Formed also by heating a solution of methyl citraconic acid at 150° in sealed tubes Prisms, sol water, insolubility of the sealed tubes Prisms, sol water, insolubility

Ag,A"
TETRA METHYLIUM HYDROXIDE v
Methylo hydroxids of Trimethylamine

DI-METHYL-KETOL v METHYL OXYETHYL KETONE

METHYL-KETOLE v (In 2) METHYL INDOLE

DI METHYL-KETONE 18 ACETONE

D1 methyl di ketone $C_4H_4O_2$ i e CH_2 CO CO CH_4 D1 acetyl (88°) SG 27 9734 S 25 at 15° Formed by heating it dicarboxylic acid (ketipic acid) either by itself or with dilute H_2SO_4 (Fittig, B 20, 3179, A 249, 200) Formed also from its mono oxim (nitroso methyl ethyl ketone) by successive treatment with $NaHSO_3$ and dilute acid CH_3 CO CMe $NOH + H_2SO_3 + H$ O

= CH, CO COMe + NH, SO, H (Von Pechmann, B 20, 3162) Most easily prepared by saponi fying methyl aceto acetic ether with dilute (3 pc) alkalı, treating the product with NaNO, and $\rm H_2SO_4$, removing alcohol by distillation, adding dilute $\rm H_2SO_4$ (20 vols of 15 pc), and distilling with steam (Von Pechmann, B 21, 1411) Yellow mobile liquid, smelling like acetone and quinone, miscible with alcohol and ether composed by alkalis or hot alkaline carbonates Forms metallic derivatives of trimethyl glyoxal ine with ammoniacal solutions of silver nitrate and of cuprous chloride With alcohol it forms an unstable compound C.H.O.2HOEt, boiling at 75° With water it forms a crystalline hy drate (C,H,O.), 2aq, insol water, alcohol, and Yields a very unstable compound with Combines with NaHSO₃ eth**er**

SO₂ Combines with Names So₃

Reactions —1 With HCy it forms the nitrile of di oxy di methyl succinic acid —2 Bromine dissolved in CS₂ forms a di bromo derivative C₄H₄Br₂O₂ [117°] —3 Ammonia forms tri

methyl glyoxalıne CHMe N CMe [133°] (271°).

4 When warmed with o tolylene diamine acet ate it is converted into tri methyl quinoxaline O_oH_4 Me< N CMe>, which crystallises from light petroleum in prisms [91°] (270°) —5 Aniline forms the anilide PhN CMe CMe NPh, which crystallises from alcohol in lustrous sulphuryellow scales [183°], v sol ether, m sol alcohol, insol water —6 On adding dilute aqueous NaOH or Na₂CO₂ to an aqueous solution of the diketone until it becomes colourless, then at once acidifying with dilute H_2 SO₄ and extract-

ing with ether, the product is di methyl quinogen CH, CO CMe CH CO CO CH, a yellowish bitter syrup, which forms a phenyl-hydrazide $C_8H_{10}(N_2HPh)$, [205°], and is converted by excess of alkali into p xyloquinone -7 Heated with an aqueous solution of urea it forms di methyl glycolurite C₂H₁₀N₁O₂ (Franchi uont a Klobbie, R T C 7, 251) —8 Reduced in alkaline solu-tion to a product (CH₂ CO CH(OH) CH₂?), which instantly reduces Fehling's solution in the cold

Mono-oxim CH, CO C(NOH) CH, Iso nitroso methyl ethy' ketone (186°)[74°] Formed by treating VD 351 (calc 349) methyl aceto acetic ether (1 mol) with aqueous KOH (3 mols), followed by nitrous acid (V Meyer a Zublin, B 11, 322) Prisms (from chloroform) or plates (from water), v e sol alcohol, ether, and chloroform Decomposed by heating with dilute HClAq at 140° into ammonia and acetic acid Boiling cone HClAq yields HOAc, hydroxylamine, and a little of the dioxim (Schramm, B 16, 177) By boiling with dilute H₂SO₄ it is split up into hydroxylamine and the diketone (Von Pechmann, B 20, 3213) Treatment with aqueous NaHSO, and dilute H₂SO₄ also forms di methyl diketone (Von Pech mann, B 20, 3162) Alkaline K.FeCy, oxidises it, even in the cold, to acetic and nitrous acids (Gutknecht, B 12, 2290) On reduction by SnCl, and HCl, followed by removal of tin by H,S and addition of alkali, tetra methyl pyrazine is obtained But if the solution is allowed to stand when acid another base is got (Braun, B 22, 559)

Methyl ether of the mono oxim CH, CO C(NOMe) CH, (125° uncor) Colour less oil, lighter than water (Ceresole, B 16,

Di oxim CH, C(NOH) C(NOH) CH, thyl ethyl acetoximic acid [234°] by the action of hydroxylamine on the mono oxim (Schramm, B 16, 179, Auwers a V Meyer, B 21, 3527) or on the diketone (Fittig, A 249, 204) Small colourless needles, insol water, v sol alcohol and ether May be sublimed

Oxim phenyl hydraside CH₃ C(NOH) C(N₂HPh) CH₂ [158°] Formed from the oxim and phenyl hydrazine (Von Pech mann a Wehsarg, B 21, 2997) Large crystals (from alcohol) Its solution in H₂SO₄ is coloured bluish violet by FeCl₂

Phenyl-hydrazide

CH, CO C(N2HPh) CH, [133°] Formed by running a solution of diazobenzene chloride into one of methyl acetoacetic acid, the reaction being completed by adding a solution of NaOAc (Japp a Klingemann, B 21, 549, A 247, 218, Von Pechmann, B 21, 1411) Yellow tables Forms a yellow solution in (from benzene) cone H2SO4

Di-phenyl di hydraside CH, C(N, HPh) C(N, HPh) CH, [243°] (Japp), [239°] (Fittig) Formed by treating the mono phenyl hydrazide with phenyl hydrazine (Japp, A 247, 218), or by the action of phenyl-hydrazine on an ethereal solution of di methyl di ketone (Fittig, A 249, 203, Von Pechmann, B 20, 3164) Formed also by heating the phenyl hydrazide of pyruvic acid (Japp a. Klingemann, B 21, 550) Yellowish needles, almost insol water, alcohol, and ether, al sol

enloroform, m sol acetone and hot benzene Dissolves in cold cone H₂SO₄ forming a brown solution, which after some time becomes dirty wine red, appearing green in thin layers K2Cr2O, in HOAc oxidises it to the 'osotetrazone CH, C N NPh

 CH_1 , which crystallises in matted red

needles [169°], insol water, sol chloroform and benzene, m sol ether, sl sol acetone and alco hol, almost insol HOAc This 'osotetrazone' is reduced to the original diphenyl dihydrazide by warming with phenyl hydrazine HCl con verts the 'osotetrazone' into an 'osotriazone' CH, CN,

NPh, which is a very weak base, CH, CN [35°], (c 255°), insol water, sol alcohol and

ether (Von Pechmann, B 21, 2759)

DI METHYL DI-KETONE DICARBOXYLIC ACID C.H.O. 10 CO.H CH. CO CO CH. CO.H Dr. keto adopte acid Ketipac acid Ketipatic Ketipatic acid Oxalyl di acetic acid Obtained by warm ing its ethyl ether with cold conc HClAq (Fittig a Daimler, B 20, 203, A 249, 183) White amorphous powder, insol or v sl sol cold water, alcohol, chloroform, CS2, benzene, and petroleum ether On heating alone or with dilute H.SO, it

is converted into dimethyl diketone
Ethyl ether Et₂A" [77°] Prepared by warming oxalic ether with chloro-acetic ether and amalgamated granulated zinc at 80° for three days The mass is extracted with water and the insoluble portion treated with dilute H₂SO₄, and the solution so obtained extracted with ether The ether is distilled off, and the ketipic ether left recrystallised from alcohol (Fittig a Daimler) Formed also by the action of NaOEt and oxalic ether on acetic ether (Wis licenus, B 20, 589, A 246, 328) Colourless plates or prisms, insol cold water, v sol ether and chloroform, m sol hot alcohol, benzene, and CS₂ Decomposed by boiling water FeCl, colours its alcoholic solution deep red

Reactions—1 Bromine added to a warm solution of the ether in CS₂ forms CO₂Et CBr₂CO CO CBr₂CO₂Et [119°], which is converted by ammonia into oxamide and di bromo acetamide [156°] Bromine added to a solution of ketipic ether in cooled CS₂ forms CO₂Et CHBr CO CO CHBr CO₂H, which is de posited in colourless plates [70°] -2 Chlorine passed into a boiling solution of the ether in chloroform forms CO2Et CCl2 CO CO CCl2 CO2Et [93°], which is also produced by chlorinating dı oxy quinone dicarboxylic ether (Böniger, B 22, 1285) -3 Phenyl hydrasine forms a phenyl hydrazide

CO₂Et CH₂ C(N₂HPh) C(N₂HPh) CH₂ CO₂Et crystallising from chloroform in light yellow needles [160°-180°]

DI-METHYL-MALEIC ACID C.H.O. ve.
CO.H.OMe OMe CO.H. Pyrocinchonic acid
Di-methyl-fumeric acid. Di-methyl-ethylene
di-carboxylic acid Butylene dicarboxylic acid

Formation —1 Its anhydride is formed by the dry distillation of cinchonic acid C,H,O, (Weidel a. Schmidt, B 12, 1151; Weidel a Brix, M 3, 608) —2 The anhydride is formed by distilling the mother liquor from the preparation of terebic acid by oxidation of turpentine with HNO, (Roser, B 15, 1318) —3 By heating the lactone CH, C(CO,H) CH(CO,H) CH, CO at 180°

(Rach, A 234, 39) —4 Together with di-chloro di-methyl succinic acid

CO₂H CClMe CClMe CO₂H by the action of reduced silver upon $d_{1-\alpha}$ chloro propionic acid (Otto a Beckurts, B 18, 825) —5 By the action of reduced silver upon di chloro di methyl succinic acid (O a B) —6 The anhydride is formed by treating either 'anti' or 'para' dimethyl-succinic acid in the fused state with bromine (Bischoff a Voit, B 23, 646)

Properties — The free acid is unstable, on adding an acid to its salts the anhydride is at once ppd The sodium salt gives a dark red colouration with FeCl₂, and crystalline pps with

Pb(NO₈)₂ and HgCl₂

Salts —Na₂A"₂aq white crystalline solid —Na₂A"1½aq —CaA" small needles, less sol hot water than cold (Roser) —CaA"aq small white plates (O a B) —BaA" white glustening plates, more sol cold water than hot —Ag₂A' sparingly soluble pp, decomposed on heating into Ag₂O and the anhydride

Methyl ther Me₂A" Colourless oil Ethyl ther Et₄A" (240°) Oil Formed by treating the anhydride with alcohol and HCl CMe CO.

Anhydride | [96°] (223°)

VD 42 (calc 43) Formed as above Crystal lises in glistening white leaflets or trimetric tables (from water), abc = 626 1 1 521 or 201 3321 V sol alcohol, ether, and benzene, al sol cold water The aqueous solution is acid and has a sweet but burning taste Volatile with steam Readily sublimes Not attacked Chromic acid mixture oxidises it to by HNO, acetic acid and CO2. Reduced by sodiumamalgam to s-di-methyl-succinic acid [194°] and two isomeric acids [241°] and [120°], the last acid being methyl-ethyl-malonic acid (Otto a Rössing, B 20, 2736) Cone HIAg at 220°, and Conc HIAq at 220°, and zinc filings in water or ammonia also reduce it to s di methyl succinic acid The anhydride is not attacked by PCl, or AcCl It is dissolved by aqueous alkalis, forming the sodium salt of the acid Potash fusion yields oxalic acid By heating with bromine and water at 100° there is formed di bromo-acetic acid When it is dissolved in benzene and shaken with phenyl-hydrazine in the cold the anhydride forms the compound CH, O(CO N,H,Ph) CMe CO O N,H,Ph, which, when shaken with HClAq, regenerates the anhydride, but when heated at 115° yields CO, CMe CO NH

phenyl-hydrazine, and | | [129°], which CMe CO NPh

erystallises from dilute alcohol in yellow mono- and benzene Fumi clinic prisms, and yields di methyl maleic acid forming CO₂ and N₂O

wnen warmed with KOHAq or HCiAq (Otto a. Holst, J pr [2] 42, 67)

CMe COCl

Chlorade | (220°-230°) Formed OMe COCl

by the action of PCl, on the anhydride (O a H) Yellow oil When acted upon by the Na salt it yields the anhydride NH, converts it into the imide Phenyl-hydrazine forms the compound CMe CO.

N NHPh [187°] isomeric with the

body melting at 129° (v supra)

Imide | NH [118°] Formed by CMe CO

heating the anhydride with alcoholic NH, Triclinic plates, m sol hot water, v sol alcohol May be sublimed — *B'₂H₂PtCl₄

Anrilade | NPh [96°] Formed

by heating the anhydride with aniline at 180° Prisms (from alcohol)

METHYL-MALONIC ACID C₄H₀O₄1e CH₃CH(CO₂H)₂ Iso succinic acid Mol w 118 [130°] H C v 365,100 H C p 364,800 H F 218,200 (Stohmann, Kleber, a Langbeir, J pr [2] 40,207) S H (0°-50°) 3372 (Hess P [2] 35,410)

Formation—1 By decomposing a cyano propionic acid with potash (Wichelhaus, Z 1867, 247, Byk, J pr [2] 1, 19)—2 From sodium malonic ether and MeI (Zublin, B 12, 1112)

Preparation—By acting on potassium a bromo propionate with pure aqueous KCy, and saponifying the product by boiling with aqueous

KOH (Cohn, A 251, 335)

Properties — Long prisms or tables (by sublimation) Decomposed on distillation into CO₂ and propionic acid FeCl₃ gives no pp in neutral solutions Fuming HNO, decomposes it into tri nitro ethane, CO₂ and acetic acid (Franchimont, R T C 5, 281) Electrolysis of a concentrated solution of its potassium salt yields hydrogen, CO₂, and oxygen

gradually becoming crystalline

Methyl ether Me₂A" (179°) S G 15 1 107 When treated with HNO₂ (S G 15) it gives a small quantity of CH₂ C(NO₂)(CO₂Me)₂

gives a small quantity of CH, C(NO₂)(CO₂Me)₂

Ethyl ether Et₂A" (1965° cor) (Krestownikoff, B 10, 409), (199°) (Perkin, C J 45, 510) S G ²²/₂ 1021 (Conrad a Bischoff, A 204, 146), 121 10213, 22 10130 (P)

146), \(\frac{1}{8} \) 10213, \(\frac{3}{25} \) 10130 \(\text{P} \) \\ Di-amide \quad \text{CH, CH(CO NH}_2)_2.} \quad [206°]. \\ Formed, together with methyl carbonate, by treating the compound \(\text{CH, C(NO}_2)(\text{CO}_2\text{Me})_2 \) (v \(supra \)) with ammonia (Franchimont, \(R \) T. C. 8, \(286 \)) \(\text{V sl sol alcohol} \)

D1-methyl-d1-amide CH₃CH(CO NHMe)₂ [154°] Formed by the action of methylamine on the ether (Franchimont, R T C 4, 204) Small needles (from benzene), v sol water and alcohol, sl sol ether and benzene Fuming HNO, decomposes it, forming CO, and N,O

Di-methyl-malonic acıd CMe₂(CO₂H)₂. | Isopyrotartaric acid | Mol w | 132 [186°] | H C 515,300 | H F 230,700 (Stohmann, Kleber, a Langbein, J pr [2] 40, 208) | S H (0°-50°) | *310 (Hess, P [2] 35, 410) | Formation — By heating bromo isobutyric scid with KCs and state of the store of the s

acid with KCy and decomposing the resulting nitrile with potash or HClAq (Markownikoff, B 6, 1440, A 182, 324) —2 By boiling di methylbarbituric acid with potash (Conrad a Guthzeit, B 14, 1644) -3 From methyl malonic acid, NaOEt, and MeI (Thorne, C J 39, 543) - 4 By oxidising & acetyl di a methyl propionic acid with nitric acid (3 pts of SG 14 and 1 pt water) (Anschutz, A 247, 105)

Properties -Transparent four sided monoclinic prisms, sl sol alcohol, v sol: water and ether Sublimes in white needles, even at 100° Split up on melting into CO and isobutyric Not attacked by boiling dilute HNO,, and scarcely at all by boiling chromic acid mixture

Salts - Na.A" small efflorescent needles, sl sol water - BaA" stellate groups of thin needles - * CaA" nodules, m sol cold water, deposited on warming its solution - *MgA" crystalline, v sol water — PbA" aq insoluble pp, changing to shining scales on boiling — ZnA" aq S 68 at 24° Monoclinic pyramids (Thorne) — ZnA" 3aq S 94 (Markownikoff) — Ag₂A" small needles, insol water

Ethyl ether Et₂A" (1945°) (Thorne), (1965° cor) (Peikin, C J 45, 511) S G $\frac{35}{49}$ 9965 (T), $\frac{15}{12}$ 1 0015, $\frac{25}{4}$ 9936 (P) M M 9 268 at 14 4°

 $Amide (CH_3)_2C(CONH)_2$ [197°] From the ether and alcoholic NH, at 120° (Thorne)

Amic acid CO₂H CMe₂ CO NH [85°] [85°] A

product of the oxidation of mesitylic acid CH₂ CMe CO₂H

CMe < by KMnO, and H.SO, CO NH

(Pinner, B 15, 580) At 132° it decomposes, giving off CO₂ Boiling KOHA4 forms NH₃ and di methyl malonic acid The potassium salt KA' 2aq crystallises in prisms, v e sol water, m sol alcohol

Di methyl di-amide CMe (CO NHMe), [123°] Long needles (from benzene), v e sol water and alcohol, sl sol ether, m sol benzene (Franchimont, R T C 4, 206) Fuming HNO₃ attacks it, forming N₂O, methyl nitrate, and

dimethylmalonic acid

Tetra methyl di amide CMe₂(CO NMe₂)₂ [80°] (276°) Long prisms (from ligroin), v e sol water, alcohol, and Fuming HNO, forms di methyl benzene malonic acid and di methyl nitramine

DIMETHYL-MALONYL-UREA v DI METHYL-BARBITURIC ACID

METHYL-MANDELIC ACID Methyl derivative of Mandelic acid and Oxy-Tolyl ACETIC ACID

Tetra methyl mandelic acid v Oxy DURYL-ACETIC ACID

METHYL-MELAMINE v Methyl cyanuramide in the article CYANIC ACIDS

METHYL MERCAPTAN CH,S te CH, SH Methyl sulphydrate (5 8°) at 752 mm (Klason, B 20, 3407), (20°) (Gregory, A 15, 239), (21°) (Obermeyer, B 20, 2919) H F p 5,950 H F v 6,370 (Thomsen, Th) Occurs in human

excrement (Nencki, M 10, 863) Obtained by distilling KMeSO, with KHS Prepared by diluting with ice a cold mixture of MeOH (500 c c) and H_2SO_4 (750 c c), adding (2.75 kilos)of) Na₂CO₃ 10aq, and evaporating until most of the Na2SO, has separated The mother liquor is mixed with a solution of potash (500 g) in water (1,000 c c) previously saturated with H2S The mixture is distilled from a water bath, and the gases evolved are passed first through a concentrated aqueous solution of KOH (50 g) and then into a solution of KOH (350 g) in water (700 cc) A small quantity of lead acetate is added to the last solution to ppt H2S, and the methyl mercaptan is then liberated by HCl, dried, and distilled The yield is fair (200 g of MeSH and 40 g of Me₂S) (Klason, B 20, 3407)

Properties -Thin, colourless, highly refrac tive liquid with very repulsive odour

crystalline hydrate

Salts -- Hg(SMe). [175°] Obtained by treating HgO with MeSH, or by passing the gas through an aqueous solution of HgCy2 sol water —Pb(SMe), minute tables —Bi(SMe), minute yellow needles -AgSMe yellow crystalline pp

Reference -Per chloro methyl mercaptan DI - METHYL - MESIDINE C11H1,N $C_pH_{11}NMe_2$ (214°) S G 908 Formed by methylation of mesidine (Hofmann, B 5, 718 Klobbie, R T C 6, 33) By treatment with H₂SO, and HNO₃ (S G 1 5) it is converted into C.Me₃(NO)₂ NMeNO [138°] —B'₂H₂PtCl₂. METHYL METHANE v ETHANE

Di methyl methane v Propane Tri methyl methane v Iso BUTANE Tetra methyl-methane v Pentane PENTAMETHENYL METHYL

TRIHY. DRIDE DICARBOXYLIC ACID C,H10O, 16. CO H CH<CH $^{\circ}$ CH $^{\circ}$ >C CO $^{\circ}$ H [188°]

tained by saponifying its ether which is among the products resulting from the distillation of di methyl butylene diketone dicarboxylic (di acetyl adipic) ether with KOH (Perkin, jun, C J 57, 227, 233) Glistening needles or groups of plates, v sol hot water, alcohol, and acetone. sl sol cold light petroleum, benzene, CS2, and chloroform

Reactions —1 Its aqueous solution decolour ises bromine in the cold and on evaporating to a syrup it gives off HBr -2 HBrAq in sealed tubes at 110° forms C₆H₁₁Br, a light brown oil, probably bromo methylpentamethylene -3 Sodium-amalgam has no action

Salts — $\times (NH_4)A''$ gelatinous — Ag_2A'' : heavy white pp which darkens in daylight — Salts -- *(NH,)A" AgHA" slender needles, v sol hot water

METHYL PENTAMETHENYLYL METHYL KETONE TRIHYDRIDE C.H., O te

CH. CMe CH₂< Methyl dihydropentens ·CH., Č CO CH,

methyl ketone (191°) Formed by the action of boiling alcoholic potash on di-methyl butylene diketone dicarboxylic (di acetyl adipic) ether (Marshall a Perkin, jun, C J 57, 232, 244) Colourless mobile oil, smelling like peppermint Lighter than water V sol alcohol and ether Readily reacts with phenyl hydrazine. May be

reduced to the alcohol C, H, O, whence HI at |

250° yields C_8H_{16} Oxim $C_8H_{12}(NOH)$ [85°] Formed by the action of hydroxylamine hydrochloride on the ketone dissolved in methyl alcohol colourless prisms, v sol alcohol, ether, acids, and alkalis May be distilled with slight de composition — (C₈H₁₃NO)₂H₂PtCl₆ tufts of orange crystals, v sol boiling alcohol, decomposing at 192°

METHYL METHRONIC ACID C.H 100, 1.e. CH(CH₃) CH CO₂H

·C(CO₂H) CMe CH_2 — $C(CH_3)$ CO_2H CO

Dr methyl keto-C(CO,H) CMe

pentene dicarboxylic acid [198°] Formed by heating acetoacetic ether, sodium pyruvate, and Ac₂O at 140°, and saponifying the resulting ether with baryta or NaOH (Fittig, A 250, 195) White needles, v sol HOAc, ether, hot alcohol, and hot water, sl sol cold water, CS2, and benz ene, almost insol petroleum ether At 250° it 18 split up into CO_2 and methyl uvic acid $C_8H_{10}O_7$ [98°], which on prolonged boiling yields СН(СН.) СН. CH CH CH,

or CO _CMe CH_ CH=CMe oil, boiling at 119°

Salts - BaA' 2aq small needles, v e sol water - CaA" 3aq small prisms - Ag A" silky

nodules, sl sol water

Mono-ethyl ether EtHA" Obtained by boiling the di ethyl ether with alcoholic potash Yellow syrup, sl sol water—Ba(EtA"), aq yellow gummy pp, v e sol water and alcohol -Ca(EtA"), 2aq needles, m sol water, v sol hot alcohol -AgEtA" flocculent pp, sl sol water, v sol alcohol and ether

D2-ethyl ether Et₂A" (280° un Heavy oil, miscible with alcohol and ether (280° uncor)

METHYL TETRAMETHYLENE C.H., 1e $CH_2 < CH_2 > CHMe$ (c 40°) Formed by the action of sodium on as di bromo pentane dis solved in toluene (Colman a Perkin, C J 53,

Very volatile oil Does not combine with conc HIAq METHÝL PENTAMETHYLENE CeH12 1 e

CH₂ CH₂ CHMe? Formed by the action of finely divided sodium on as di bromo hexane dis solved in toluene (Perkin, C J 53, 214) not attacked by HI
